            set client-certificate bypass
            set unsupported-ssl-cipher allow
```

```
            set unsupported-ssl-negotiation allow
            set expired-server-cert block
            set revoked-server-cert block
            set untrusted-server-cert allow
            set cert-validation-timeout allow
            set cert-validation-failure block
        end
    next
end
```

2. Configure the DNS filter profile:

```
config dnsfilter profile
    edit "dnsfilter"
        config ftgd-dns
            config filters
                edit 1
                    set category 30
                    set action block
                next
            end
        end
        set block-botnet enable
    next
end
```

3. Configure the firewall policy:

```
config firewall policy
    edit 1
        set srcintf "port1"
        set dstintf "port3"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set inspection-mode proxy
        set profile-protocol-options "protocol"
        set ssl-ssh-profile "ssl"
        set webfilter-profile "webfilter"
        set dnsfilter-profile "dnsfilter"
        set nat enable
    next
end
```

Testing the connection

To query DNS over TLS:

1. Send a DNS query over TLS to the Cloudflare server 1.1.1.1 (this example uses kdig on an Ubuntu client). The www.ubc.ca domain belongs to the education category:

```
~$ kdig -d @1.1.1.1 +tls-ca +tls-host=cloudflare-dns.com www.ubc.ca
;; DEBUG: Querying for owner(www.ubc.ca.), class(1), type(1), server(1.1.1.1), port(853),
protocol(TCP)
;; DEBUG: TLS, imported 128 system certificates
;; DEBUG: TLS, received certificate hierarchy:
;; DEBUG:  #1, C=US,ST=California,L=San Francisco,O=Cloudflare\, Inc.,CN=cloudflare-dns.com
;; DEBUG:      SHA-256 PIN: elpYCnCs9ZtkQBI4+cb2QtZcyOl5UI9jMkSvbTsTad0=
;; DEBUG:  #2, C=US,ST=California,L=Sunnyvale,O=Fortinet,OU=Certificate
Authority,CN=FG3H1E5818903681,EMAIL=support@fortinet.com
;; DEBUG:      SHA-256 PIN: s48VtdODlNZfAG2g/92hMLhitU51qsP9pkHAUtTJ+f4=
;; DEBUG: TLS, skipping certificate PIN check
;; DEBUG: TLS, The certificate is trusted.
;; TLS session (TLS1.3)-(ECDHE-SECP256R1)-(ECDSA-SECP256R1-SHA256)-(AES-256-GCM)
;; ->>HEADER<<- opcode: QUERY; status: NOERROR; id: 56850
;; Flags: qr rd; QUERY: 1; ANSWER: 1; AUTHORITY: 0; ADDITIONAL: 0

;; QUESTION SECTION:
;; www.ubc.ca.                  IN      A

;; ANSWER SECTION:
www.ubc.ca.             60      IN      A       208.91.112.55

;; Received 44 B
;; Time 2021-03-12 06:53:37 UTC
;; From 1.1.1.1@853(TCP) in 6.0 ms
```

   In this query, the FortiGate inspects the DNS query to the Cloudflare DNS server. It replaces the result with the IP of the FortiGuard block page, which successfully blocks the query.

To query DNS over HTTPS:

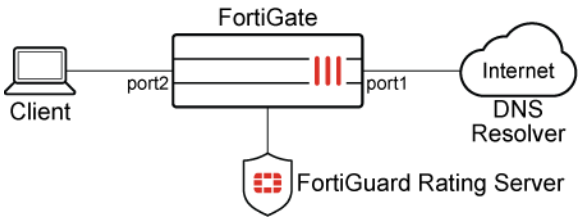
1. In your browser, enable DNS over HTTPS.
2. Go to www.ubc.ca. The website is redirected to the block page.

DNS over QUIC and DNS over HTTP3 for transparent and local-in DNS modes

DNS over QUIC (DoQ) and DNS over HTTP3 (DoH3) are supported in proxy mode inspection for transparent and local-in explicit modes. With DoQ and DoH3, connections can be established faster than with DNS over TLS (DoT) or DNS over HTTPS (DoH). The FortiGate can also handle the QUIC/TLS handshake and perform deep inspection for HTTP3 and QUIC traffic. This allows for faster and more secure DNS resolution, with improved privacy and reduced latency.

In transparent mode, the FortiGate is acting as a proxy, forwarding DNS queries, and not as a DNS server. In local-in DNS mode, the FortiGate acts as the DNS server and a DNS filter profile is applied in the system DNS server.

The firewall policy must be in proxy mode.

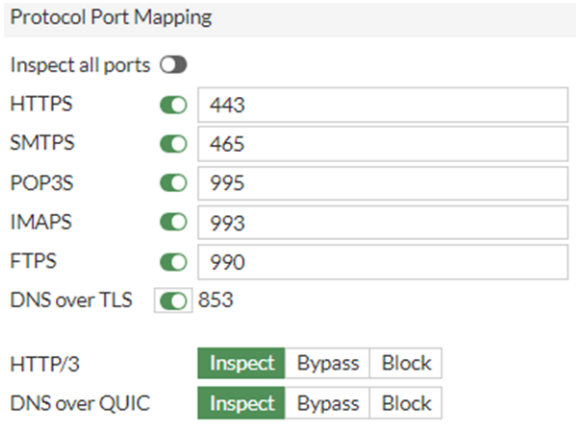


DoQ transparent and local-in query can be achieved using tools or applications in Linux, such as the q tiny command line DNS client from Natesales.

DoH3 transparent and local-in query can be achieved in Linux using q or Curl. In Windows, change the client network DNS server to the FortiGate and treat the FortiGate as an HTTP3 DNS server listening for DoH3 connections.

To enable QUIC in SSL/SSH inspection profiles in the GUI:

1. Go to *Security Profiles* > *SSL/SSH Inspection* and click *Create New*.
2. Under *Protocol Port Mapping*, set *HTTP/3* and *DNS over QUIC* to *Inspect*.



3. Configure the remaining settings as required.
4. Click *OK*.

To configure DoQ in transparent mode in the CLI:

1. Enable QUIC in the ssl-ssh-profile:

```
config firewall ssl-ssh-profile
    edit "protocols"
        config dot
            set status deep-inspection
            set quic inspect
        end
    next
end
```

2. Configure a DNS filter profile:

```
config dnsfilter profile
    edit "dnsfilter_fgd"
        config ftgd-dns
            config filters
                edit 1
                    set category 30
                    set action block
                next
            end
        end
    next
end
```

3. Apply the profiles to a proxy firewall policy:

```
config firewall policy
    edit 1
        set name "dnsfilter"
        set srcintf "port2"
        set dstintf "port1"
        set action accept
        set srcaddr "all"
        set dstaddr "all"
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set inspection-mode proxy
        set profile-protocol-options "protocol"
        set ssl-ssh-profile "protocols"
        set dnsfilter-profile "dnsfilter_fgd"
        set logtraffic all
        set nat enable
    next
end
```

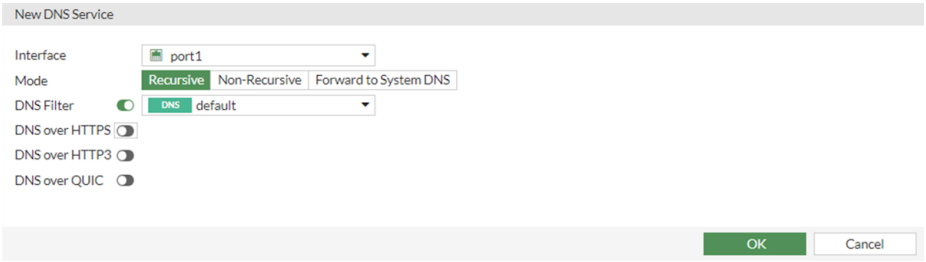
4. Test the configuration:

   On the client, use q to query a FortiGuard category30 domain with the Adguard DNS server over QUIC. The default redirect block IP address should be returned:

```
pc03:~# q www.sfu.ca @quic://dns.adguard.com --tls-no-verify
2023/08/18 18:53:44 failed to sufficiently increase receive buffer size (was: 208 kiB, wanted:
2048 kiB, got: 416 kiB). See https://github.com/quic-go/quic-go/wiki/UDP-Receive-Buffer-Size
for details.
www.sfu.ca. 1m0s A 208.91.112.55
www.sfu.ca. 1m0s AAAA 2620:101:9000:53::55
```

To enable DNS over HTTP3 or DNS over QUIC on the DNS server in the GUI:

1. Go to *Network* > *DNS Servers*.
   If this option is not available, go to *System* > *Feature Visibility* and enable *DNS Database*.
2. In the *DNS Service on Interface* section, edit an existing interface, or create a new one.
3. Set the *Mode* option as desired.
4. Enable *DNS Filter* and select a profile.
5. Enable *DNS over HTTP3* or *DNS over QUIC*.



6. Click *OK*.

To configure DoQ in local-in mode in the CLI:

1. In the FortiGate DNS server configuration, enable DoQ for a port with the previously configured DNS filter profile applied:

```
config system dns-server
    edit "port2"
        set dnsfilter-profile "dnsfilter_fgd"
        set doq enable
    next
end
```

2. Test the configuration:
   On the client, use q to query a FortiGuard category30 domain with the FortiGate interface over QUIC. The default redirect block IP address should be returned:

```
pc03:~# q www.mcgill.ca @quic://10.1.100.150 --tls-no-verify
2023/08/18 20:05:53 failed to sufficiently increase receive buffer size (was: 208 kiB, wanted:
2048 kiB, got: 416 kiB). See https://github.com/quic-go/quic-go/wiki/UDP-Receive-Buffer-Size
for details.
www.mcgill.ca. 1m0s A 208.91.112.55
www.mcgill.ca. 1m0s AAAA 2620:101:9000:53::55
```

To configure DoH3 in transparent mode in the CLI:

1. Enable QUIC in the ssl-ssh-profile:

```
config firewall ssl-ssh-profile
    edit "protocols"
        config https
            set ports 443 8443
            set status deep-inspection
            set quic inspect
        end
    next
end
```

2. Configure a DNS filter profile:

```
config dnsfilter profile
    edit "dnsfilter_fgd"
        config ftgd-dns
            config filters
                edit 1
                    set category 30
                    set action block
                next
            end
        end
    next
end
```

3. Apply the profiles to a proxy firewall policy:

```
config firewall policy
    edit 1
        set name "dnsfilter"
        set srcintf "port2"
        set dstintf "port1"
        set action accept
        set srcaddr "all"
        set dstaddr "all"
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set inspection-mode proxy
        set profile-protocol-options "protocol"
        set ssl-ssh-profile "protocols"
        set dnsfilter-profile "dnsfilter_fgd"
        set logtraffic all
        set nat enable
    next
end
```

4. Test the configuration:

On the client with HTTP3 support, use q or Curl to query a FortiGuard category30 domain with the Adguard DNS server or Cloudflare DNS server over QUIC. The default redirect block IP address should be returned:

```
pc03:~# q www.mcgill.ca --http3 @https://dns.adguard.com --tls-no-verify
2023/08/18 21:04:02 failed to sufficiently increase receive buffer size (was: 208 kiB, wanted:
2048 kiB, got: 416 kiB). See https://github.com/quic-go/quic-go/wiki/UDP-Receive-Buffer-Size
for details.
www.mcgill.ca. 1m0s A 208.91.112.55
www.mcgill.ca. 1m0s AAAA 2620:101:9000:53::55
```

```
pc03:~# curl -H 'accept: application/dns-message' -v -k --http3 'https://1.1.1.1/dns-
query?dns=q80BAAABAAAAAAAAA3d3dwN1YmMCY2EAAAEAAQ' | hexdump
*   Trying 1.1.1.1:443...

* h3 [:path: /dns-query?dns=q80BAAABAAAAAAAAA3d3dwN1YmMCY2EAAAEAAQ]
* h3 [:scheme: https]
* h3 [:authority: 1.1.1.1]
* h3 [user-agent: curl/7.80.0-DEV]
* h3 [accept: application/dns-message]
* Using HTTP/3 Stream ID: 0 (easy handle 0x558fdd1c2220)
> GET /dns-query?dns=q80BAAABAAAAAAAAA3d3dwN1YmMCY2EAAAEAAQ HTTP/3
> Host: 1.1.1.1
> user-agent: curl/7.80.0-DEV
> accept: application/dns-message
>
< HTTP/3 200
< content-type: application/dns-message
< content-length: 44
<
{ [44 bytes data]
100    44  100    44    0     0   1305      0 --:--:-- --:--:-- --:--:--  1375
* Connection #0 to host 1.1.1.1 left intact
0000000 cdab 0081 0100 0100 0000 0000 7703 7777
0000010 7503 6362 6302 0061 0100 0100 0cc0 0100
0000020 0100 0000 3c00 0400 5bd0 3770
000002c
```

To configure DoH3 in local-in mode in the CLI:

1. In the FortiGate DNS server configuration, enable DoH3 for a port with the previously configured DNS filter profile applied:

```
config system dns-server
    edit "port2"
        set dnsfilter-profile "dnsfilter_fgd"
        set doh3 enable
```

```
    next
end
```

2. Test the configuration:

   On the client with HTTP3 support, use q or Curl to query a FortiGuard category30 domain with the FortiGate interface over HTTP3. The default redirect block IP address should be returned:

```
pc03:~# q www.mcgill.ca --http3 @https://10.1.100.150 --tls-no-verify
2023/08/18 20:37:55 failed to sufficiently increase receive buffer size (was: 208 kiB, wanted:
2048 kiB, got: 416 kiB). See https://github.com/quic-go/quic-go/wiki/UDP-Receive-Buffer-Size
for details.

```

Troubleshooting for DNS filter

If you have trouble with the DNS filter profile in your policy, start with the following troubleshooting steps:

- Check the connection between the FortiGate and FortiGuard DNS rating server (SDNS server).
- Check that the FortiGate has a valid FortiGuard web filter license.
- Check the FortiGate DNS filter configuration.

Checking the connection between the FortiGate and FortiGuard SDNS server

You need to ensure the FortiGate can connect to the FortiGuard SDNS server. By default, the FortiGate uses DNS over TLS (DoT, TCP port 853) to connect to the SDNS server. See DNS over TLS and HTTPS on page 374 for more information.

To check the connection between the FortiGate and SDNS server:

1. Verify the FortiGuard SDNS server information:

```
# diagnose test application dnsproxy 3
...
SDNS servers:
173.243.140.53:853 vrf=0 tz=-480 encrypt=dot req=0 to=0 res=0 rt=34 ready=1 timer=0 probe=0
failure=0 last_failed=0
```

   The SDNS server IP address might be different depending on location (in this example, it is 173.243.140.53:853).
2. In the management VDOM, check the communication between the FortiGate and the SDNS server:

```
# execute ping 173.243.140.53
```

3. If FortiGuard is not reachable using anycast, configure the default FortiGuard SDNS (unicast) server (208.91.112.220):

```
config system fortiguard
    set fortiguard-anycast disable
    set sdns-server-ip "208.91.112.220"
end
```

4. Verify the list of SDNS servers again:

```
# diagnose test application dnsproxy 3
FGD_DNS_SERVICE_LICENSE:
server=208.91.112.220:53, expiry=2023-10-28, expired=0, type=2
server=83.231.212.53:53, expiry=2023-10-28, expired=0, type=2
```

   The default FortiGuard SDNS server should work in most cases; however, you can switch to another server to see if it improves latency.

By default, DNS filtering connects to the FortiGuard secure DNS server over anycast and uses DoT (TCP port 853) when the default settings of `fortiguard-anycast enable` and `fortiguard-anycast-source fortinet` are configured. Disabling `fortiguard-anycast` will force the FortiGate to use cleartext (UDP port 53) instead of DoT (TCP port 853) in addition to disabling FortiGuard secure DNS over anycast.

Checking the FortiGuard DNS rating service license

The FortiGuard DNS rating service shares the license with the FortiGuard web filter, so you must have a valid web filter license for the DNS rating service to work. While the license is shared, the DNS rating service uses a separate connection mechanism from the web filter rating.

To check the DNS rating service license in the CLI:

1. View the DNS settings:

```
# diagnose test application dnsproxy 3
```

2. Find the `FGD_DNS_SERVICE_LICENSE` line and check that the license has not expired:

```
FGD_DNS_SERVICE_LICENSE:
server=173.243.140.53:853, expiry=2023-10-28, expired=0, type=2
```

3. Find the `SDNS servers` line to view the functioning servers:

```
SDNS servers:
173.243.140.53:853 vrf=0 tz=-480 encrypt=dot req=0 to=0 res=0 rt=34 ready=1 timer=0 probe=0
failure=0 last_failed=0
```

Checking the FortiGate DNS filter profile configuration

To check the DNS filter profile configuration:

1. In FortiOS, create a local domain filter and set the *Action* to *Redirect to Block Portal* (see Local domain filter on page 2329).
2. Apply this DNS filter profile to the policy.
3. From the client PC, perform a DNS query on this domain. If you get the profile's redirected portal address, this means that the DNS filter profile works as expected.

Additional troubleshooting

Use `diagnose test application dnsproxy <test level>` to troubleshoot further DNS proxy information, where:

Test level	Action
1	Clear DNS cache
2	Show statistics
3	Dump DNS setting
4	Reload FQDN
5	Requery FQDN
6	Dump FQDN
7	Dump DNS cache
8	Dump DNS database
9	Reload DNS database
10	Dump secure DNS policy/profile
11	Dump botnet domain
12	Reload secure DNS setting
13	Show hostname cache
14	Clear hostname cache
15	Show SDNS rating cache
16	Clear SDNS rating cache
17	Show DNS debug bit mask
18	Show DNS debug object members
99	Restart the dnsproxy worker

To debug DNS proxy details:

```
# diagnose debug application dnsproxy -1
# diagnose debug {enable | disable}
```

Telemetry profile

This topic applies only to a FortiGate acting as a FortiTelemetry Controller with *FortiTelemetry* enabled on the *System > Feature Visibility* page. For a summary of FortiTelemetry-related tasks that you can do in FortiOS, see FortiTelemetry on page 138. See also *FortiTelemetry Administration Guide*.

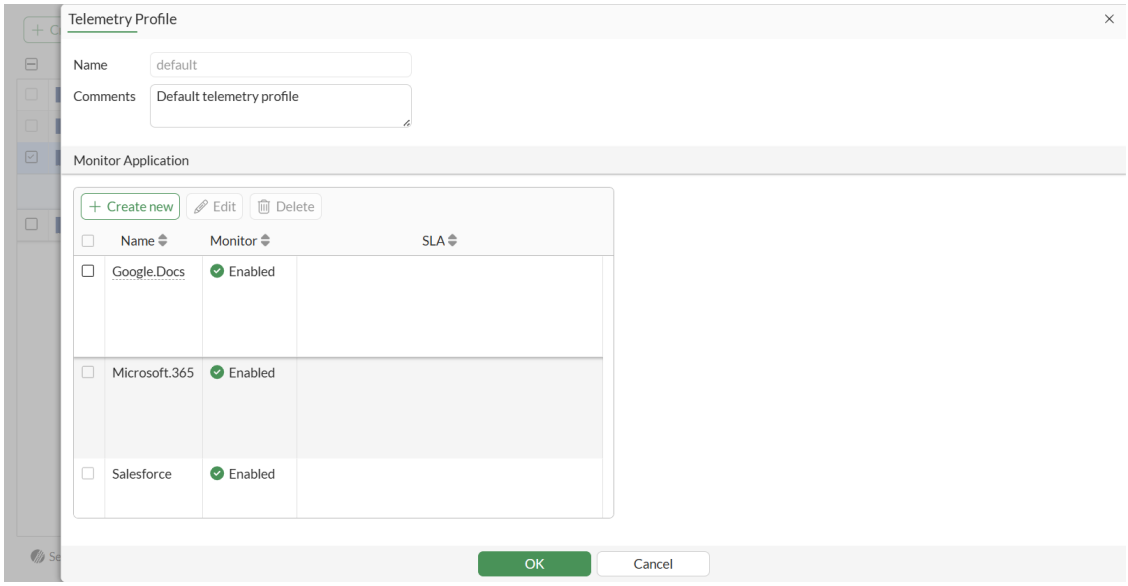
Telemetry profiles are used by FortiTelemetry agent(s). Telemetry profiles instruct FortiTelemetry agent(s) what predefined applications to monitor.

A telemetry profile must be configured in a firewall policy to create a telemetry policy. See Telemetry policy on page 1844 for more information.

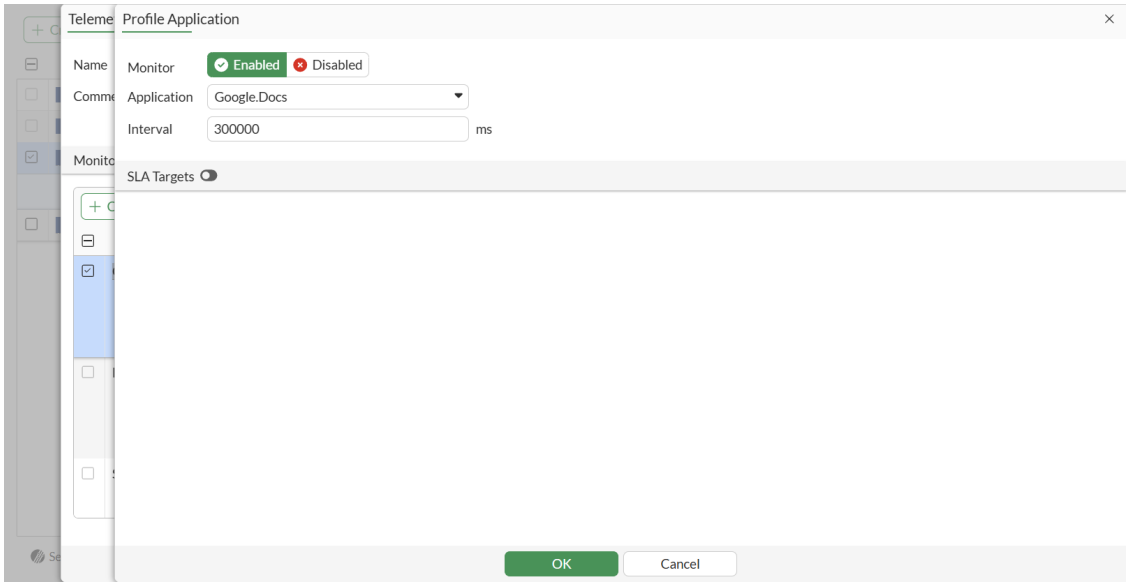
To view Telemetry profiles:

1. Go to *Security Profiles* > *Telemetry Profile*. The list of telemetry profiles is displayed, including a *default* telemetry profile.
2. Select a profile to access additional buttons, such as *Edit*, *Clone*, *Delete*, and *More*.
3. Select the *default* profile, and click *Edit*. The *Telemetry Profile* pane opens.

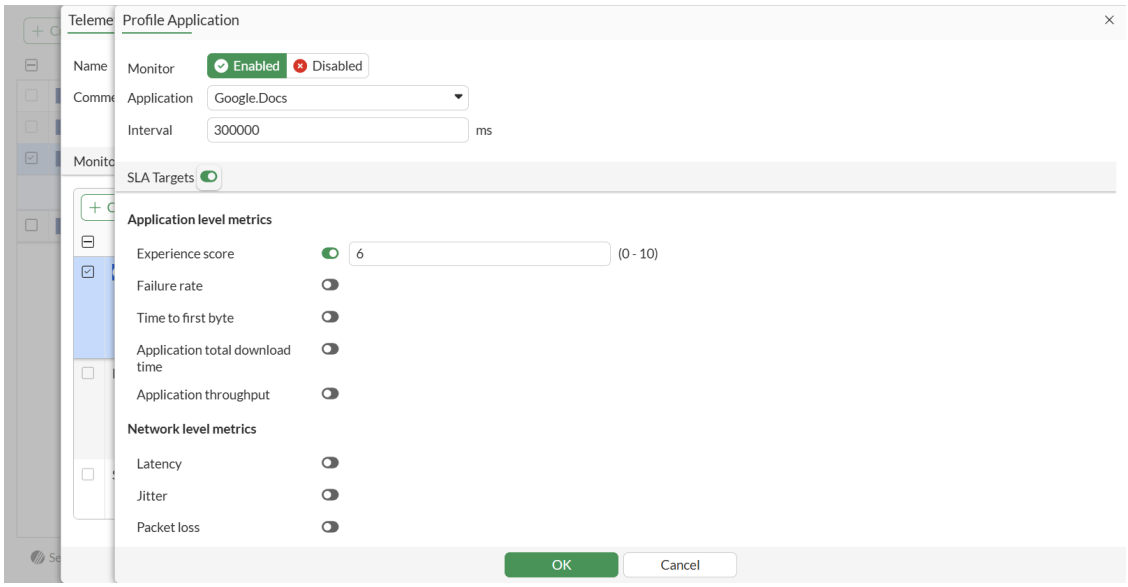
   The default profile monitors the following predefined applications: Google docs, Microsoft 365, and Salesforce. No SLA targets are defined.



4. Select an application, and click *Edit*. The *Profile Application* pane opens.



5. Enable *SLA Targets* to view what data will be collected. Although you can enable and set SLA targets, the functionality does not work yet



6. Click *OK* to save profile application settings.
7. Click *OK* to save telemetry profile settings.

Predefined applications

FortiOS 8.0.0 includes the following SaaS applications that FortiTelemetry agents can monitor:

- Adobe
- Atlassian Cloud
- Dropbox
- Elastic Search
- Google Docs
- Google Drive
- Google Maps
- Go To Meeting
- Microsoft 365
- Microsoft SharePoint
- Microsoft Teams
- Sales Force
- Slack
- Twilio
- Webex
- Yahoo
- Zendesk
- Zoom

On the FortiTelemetry Controller, use the `config telemetry-controller application predefine` command to view the list.

Creating telemetry profiles

This topic applies only to a FortiGate acting as a FortiTelemetry Controller with *FortiTelemetry* enabled on the *System > Feature Visibility* page. For a summary of FortiTelemetry-related tasks that you can do in FortiOS, see FortiTelemetry on page 138. See also *FortiTelemetry Administration Guide*.

FortiOS includes a *default* telemetry security profile. You can edit or clone the profile, or you can create a new profile.

Although you can enable SLA targets, the functionality does not work yet.

To edit the default telemetry profile in the GUI:

1. Go to *Security Profiles* > *Telemetry Profile*.
2. Select the default profile, and click *Edit*. The profile opens for editing.
3. Enter your changes, and click *OK* to save the changes.

To clone a telemetry profile in the GUI:

1. Go to *Security Profiles* > *Telemetry Profile*.
2. Select a profile, and click *Clone*. The profile opens for editing.
3. Set *Name* to a unique name.
4. Enter your changes, and click *OK* to save the new profile.

To create a telemetry profile in the GUI:

1. Go to *Security Profiles* > *Telemetry Profile*, and click *Create New*.
2. Enter a name and optional comment for the profile.
3. In the *Monitored Applications* section, add to the profile the applications to monitor:
   a. Click *Create New*.
   b. Choose the *Monitor* status for the application:
      - Choose *Enabled* to monitor the application.
      - Choose *Disabled* to disable monitoring of the application.
   c. From the *Applications* dropdown, select a predefined application to monitor. See Predefined applications on page 2353 for more information.
   d. Set the monitoring *Interval* in milliseconds.
   e. Enable *SLA Targets* to view what data will be collected. Although you can enable and set SLA targets, the functionality does not work yet.

Application level metrics:	
Experience score	Overall application experience score threshold between 0 and 10. Experience scores are categorized as follows: • Good: 8 to 10 • OK: 5 to 8 • Poor: 3 to 5 • Broken: 0 to 3
Failure rate	Failure rate threshold for monitoring HTTP requests as a percentage (%).
Time to first byte	Time to first byte threshold monitor requests in milliseconds (ms).
Application total download time	Application total download time threshold for monitoring HTTP requests in milliseconds (ms).
Application throughput	The throughput threshold for monitoring HTTP requests in megabytes (MBps).
Network level metrics:	

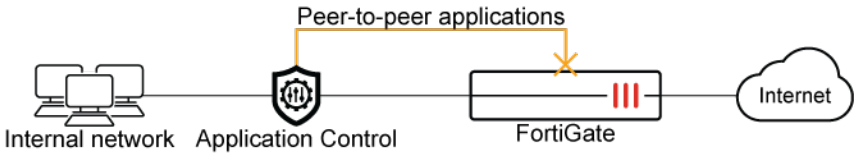
Latency	Average latency threshold for network probes in milliseconds (ms).
Jitter	Jitter threshold for network probes in milliseconds (ms).
Packet loss	Packet-loss threshold for network probes as a percentage.
TCP round trip time	TCP round trip time threshold for monitoring HTTP requests in milliseconds (ms).
95% DNS resolving time	DNS resolving time threshold for monitoring HTTP requests in milliseconds.
95% TLS handshake time	TLS time threshold in milliseconds.

f. Click *OK* to save the monitored application.
g. Repeat the steps to include additional applications as needed in the profile.

4. Click *OK* to save the telemetry profile.

Application control

FortiGates can recognize network traffic generated by a large number of applications. Application control sensors specify what action to take with the application traffic. Application control uses IPS protocol decoders that can analyze network traffic to detect application traffic, even if the traffic uses non-standard ports or protocols. Application control supports traffic detection using the HTTP protocol (versions 1.0, 1.1, and 2.0).



FortiOS includes three preloaded application sensors:

- *default* (monitors all applications)
- *wifi-default* (default configuration for offloading WiFi traffic)
- *block-high-risk*

You can customize these sensors, or you can create your own to log and manage the applications on your network.

Once configured, you can add the application sensor to a firewall policy.

This functionality requires a subscription to FortiGuard Application Control.

The following topics provide information about application control:

- Configuring an application sensor on page 2356
- Application matching signature priority on page 2357
- Basic category filters and overrides on page 2359
- Excluding signatures in application control profiles on page 2364

- Port enforcement check on page 2366
- Protocol enforcement on page 2367
- SSL-based application detection over decrypted traffic in a sandwich topology on page 2369
- Matching multiple parameters on application control signatures on page 2370
- Application signature dissector for DNP3 on page 2373
- Application control on page 2355

Configuring an application sensor

FortiGates can recognize network traffic generated by a large number of applications using application control, which relies on IPS protocol decoders. Application sensors control what action is taken with application traffic.

To configure an application sensor:

1. Go to *Security Profiles* > *Application Control* and click *Create New*.
2. Configure the following settings:

Name	Enter a unique name for the sensor.
Comments	Enter a comment (optional).
Categories	Configure the action to take on groups of signatures based on their category type. Applications belonging to the category trigger the configured action: monitor, allow, block, or quarantine. See Basic category filters and overrides on page 2359 for more information.
Network Protocol Enforcement	Enable/disable the enforcement of protocols over selected ports. See Protocol enforcement on page 2367 for more information.
Application and Filter Overrides	Configure multiple applications signatures with a dedicated action for a single sensor. Filters can be added based on the application category, behavior, popularity, protocol, risk, technology, or vendor subtype. For more information, see • Configuring application and filter overrides on page 2361 • Matching multiple parameters on application control signatures on page 2370 • Blocking applications with custom signatures on page 2650
Block applications detected on non-default ports	When enabled: • For monitor and allow actions, applications will be blocked if detected on non-default ports (as defined in FortiGuard application signatures). • Block actions still block traffic for the application regardless of the port. See Port enforcement check on page 2366 for more information.

Allow and Log DNS Traffic	The intended behavior is to allow and log DNS traffic. However, to fully enable logging, configure the following: 1. Within the application sensor profile, create a new *Application and Filter Overrides* entry. 2. Set the *Action* to *Monitor*. 3. Search for the DNS application, select it, and click *Add Selected*. 4. Click *OK* to save the override, then click *OK* to save the application sensor profile.
Replacement Messages for HTTP-based Applications	Enable/disable replacement messages for blocked applications. See Replacement messages on page 3766 for information about replacement messages.

3. Click *OK*.

Application matching signature priority

Many applications will match more than one application control signature. When attempting to match a signature to the application traffic, FortiGate evaluates several factors and selects a signature based on the following tie breakers:

1. Segments are considered in sequential order. The order of the applications within the segment does not matter.

   Segments are groupings of applications and protocols that are all evaluated at the same time for the best match. The default segment is defined by the Category section. Additional segments may be defined using the Application and Filter Overrides section. In the CLI these segments are called entries.
2. Custom signatures take precedence over FortiGuard signatures.
3. The signature with the most pre/post-match signature actions is preferred.

   For example,one signature could have a lot of the --deep_ctrl option (used for pattern matching) and each one would increment the post-match counter. Similarly, options like --quiet are considered a pre-match action that would suppress logging of the match. See Creating IPS and application control signatures for more attributes.
4. The application weight.

   For predefined signatures, the weight is defined by FortiGuard signature analysts and is not configurable. Generally, more specific application signatures will have a higher weight than more broad protocol signatures. Not all application signature types (such as protocols) have the same weight.
5. Signature visibility options. Non-hidden signatures are preferred.

   A signature could have *hidden* visibility if it is a beta or test signature that is still under false-positive detection evaluation, marked --quiet, or a built-in protocol dissector/peer-to-peer rule.
6. Pattern counts.

   A comparison between signature --pattern and --pcre count. The signature with more of them is preferred.
7. ID comparison.

   A comparison between signature IDs. Select the one with a larger, and therefore most likely newer, ID.

Application weight is used the most often to decide the match. To see the weight of applications and protocols, use the `get application name status` command.

The following examples use grep to find specific applications by name. The -A flag is used to include a specific number of lines after the match is found.

```
# get application name status | grep -A10 "app-name: \"Facebook\""
app-name: "Facebook"
id: 15832
category: "Social.Media"
cat-id: 23
popularity: 5.low
risk: 3.low
weight: 10
shaping: 0
protocol: 1.TCP, 9.HTTP, 2.UDP, 26.SSL
vendor: 3.Meta
technology: 1.Browser-Based
```

```
# get application name status | grep -A10 "app-name: \"SSL\""
app-name: "SSL"
id: 15895
category: "Network.Service"
cat-id: 15
popularity: 5.low
risk: 2.high
weight: 1
shaping: 0
protocol: 1.TCP, 26.SSL
vendor: 0.Other
technology: 0.Network-Protocol
```

Finding the applications belonging to an application category

When you have an application category and you want to find the matching applications, use the following command to list the applications filtered by the category name:

```
# get application name status | grep 'category: "Email"' -B2
app-name: "1und1.Mail"
id: 29025
category: "Email"
--
app-name: "126.Mail"
id: 16554
category: "Email"
--
app-name: "AIM.Webmail"
id: 15819
category: "Email"
--
....
```

If you only have the application category ID, you can use the following command to list the applications:

```
# get application name status | grep 'cat-id: 21' -B3
app-name: "1und1.Mail"
id: 29025
category: "Email"
cat-id: 21
--
app-name: "126.Mail"
id: 16554
category: "Email"
cat-id: 21
--
app-name: "AIM.Webmail"
id: 15819
category: "Email"
cat-id: 21
--
...
```

Basic category filters and overrides

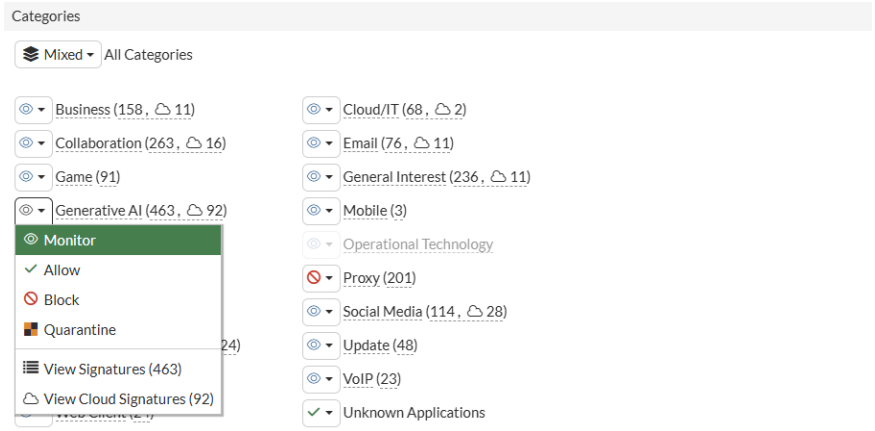
When creating an application sensor, you can define the applications that you want to control. You can add applications and filters using categories, application overrides, and/or filter overrides with designated actions (monitor, allow, block, or quarantine).

Action	Description
Monitor	Passes the traffic and generates a log message.
Allow	Passes the traffic but does not generate a log message.
Block	Drops the detected traffic and generates a log message.
Quarantine	Blocks the traffic from an attacker IP address until the expiration time is reached and generates a log message.

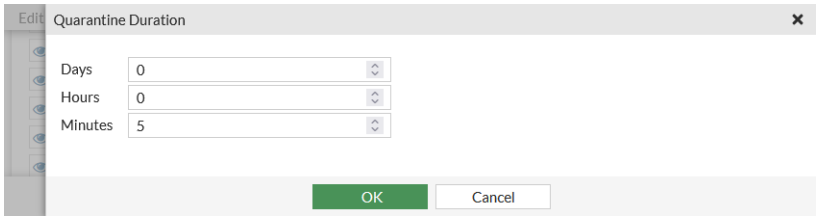
For more information about application control logs, see Security Events log page on page 4619.

To configure category filters in the GUI:

1. Go to *Security Profiles* > *Application Control* and click *Create New*, or edit an existing sensor.
2. Under *Categories*, click the icon next to the category name to set the action or view the application signatures.



3. If you select the *Quarantine* action, the *Quarantine Duration* pane will open. Enter the duration values and click *OK*.



4. Click *OK*.

To configure category filters in the CLI:

```
config application list
    edit <name>
        config entries
            edit <id>
                set category <id>
                set action {pass | block | reset}
                set quarantine {none | attacker}
                set quarantine-expiry <###d##h###m>
                set log {enable | disable}
            next
        end
    next
end
```

Command	Description
`category <id>`	Set the category by category ID. To view the category list by ID, enter `set category ?` • all (All) • 2 (P2P) • 3 (VoIP) • 5 (Video/Audio) • 6 (Proxy)

Command	Description
	• 7 (Remote.Access) • 8 (Game) • 12 (General.Interest) • 15 (Network.Service) • 17 (Update) • 21 (Email) • 22 (Storage.Backup) • 23 (Social.Media) • 25 (Web.Client) • 26 (Industrial) • 28 (Collaboration) • 29 (Business) • 30 (Cloud.IT) • 31 (Mobile) • 32 (Unknown Applications) • 36 (GenAI) Application categories may differ between different versions and models.
`action {pass | block | reset}`	Pass/block traffic or reset the connection for traffic from this application (default = block).
`quarantine {none | attacker}`	Set the quarantine method: • `none`: Quarantine is disabled. • `attacker`: Block all traffic sent from attacker's IP address. The attacker's IP address is also added to the banned user list. The target's address is not affected.
`quarantine-expiry <###d##h##m>`	Duration of quarantine, in minutes (1 - 364d23h59, default = 5). Requires `quarantine` set to `attacker`.
`log {enable | disable}`	Enable/disable logging for this application list (default = enable).

Configuring application and filter overrides

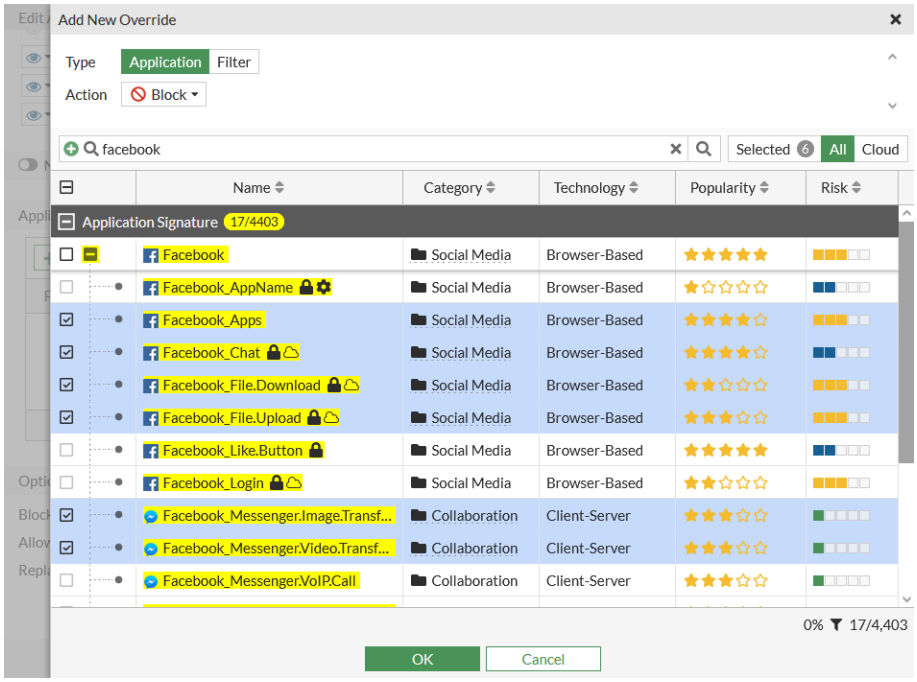
Multiple application signatures can be added for one sensor with a designated action. Filters can be added based on behavior, application category, popularity, protocol, risk, technology, or vendor subtypes.

To configure overrides in the GUI:

1. Go to *Security Profiles* > *Application Control* and click *Create New*, or edit an existing sensor.
2. Add an application:
   a. In the *Application and Filter Overrides* table, click *Create New*.
   b. For *Type*, select *Application*.
   c. Select an *Action* from the dropdown.

d. In the *Search* box, enter an application name and press `Enter`, or click the plus icon and configure a search filter.

e. In the search results, select the required applications (you can select multiple applications).



f. Click *OK*.

3. Add a filter:

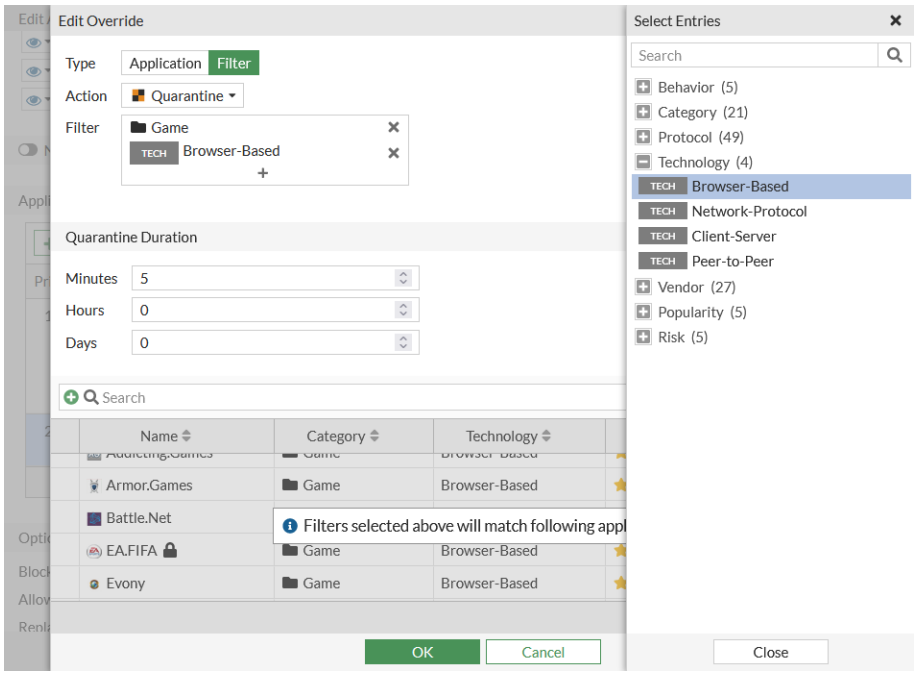
a. In the *Application and Filter Overrides* table, click *Create New*.

b. For *Type*, select *Filter*.

c. Select an *Action* from the dropdown.

If the action is set to *Quarantine*, set the duration of the quarantine.

d. In the *Filter* field, click the *+* . The *Select Entries* pane opens, and you can search based on filter subtypes. This example uses Browser-Based (under Technology) and Game (under Category).



e. Click *OK*.

4. Click *OK*.

To configure overrides in the CLI:

```
config application list
    edit <name>
        config entries
            edit <id>
                set protocols <integer>
                set risk <integer>
                set vendor <id>
                set technology <id>
                set behavior <id>
                set popularity <integer>
                set action {pass | block | reset}
                set quarantine {none | attacker}
                set log {enable | disable}
            next
        end
    next
end
```

Command	Description
`protocols <integer>`	Application protocol filter (0 - 54, or all).
`risk <integer>`	Risk or impact of allowing traffic from this application to occur (1 - 5; low (1), elevated (2), medium (3), high (4), and critical (5)).

Command	Description
`vendor <id>`	Application vendor filter (0 - 25, or all).
`technology <id>`	Application technology filter: • all • 0 (network-protocol) • 1 (browser-based) • 2 (client-server) • 4 (peer-to-peer)
`behavior <id>`	Application behavior filter: • all • 2 (botnet) • 3 (evasive) • 5 (excessive bandwidth) • 6 (tunneling) • 9 (cloud)
`popularity <integer>`	Application popularity filter (1 - 5, from least to most popular).
`action {pass | block | reset}`	Pass/block traffic or reset the connection for traffic from this application (default = block).
`quarantine {none | attacker}`	Set the quarantine method: • `none`: Quarantine is disabled. • `attacker`: Block all traffic sent from attacker's IP address. The attacker's IP address is also added to the banned user list. The target's address is not affected.
`log {enable | disable}`	Enable/disable logging for this application list (default = enable).

For more information, see the FortiOS CLI reference.

Excluding signatures in application control profiles

In an application control list, the exclusion option allows users to specify a list of applications they wish to exclude from an entry filtered by category, technology, or others. By excluding the signature, the application is no longer processed on the entry in which it is excluded, but may match subsequent entries that exist.

To configure signature exclusion:

```
config application list
    edit <name>
        config entries
            edit <id>
                set category <id>
                set exclusion <application id>
                set action {pass | block | reset}
```

```
            next
        end
    next
end
```

Sample configurations

In the following example, category 23 (social media) is blocked in the entries, and signature 34527 (Instagram) is excluded from this entry. Traffic to Instagram will pass because the signature is removed from entry 1 and the action of `other-application-action` is set to `pass`.

To configure signature exclusion:

```
config application list
    edit "test"
        set other-application-action pass
        set unknown-application-action pass
        set other-application-log enable
        set unknown-application-log enable
            config entries
                edit 1
                    set category 23
                    set exclusion 34527
                    set action block
                next
            end
    next
end
```

In the following example, entry 1 is configured so that category 23 (social media) is set to pass and signature 34527 (Instagram) is excluded. In entry 2, application 34527 (Instagram) is blocked, so the traffic to Instagram will be blocked, even though it is excluded in entry 1. Traffic to other signatures in category 23, such as Facebook, will still pass.

To configure signature exclusion:

```
config application list
    edit "test"
        set other-application-action pass
        set unknown-application-action pass
        set other-application-log enable
        set unknown-application-log enable
            config entries
                edit 1
                    set category 23
                    set exclusion 34527
                    set action pass
                next
                edit 2
```

```
                    set application 34527
                    set action block
                next
            end
    next
end
```

In the following example, an explicit proxy is behind the FortiGate with an excluded signature for 107347980 (Proxy.HTTP) and category 6 (proxy) is set to block. The client will allow normal proxy traffic to pass, but it will discard all proxy application traffic (such as KProxy, Tor, and so on).

To configure signature exclusion:

```
config application list
    edit "test"
        set other-application-action pass
        set unknown-application-action pass
        set other-application-log enable
        set unknown-application-log enable
            config entries
                edit 1
                    set category 6
                    set exclusion 107347980
                    set action block
                next
            end
    next
end
```

Port enforcement check

Most networking applications run on specific ports. For example, SSH runs on port 22, and Facebook runs on ports 80 and 443.

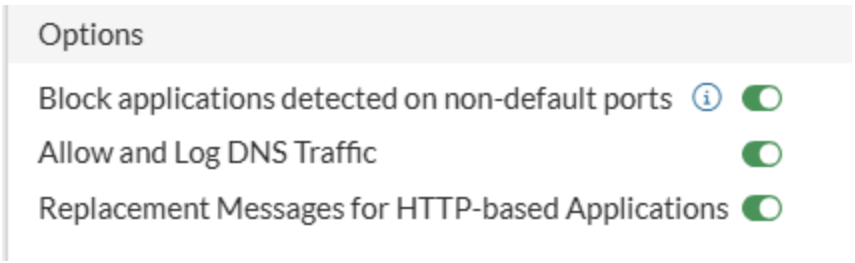
If the default network service is enabled in the application control profile, the IPS engine performs a check at the application profile level, and any detected application signatures running on the non-standard TCP/IP port are blocked. This means that each allowed application runs on its default port.

Default ports for network services are defined by FortiGuard. See Application Control Service.

In the following example, an application sensor is configured to enforce FTP on port 21.

To configure port enforcement check in the GUI:

1. Go to *Security Profiles* > *Application Control*.
2. Create a new application sensor or edit an existing one.
3. In *Options*, enable *Block applications detected on non-default ports*.



4. In *Application and Filter Overrides*, you can configure actions for individual applications, overriding the action configured for their category.
   a. Click *Create New*.
   b. Select the desired action from the dropdown list in the upper left corner. For example, select *Allow*.

      When an application is configured with an action of *Monitor* or *Allow*, when its traffic is detected on non-standard ports (as defined in FortiGuard application signatures) then the application will be blocked. An application configured with an action of *Block* will have its traffic blocked regardless of the port its traffic is detected on.

   c. Select the desired applications. For example, select *FTP*.
   d. Click *OK*. The entries are displayed in a table.
5. Click *OK*.

To configure port enforcement check in the CLI:

```
config application list
    edit <name>
        set enforce-default-app-port enable
        config entries
            edit 1
                set application 15896
                set action pass
            next
        end
    next
end
```

With the above GUI or CLI configuration, FTP traffic (application 15896 in the CLI) with the standard port (port 21) is allowed, while a non-standard port (port 2121) is blocked.

Protocol enforcement

Protocol enforcement allows you to enforce known protocols (such as FTP, HTTP, and HTTPS) on known ports (such as 21, 80, and 443). If the port of incoming traffic does not match the allowed protocols, or is not allowlisted, then the Intrusion Prevention System (IPS) engine applies the configured violation action, such as blocking or monitoring the traffic.

You can use this feature in the following scenarios:

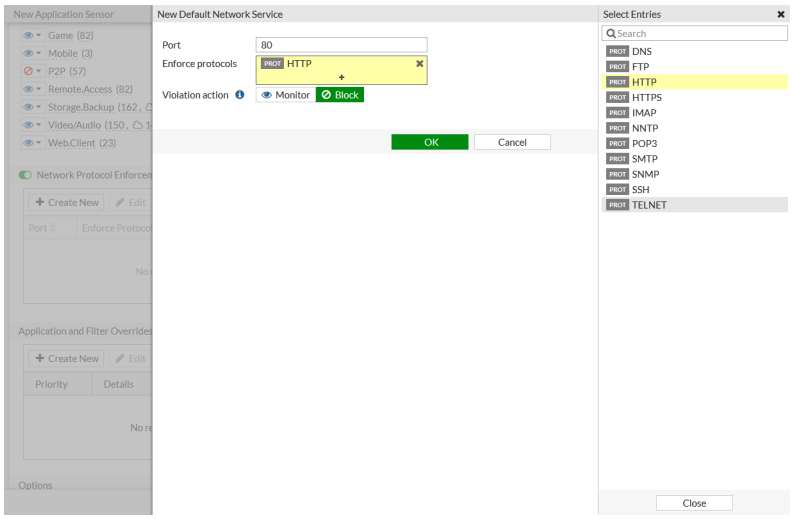
- When an IPS protocol decoder identifies a network traffic service, it checks whether the service port aligns with the enforced protocols. If the decoder finds a match, that is, the traffic is allowlisted, then the traffic proceeds without restriction. If there is no match, the traffic is classified as a violation and the specified action, monitoring or blocking, is applied.
- When there is no confirmed service for the network traffic, the traffic is classified as a violation if IPS protocol decoders rule out all of the services enforced under its server port.

In an applicable profile, a default network service list can be created to associate well known ports with accepted services. Default ports for network services are defined by FortiGuard. See Application Control Service.

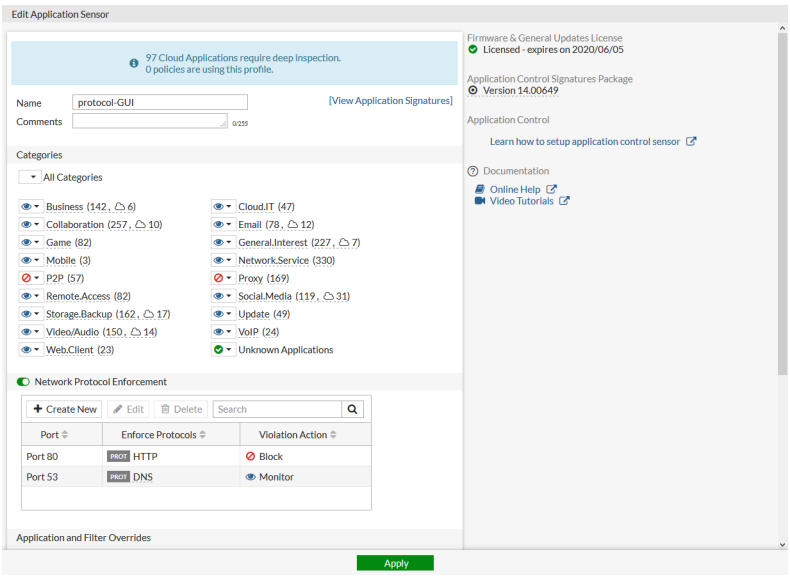
In the following example, an application sensor is configured to enforce HTTP on port 80 (block), and DNS on port 53 (monitor).

To configure protocol enforcement in the GUI:

1. Go to *Security Profiles* > *Application Control*.
2. Create a new application sensor or edit an existing one.
3. Enable *Network Protocol Enforcement*.
   Enforcement entries can be created, edited, or deleted to configure network services on certain ports and determine the violation action.
4. In the *Network Protocol Enforcement* table, click *Create New*.
5. Configure the entry for HTTP:
   a. For *Port*, enter 80.
   b. For *Enforced protocols*, select *HTTP*.
   c. For *Violation action*, select *Block*.
   d. Click *OK*.



6. Configure the entry for DNS:
   a. Click *Create New*, then for *Port*, enter 53.
   b. For *Enforced protocols*, select *DNS*.
   c. For *Violation action*, select *Monitor*.
   d. Click *OK*.
   The entries are displayed in the table.



7. Click *OK*.

To configure protocol enforcement in the CLI:

```
config application list
    edit "protocol-GUI"
        set other-application-log enable
        set control-default-network-services enable
        config default-network-services
            edit 1
                set port 80
                set services http
                set violation-action block
            next
            edit 2
                set port 53
                set services dns
                set violation-action monitor
            next
        end
    next
end
```

SSL-based application detection over decrypted traffic in a sandwich topology

When a FortiGate is sandwiched between SSL encryption and decryption devices, the FortiGate can process the decrypted traffic that passes between those devices. This feature adds support for decrypted traffic in application control. In some predefined signatures, the signature is pre-marked with the *require_ssl_di* tag. The `force-inclusion-ssl-di-sigs` option under `application list` allows users to control the inspection of dissected traffic. When this option is enabled, the IPS engine forces the pre-marked SSL-based signatures to be

applied to the decrypted traffic of the respective applications. In the following topology, SSL Proxy 1 handles the client connection and SSL Proxy 2 handles the server connection, leaving the content unencrypted as traffic passes through the FortiGate.

To configure SSL-based application detection over decrypted traffic:

```
config application list
    edit "test"
        set force-inclusion-ssl-di-sigs {enable | disable}
    next
end
```

Example pre-marked SSL-based signature:

F-SBID(--vuln_id 15722; --attack_id 42985; --name "Facebook_Chat"; --group im; --protocol tcp; --default_action pass; --revision 4446; --app_cat 23; --vendor 3; --technology 1; --behavior 9; --pop 4; --risk 2; --language "Multiple"; --weight 20; --depend-on 15832; --depend-on 38468; ***--require_ssl_di "Yes"****; --casi 1; --casi 8; --parent 15832; --app_port "TCP/443"; --severity info; --status hidden; --service http; --flow from_client; --pattern "/pull?"; --context uri; --no_case; --pattern ".facebook.com"; --context host; --no_case; --tag set,Tag.Facebook.Pull; --tag quiet; --scan-range 10m,all; --date 20190301;)*

All signatures that include the *require_ssl_di* tag are predefined and cannot be customized.

Matching multiple parameters on application control signatures

Application control signatures that support parameters (such as SCADA protocols) can have multiple parameters grouped together and matched at the same time. Multiple application parameter groups can be added to an override. Traffic will be flagged if it matches at least one parameter group.

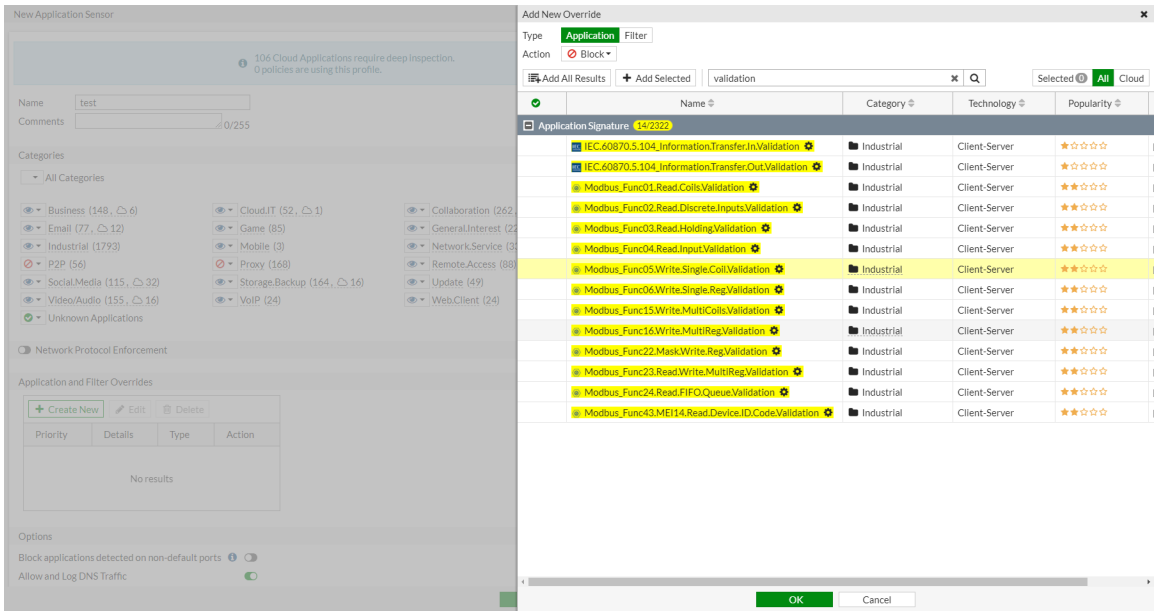
This example uses the Modbus_Func05.Write.Single.Coil.Validation signature. This is an OT signature, so ensure that no signatures are excluded:

```
config ips global
    set exclude-signatures none
end
```

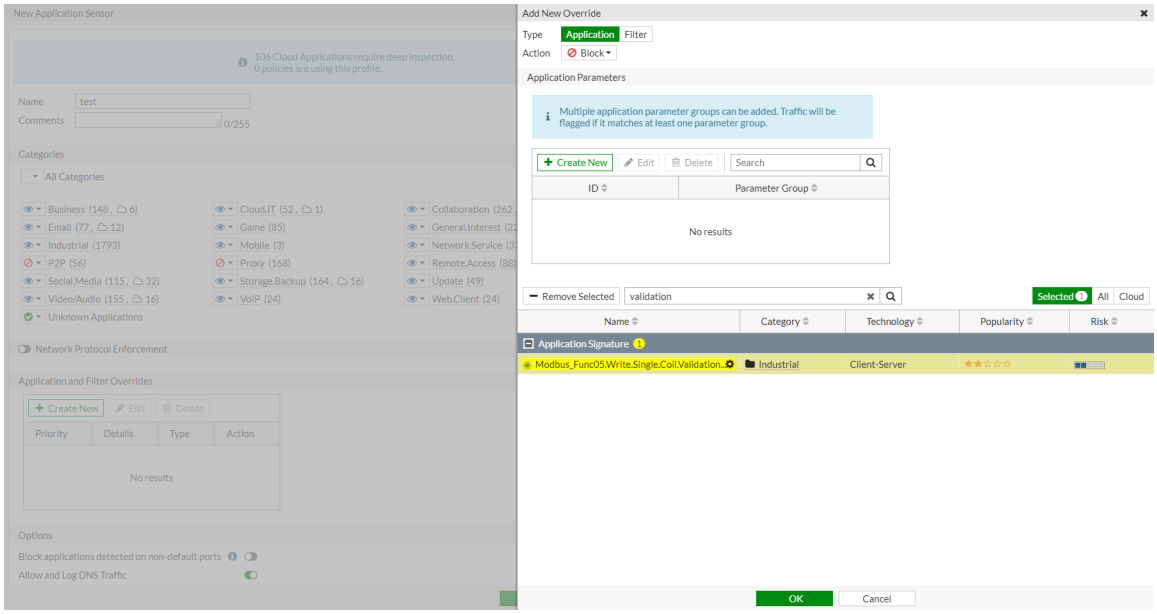
To configure an application sensor with multiple parameters in the GUI:

1. Go to *Security Profiles* > *Application Control* and click *Create New*, or edit an existing sensor.
2. In the *Application and Filter Overrides* table, click *Create New*.

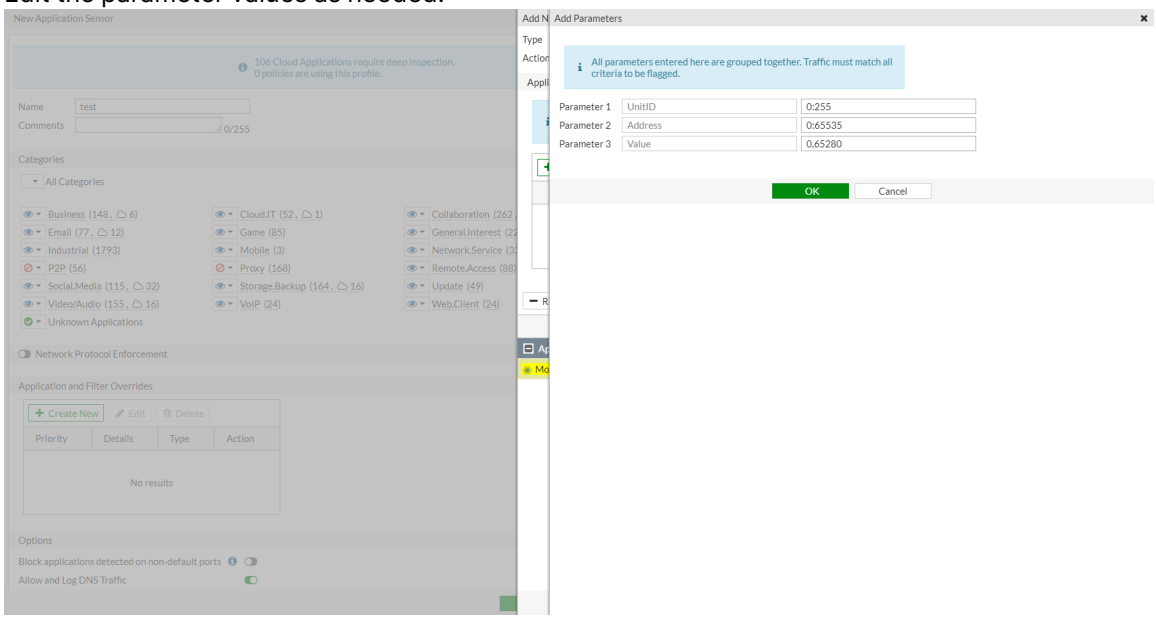
3. Search for *Modbus_Func05.Write.Single.Coil.Validation* and press `Enter`. A gear icon beside the signature name indicates it has configurable application parameters.
4. In the search results, select *Modbus_Func05.Write.Single.Coil.Validation* and click *Add Selected*.



5. Click the *Selected* tab. In the *Application Parameters* section, click *Create New*.



6. Edit the parameter values as needed.



7. Click *OK*.
8. Add more signatures if needed.
9. Click *OK*.

To configure an application sensor with multiple parameters in the CLI:

```
config application list
    edit "test"
        set other-application-log enable
        config entries
            edit 1

                set application 48885
                config parameters
                    edit 1
                        config members
                            edit 1
                                set name "UnitID"
                                set value "0:255"
                            next
                            edit 2
                                set name "Address"
                                set value "0:65535"
                            next
                            edit 3
                                set name "Value"
                                set value "0,65280"
                            next
                        end
                    next
                end
```

```
            next
            edit 2
                set category 2 6
            next
        end
    next
end
```

Application signature dissector for DNP3

The DNP3 application signature dissector supports detecting DNP3 traffic that is encapsulated by the RealPort protocol (Net.CX). DNP3 is used in industrial solutions over serial ports, USB ports, printers, and so on. RealPort encapsulation allows transportation of the underlying protocols over TCP/IP. The FortiGate OT signatures must be enabled to use RealPort.DNP3 signatures:

```
config ips global
    set exclude-signatures none
end
```

IPS engine version 7.0015 and later supports RealPort.DNP3 dissectors.

Sample logs

```

Domain fronting protection

FortiOS can protect against domain fronting in both explicit proxy and proxy-based firewall policies. In both cases, FortiGate checks whether the domain of the request matches the host domain in the HTTP header, and then allows, blocks, or monitors the traffic. This feature enhances security by preventing unauthorized access that could result from domain mismatches.

```
config firewall profile-protocol-options
    edit protocol
        config http
            set domain-fronting {allow | monitor | block | strict}
        next
    end
end
```

Command	Description
`domain-fronting {allow | block | monitor}`	Configure HTTP domain fronting (default = block). • `allow`: allow domain fronting. • `monitor`: allow and log domain fronting. • `block`: block and log domain fronting. • `strict`: block and log domain fronting. Will block potential matching IP and domain.

Domain fronting protection supports HTTP/1.1 but not HTTP/2.

Example

In this example, the server name indication (SNI) in the request is `httpbin.org`, and the host header in the request is `google.com`.

When FortiGate has an explicit proxy policy configured with `set domain-fronting block`, traffic is blocked and logged when the request domain does not match the HTTP header domain.

- Example traffic log:

```
1: date=2024-06-11 time=10:38:23 eventtime=1718127503650731465 tz="-0700" logid="0000000013"
type="traffic" subtype="forward" level="notice" vd="vdom1" srcip=10.1.100.77 srcport=41548
srcintf="port2" srcintfrole="undefined" dstip=3.211.196.247 dstport=443 dstintf="port3"
dstintfrole="undefined" srccountry="Reserved" dstcountry="United States" sessionid=1542161161
proto=6 action="deny" policyid=1 policytype="proxy-policy" poluuid="01352fb2-1370-51ef-8ac3-
c46f77827b80" service="HTTPS" trandisp="noop" duration=0 sentbyte=0 rcvdbyte=0 sentpkt=0
rcvdpkt=0 appcat="unscanned" utmaction="block" countweb=1 msg="Traffic denied because of
domain fronting" utmref=65498-0
```

- Example Web filter UTM log:

```
1: date=2024-06-11 time=10:38:23 eventtime=1718127503650663438 tz="-0700" logid="0320013318"
type="utm" subtype="webfilter" eventtype="domain-fronting" level="notice" vd="vdom1"
policyid=1 poluuid="01352fb2-1370-51ef-8ac3-c46f77827b80" policytype="proxy-policy"
sessionid=1542161161 transid=1 srcip=10.1.100.77 srcport=41548 srccountry="Reserved"
srcintf="port2" srcintfrole="undefined" dstip=3.211.196.247 dstport=443 dstcountry="United
States" dstintf="port3" dstintfrole="undefined" proto=6 httpmethod="GET" service="HTTPS"
hostname="google.com" agent="curl/7.83.1" profile="protocol" action="blocked" reqtype="direct"
url="https://google.com/" sentbyte=860 rcvdbyte=5470 direction="outgoing" msg="Domain fronting
detected" rawdata="HTTP Host <google.com> does not match SNI <httpbin.org>"
```

When FortiGate has a transparent proxy policy configured with `set domain-fronting monitor`, traffic is passed and logged when the request domain does not match the HTTP header domain.

- Example traffic log:

```
1: date=2024-06-11 time=11:14:22 eventtime=1718129661884640964 tz="-0700" logid="0000000010"

<httpbin.org>"
```

Inline CASB

The inline CASB security profile enables the FortiGate to perform granular control over SaaS applications directly on firewall policies. The supported controls include:

Control	Description
Privilege control	Specify the action to apply to user activities per application such as upload, download, share, delete, log in, and so on. See Privilege control on page 2377 for an example.
Safe search	On SaaS applications that support searching, enable and select the level of safe search. See Safe search on page 2379 for an example.
Tenant control	Allow only users belonging to specific domains to access the SaaS application. See Tenant control on page 2382 for an example.
Advanced tenant control	Allows for much more granular manipulation of HTTP requests, including custom headers and dynamic attribute mapping.

Control	Description
	See Advanced tenant control on page 2385 for an example.
UTM bypass	For each user activity, bypass further UTM scanning any of the following security profiles: • Antivirus • DLP • File filter • Video filter • Web filter See UTM bypass on page 2387 for an example.

Administrators can customize their own SaaS applications, matching conditions, and custom controls and actions.

A firewall policy must use proxy-based inspection with a deep inspection SSL profile to apply the inline CASB profile and scan the traffic payload.

Inline CASB can be applied to a firewall policy or a proxy policy.

This feature is not supported on FortiGate models with 2 GB RAM or less. See Proxy-related features not supported on FortiGate 2 GB RAM models on page 126 for more information.

The Inline-CASB Application Definitions entitlement is licensed under the basic firmware and updates contract. To view the entitlement information, go to *System > FortiGuard* and expand the *Firmware, VM, and base subscriptions* section in the *Subscriptions > Licensed* tab.

To enable inline CASB security profiles in the GUI:

1. Go to *System > Feature Visibility*.
2. Enable *Inline-CASB* in the *Security Features* section.
3. Click *Apply*.

See Inline CASB examples on page 2376 for sample configurations.

Inline CASB examples

The following examples are included:

- Privilege control on page 2377
- Safe search on page 2379
- Tenant control on page 2382
- Advanced tenant control on page 2385
- UTM bypass on page 2387
- Customized SaaS application and user activity on page 2390
- Support control factors in exchanged JSON data for custom SaaS applications on page 2395

Privilege control

In this example, logging in to Microsoft Outlook is blocked by the privilege control settings in the inline CASB profile.

To configure an inline CASB profile with privilege control in the GUI:

1. Configure the inline CASB profile:
   a. Go to *Security Profiles* > *Inline-CASB* and click *Create new*.
   b. Enter a *Name*, such as *outlook_test*.
   c. In the *SaaS Applications* table, click *Create new*. The *Create SaaS Application Rules* pane opens.
   d. Set the *Application* to *microsoft-outlook*, then click *Next*.

   e. Enable *Logging*.
   f. In the *Privilege Control* table, select *login* and from the *Set Action* dropdown, select *Block*.

   g. Click *OK*.
2. Configure the firewall policy:

a. Go to *Policy & Objects > Firewall Policy*. Edit an existing policy, or create a new one.
b. Set the *Inspection Mode* to *Proxy-based*.
c. In the *Security Profiles* section, enable *Inline-CASB* and select the *outlook_test* profile.
d. Set the *SSL Inspection* profile to one that uses deep inspection.
e. Configure the other settings as needed.
f. Click *OK*.

To configure an inline CASB profile with privilege control in the CLI:

1. Configure the inline CASB profile:

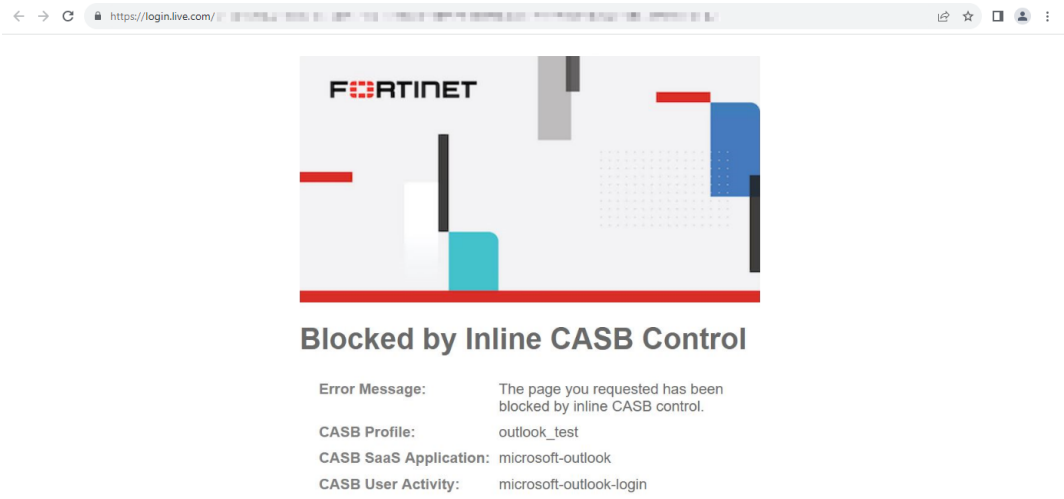
```
config casb profile
    edit "outlook_test"
        config saas-application
            edit "microsoft-outlook"
                config access-rule
                    edit "microsoft-outlook-login"
                        set action block
                    next
                end
            next
        end
    next
end
```

2. Configure the firewall policy:

```
config firewall policy
    edit 6
        set name "casb_test"
        set srcintf "port1"
        set dstintf "port3"
        set action accept
        set srcaddr "all"
        set dstaddr "all"
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set inspection-mode proxy
        set ssl-ssh-profile "ssl"
        set casb-profile "outlook_test"
        set nat enable
    next
end
```

To test the configuration:

1. Open a browser and attempt to access the Outlook login page.
2. The traffic is blocked by the firewall policy. The browser displays a replacement message: *Blocked by Inline CASB Control*.



Sample log:

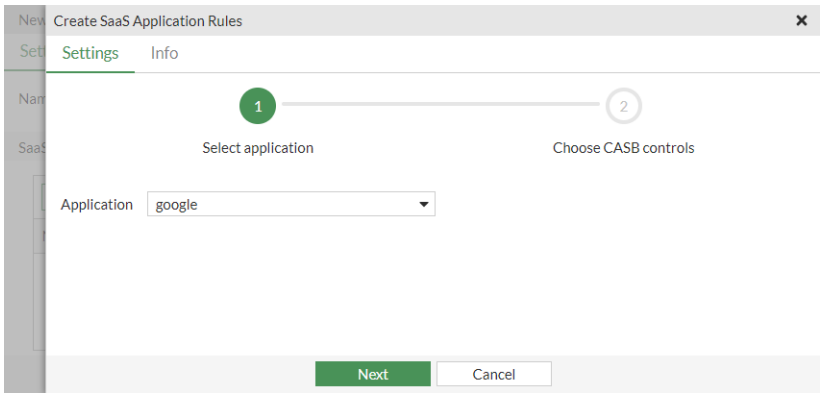
```
1: date=2023-08-18 time=16:59:32 eventtime=1692403171962221884 tz="-0700" logid="2500010000"
type="utm" subtype="casb" eventtype="casb" level="warning" vd="vdom1" msg="CASB access was blocked
because it contained banned activity." policyid=6 sessionid=63635 srcip=10.1.100.195
dstip=20.190.190.130 srcport=61013 dstport=443 srcintf="port1" srcintfrole="undefined"
dstintf="port3" dstintfrole="undefined" proto=6 action="block" profile="outlook_test"
saasapp="microsoft-outlook" useractivity="microsoft-outlook-login" activitycategory="activity-
control"
```

Safe search

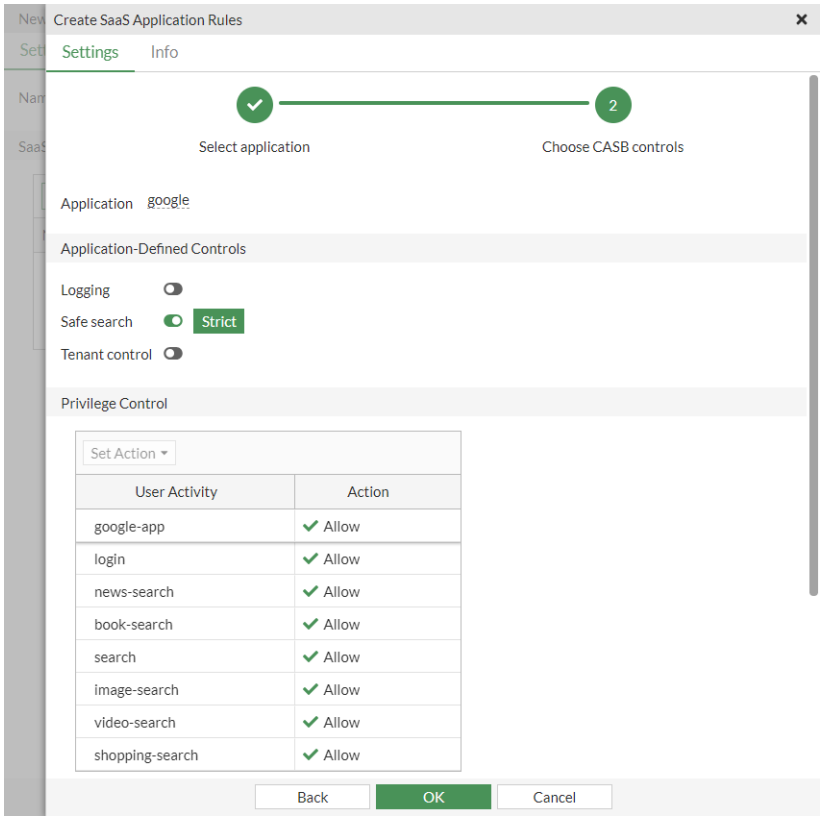
In this example, safe search is configured for Google in the inline CASB profile.

To configure an inline CASB profile with safe search in the GUI:

1. Configure the inline CASB profile:
   a. Go to *Security Profiles* > *Inline-CASB* and click *Create new*.
   b. Enter a *Name*, such as *google_test*.
   c. In the *SaaS Applications* table, click *Create new*. The *Create SaaS Application Rules* pane opens.
   d. Set the *Application* to *google*, then click *Next*.



e. Enable *Safe search*.



f. Click *OK*.

2. Configure the firewall policy:
   a. Go to *Policy & Objects* > *Firewall Policy*. Edit an existing policy, or create a new one.
   b. Set the *Inspection Mode* to *Proxy-based*.
   c. In the *Security Profiles* section, enable *Inline-CASB* and select the *google_test* profile.
   d. Set the *SSL Inspection* profile to one that uses deep inspection.
   e. Configure the other settings as needed.
   f. Click *OK*.

To configure an inline CASB profile with safe search in the CLI:

1. Configure the inline CASB profile:

```
config casb profile
    edit "google_test"
        config saas-application
            edit "google"
                set safe-search enable
                set safe-search-control "strict"
            next
        end
    next
end
```

2. Configure the firewall policy:

```
config firewall policy
    edit 7
        set name "casb_test_google"
        set srcintf "port1"
        set dstintf "port3"
        set action accept
        set srcaddr "all"
        set dstaddr "all"
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set inspection-mode proxy
        set ssl-ssh-profile "ssl"
        set casb-profile "google_test"
        set nat enable
    next
end
```

To test the configuration:

1. Open a browser and attempt to search in Google for content that is considered mature or explicit.
2. The sensitive content is filtered out in the search results.

Sample log:

```
1: date=2023-08-18 time=17:01:36 eventtime=1692403295962385271 tz="-0700" logid="2500010002"
type="utm" subtype="casb" eventtype="casb" level="information" vd="vdom1" msg="CASB access was
monitored because it contained activity." policyid=7 sessionid=63774 srcip=10.1.100.195
dstip=142.250.217.98 srcport=61065 dstport=443 srcintf="port1" srcintfrole="undefined"
dstintf="port3" dstintfrole="undefined" proto=6 action="monitor" profile="google_test"
saasapp="google" useractivity="google-safe-search" activitycategory="safe-search-control"
```

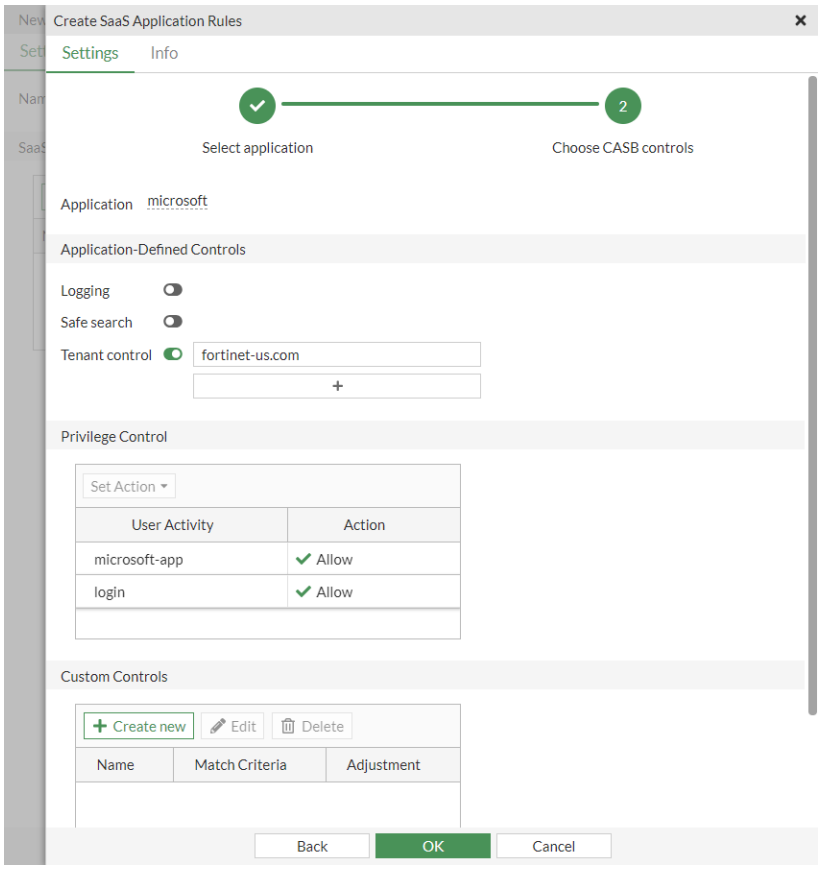
Tenant control

In this example, tenant control is configured for Microsoft in the inline CASB profile for the fortinet-us.com domain.

To configure an inline CASB profile with tenant control in the GUI:

1. Configure the inline CASB profile:
   a. Go to *Security Profiles* > *Inline-CASB* and click *Create new*.
   b. Enter a *Name*, such as *microsoft_test*.
   c. In the *SaaS Applications* table, click *Create new*. The *Create SaaS Application Rules* pane opens.
   d. Set the *Application* to *microsoft*, then click *Next*.

   e. Enable *Tenant control*. Click the + and enter *fortinet-us.com*.



f. Click *OK*.

2. Configure the firewall policy:
   a. Go to *Policy & Objects* > *Firewall Policy*. Edit an existing policy, or create a new one.
   b. Set the *Inspection Mode* to *Proxy-based*.
   c. In the *Security Profiles* section, enable *Inline-CASB* and select the *microsoft_test* profile.
   d. Set the *SSL Inspection* profile to one that uses deep inspection.
   e. Configure the other settings as needed.
   f. Click *OK*.

To configure an inline CASB profile with tenant control in the CLI:

1. Configure the inline CASB profile:

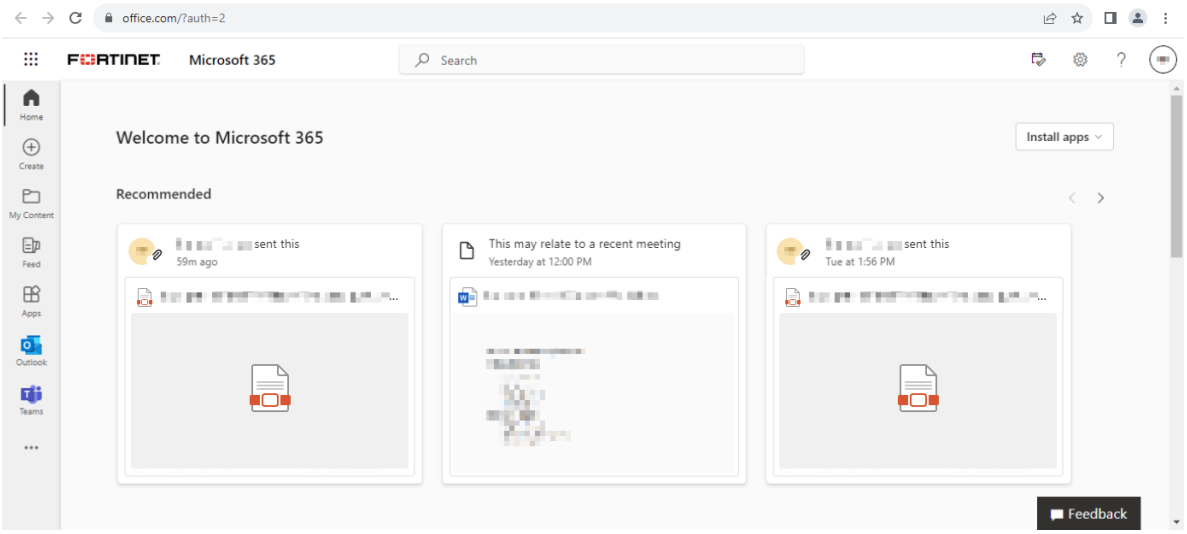
```
config casb profile
    edit "microsoft_test"
        config saas-application
            edit "microsoft"
                set tenant-control enable
                set tenant-control-tenants "fortinet-us.com"
            next
        end
    next
end
```

2. Configure the firewall policy:

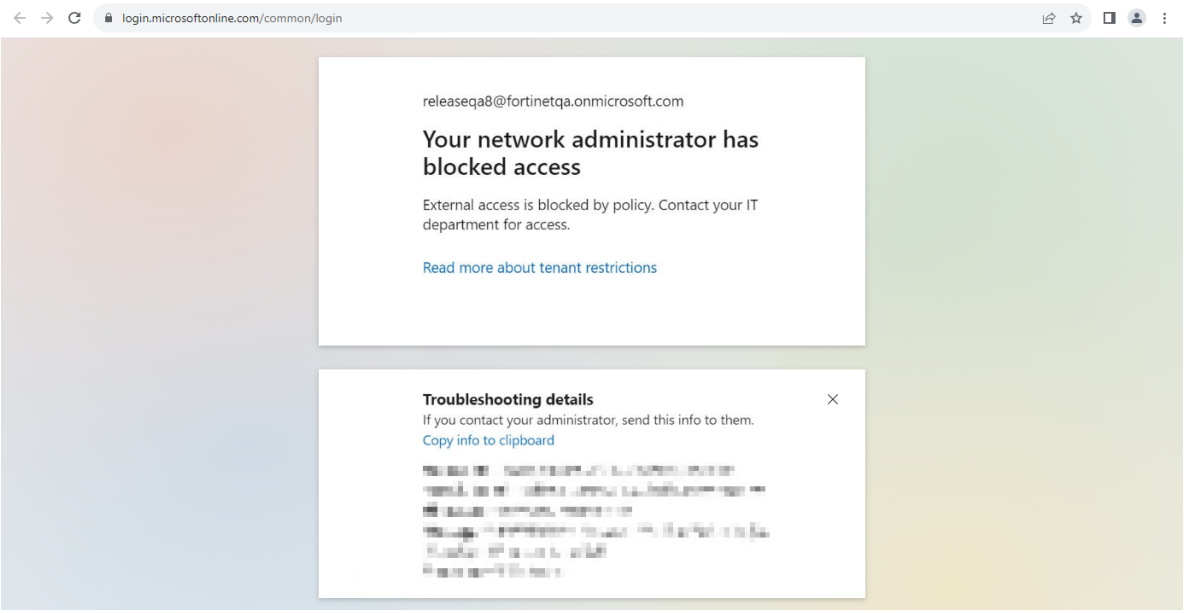
```
config firewall policy
    edit 8
        set name "casb_test_microsoft"
        set srcintf "port1"
        set dstintf "port3"
        set action accept
        set srcaddr "all"
        set dstaddr "all"
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set inspection-mode proxy
        set ssl-ssh-profile "ssl"
        set casb-profile "microsoft_test"
        set nat enable
    next
end
```

To test the configuration:

1. Open a browser and attempt to log in to Microsoft Office 365 with a fortinet-us.com account.
2. Since the domain is valid, the user can log in successfully.



3. Attempt to log in to Microsoft Office 365 with another account with a different domain.
4. The domain is invalid. The user is unable to log in, and an error message appears: *Your network administrator has blocked access*.



Sample log:

```
1: date=2023-08-18 time=17:09:25 eventtime=1692403765238967943 tz="-0700" logid="2500010002"
type="utm" subtype="casb" eventtype="casb" level="information" vd="vdom1" msg="CASB access was
monitored because it contained activity." policyid=8 sessionid=65108 srcip=10.1.100.195
dstip=20.189.173.15 srcport=61912 dstport=443 srcintf="port1" srcintfrole="undefined"
dstintf="port3" dstintfrole="undefined" proto=6 action="monitor" profile="microsoft_test"
saasapp="microsoft" useractivity="ms-tenant-control" activitycategory="tenant-control"
```

Advanced tenant control

Advanced tenant control allows administrators to go beyond simple tenant restriction by performing granular manipulation of HTTP headers—including adding, modifying, or deleting request headers. By defining custom SaaS applications and user activities, administrators can inject specific metadata (such as business unit, location, or tenant IDs) into the traffic flow for better visibility or compliance at the destination SaaS application.

To configure a customized inline CASB profile with advanced tenant control:

1. Configure the CASB SaaS application:

```
config casb saas-application
    edit "httpbin"
        set domains "httpbin.org"
        config input-attributes
            edit "business_name"
            next
            edit "city"
            next
            edit "province"
            next
```

```
        end
    next
end
```

2. Configure the CASB user activity:

```
config casb user-activity
    edit "httpbin-tenant"
        set application "httpbin"
        set category advanced-tenant-control
        config control-options
            edit "tenant-control"
                config operations
                    edit "add_header1"
                        set action new-on-not-found
                        set header-name "X-Business-Name"
                        set value-from-input enable
                        set value-name-from-input "business_name"
                    next
                    edit "add_header2"
                        set action new-on-not-found
                        set header-name "X-City"
                        set value-from-input enable
                        set value-name-from-input "city"
                    next
                    edit "add_header3"
                        set action new-on-not-found
                        set header-name "X-Province"
                        set value-from-input enable
                        set value-name-from-input "province"
                    next
                end
            next
        end
    next
end
```

3. Configure the inline CASB profile:

```
config casb profile
    edit "advanced_casb"
        config saas-application
            edit "httpbin"
                set tenant-control enable
                config advanced-tenant-control
                    edit "httpbin-tenant"
                        config attribute
                            edit "business_name"
                                set input "Pochiya Limited"
                            next
                            edit "city"
                                set input "Coquitlam"
```

```
                            next
                            edit "province"
                                set input "BC"
                            next
                        end
                    next
                end
            next
        end
    next
end
```

4. Configure the firewall policy:

```
config firewall policy
    edit 1
        set utm-status enable
        set inspection-mode proxy
        set ssl-ssh-profile "deep-inspection"
        set casb-profile "advanced_casb"
        set schedule "always"
        set service "HTTPS"
        set action accept
    next
end
```

Verification

To verify that the headers are being injected correctly, perform a request from a client behind the FortiGate to the configured domain using `curl`:

```
# curl -k https://httpbin.org/headers
{
  "headers": {
    "Accept": "*/*",
    "Host": "httpbin.org",
    "User-Agent": "curl/7.68.0",
    "X-Business-Name": "Pochiya Limited",
    "X-City": "Coquitlam",
    "X-Province": "BC"
  }
}
```

The successful verification of the custom headers (X-Business-Name, X-City, and X-Province) confirms that the FortiGate is successfully intercepting the HTTPS traffic, identifying the SaaS application context, and performing real-time header manipulation.

UTM bypass

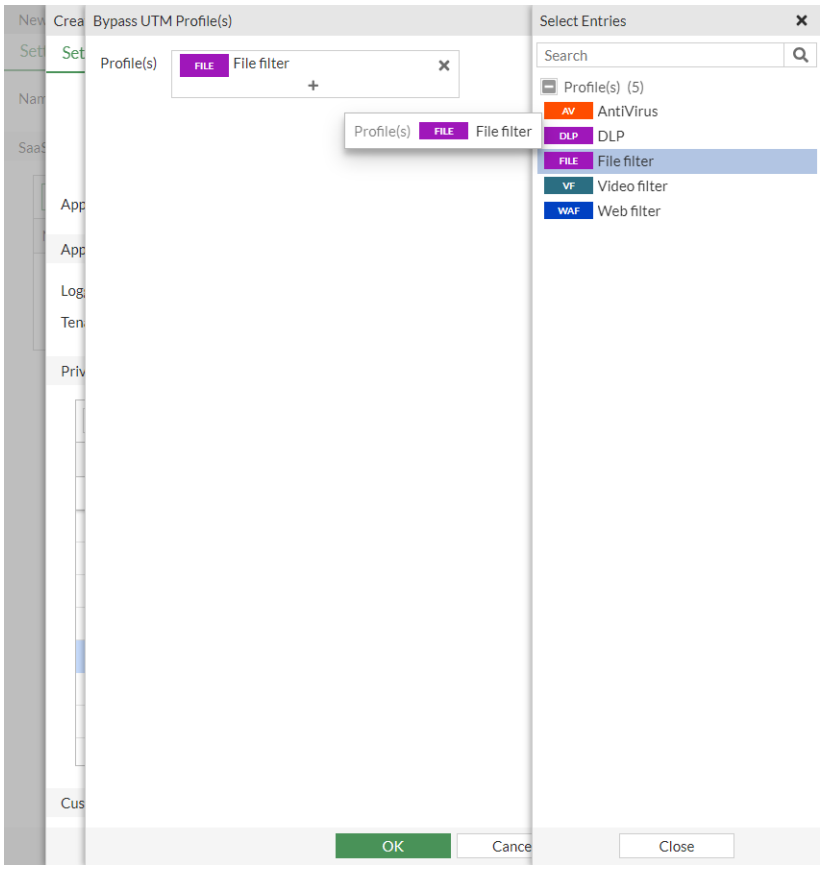
In this example, UTM bypass is configured for Dropbox file downloading in the inline CASB profile.

To configure an inline CASB profile with UTM bypass in the GUI:

1. Configure the inline CASB profile:
   a. Go to *Security Profiles* > *Inline-CASB* and click *Create new*.
   b. Enter a *Name*, such as *dropbox_test*.
   c. In the *SaaS Applications* table, click *Create new*. The *Create SaaS Application Rules* pane opens.
   d. Set the *Application* to *dropbox*, then click *Next*.

   e. Enable *Logging*.
   f. In the *Privilege Control* table, select *download-file* and from the *Set Action* dropdown, select *Bypass*.

   The *Bypass UTM Profile(s)* pane opens.
   g. Click the *+* and set *Profile(s)* to *File Filter*.



h. Click *OK* to save the bypass UTM profile.
i. Click *OK* to save the inline CASB profile

2. Configure the firewall policy:
   a. Go to *Policy & Objects* > *Firewall Policy*. Edit an existing policy, or create a new one.
   b. Set the *Inspection Mode* to *Proxy-based*.
   c. In the *Security Profiles* section, enable *Inline-CASB* and select the *dropbox_test* profile.
   d. Set the *SSL Inspection* profile to one that uses deep inspection.
   e. Configure the other settings as needed.
   f. Click *OK*.

To configure an inline CASB profile with UTM bypass in the CLI:

1. Configure the inline CASB profile:

```
config casb profile
    edit "dropbox_test"
        config saas-application
            edit "dropbox"
                config access-rule
                    edit "dropbox-download-file"
                        set bypass file-filter
                        set action bypass
                    next
```

```
                end
            next
        end
    next
end
```

2. Configure the firewall policy:

```
config firewall policy
    edit 9
        set name "casb_test_dropbox"
        set srcintf "port1"
        set dstintf "port3"
        set action accept
        set srcaddr "all"
        set dstaddr "all"
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set inspection-mode proxy
        set ssl-ssh-profile "ssl"
        set casb-profile "dropbox_test"
        set nat enable
    next
end
```

To test the configuration:

1. Open a browser and log in to Dropbox.
2. Attempt to download a file, such as a PDF. The download is successful.

Sample log:

```
1: date=2023-08-18 time=17:15:29 eventtime=1692404129378193492 tz="-0700" logid="2500010001"
type="utm" subtype="casb" eventtype="casb" level="information" vd="vdom1" msg="CASB access was
allowed although it contained activity." policyid=9 sessionid=65452 srcip=10.1.100.195
dstip=162.125.1.15 srcport=62110 dstport=443 srcintf="port1" srcintfrole="undefined"
dstintf="port3" dstintfrole="undefined" proto=6 action="bypass" profile="dropbox_test"
saasapp="dropbox" useractivity="dropbox-download-file" activitycategory="activity-control"
```

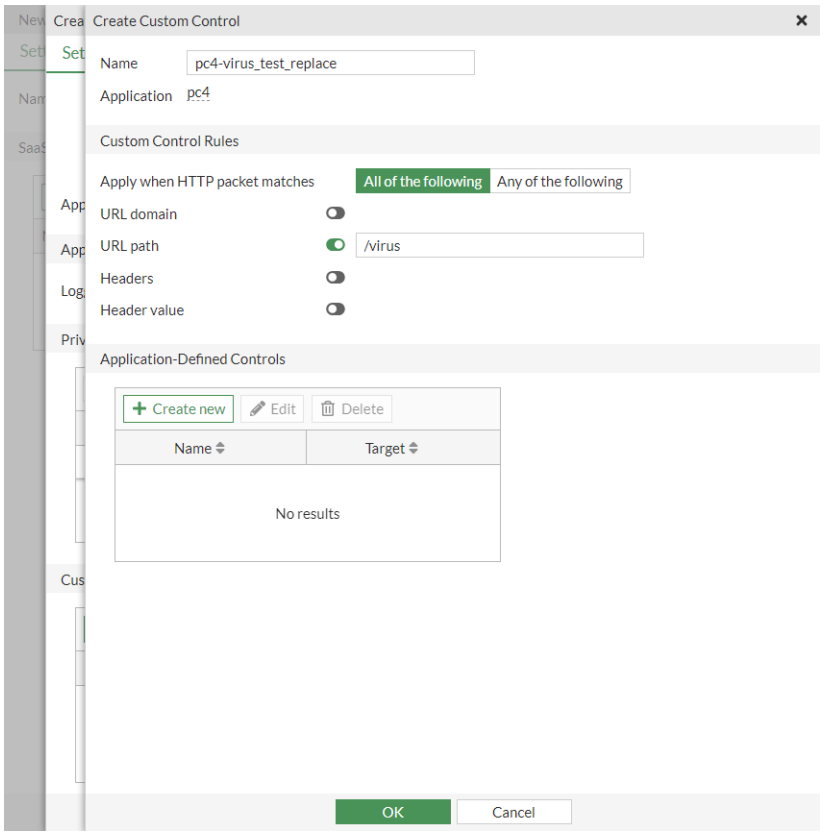
Customized SaaS application and user activity

In this example, a custom SaaS application is created (pc4) with a custom user action. When a user accesses pc4.qa.fortinet.com/virus, they are redirected to pc4.qa.fortinet.com/testweb/testweb.htm.

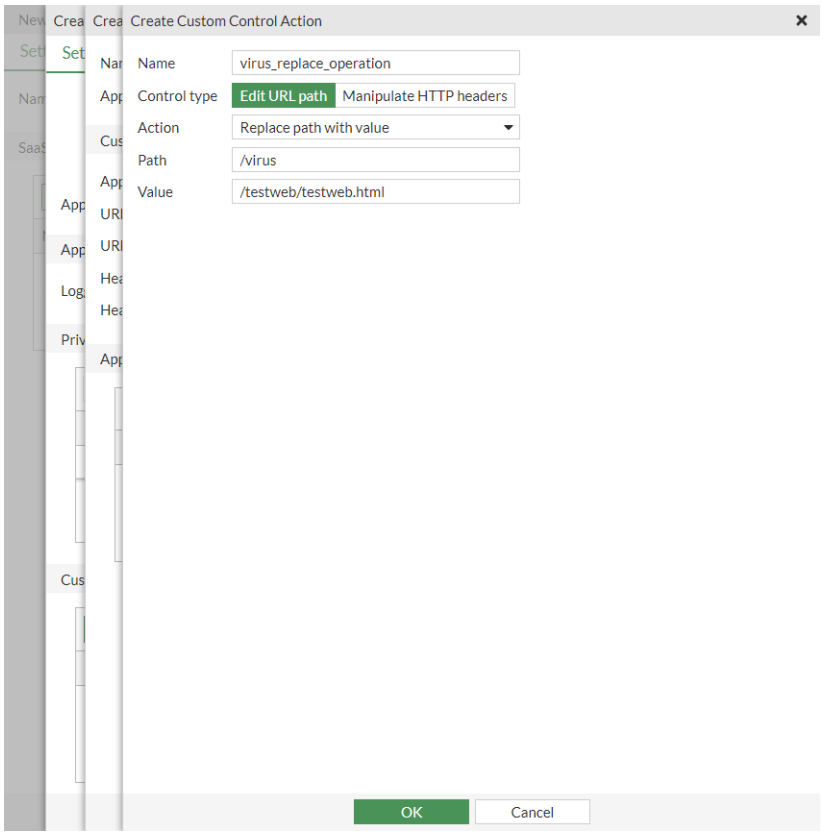
To configure a customized inline CASB profile in the GUI:

1. Configure the inline CASB profile:
   a. Go to *Security Profiles* > *Inline-CASB* and click *Create new*.
   b. Enter a *Name*, such as *custom_test*.
   c. In the *SaaS Applications* table, click *Create new*. The *Create SaaS Application Rules* pane opens.
   d. In the *Application* dropdown, click the *+* to create a custom entry. The *Create Inline-CASB SaaS Application* pane opens.
   e. Enter the *Name* (*pc4*) and *Domains* (*pc4.qa.fortinet.com*), then click *OK*.

   f. Select *pc4* and click *Next*.
   g. Configure the custom control and action:
      i. In the *Custom Controls* table, *Create new*. The *Create Custom Control* pane opens.
      ii. Enter a *Name*, such as *pc4-virus_test_replace*.
      iii. Set *Apply when HTTP packet matches* to *All of the following*.
      iv. Enable *URL path* and enter */virus*.



v. In the *Application-Defined Controls* table, *Create new*. The *Create Custom Control Action* pane opens.
vi. Enter a *Name*, such as *virus_replace_operation*.
vii. Set the *Control Type* to *Edit URL path*.
viii. Set the *Action* to *Replace path with value*.
ix. Set the *Path* to */virus*.
x. Set the *Value* to */testweb/testweb.html*.



xi. Click *OK* to save the custom action.

xii. Click *OK* to save the custom control.

h. Click *OK* to save the application rule.

i. Click *OK* to save the inline CASB profile.

2. Configure the firewall policy:
   a. Go to *Policy & Objects* > *Firewall Policy*. Edit an existing policy, or create a new one.
   b. Set the *Inspection Mode* to *Proxy-based*.
   c. In the *Security Profiles* section, enable *Inline-CASB* and select the *custom_test* profile.
   d. Set the *SSL Inspection* profile to one that uses deep inspection.
   e. Configure the other settings as needed.
   f. Click *OK*.

To configure a customized inline CASB profile in the CLI:

1. Configure the CASB SaaS application:

```
config casb saas-application
    edit "pc4"
        set domains "pc4.qa.fortinet.com"
    next
end
```

2. Configure the CASB user activity:

```
config casb user-activity
    edit "pc4-virus_test_replace"
        set application "pc4"
        set category other
        config match
            edit 1
                config rules
                    edit 1
                        set type path
                        set match-value "/virus"
                    next
                end
            next
        end
        config control-options
            edit "virus_replace_operation"
                config operations
                    edit "virus_replace_operation"
                        set target path
                        set action replace
                        set search-key "/virus"
                        set values "/testweb/testweb.html"
                    next
                end
            next
        end
    next
end
```

3. Configure the inline CASB profile:

```
config casb profile
    edit "custom_test"
        config saas-application
            edit "pc4"
                config custom-control
                    edit "pc4-virus_test_replace"
                        config option
                            edit "virus_replace_operation"
                            next
                        end
                    next
                end
            next
        end
    next
end
```

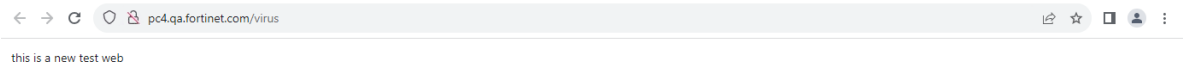
4. Configure the firewall policy:

```
config firewall policy
    edit 10
```

```
        set name "casb_test_custom"
        set srcintf "port1"
        set dstintf "port3"
        set action accept
        set srcaddr "all"
        set dstaddr "all"
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set inspection-mode proxy
        set ssl-ssh-profile "ssl"
        set casb-profile "custom_test"
        set nat enable
    next
end
```

To test the configuration:

1. Open a browser and go to pc4.qa.fortinet.com/virus.
2. Access is redirected to pc4.qa.fortinet.com/testweb/testweb.htm.



Sample log:

```
1: date=2023-08-21 time=08:31:06 eventtime=1692631866382806917 tz="-0700" logid="2500010001"
type="utm" subtype="casb" eventtype="casb" level="information" vd="vdom1" msg="CASB access was
allowed although it contained activity." policyid=10 sessionid=3139 srcip=10.1.100.195
dstip=172.16.200.44 srcport=56774 dstport=80 srcintf="port1" srcintfrole="undefined"
dstintf="port3" dstintfrole="undefined" proto=6
url="http://pc4.qa.fortinet.com/testweb/testweb.html" action="bypass" profile="custom_test"
saasapp="pc4" useractivity="pc4-virus_test_replace" activitycategory="other"
```

Support control factors in exchanged JSON data for custom SaaS applications

The inline CASB security profile supports control factors, such as tenant information in JSON data exchanged between a web browser and a custom SaaS application. For example, for some custom SaaS applications, the URL does not change to reflect the type or identity of the user or organization when logged in as such tenant information is exchanged using JSON data instead of through changes in the URL. JSON data can be extracted using JQ filters (see https://jqlang.org/manual/v1.5/#basic-filters).

In this example, the administrator wants to distinguish between two types of users in different categories, and assign different actions accordingly. The following two SaaS application requests will be made:

```
curl -k https://httpbin.org/headers -H "Partners-Data: {'company': 'contractorsA'}"
curl -k https://httpbin.org/headers -H "Partners-Data: {'company': 'contractorsB'}"
```

Sending the CURL request for contractorsA as:

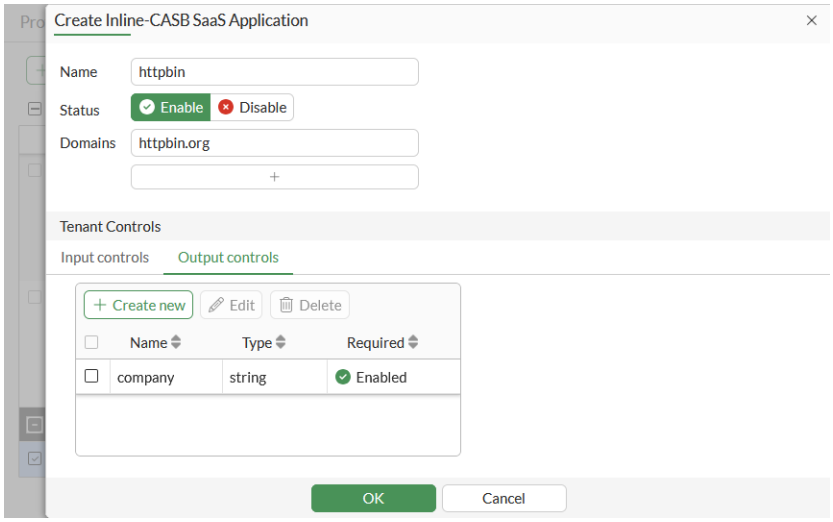
```
GET /headers HTTP/2.0
Host: httpbin.org
user-agent: curl/7.68.0
accept: */*
partners-data: {'company': 'contractorsA'}
```

Traffic is classified based on the tenant information *company* in the HTTP request header *Partners-Data*. Traffic from *contractorsA* is authorized and monitored, and traffic from *contractorsB* is blocked.

This information is transported in a JSON structure within the request, so the JQ tenant extraction feature is used.

To configure a CASB SaaS application in the GUI:

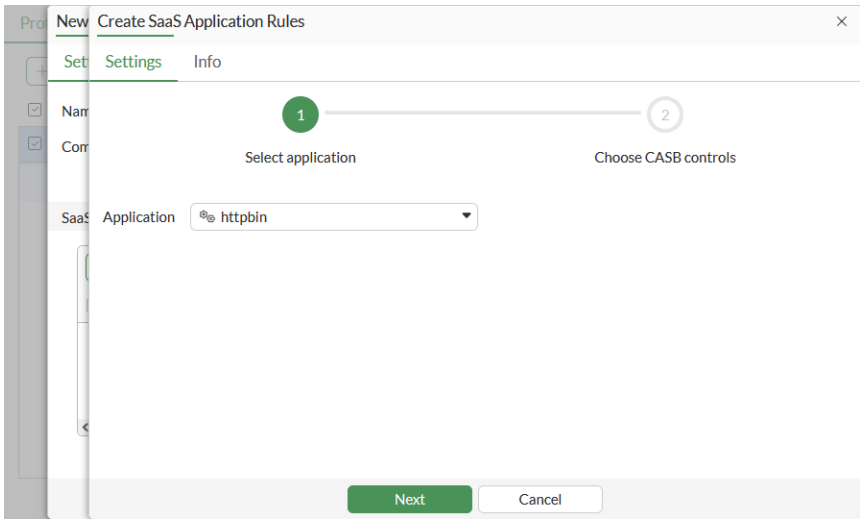
1. Go to *Security Profiles* > *Inline-CASB* and select the *SaaS Application* tab.
2. Click *Create New*.
3. Enter a *Name*, such as *httpbin*.
4. Enter the *Domains*, such as *httpbin.org*.
5. In *Tenant Controls*, select the *Output controls* tab and then click *Create New*.
6. Enter the *Attribute*, such as *company*, then click *OK*.



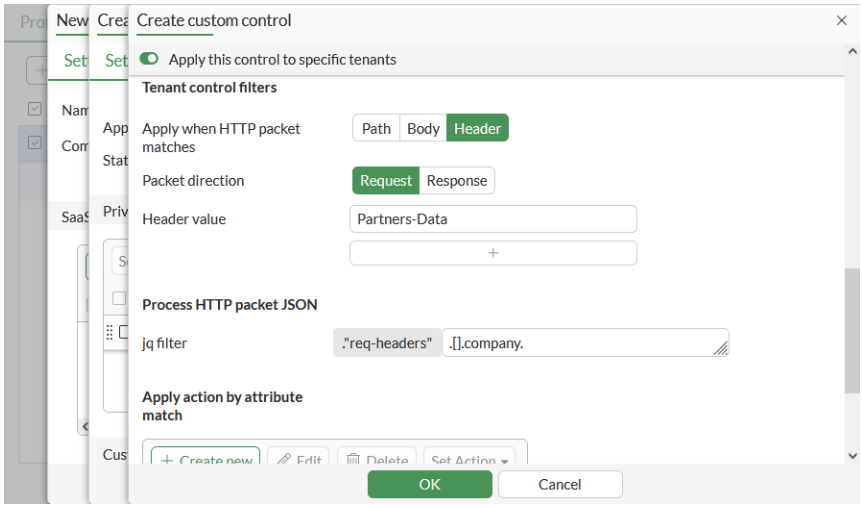
7. Click *OK*.

To configure a CASB profile in the GUI:

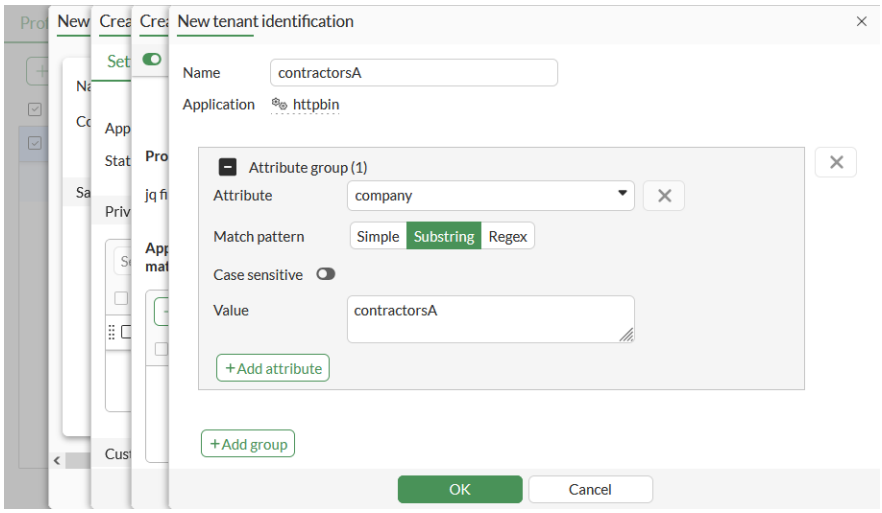
1. Go to *Security Profiles* > *Inline-CASB* and, on the *Profile* tab, click *Create New*.
2. Enter a *Name*, such as *casbProfile*.
3. In the *SaaS applications* table, click *Create New*.
4. Select the *httpbin* custom application (custom applications are at the bottom of the list), then click *Next*.



5. In the *Custom controls* table, click *Create New*.
6. Enter a *Name*, such as *partners*.
7. Enable *URL path* and set it to */headers*. This how the user activity (UA) will be identified. The administrator needs to find a way to recognize this traffic, which can be done using the path, a special header/value pair, or the URL domain name.
8. Enable *Apply this control to specific tenants*.
9. Set *Apply when HTTP packet matches* to *Header*, because in this case the JSON is in the HTTP header.
10. Set *Header value* to *Partners-Data*.
11. Set *jq filter* to *.[].company*. This is the tenant extraction field; it tells the FortiGate to extract the *company* field from the JSON structure that is in the HTTP request header.



12. In the *Apply action by attribute match* table click *Create New*.
13. Configure the tenant information for contractorsA:

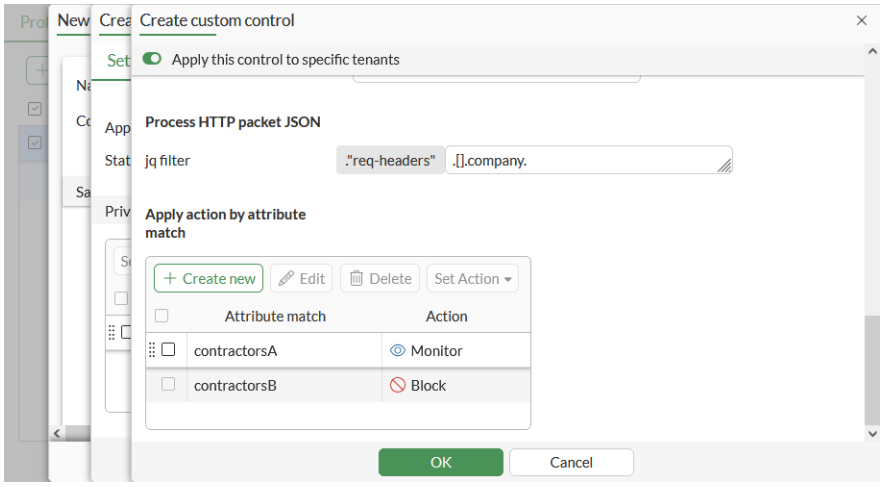


Field	Value
Name	contractorsA
Attribute	company
Match pattern	substring
Value	contractorsA

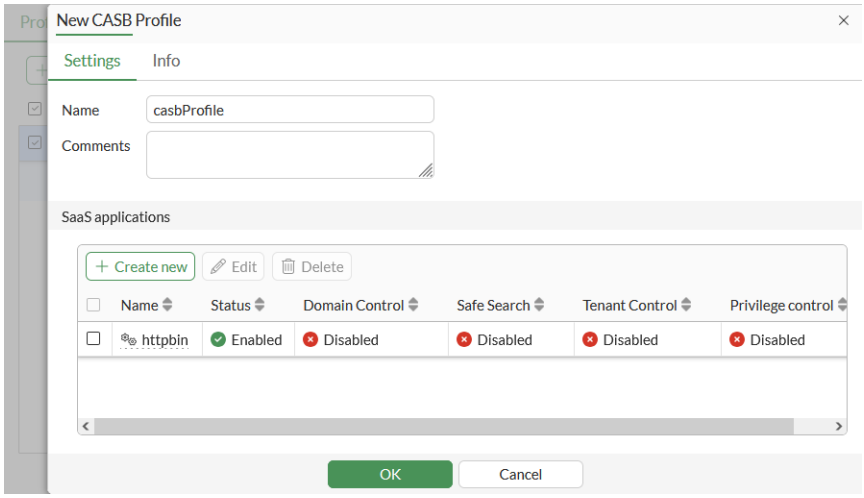
14. Click *OK*, then click *Create New* again to configure the tenant information for contractorsB:

Field	Value
Name	contractorsB
Attribute	company
Match pattern	substring
Value	contractorsB

15. Click *OK*.
16. In the *Apply action by attribute match* table, select *contractorsB* and click *Set Action* > *Block*.



17. Click *OK* to save the custom control.
18. Click *OK* to save the SaaS application rules.



19. Click *OK* to save the CASB profile.

To configure a CASB SaaS application in the CLI:

```
config casb saas-application
    edit "httpbin"
        set domains "httpbin.org"
        config output-attributes
            edit "company"
            next
        end
    next
end
```

To configure a CASB profile in the CLI:

1. Configure CASB user activity:

```
config casb user-activity
    edit "httpbin-partners"
        set application "httpbin"
        set category other
        config match
            edit 1
                config rules
                    edit 1
                        set type path
                        set match-value "/headers"
                    next
                end
                config tenant-extraction
                    set status enable
                    set jq ".\"req-headers\".[].company"
```

```
                    config filters
                        edit 1
                            set header-name "Partners-Data"
                        next
                    end
                end
            next
        end
    next
end
```

2. Configure CASB attribute match rules:

```
config casb attribute-match
    edit "httpbin-contractorsA"
        set application "httpbin"
        config match
            edit 1
                config rule
                    edit 1
                        set attribute "company"
                        set match-pattern substr
                        set match-value "contractorsA"
                    next
                end
            next
        end
    next
    edit "httpbin-contractorsB"
        set application "httpbin"
        config match
            edit 1
                config rule
                    edit 1
                        set attribute "company"
                        set match-pattern substr
                        set match-value "contractorsB"
                    next
                end
            next
        end
    next
end
```

3. Configure a CASB profile:

```
config casb profile
    edit "casbProfile"
        config saas-application
            edit "httpbin"
                config custom-control
                    edit "httpbin-partners"
```

```
                        config attribute-filter
                            edit 1
                                set attribute-match "httpbin-contractorsA"
                                set action monitor
                            next
                            edit 2
                                set attribute-match "httpbin-contractorsB"
                                set action block
                            next
                        end
                    next
                end
            next
        end
    next
end
```

To test the profile:

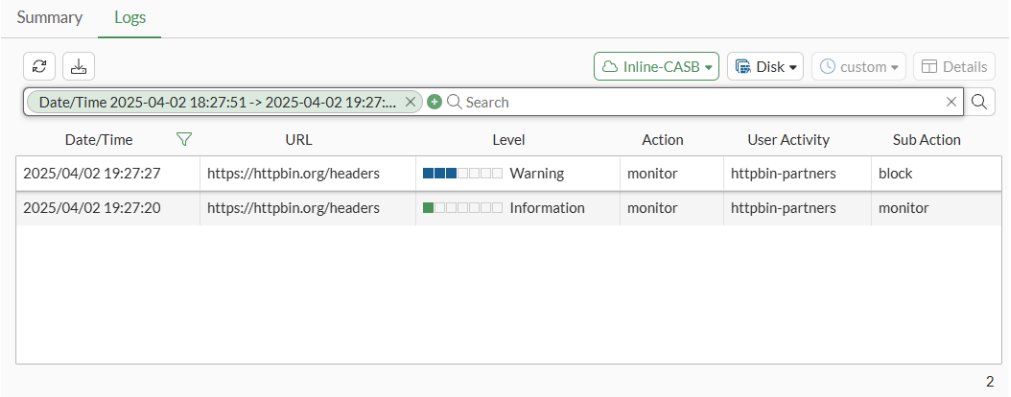
1. Make the following two SaaS application requests:

```
curl -k https://httpbin.org/headers -H "Partners-Data: {'company': 'contractorsA'}"
curl -k https://httpbin.org/headers -H "Partners-Data: {'company': 'contractorsB'}"
```

2. Check the logs to see that the SaaS application request for contractorsA is passed and a log is generated:

```
1: date=2025-03-22 time=00:25:19 eventtime=1742628319441656177 tz="-0700" logid="2500010002"
type="utm" subtype="casb" eventtype="casb" level="information" vd="vdom1" policyid=1
poluuid="e0a45778-05e0-51f0-d77d-e4e8a02811e2" policytype="policy" sessionid=7535
srcip=10.1.100.13 dstip=54.236.151.211 srcport=46476 dstport=443 srcintf="lan"
srcintfrole="undefined" srcuuid="bcbee936-05e0-51f0-5712-f0e95616dde0" dstintf="mgmt"
dstintfrole="lan" dstuuid="bcbee936-05e0-51f0-5712-f0e95616dde0" proto=6
url="https://httpbin.org/headers" action="monitor" profile="casbProfile" saasapp="httpbin"
useractivity="httpbin-partners" subaction="monitor" tenantmatch="matched"
activitycategory="other" msg="CASB access was monitored because it contained activity."
```

3. In the GUI, go to *Log & Report > Security Events* and view the *Inline-CASB* event logs.
4. Confirm that the SaaS application request for contractorsB is blocked, as its sub-action is set to *block*.



Intrusion prevention

Intrusion Prevention System (IPS) detects network attacks and prevents threats from compromising the network, including protected devices. IPS can be in the form of a standalone appliance, or part of the feature set of a Next Generation Firewall (NGFW), such as FortiGate. IPS utilizes signatures, protocol decoders, heuristics (or behavioral monitoring), threat intelligence (such as FortiGuard Labs), and advanced threat detection in order to prevent exploitation of known and unknown zero-day threats. FortiGate IPS is even capable of performing deep packet inspection to scan encrypted payloads in order to detect and prevent threats from attackers.

When implementing IPS profiles, Fortinet recommends tuning the sensor to reflect the environment that it is protecting. This involves selecting only signatures that match the services and devices that it is meant to protect, and adjusting thresholds for selected anomalies to suit your environment.

Networks and devices are often exploited through vulnerabilities. Software vulnerabilities are one such example where a bug or inherent weakness in the code provides attackers an opportunity to gain access to the software. More severe vulnerabilities allow unauthorized access, data loss, and execution of malicious code. Exploitation of these vulnerabilities can cause damage to the machine and infect others. While the best solution is to patch vulnerabilities as soon as patches are available, IPS signatures offer a solution to detect and block exploitation of many vulnerabilities before they enter the network.

IPS signatures

In order to download updated IPS definitions, at least 1 policy with a security profile that has IPS scanning must be enabled.

Fortinet's solution combines industry-leading threat intelligence from FortiGuard Labs with the FortiGate NGFW to identify the latest threats and prevent them from entering your network. IPS signatures are one such method for delivering the latest protection. FortiGuard Labs uses AI and Machine Learning (ML) to analyze billions of events every day. The FortiGuard Labs research team also proactively performs threat research to discover new vulnerabilities and exploitation, and produces signatures to identify such threats. These IPS signatures are delivered to each FortiGate daily, so that the IPS engine is armed with the latest databases to match the latest threats.

IPS sensors

A FortiGate IPS sensor is a collection of IPS signatures and filters that define the scope of what the IPS engine will scan when the IPS sensor is applied. An IPS sensor can have multiple sets of signatures and/or filters. A set of IPS signatures consists of manually selected signatures, while a set of IPS filters consists of filters based on signature attributes like target, severity, protocol, OS, and application. Each signature has predefined attributes and an action, such as block, allow, monitor (pass), quarantine, and reset. It is also possible to create custom IPS signatures to apply to an IPS sensor.

From the *Security Profiles* > *Intrusion Prevention* pane, you can create new IPS sensors and view a list of predefined sensors.

FortiOS includes the following predefined IPS sensors with associated predefined signatures:

Predefined IPS sensors	Description
all_default	Filters all predefined signatures, and sets action to the signature's default action.
all_default_pass	Filters all predefined signatures, and sets action to pass/monitor.
default	Filters all predefined signatures with severity of Critical/High/Medium. Sets action to signature's default action.
high_security	Filters all predefined signatures with severity of Critical/High/Medium, and sets action to Block. For Low severity signatures, sets action to signature's default action.
protect_client	Protects against client-side vulnerabilities by filtering on `Target=Client`. Sets action to signature's default action.
protect_email_server	Protects against email server-side vulnerabilities by filtering on `Target=Server` and `Protocol=IMAP`, `POP3` or `SMTP`. Sets action to signature's default action.
protect_http_server	Protects against HTTP server-side vulnerabilities by filtering on `Target=Server` and `Protocol=HTTP`. Sets action to signature's default action.
wifi-default	Filters all predefined signatures with severity of Critical/High/Medium. Sets action to signature's default action. Used in profile for offloading WiFi traffic.

New signatures

When new vulnerabilities are discovered and the FortiGuard team creates signatures to match them, the priority is to match the malicious traffic and release the signature as quickly as possible. As a result, the signatures are more broad at the start and become refined over time, incidentally causing some false positives. For this reason, the signatures are often released with an action of pass.

You must decide on the tradeoff between protection and usability with potential false positives. The high_security IPS sensor (or any custom sensor which overwrites the default action of Medium/High/Critical) should be used when false positives are acceptable to provide a higher level of security.

DDoS attacks

Besides protecting against threats and exploitation of vulnerabilities, the IPS engine is also responsible for mitigating Denial of Service (DoS) attacks where attackers attempt to bring a service down by flooding the target with traffic from distributed systems. Using anomaly-based defense, FortiGate can detect a variety of L3 and L4 anomalies and take action against these attacks. This can be configured under IPv4 and IPv6 DoS Policies, which is discussed in detail under DoS policy on page 1836.

This section contains the following topics:

- Signature-based defense on page 2404
- Configuring an IPS sensor on page 2407
- IPS configuration options on page 2410
- IPS signature filter options on page 2422
- SCTP filtering capabilities on page 2416

- Diameter protocol inspection on page 2418

This section also provides the following examples about IPS sensors:

- IPS with botnet C&C IP blocking on page 2426
- IPS signatures for the operational technology security service on page 2430
- IPS sensor for IEC 61850 MMS protocol on page 2432
- IPS Modbus TCP decoder on page 2433
- AI and ML-based IPS detection on page 2435
- Support Ethernet layer protocols in the IPS engine on page 2438

Signature-based defense

Signature-based defense is used against known attacks or vulnerability exploits. These often involve an attacker attempting to gain access to your network. The attacker must communicate with the host in an attempt to gain access, and this communication includes commands or sequences of commands and variables. The IPS signatures include these command sequences, allowing the FortiGate unit to detect and stop the attack.

This section describes the following components used in signature-based defense:

- IPS signatures on page 2404
- Protocol decoders on page 2404
- IPS engine on page 2405
- IPS sensors on page 2405
- IPS filters on page 2406
- Custom and predefined signature entries on page 2406
- Policies on page 2407

IPS signatures

IPS signatures are the basis of signature-based intrusion prevention. Every attack can be reduced to a particular string of commands or a sequence of commands and variables. Signatures include this information, and FortiGate uses the information to detect and stop attacks.

Signatures also include characteristics about the attack they describe. These characteristics include the network protocol associated with the attack, the vulnerable operating system, and the vulnerable application.

To view the complete list of signatures, go to *Security Profiles* > *IPS Signatures*. The list of signatures includes predefined and custom signatures. You can hover over the name of the IPS signature to display a pop-up window that includes an ID number. You can click the ID number to display the FortiGuard page.

Protocol decoders

Before examining network traffic for attacks, the IPS engine uses protocol decoders to identify each protocol appearing in the traffic. Attacks are protocol-specific, so your FortiGate unit conserves resources by looking for attacks only in the protocols used to transmit them. For example, the FortiGate unit will only examine HTTP traffic for the presence of a signature describing an HTTP attack.

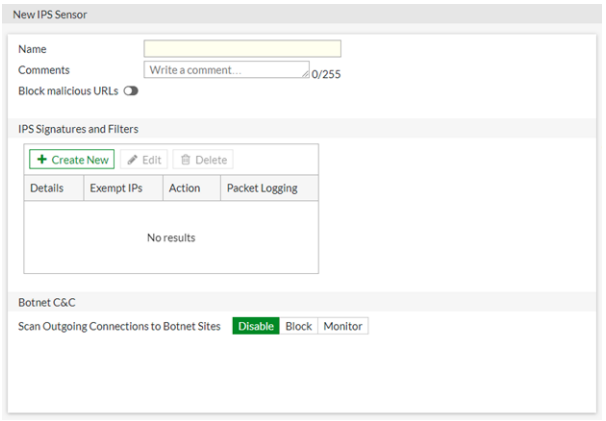
IPS engine

Once the protocol decoders separate the network traffic by protocol, the IPS engine examines the network traffic for the attack signatures by using IPS sensors.

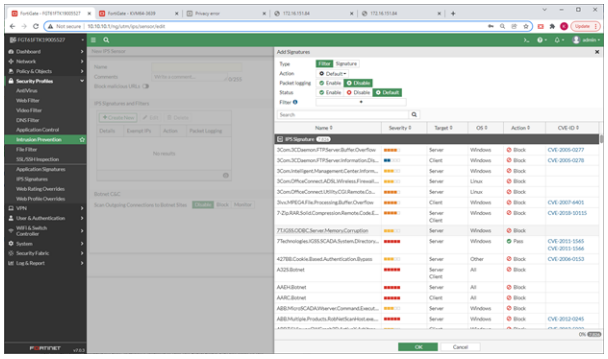
IPS sensors

The IPS engine does not examine network traffic for all signatures. The IPS engine examines network traffic for signatures specified in IPS sensors. You must first create an IPS sensor, and then you can specify what signatures the IPS sensor will use. You can add individual signatures to IPS sensors, or you can add filters to IPS sensors, and the filters automatically include the applicable signatures.

To view IPS sensors, go to *Security Profiles* > *Intrusion Prevention*. To create a new sensor, click *Create New*.



An IPS sensor is composed of IPS signatures and filters. Under *IPS Signatures and Filters*, click *Create New* to create a set of IPS signatures or a set of IPS filters.



You can create IPS sensors for specific types of traffic, and then select the IPS sensors in firewall policies designed to handle the same type of traffic. For example, you can specify all of the web-server related signatures in an IPS sensor, and select the IPS sensor in a firewall policy that controls all traffic to and from a web server that is protected by the FortiGate unit.

The FortiGuard Service periodically adds new predefined signatures to counter new threats. New predefined signatures are automatically included in IPS sensors that are configured to use filters when the new signatures match existing filter specifications. For example, if you have an IPS sensor with a filter that includes all

signatures for the Windows operating system, your filter will automatically incorporate new Windows signatures that the FortiGuard Service adds to the database.

IPS signature and filter entries are checked from top down. When a signature is found in a set of signatures or filters, the action defined for the signature is taken.

IPS filters

IPS sensors can contain one or more IPS filters. A filter is a collection of signature attributes that you specify. The signatures that have all of the attributes specified in a filter are included in the IPS filter.

Following are the attribute groups:

- Target
- Severity
- Protocol
- OS
- Application

Starting in FortiOS 6.4.2, you can also filter by CVE ID or CVE pattern by using the CLI. See FortiOS 6.4 New Features > IPS signature filter options.

When selecting multiple attributes within the same group, the selections are combined by using a logical `OR`. When selecting multiple attributes between attribute groups, each attribute group is combined by using a logical `AND`.

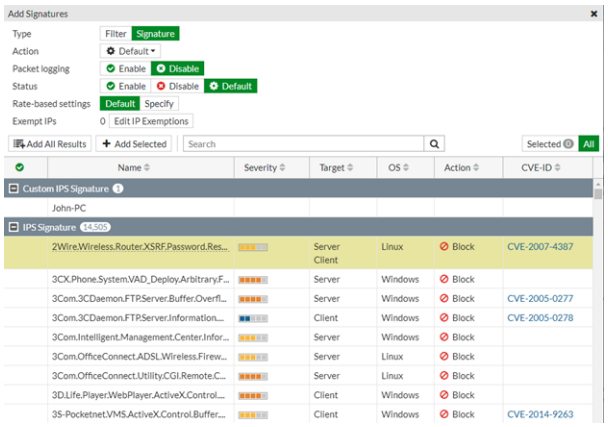
Once you select filters in the GUI, the filtered list of IPS signatures are displayed. Adjust your filters accordingly to construct a suitable list for your needs.

For example, if your FortiGate unit protects a Linux server running the Apache web server software, you could create a new filter to protect it. By setting *OS* filter attribute to *Linux*, and the filter attribute *Application* to *Apache*, the filter will include only the signatures that apply to both Linux and Apache. If you wanted to scan for all the Linux signatures and all the Apache signatures, you would create two filters, one for each.

To view the filters in an IPS sensor, go to *Security Profiles* > *Intrusion Prevention*, select the IPS sensor, and click *Edit*.

Custom and predefined signature entries

Signature entries allow you to add individual, custom or predefined IPS signatures to an IPS sensor. If you need only one signature, or you want to manually select multiple signatures that don't fall into the criteria for an IPS filter, adding a signature entry to an IPS sensor is the easiest way. Signature entries are also the only way to include custom signatures in an IPS sensor.



To select an individual signature, click a signature, and select *Add Selected*. The signature moves to the *Selected* list.

To select multiple signatures, use the *Search* bar to perform a keyword search, and then click *Add All Results* to move all entries to the *Selected* list.

Overriding the default action

Each IPS signature comes with a default action such as *Block* and *Pass*. In some scenarios, you may want to override this action. You can override a set of IPS filter or signatures. By default, a set of IPS filter or signatures has an action of *Default*, which applies a signature's default action when the signature is matched. By changing the action, you can override the setting for all signatures within the filter or signature set.

Policies

You must select an IPS sensor in a security policy or an interface policy to apply the IPS sensor to traffic. An IPS sensor that it not selected in a policy is not applied to network traffic.

Configuring an IPS sensor

You can configure IPS sensors to be used in policies in the GUI.

To configure an IPS sensor:

1. Go to *Security Profiles* > *Intrusion Prevention*.
2. Click *Create New*.
3. Configure the following settings:

Name	Enter a unique name for the sensor.
Comments	Enter a comment (optional).
Block malicious URLS	Enable to block malicious URLs based on a local malicious URL database on the FortiGate to assist in the detection of drive-by exploits. See Malicious URL database for drive-by exploits detection on page 2411.

IPS Signature and Filters		Select a signature or filter to assign to the sensor. See Configuring signatures and filters on page 2408.
Botnet C&C		
	Scan Outgoing Connections to Botnet Sites	Define the botnet scanning across traffic that matches the policy: • *Disable*: Do not scan connections to botnet servers. • *Block*: Block connections to botnet servers. • *Monitor*: Log connections to botnet servers. See IPS with botnet C&C IP blocking on page 2426.

4. Click *OK*.

For information on configuring IPS sensors in the CLI, see IPS configuration options on page 2410.

Configuring signatures and filters

Signatures and filters can be configured and added to IPS sensors. A filter is a collection of signature attributes. Any signatures that meet all of the attributes specified in a filter are automatically included in the IPS sensor. See IPS signature filter options on page 2422.

To configure a Signature entry of type Filter:

1. Go to *Security Profiles* > *Intrusion Prevention*.
2. Click *Create New*.
3. Configure the IPS sensor settings.
4. In *IPS Signatures and Filters*, click *Create New*. The *Add Signatures* pane is displayed.
5. Configure the settings as follows:

Type	Select *Filter*.
Action	Click the dropdown menu and select the action when a signature is triggered: • *Allow*: Allow traffic to continue to its destination. • *Monitor*: Allow traffic to continue to its destination and log the activity. • *Block*: Drop traffic that matches the signature. • *Reset*: Reset the session whenever the signature is triggered. • *Default*: Use the default action of the signature. Search for the signature in the *IPS Signature* pane to view the default *Action*. • *Quarantine*: Block the matching traffic. Enable packet logging. Quarantine the attacker.
Packet logging	Enable packet logging to save a copy of the packets when they match the signature. Packet copies can be analyzed later.

	Packet logging is not supported on all FortiGate devices. FortiAnalyzer logging or a hard disk are required to support this feature; see the Feature Platform Matrix.
Status	Define the signature status: • *Enable*: Enable the signature. • *Disable*: Disable the signature. • *Default*: Use the default status of the signature. Search for the signature in the *IPS Signature* pane to view the default *Status*.
Filter	Select the *+* to open the *Select Entries* field and select filter entries. There are different entry categories: • *Target*: Refers to the type of device targeted by the attack. • *Severity*: Refers to the level of the threat posed by the attack. • *Protocol*: Refers to the protocol that is the vector for the attack. • *OS*: Refers to the Operating System affected by the attack. • *Application*: Refers to the application affected by the attack.

6. Select one or more signatures from the *IPS Signatures* pane.
7. Click *OK*. The signature is added to the IPS sensor.
8. Click *OK*.

Individual signatures, custom or predefined IPS signatures can be selected for an IPS sensor. If you need only one signature, or you want to manually select multiple signatures that don't fall into the criteria for an IPS filter, adding a signature entry to an IPS sensor is the easiest way.

To configure a Signature entry of type Signature:

1. Go to *Security Profiles > Intrusion Prevention*.
2. Click *Create New*.
3. Configure the IPS sensor settings.
4. In *IPS Signatures and Filters*, click *Create New*. The *Add Signatures* pane is displayed.
5. Configure the settings as follows:

Type	Select *Signature*.
Action	Click the dropdown menu and select the action when a signature is triggered: • *Allow*: Allow traffic to continue to its destination. • *Monitor*: Allow traffic to continue to its destination and log the activity. • *Block*: Drop traffic that matches the signature. • *Reset*: Reset the session whenever the signature is triggered. • *Default*: Use the default action of the signature. Search for the signature in the *IPS Signature* pane to view the default *Action*. • *Quarantine*: Block the matching traffic. Enable packet logging. Quarantine the attacker.

Packet Logging	Enable packet logging to save a copy of the packets when they match the signature. Packet copies can be analyzed later. Packet logging is not supported on all FortiGate devices. FortiAnalyzer logging or a hard disk are required to support this feature; see the Feature Platform Matrix.
Status	Define the signature status: • *Enable*: Enable the signature. • *Disable*: Disable the signature. • *Default*: Use the default status of the signature. Search for the signature in the *IPS Signature* pane to view the default *Status*.
Rate-based settings	
Default	Use the default rate-based settings.
Specify	Specify the rate-based settings: • *Threshold*: Enter the threshold. See IPS signature rate count threshold on page 2411. • *Duration (seconds)*: Enter the duration in seconds. • *Track By*: Select the tracking method as *Any*, *Source IP*, or *Destination IP*.
Exempt IPs	Add IP addresses that are exempt from the signature rules. Click *Edit IP Exemptions* and click *Create New*. Edit the *Source IP/Netmask* and the *Destination IP/Netmask* to define the IP address for exemption. Click *OK* to add it to *Exempt IPs*.

6. Select one or more signatures from the *IPS Signatures* pane.
7. Click *OK*. The signature is added to the IPS sensor.
8. Click *OK*.

IPS configuration options

Besides configuring an IPS filter or selecting IPS signatures for an IPS sensor, you can configure additional IPS options for each sensor or globally for all sensors. This topic introduces the following available configuration options:

- Malicious URL database for drive-by exploits detection on page 2411
- IPS signature rate count threshold on page 2411
- Botnet C&C on page 2412
- Hardware acceleration for flow-based security profiles (NTurbo and IPSA) on page 2412
- Extended IPS database on page 2413
- IPS engine-count on page 2414
- OT threat definitions on page 2414
- Fail-open on page 2414
- IPS buffer size on page 2415
- Session count accuracy on page 2415

- Protocol decoders on page 2415

To configure IPS sensors, signatures, and filters in the GUI, see Configuring an IPS sensor on page 2407.

Malicious URL database for drive-by exploits detection

This feature uses a local malicious URL database on the FortiGate to assist in detection of drive-by exploits, such as adware that allows automatic downloading of a malicious file when a page loads without the user's detection. The database contains all malicious URLs active in the last one month, and all drive-by exploit URLs active in the last three months. The number of URLs controlled are in the one million range.

This feature can be enabled from an IPS sensor in the GUI by going to *Security Profiles* > *Intrusion Prevention* and editing or creating an IPS Sensor, then enabling *Block malicious URLs*. See Configuring an IPS sensor on page 2407.

To enable the blocking of malicious URLs in the CLI:

```
config ips sensor
    edit <profile>
        set block-malicious-url {enable | disable}
    next
end
```

Blocking malicious URLs is not supported on some FortiGate models, such as FortiGate 51E, 50E, or 30E.

IPS signature rate count threshold

You can use the IPS signature rate-based settings to specify a rate count threshold that must be met before the signature is triggered. A rate count threshold provides a more controlled recording of attack activity. For example, if multiple login attempts produce a failed result over a short period of time, then an alert would be sent and traffic might be blocked, which is a more manageable response than sending an alert every time a login fails.

This can be configured from the GUI by going to *Security Profiles* > *Intrusion Prevention*. Create or edit an IPS sensor. Within the sensor, edit the IPS signatures and filters. Only IPS signatures have the rate-based settings option. IPS filters do not. See Configuring an IPS sensor on page 2407.

Some settings are only available in the CLI.

To configure the IPS signature rate-based settings in the CLI:

```
config ips sensor
    edit <sensor>
        config entries
            edit <filter ID number>
```

```
                set rule <ids>
                set rate-count <integer>
                set rate-duration <integer>
                set rate-mode {continuous | periodical}
                set rate-track {none | src-ip | dest-ip | dhcp-client-mac  | dns-domain}
            next
        end
    next
end
```

`rule <ids>`	The predefined or custom IPS signatures to add to the sensor.
`rate-count <integer>`	The count of the rate (0 - 65535, default = 0). The rate-count must be configured before the other rate settings can be set.
`rate-duration <integer>`	Duration of the rate, in seconds (0 - 65535, default = 60)
`rate-mode {continuous | periodical}`	How the count threshold is met. • `continuous`: If the action is set to block, the action is engaged as soon as the rate-count is reached. For example, if the count is 10, the traffic would be blocked as soon as the signature is triggered 10 times. This is the default. • `periodical`: The FortiGate allows up to the value of the rate-count incidents where the signature is triggered during the rate-duration. For example, if the rate count is 100 and the duration is 60, the signature would need to be triggered 100 times in 60 seconds for the action to be engaged.
`rate-track {none | src-ip | dest-ip | dhcp-client-mac | dns-domain}`	Track one of the protocol fields within the packet (default = none).

Botnet C&C

See IPS with botnet C&C IP blocking on page 2426 for information on configuring settings in the CLI.

Hardware acceleration for flow-based security profiles (NTurbo and IPSA)

Some FortiGate models support a feature call NTurbo that can offload flow-based firewall sessions to network processors. See also NTurbo offloads flow-based processing in the Hardware Acceleration Guide. For IPSA enhanced pattern matching, see IPSA offloads flow-based advanced pattern matching in the Hardware Acceleration Guide.

Some FortiGate models also support offloading enhanced pattern matching for flow-based security profiles to CP8 or CP9 content processors.

To configure NTurbo and IPSA:

```
config ips global
    set np-accel-mode {none | basic}
    set cp-accel-mode {none | basic | advanced}
end
```

If the `np-accel-mode` option is available, your FortiGate supports NTurbo. The `none` option disables NTurbo, and `basic` (the default) enables NTurbo.

If the `cp-accel-mode` option is available, your FortiGate supports IPSA. The `none` option disables IPSA, and `basic` enables basic IPSA, and `advanced` enables enhanced IPSA, which can offload more types of pattern matching than basic IPSA. The `advanced` option is only available on FortiGate models with two or more CP8 processors, or one or more CP9 processors.

Starting in 7.6.5, memory usage for FortiGate models with 2 GB or 4 GB of RAM is optimized by:

- Reducing the memory reserved for Network Processors (NPs)
- Setting NTurbo max frame size to 1500. Interfaces with higher MTU will not offload to NTurbo.

Extended IPS database

Some models have access to an extended IPS Database. Because the extended database may affect FortiGate performance, the extended database package may be disabled by default on some models, such as entry-level models.

You can only enable the extended IPS database by using the CLI.

To enable the extended IPS database:

```
config ips global
    set database extended
end
```

FortiGate models with the CP9 SPU receive the IPS full extended database, and the other physical FortiGate models receive a slim version of the extended database. The slim-extended DB is a smaller version of the full extended DB that contains top active IPS signatures. It is designed for customers who prefer performance.

Customers with non-CP9 SPU models need to upgrade to a CP9 SPU model (physical FortiGate) in order to get full IPS signature coverage. All FortiGate models 200 (E and F) and higher have a CP9 SPU.

See Determining the content processor in your FortiGate unit in the FortiOS Hardware Acceleration Guide to check if your device has a CP9 SPU.

FortiGate VMs with eight or more vCPUs can be configured to have a minimum of eight cores to be eligible to run the full extended database. Any FortiGate VM with less than eight cores will receive a slim version of the extended database.

IPS engine-count

FortiGate units with multiple processors can run one or more IPS engine concurrently. The `engine-count` CLI command allows you to specify how many IPS engines to use at the same time.

To specify the number of concurrent IPS engines running:

```
config ips global
    set engine-count <int>
end
```

The recommended and default setting is `0`, which allows the FortiGate unit to determine the optimum number of IPS engines.

OT threat definitions

Operational Technology (OT) threat definitions are defined to protect Industrial Control Systems (ICS), Operational Technology (OT) and SCADA systems, which are critical infrastructure used by manufacturing industries. An OT Security Service license is required to use this signature database. These signatures are excluded by default, but can be configured in the CLI.

Enabling the OT threat definitions may impact IPS performance, since this increases the number of signatures to scan. To optimize IPS performance, enable only IPS signature packages that are needed.

To configure OT signatures:

```
config ips global
    set exclude-signatures {none | ot}
end
```

Fail-open

A fail-open scenario is triggered when IPS raw socket buffer is full. Therefore IPS engine has no space in memory to create more sessions and needs to decide whether to drop the sessions or bypass the sessions without inspection.

To enable fail-open mode:

```
config ips global
    set fail-open {enable | disable}
end
```

The default setting is `disable`, so sessions are dropped by IPS engine when the system enters fail-open mode.

When enabled, the IPS engine fails open, and it affects all protocols inspected by FortiOS IPS protocol decoders, including but not limited to HTTP, HTTPS, FTP, SMTP, POP3, IMAP, and so on. When the IPS engine fails open, traffic continues to flow without IPS scanning.

Sessions offloaded to Nturbo do not support fail-open. When Nturbo data path is overloaded, traffic is dropped regardless of fail-open setting.

IPS buffer size

If system enters fail-open mode frequently, it is possible to increase the IPS socket buffer size to allow more data buffering, which reduces the chances of overloading the IPS engine. You can set the size of the IPS buffer.

To set the socket buffer size:

```
config ips global
    set socket-size <int>
end
```

The default socket size and maximum configurable value varies by model. In short, socket-size determines how much data the kernel passes to the IPS engine each time the engine samples packets.

Take caution when modifying the default value. If the socket-size is too large, the higher memory used by the IPS engine may cause the system to enter conserve mode more frequently. If set too low, the system may enter IPS fail-open mode too frequently.

Session count accuracy

The IPS engine can track the number of open session in two ways. An accurate count uses more resources than a less accurate heuristic count.

To configure the IPS open session count mode:

```
config ips global
    set session-limit-mode {accurate | heuristic}
end
```

The default is `heuristic`.

Protocol decoders

The FortiGate Intrusion Prevention system uses protocol decoders to identify the abnormal traffic patterns that do not meet the protocol requirements and standards. For example, the HTTP decoder monitors traffic to identify any HTTP packets that do not meet the HTTP protocol standards.

To change the ports a decoder examines, you must use the CLI.

To configure protocol decoder ports:

```
config ips decoder dns_decoder
    config parameter "port_list"
        set value "100,200,300"
    end
end
```

In this example, the ports examined by the DNS decoder were changed from the default 53 to 100, 200, and 300.

You cannot assign specific ports to decoders that are set to *auto* by default. These decoders can detect their traffic on any port. Specifying individual ports is not necessary.

SCTP filtering capabilities

A Stream Control Transmission Protocol (SCTP) dissector and Payload Protocol Identifier (PPID) filter can be used to either terminate the SCTP session, or replace the offending data chunk with zeros to keep the client and server sequence numbers synchronized. The SCTP filter action can also pass the data chunk.

To configure and test an SCTP filter:

1. Configure an SCTP filter profile that uses the reset action:

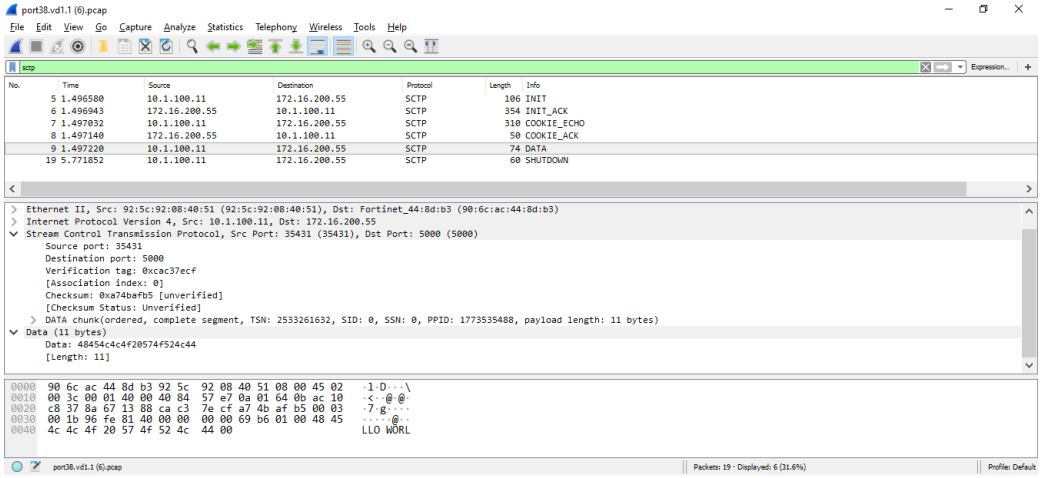
```
config sctp-filter profile
    edit "sctp"
        set comment "Demo profile"
        config ppid-filters
            edit 1
                set ppid 112233
                set action reset
                set comment "test chunk"
            next
        end
    next
end
```

2. Use the SCTP filter profile in a firewall policy:

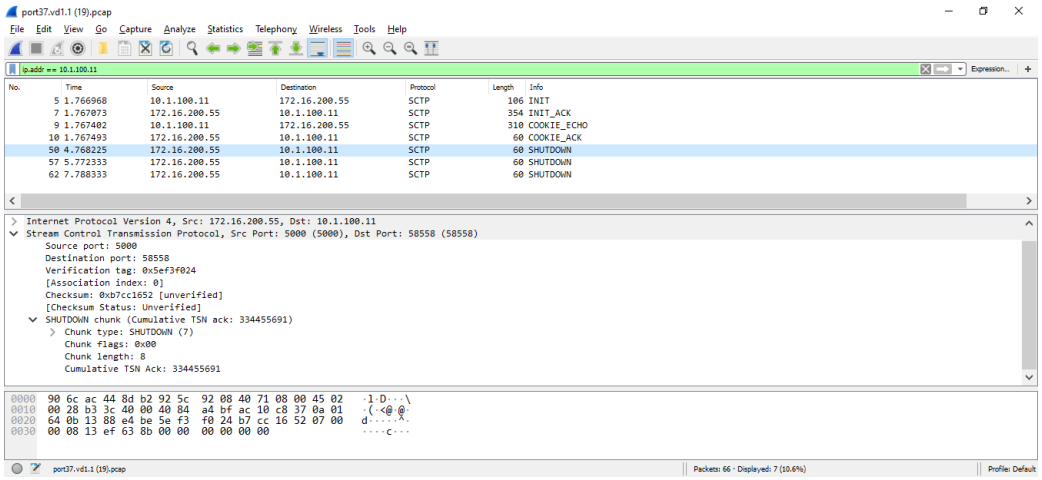
```
config firewall policy
    edit 1
        set name "1"
        set srcintf "port38"
        set dstintf "port37"
        set srcaddr "all"
        set dstaddr "all"
```

```
        set action accept
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set ssl-ssh-profile "new-deep-inspection"
        set sctp-filter-profile "sctp"
        set logtraffic all
    next
end
```

3. On the SCTP client, confirm that the connection works and send a data chunk with PPID 112233.



4. The IPS engine detects the data chunk. The PPID matches the PPID filter, and the filter action is reset, so the data chunk is not received on the server, and the session is terminated.

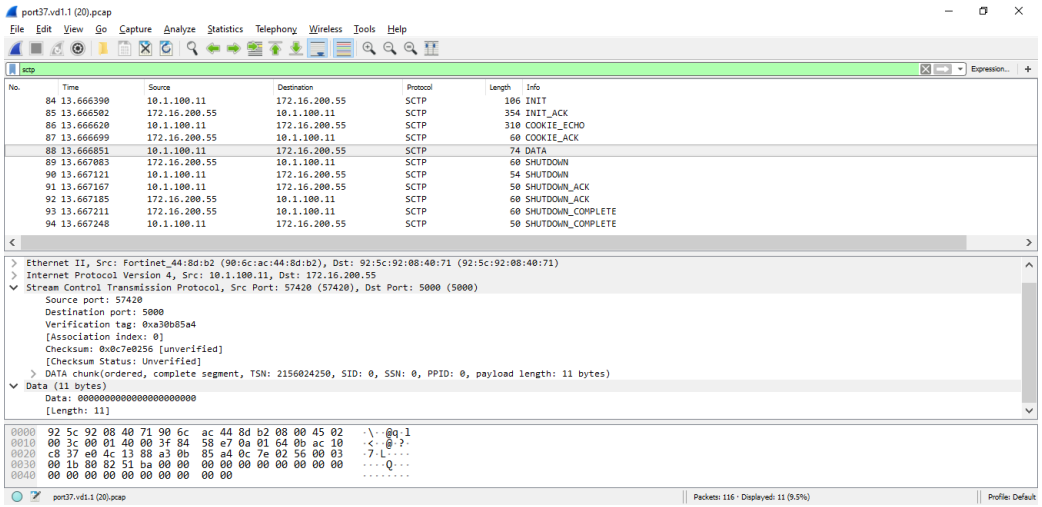


5. Change the filter action to replace:

```
config sctp-filter profile
    edit "sctp"
        config ppid-filters
            edit 1
                set action replace
            next
```

```
        end
    next
end
```

6. Resend the data chunk.
7. The IPS engine detects the data chunk. The PPID matches the PPID filter, and the filter action is replace, so the data chunk is replaced with zeros.



Diameter protocol inspection

Diameter protocol inspection is supported on the FortiGate, which offers the following capabilities.

- Diameter-based packet forwarding and routing: the FortiGate can forward and route Diameter packets that match a firewall policy with an enabled and assigned `diameter-filter profile`. These diameter packets traverse over SCTP or TCP on the reserved port 3868.
- Packet sanity checking: this feature checks if the packet passing through the FortiGate conforms to the Diameter protocol standards as defined in RFC 3588.
  - This includes checking the release version field, error command flags, message length, reserved command flag bits, command code, and tracking the request and answer of the Diameter-based packets.
- Logging: for network auditing purposes, the traffic for both dropped and forwarded Diameter-based packets of the supported commands can be logged. By default, these are disabled.

Diameter protocol is particularly important on interfaces that are used to exchange information with roaming partners, through the Internetwork Packet Exchange (IPX) network.

This feature requires a valid IPS license.

```
config diameter-filter profile
    edit <name>
        set monitor-all-messages {enable | disable}
        set log-packet {enable | disable}
```

```
        set track-requests-answers {enable | disable}
        set missing-request-action {allow | block | reset | monitor}
        set protocol-version-invalid {allow | block | reset | monitor}
        set message-length-invalid {allow | block | reset | monitor}
        set request-error-flag-set {allow | block | reset | monitor}
        set cmd-flags-reserve-set {allow | block | reset | monitor}
        set command-code-invalid {allow | block | reset | monitor}
        set command-code-range <min-max>
    next
end
```

Command	Description
`monitor-all-messages {enable | disable}`	Enable/disable logging for all User-Name and Result-Code AVP messages.
`log-packet {enable | disable}`	Enable/disable packet log for triggered Diameter settings.
`track-requests-answers {enable | disable}`	Enable/disable validation that each answer has a corresponding request.
`missing-request-action {allow | block | reset | monitor}`	Set the action to be taken for answers without a corresponding request. • `allow`: allow or pass matching traffic. • `block`: block or drop matching traffic. • `reset`: reset sessions for matching traffic. • `monitor`: allow and log matching traffic.
`protocol-version-invalid {allow | block | reset | monitor}`	Set the action to be taken for an invalid protocol version. • `allow`: allow or pass matching traffic. • `block`: block or drop matching traffic. • `reset`: reset sessions for matching traffic. • `monitor`: allow and log matching traffic.
`message-length-invalid {allow | block | reset | monitor}`	Set the action to be taken for an invalid message length. • `allow`: allow or pass matching traffic. • `block`: block or drop matching traffic. • `reset`: reset sessions for matching traffic. • `monitor`: allow and log matching traffic.
`request-error-flag-set {allow | block | reset | monitor}`	Set the action to be taken for request messages with an error flag set. • `allow`: allow or pass matching traffic. • `block`: block or drop matching traffic. • `reset`: reset sessions for matching traffic. • `monitor`: allow and log matching traffic.
`cmd-flags-reserve-set {allow | block | reset | monitor}`	Set the action to be taken for messages with a command flag reserve bits set. • `allow`: allow or pass matching traffic. • `block`: block or drop matching traffic. • `reset`: reset sessions for matching traffic.

Command	Description
	• `monitor`: allow and log matching traffic.
`command-code-invalid {allow | block | reset | monitor}`	Set the action to be taken for messages with an invalid command code. • `allow`: allow or pass matching traffic. • `block`: block or drop matching traffic. • `reset`: reset sessions for matching traffic. • `monitor`: allow and log matching traffic.
`command-code-range <min-max>`	Set the valid range for command codes (min = 0, max = 16777215, default = 256-16777213).

To configure Diameter protocol inspection:

1. Configure the Diameter filter profile:

```
config diameter-filter profile
    edit "diameter_profile"
        set monitor-all-messages disable
        set log-packet enable
        set track-requests-answers enable
        set missing-request-action block
        set protocol-version-invalid block
        set message-length-invalid block
        set request-error-flag-set block
        set cmd-flags-reserve-set block
        set command-code-invalid block
        set command-code-range 256-1677213
    next
end
```

2. Apply the Diameter filter to a firewall policy:

```
config firewall policy
    edit 1
        set srcintf "port1"
        set dstintf "port3"
        set action accept
        set srcaddr "all"
        set dstaddr "all"
        set srcaddr6 "all"
        set dstaddr6 "all"
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set ssl-ssh-profile "deep-inspection"
        set diameter-filter-profile "diameter_profile"
        set logtraffic all
        set auto-asic-offload disable
    next
end
```

NTurbo does not fully support SCTP, so if the configuration includes Diameter-over-SCTP, the `auto-asic-offload` setting should be disabled in the firewall policy. Otherwise, IPS does not get the full session packets.

Sample logs

No matching request:

```

IPS signature filter options

IPS signature filter options include hold time, CVE pattern, and IPS sensor attributes.

Hold time

The hold time option allows you to set the amount of time that signatures are held after a FortiGuard IPS signature update per VDOM. During the holding period, the signature's mode is monitor. The new signatures are enabled after the hold time to avoid false positives.

The hold time can be from 0 days and 0 hours (default) up to 21 days, in the format ##d##h.

To configure the amount of time to hold and monitor IPS signatures:

```
config system ips
    set signature-hold-time 3d12h
    set override-signature-hold-by-id enable
end
```

When a signature that is on hold is matched, the log will include the message `signature is on hold`:

```
date=2010-07-06 time=00:00:57 logid="0419016384" type="utm" subtype="ips" eventtype="signature"
level="alert" vd="vd1" eventtime=1278399657778481842 tz="-0700" severity="info" srcip=10.1.100.22
srccountry="Reserved" dstip=172.16.200.55 srcintf="port13" srcintfrole="undefined"
dstintf="port14" dstintfrole="undefined" sessionid=3620 action="detected" proto=6 service="HTTP"
policyid=1 attack="Eicar.Virus.Test.File" srcport=52170 dstport=80 hostname="172.16.200.55"
url="/virus/eicar" direction="incoming" attackid=29844 profile="test"
ref="http://www.fortinet.com/ids/VID29844" incidentserialno=25165825 msg="file_transfer:
Eicar.Virus.Test.File, (signature is on hold)"
```

To view signatures being held by rule ID 29844 on the VDOM:

```
# diagnose ips signature on-hold vd1 29844
Rule: 29844, attack_id: 58886, last updated: 20170411
Rule: 29844, attack_id: 59517, last updated: 20170411
Rule: 29844, attack_id: 60105, last updated: 20170411
...
```

To view all help signatures on the VDOM:

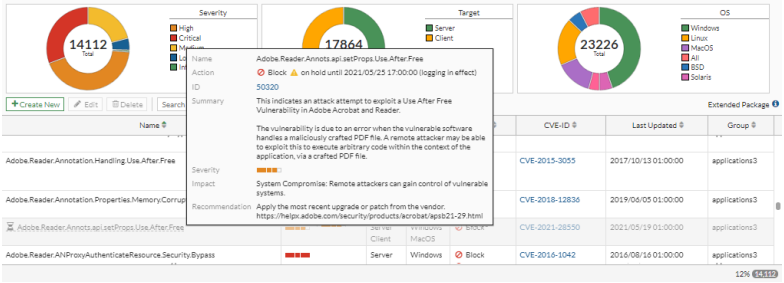
```
# diagnose ips signature on-hold vd1
Rule: 17541, attack_id: 20899, last updated: 20140423
Rule: 17557, attack_id: 20934, last updated: 20140423
Rule: 17559, attack_id: 20932, last updated: 20140423
Rule: 17560, attack_id: 20933, last updated: 20140423
Rule: 17562, attack_id: 20928, last updated: 20170908
Rule: 17677, attack_id: 21187, last updated: 20171106
Rule: 17713, attack_id: 43756, last updated: 20140424
Rule: 17759, attack_id: 21298, last updated: 20140423
...
```

When diagnosing IPS signatures in the CLI, the `Rule` field corresponds to the `attackid` log field, the *ID* in the FortiGate GUI, as well as the IPS entry ID in the FortiGuard IPS encyclopedia.

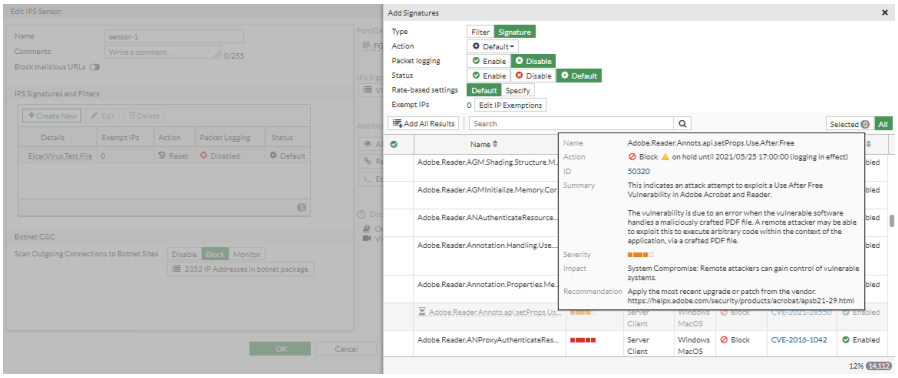
Viewing on hold information in the GUI

On hold signatures are grayed out in the GUI with an hourglass icon beside the signature name. A tooltip displays the on hold expiry time and other details.

On the *Security Profiles* > *IPS Signatures* page, for example, the *Adobe.Reader.Annots.api.setProps.Use.After.Free* signature is on hold. Hover over the grayed-out entry to view the tooltip, which includes the action and hold time expiry. On this page, all on hold signatures are displayed as on hold regardless of whether `override-signature-hold-by-id` is enabled.



The same tooltip is available on the *Edit IPS Sensor* (*Security Profiles* > *Intrusion Prevention*) page when creating or editing the IPS signatures. In the *Add Signatures* pane when the *Type* is *Signature*, signatures on hold are only displayed as on hold if `override-signature-hold-by-id` is enabled.



You can still use on hold signatures in an IPS sensor profile; however, the profile will not block matching traffic. It will monitor it instead (logging in effect) until the on hold time expires.

CVE pattern

The CVE pattern option allows you to filter IPS signatures based on CVE IDs or with a CVE wildcard, ensuring that any signatures tagged with that CVE are automatically included.

To configure CVE patterns for CVE-2010-0177 and all CVE-2017 CVEs:

```
config ips sensor
    edit "cve"
        set comment "cve"
        config entries
            edit 1
                set cve "cve-2010-0177"
                set status enable
                set log-packet enable
                set action block
            next
            edit 2
                set cve "cve-2017"
                set action reset
```

```
            next
        end
    next
end
```

For example, the CVE of the IPS signature *Mozilla.Firefox.PluginArray.NsMimeType.Code.Execution* is CVE-2010-0177. This matches the CVE filter in the IPS sensor, so traffic is blocked and logged:

```
date=2020-07-13 time=15:44:56 logid="0419016384" type="utm" subtype="ips" eventtype="signature"
level="alert" vd="vd1" eventtime=1594593896666145871 tz="-0700" severity="critical"
srcip=10.1.100.22 srccountry="Reserved" dstip=172.16.200.55 srcintf="port2"
srcintfrole="undefined" dstintf="port1" dstintfrole="undefined" sessionid=1638 action="dropped"
proto=6 service="HTTPS" policyid=1 attack="Mozilla.Firefox.PluginArray.NsMimeType.Code.Execution"
srcport=58298 dstport=443 hostname="172.16.200.55" url="/Mozilla" direction="incoming"

incidentserialno=124780667 msg="web_client:
Mozilla.Firefox.PluginArray.NsMimeType.Code.Execution," crscore=50 craction=4096
crlevel="critical"
```

IPS sensor attributes

When configuring IPS sensor profiles, IPS signatures can be filtered based on the attributes: default status, default action, vulnerability type, and the last update date. When monitoring the specific, filtered signatures, logs are not generated for other, irrelevant signatures.

This avoids generating a lot of false positives due to many signatures having the pass action, which is never logged.

To configure filters in an IPS sensor profile:

```
config ips sensor
    edit "test_default"
        config entries
            edit 1
                set default-action pass
                set default-status enable
                set vuln-type 12
                set last-modified before 2020/02/02
            next
        end
    next
end
```

`default-action {pass | block | all}`	Filter by signatures' default actions (default = all).
`default-status {enable | disable | all}`	Filter by signatures' default statuses (default = all).
`vuln-type <integer> ... <integer>`	Filter by signatures' vulnerability types.

`last-modified {before | after | between} <date> [end-date]`	Filter by signatures' last modified date (default = before 00/00/00). The date format is `yyyy/mm/dd`. The year range is 2001 - 2050.

When the IPS profile is used in a firewall profile and then the EICAR virus test file signature is triggered, the signature matches the values set in the filter and logs are generated:

```
1:date=2022-02-15 time=14:07:03 eventtime=1644962823303491048 tz="-0800" logid="0419016384"

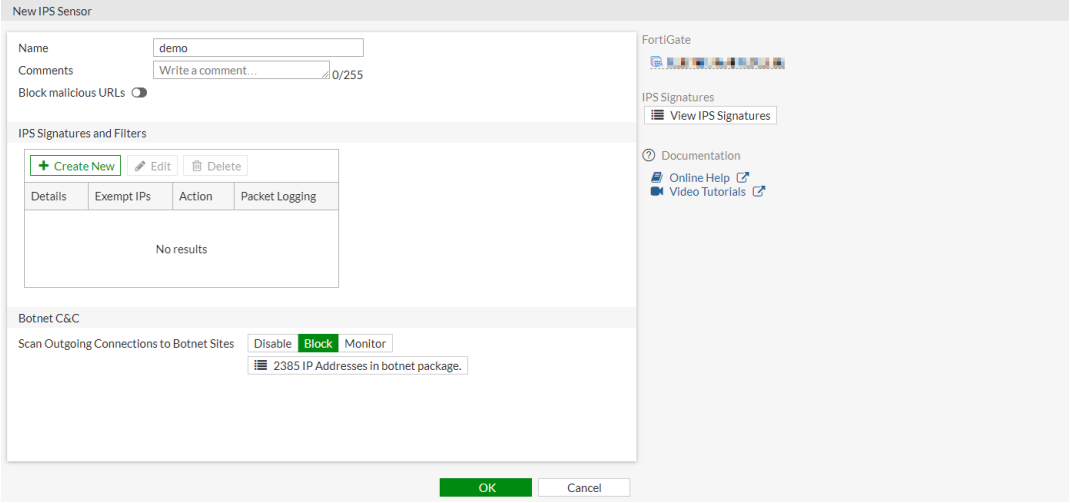
IPS with botnet C&C IP blocking

The *Botnet C&C* section consolidates multiple botnet options in the IPS profile. This allows you to enable botnet blocking across all traffic that matches the policy by configuring one setting in the GUI, or by the `scan-botnet-connections` option in the CLI.

To configure botnet C&C IP blocking in the GUI:

1. Go to *Security Profiles* > *Intrusion Prevention*, and click *Create New* to create a new IPS sensor, or double-click an existing IPS sensor to open it for editing.
2. Navigate to the *Botnet C&C* section.
3. For *Scan Outgoing Connections to Botnet Sites*, select *Block* or *Monitor*.



4. Configure the other settings as needed.
5. Click *OK* to save the IPS sensor.
6. Add the IPS sensor to a firewall policy.

   The IPS engine will scan outgoing connections to botnet sites. If you access a botnet IP address, an IPS log is generated for this attack.
7. Go to *Log & Report* > *Security Events* and click the *Intrusion Prevention* card to view the log.

To configure botnet C&C IP blocking in the CLI:

```
config ips sensor
    edit "Demo"
        set scan-botnet-connections {disable | block | monitor}
    next
end
```

The `scan-botnet-connections` option is no longer available in the following CLI commands:

- `config firewall policy`
- `config firewall interface-policy`
- `config firewall proxy-policy`
- `config firewall sniffer`

Sample log

```
# execute log filter category 4
# execute log display
1 logs found.
1 logs returned.

1: date=2022-04-28 time=16:18:34 eventtime=1651187914585406621 tz="-0700" logid="0422016400"

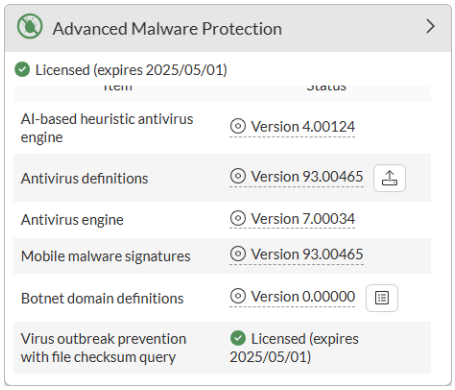
crscore=50 craction=4 crlevel="critical"
```

Botnet IPs and domains lists

To view botnet IPs and domains lists:

1. Go to *System* > *FortiGuard*.
2. Go to the *Subscriptions* > *Licensed* tab.
3. Expand *Advanced Malware Protection* to view *Botnet domain definitions* information.

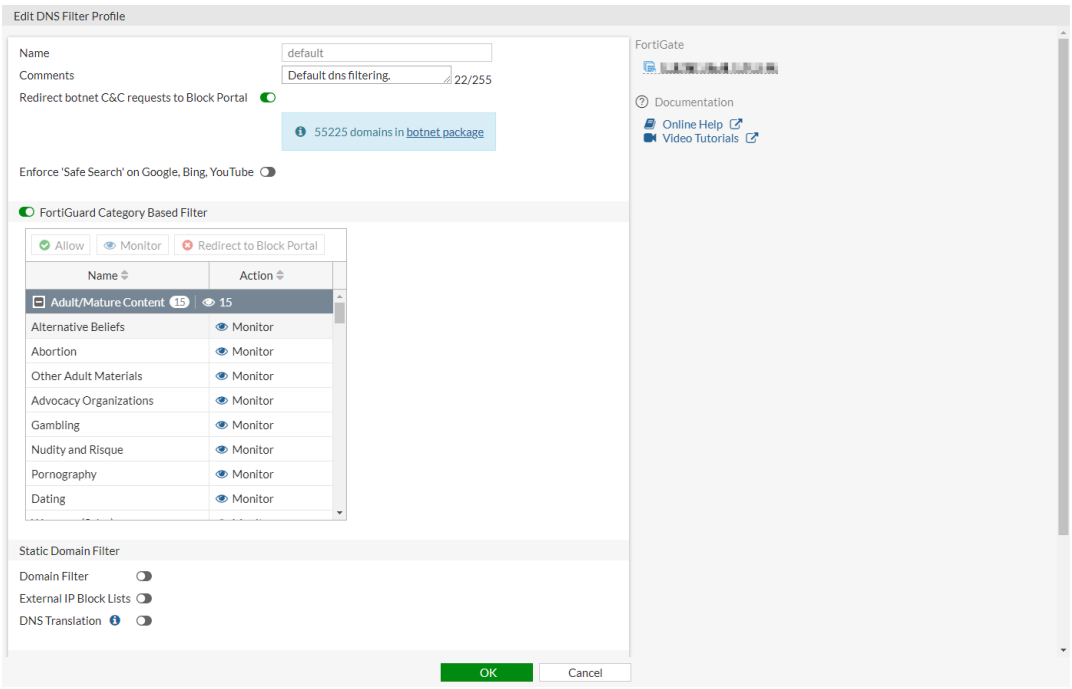


4. Click the action.

Botnet C&C domain blocking

To block connections to botnet domains:

1. Go to *Security Profiles* > *DNS Filter*, and click *Create New*, or double-click an existing filter to open it for editing.
2. Enable *Redirect botnet C&C requests to Block Portal*.

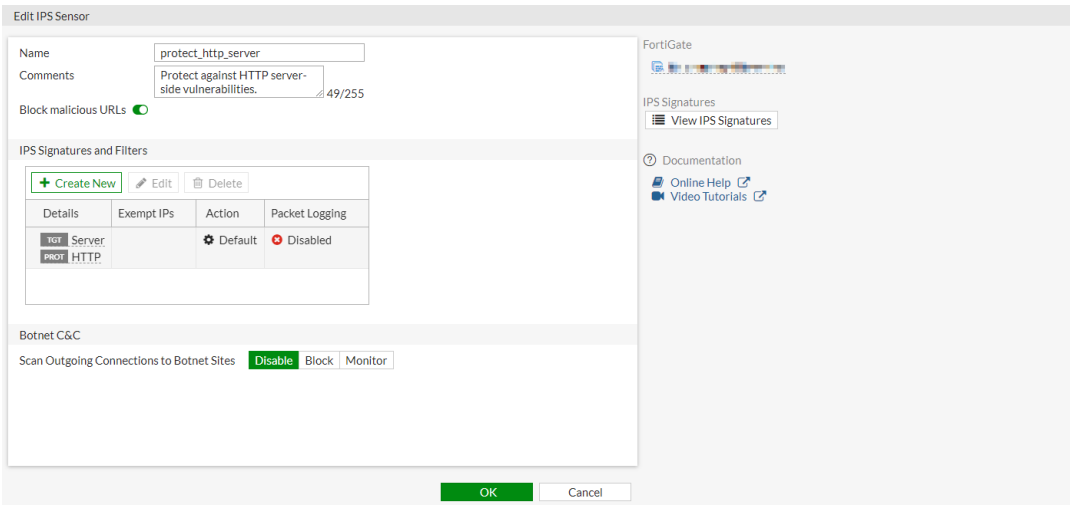


3. Configure the other settings as needed.
4. Click *OK*.
5. Add the filter profile to a firewall policy.

Botnet C&C URL blocking

To block malicious URLs:

1. Go to *Security Profiles* > *Intrusion Prevention*, and click *Create New*, or double-click an existing filter to open it for editing.
2. Enable *Block malicious URLs*.



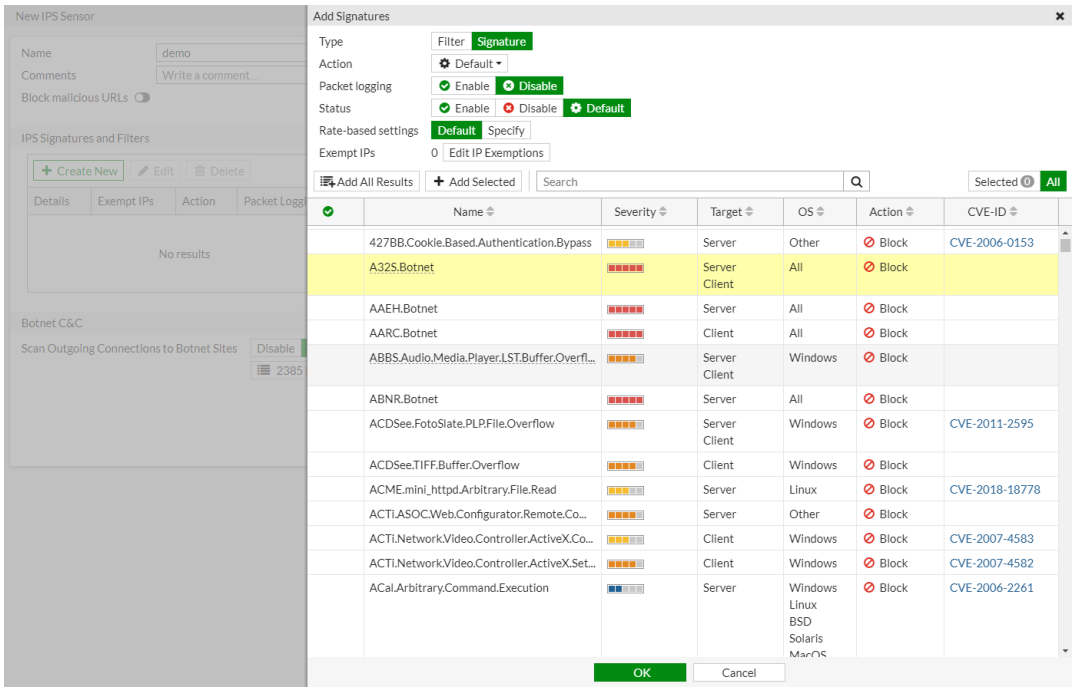
3. Configure the other settings as needed.
4. Click *OK*.

5. Add the sensor to a firewall policy.

Botnet C&C signature blocking

To add IPS signatures to a sensor:

1. Go to *Security Profiles* > *Intrusion Prevention*, and click *Create New*, or double-click an existing sensor to open it for editing.
2. In the *IPS Signatures and Filters* section, click *Create New*. A list of available signatures appears.
3. For *Type*, select *Signature*. Select the signatures you want to include from the list.
4. Configure the other settings as needed.
5. Click *Add Selected*.



6. Click *OK* to add the IPS signatures to the IPS sensor.
7. Click *OK* to save the IPS sensor.
8. Add the sensor to a firewall policy to detect or block attacks that match the IPS signatures.

IPS signatures for the operational technology security service

The FortiGuard Operational Technology (OT) includes both application control and intrusion prevention signatures for industrial applications and protocols. The OT attack definitions are only updated if the FortiGate has a valid OT Security Services license and an IPS security profile is used in a policy.

By default, OT signatures are excluded from the signature lists in the GUI.

To verify that the FortiGate has a valid OT Security Service license:

1. Go to *System* > *FortiGuard* > *Subscriptions* tab.
2. In the *Licensed* content, check the license status of *Operational Technology (OT) Security Service*.
3. Expand the *Operational Technology (OT) Security Service* entry to see the current versions.

To force the industrial DB attack definitions to update:

1. Optionally, create an IPS profile:
   a. Go to *Security Profiles* > *Intrusion Prevention* and click *Create New*.
   b. Enter a name for the profile.
   c. In the *IPS Signatures and Filters* table click *Create New*.
   d. Click *OK*.
   e. Click *OK*.
   See Intrusion prevention on page 2402 for more information.
2. Use the IPS profile in a policy:
   a. Go to *Policy & Objects* > *Firewall Policy*.
   b. Edit an existing policy, or click *Create New* to create a new policy.
   c. Under *Security Profiles*, enable *IPS* and select an IPS profile.
   d. Configure the remaining settings as needed, then click *OK*.
3. Go to *System* > *FortiGuard* and either click *Update Licenses & Definitions Now*, or wait for the next automatic update. The update could take a few minutes.
4. Refresh the page, then check the *Operational Technology (OT) Security Service* versions to confirm that they have been updated.

To make OT IPS and application control signatures available in the GUI:

```
config ips global
    set exclude-signatures none
end
```

To view the signatures in the GUI:

1. Go to *Security Profiles* > *Application Signatures* and to find signatures that identify OT protocols.
2. Go to *Security Profiles* > *IPS Signatures* to find signatures that detect networks attacks that target OT assets.

To see the entire list of OT IPS Rules and OT Application Control rules, go to the following links:

- https://www.fortiguard.com/encyclopedia?type=otips
- https://www.fortiguard.com/encyclopedia?type=otapp

To see the list of Industrial Application Control signatures, go to the following link:

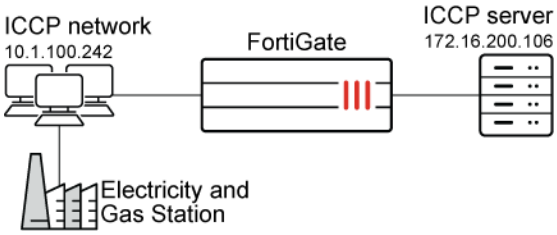
- https://www.fortiguard.com/appcontrol?category=Industrial

IPS sensor for IEC 61850 MMS protocol

IEC 61850 is a SCADA protocol whose services are mapped to a number of protocols, including MMS services. MMS/ICCP detection is supported in IPS. The purpose of the MMS dissectors is to identify every IEC 61850 service to distinguish different MMS/ICCP messages. IPS engine 6.0.12 and later support MMS dissectors.

The following scenarios are also supported:

- Multiple MMS PDUs are transferred in one TCP payload, and the IPS engine identifies individuals.
- An MMS message is split over multiple TCP segments, where MMS runs over COTP segments.
- ICCP/TASE.2 that also uses MMS transport (ISO transport over TCP for ICCP) is detected.



OT signatures must be enabled in the global IPS settings to receive MMS/ICCP signatures. By default, OT signatures are excluded.

```
config ips global
    set exclude-signatures {none | ot}
end
```

Below are some OT signatures for MMS/ICCP messages that can be detected by the IPS engine. This is not an exhaustive list.

- MMS_GetNameList.Request
- MMS_GetNamedVariableListAttributes.Request
- MMS_GetVariableAccessAttributes.Request
- MMS_Identify.Request
- MMS_Initiate.Request
- MMS_Read.Request
- MMS_Reset.Request
- ICCP_Transfer.Reporting
- ICCP_Create.Dataset
- ICCP_Abort
- ICCP_Start.Transfer.DSTransferSet
- ICCP_Get.Dataset.Element.Values

Diagnose command

The COTP dissector adds support for identifying every MMS PDU, and let the IPS engine separate them, like the Modbus and IEC-104 services for example.

```
# diagnose ips debug enable all
# diagnose debug enable
[284@78]ips_l7_dsct_processor: serial=8142 create: cotp
[284@78]ips_l7_dsct_processor: serial=8142 create: iec104
[284@78]ips_l7_dsct_processor: serial=8142 create: modbus
```

Log samples

MMS dissectors can be triggered, and MMS/ICCP signatures can be monitored and logged.

Log samples:

```

IPS Modbus TCP decoder

Modbus TCP is a protocol used to facilitate communication between devices in the Operational Technology (OT) environment. By default, it uses TCP/502 port for communication.

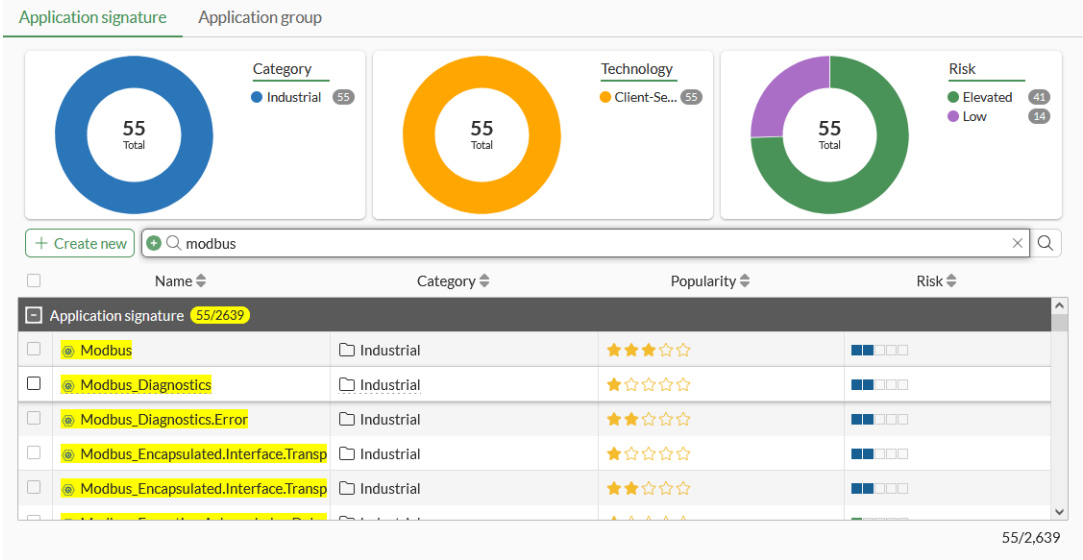
The IPS engine supports the Modbus TCP decoder, allowing it to decode Modbus protocol messages and enable application control signatures for Modbus commands and parameters. See Matching multiple parameters on application control signatures on page 2370 for information about parameter-level application policies.

OT IPS signatures must be enabled in the global IPS settings to receive Modbus signatures for application control and vulnerability protection. OT IPS signatures are part of the FortiGuard OT security service, and are excluded by default.

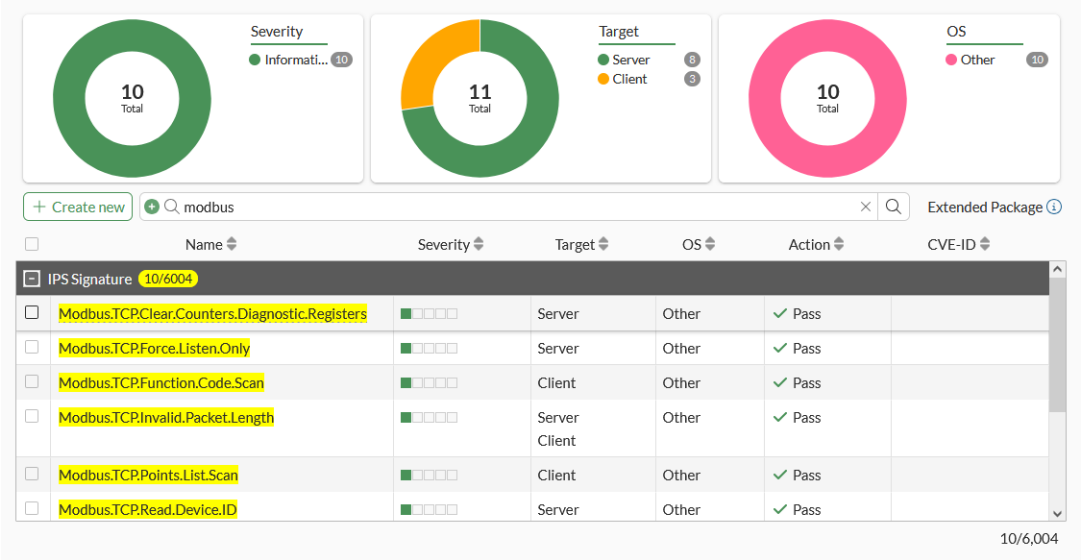
To include OT IPS signatures:

```
config ips global
    set exclude-signatures none
end
```

Modbus application control signatures are listed on *Security Profiles* > *Application Signatures*. Search for *Modbus* to see the Modbus signatures, such as *Modbus_Diagnostics* and *Modbus_Read.Coils*.



Modbus vulnerability protection signatures are listed on *Security Profiles* > *IPS Signatures*. Search for *Modbus* to see the Modbus signatures.



By default, the Modbus decoder listens on TCP/502 port only, but can be configured to listen on additional TCP ports.

To configure the Modbus decoder to listen on additional TCP ports:

```
config ips decoder "modbus_decoder"
    config parameter "port_list"
        set value "502:505"
    end
end
```

AI and ML-based IPS detection

As cyber threats become increasingly sophisticated, traditional signature-based detection is struggling to keep up. To improve it, AI and machine learning-based models are trained on features extracted during protocol decoding, such as HTTP traffic. These models act as classifiers, distinguishing exploits from clean traffic through supervised learning.

Instead of applying machine learning (ML) models blindly across all traffic, we will first use signatures for preliminary filtering, allowing AI-based detection to be more targeted and efficient. This hybrid approach will reduce false positives while maintaining high performance.

CLI syntax

The setting is enabled by default at the IPS global setting level:

```
config ips global
    set machine-learning-detection {enable | disable}
end
```

The `AI/Machine Learning IPS Definitions` package is downloaded by FortiOS from FortiGuard through FortiGuard updates. Devices with active IPS subscription can download this package. The package can be viewing in the `diagnose autoupdate versions` output.

```
# diagnose autoupdate versions | grep -A 7 AI

AI/Machine Learning IPS Definitions
---------
Version: 2503.00100 signed
Contract Expiry Date: Thu Jan  1 2032
Last Updated using manual update on Thu Mar 13 18:01:37 2025
Last Update Attempt: Thu Mar 13 18:01:37 2025
Result: Updates Installed
```

The IPS machine learning database version is displayed in the output of `get system status` command.

```
# get system status

Version: FortiGate-1101E v7.6.3,build3495,250313 (interim)
First GA patch build date: 240724
Security Level: Low
...
```

```
IPS-MLDB: 2503.00100(2025-03-13 03:43)
...
```

The IPS machine learning rules can be displayed in the output of `get ips rule status` command. For example, looking up rule `57293` returns the following:

```
# get ips rule status | grep -B 2 -A 16 57293

rule-name: "Backdoor.Cobalt.Strike"
rule-id: 57293
rev: 0.000
date: 2025-03-12 09:00:00
action: pass
status: enable
log: disable
log-packet: disable
severity: 3.high
service: TCP, HTTP
location: client
os: All
application: All
rate-count: 0
rate-duration: 0
rate-track: none
rate-mode: continuous
```

Example

In the following example, AI and ML-based IPS detection is implemented on a regular firewall policy. As the IPS machine learning detection runs alongside traditional IPS signature detection, the configuration of the IPS sensor remains the same.

To add AI and ML-based IPS detection:

1. Configure an IPS sensor with machine learning signature `Backdoor.Cobalt.Strike` set to `block`:

```
config ips sensor
    edit "MI-test"
        config entries
            edit 1
                set rule 57293
                set status enable
                set action block
            next
        end
    next
end
```

2. Apply the IPS sensory to a firewall policy:

```
config firewall policy
    edit 1
        set name "test"
        set srcintf "port2"
        set dstintf "port1"
        set action accept
        set srcaddr "all"
        set dstaddr "all"
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set ssl-ssh-profile "certificate-inspection"
        set ips-sensor "MI-test"
    next
end
```

3. Generate traffic from the client.
4. Review the IPS event logs:

```
# execute log filter category 4

date=2025-03-14 time=11:46:12 eventtime=1741977972028174920 tz="-0700" logid="0419016384"
type="utm" subtype="ips" eventtype="signature" level="alert" vd="root" severity="high"
srcip=10.1.100.240 srccountry="Reserved" dstip=172.16.200.240 dstcountry="Reserved"
srcintf="port2" srcintfrole="undefined" dstintf="port1" dstintfrole="undefined" sessionid=4012
action="dropped" proto=6 service="HTTP" policyid=1 poluuid="9d827014-00fa-51f0-e5af-

```

To filter the debug logs to only display the bolded results, enter `diagnose ips debug enable ml` instead.

Support Ethernet layer protocols in the IPS engine

The IPS engine has been enhanced to detect industrial Ethernet protocols such as LLDP, GOOSE, EtherCAT, and PROFINET RT. Device detection starts to detect and log the Ethernet devices through the L2 protocol. Additionally, the IPS sensor detects the Ethernet protocol and logs the traffic.

Custom signature rules have been enhanced with three new rule options for `ethertype`, `mac_src`, and `mac_dst`.

The L2 protocol to be detected by the custom signature is specified by the administrator through the Ethertype hexadecimal value for the `ethertype` option.

In Examples 2 and 3 below, the `ethertype` value of `0x88cc` is used to detect LLDP protocol traffic.

The following examples are explored:

- Example 1: Ethernet protocol device detection on the interface on page 2438
- Example 2: Ethernet protocol detection with custom IPS signatures on the interface policy on page 2439
- Example 3: Ethernet protocol detection with custom IPS signatures on the sniffer policy on page 2440

Example 1: Ethernet protocol device detection on the interface

Device detection requires new signatures included in both the IoT Detection package and OT Detection package, which will be available in future FortiGuard updates.

In this example, the IPS engine detects Ethernet devices, such as those using the LLDP protocol, which contains device information.

To apply Ethernet protocol device detection on the interface:

1. Enable device detection and passive gathering of identity information about the host:

```
config system interface
    edit "port15"
        set vdom "root"
        set type physical
        set device-identification enable
        set snmp-index 17
```

```
    next
end
```

2. Apply the interface to the firewall interface policy:

```
config firewall interface-policy
    edit 1
        set interface "port15"
        set srcaddr "all"
        set dstaddr "all"
        set service "ALL"
    next
end
```

3. Generate traffic from the client.
4. Review the application control log for device detection on Ethernet protocol LLDP:

```
# diagnose log filter category 4
# diagnose log display
1: date=2025-03-20 time=18:46:52 eventtime=1742521612517801102 tz="-0700" logid="1059028738"
type="utm" subtype="app-ctrl" eventtype="signature" level="warning" vd="root" ethertype=35020
srcmac="00:0c:29:c6:ae:bf" dstmac="e0:23:ff:83:2d:2d" appid=10008004 srcintf="port15"
srcintfrole="undefined" dstintf="port15" dstintfrole="undefined" policyid=1 poluuid="c5ed61a0-
0445-51f0-1e08-ea9d568326bd" policytype="interface-policy" action="pass" appcat="IoT"
app="LLDP.Device.Test" msg="IoT: LLDP.Device.Test" clouddevice="Vendor=HP, Product=ProCurve
Swtich, Model=ProCurve Swtich 2600-8-PWR, Version=H.08.89" apprisk="low"
```

The `ethertype` field has been added in the device detection log. The `src_mac` and `dst_mac` log fields have been added instead of the source and destination IP addresses. These three new fields are not included for regular application control logs.

Example 2: Ethernet protocol detection with custom IPS signatures on the interface policy

In this example, the IPS sensor is able to detect Ethernet protocols by matching signatures in the NIDS database or by using custom-defined signatures.

To apply Ethernet protocol detection with custom IPS signatures on the interface policy:

1. Create a new custom signature for LLDP protocol with source MAC address and destination MAC address defined:

```
config ips custom
    edit "LLDP-test"
        set signature "F-SBID( --attack_id 6312;  --name \"LLDP-test-mac\"; --default_action
drop;  --ethertype 0x88cc; --mac_src 00:0c:29:c6:ae:bf; --mac_dst e0:23:ff:83:2d:2d; --
severity high; --status disable; )"
    next
end
```

2. Create a new IPS sensor and allow the new custom signatures to pass:

```
config ips sensor
    edit "l2-test"
        config entries
            edit 1
                set rule 6312
                set status enable
                set action pass
            next
        end
    next
end
```

The rule identifies the IPS signatures to add to the sensor.

3. Enable the IPS sensor in a firewall interface policy and apply the new IPS sensor:

```
config firewall interface-policy
    edit 1
        set interface "port15"
        set srcaddr "all"
        set dstaddr "all"
        set service "ALL"
        set ips-sensor-status enable
        set ips-sensor "l2-test"
    next
end
```

4. Generate traffic from the client.
5. Review the IPS sensor log for the Ethernet protocol LLDP custom signature:

```
# diagnose log filter category 4
# diagnose log display
1: date=2025-03-21 time=10:16:03 eventtime=1742577362746522425 tz="-0700" logid="0419016402"
type="utm" subtype="ips" eventtype="signature" level="warning" vd="root" ethertype=35020
srcmac="00:0c:29:c6:ae:bf" dstmac="e0:23:ff:83:2d:2d" srcintf="port15" srcintfrole="undefined"
dstintf="port15" dstintfrole="undefined" policyid=1 poluuid="8fcb4bf0-0675-51f0-fa7a-
9fec94e8115c" policytype="interface-policy" action="dropped" attack="\"LLDP-test\""
attackid=6312 profile="l2-test" incidentserialno=75497498 msg="custom: \"LLDP-test\""
crscore=30 craction=8192 crlevel="high"
```

A new log ID has been created for the L2 detection logs.

The `ethertype` field has been added in the device detection log. The `src_mac` and `dst_mac` log fields have been added instead of the source and destination IP addresses. These new fields are not included in a regular IPS sensor log.

Example 3: Ethernet protocol detection with custom IPS signatures on the sniffer policy

Ethernet protocol detection is supported in sniffer policies. In this example, the software switch with spanning is set for the sniffer detection.

To apply Ethernet protocol detection with custom IPS signatures on the sniffer policy:

1. Create a new software switch with the destination and source ports for spanning configured:

```
config system switch-interface
    edit "test-sw"
        set vdom "root"
        set member "port2" "port15"
        set span enable
        set span-dest-port "port2"
        set span-source-port "port15"
    next
end
```

2. Enable one arm sniffer on the destination interface:

```
config system interface
    edit "port2"
        set vdom "root"
        set ips-sniffer-mode enable
        set type physical
        set snmp-index 4
    next
end
```

3. Create a new custom signature for LLDP protocol with source MAC address and destination MAC address defined:

```
config ips custom
    edit "LLDP-test"
        set signature "F-SBID( --attack_id 6312;  --name \"LLDP-test-mac\"; --default_action
drop;  --ethertype 0x88cc; --mac_src 00:0c:29:c6:ae:bf; --mac_dst 01:80:c2:00:00:0e; --
severity high; --status disable; )"
    next
end
```

4. Configure the IPS sensor:

```
config ips sensor
    edit "g-sniffer-profile"
        set comment "Monitor IPS attacks."
        config entries
            edit 2
                set rule 29844
                set status enable
                set action block
            next
            edit 1
                set rule 6312
                set status enable
                set action pass
            next
        end
```

```
    next
end
```

5. Apply the interface to the firewall sniffer policy:

```
config firewall sniffer
    edit 1
        set non-ip enable
        set interface "port2"
        set ips-sensor-status enable
        set ips-sensor "g-sniffer-profile"
    next
end
```

> Confirm that non-IP address packet sniffing is also enabled. If it is not enabled, L2 traffic will not be detected.

6. Generate Ethernet traffic and mirror it to the designated interface port.
7. Review new log for sniffer policy Ethernet protocol detection:

```
# diagnose log filter category 4
# diagnose log display
1: date=2025-04-14 time=17:28:21 eventtime=1744676901127125507 tz="-0700" logid="0419016402"
type="utm" subtype="ips" eventtype="signature" level="warning" vd="root" ethertype=35020
srcmac="00:0c:29:c6:ae:bf" dstmac="01:80:c2:00:00:0e" srcintf="port2" srcintfrole="undefined"
dstintf="port2" dstintfrole="undefined" policyid=1 poluuid="39650ea6-011e-51f0-c237-
d19ed520eaf1" policytype="sniffer" action="detected" attack="LLDP-test-mac" attackid=6312
profile="g-sniffer-profile" incidentserialno=216006666 msg="custom: LLDP-test-mac" crscore=30
craction=8192 crlevel="high"
```

The Ethernet protocol detection does not support traffic logging; only an IPS log will be generated if the sniffer policy is matched.

File filter

A file filter can be configured to control the flow of different types of files passing through FortiGate. This is done by setting up rules that specify which file types are allowed or blocked. The file filter can be applied directly to firewall policies and supports various traffic protocols in proxy or flow mode. The feature set setting (proxy or flow) in the file filter profile must match the inspection mode setting (proxy or flow) in the associated firewall policy. For example, a flow-based file filter profile must be used with a flow-based firewall policy.

Protocol	Proxy mode	Flow mode
CIFS	Yes	Yes
FTP	Yes	Yes
HTTP	Yes	Yes

Protocol	Proxy mode	Flow mode
IMAP	Yes	Yes
MAPI	Yes	No
POP3	Yes	Yes
SMTP	Yes	Yes
SSH	Yes	No
WEBSOCKET	Yes	Yes

File filtering is based only on the file type (file meta data) and not on file size or content. A DLP dictionary, sensor, and profile would need to be configured to block files based on size or content, such as SSN numbers, credit card numbers, or regular expressions (see Basic DLP settings on page 2530 for more information). See Supported file types on page 2444 for a list of the supported file types.

The following options can be configured in a file filter profile:

GUI option	CLI option	Description
Basic profile settings		
Name	`name <string>`	Enter a unique name for the profile.
Comments	`comment <var-string>`	Enter a comment (optional).
Scan archive contents	`scan-archive-contents {enable | disable}`	Enable to scan archive contents.

Feature set	`feature-set {flow | proxy}`	Select the feature set for the profile. The feature set mode must match the inspection mode used in the associated firewall policy.
		• *Flow-based*
		• *Proxy-based*
		If the *Feature set* option is not visible in the GUI, enter the following in the CLI:
		`config system settings`
		`set gui-proxy-inspection enable`
		`end`

n/a	`log {enable | disable}`	Enable to use file filter logging. This setting is enabled by default.
n/a	`extended-log {enable | disable}`	Enable to use file filter extended logging. This setting is disabled by default.
n/a	`replacemsg-group <string>`	Set a replacement message group.
File filter rule settings		
Name	`name <string>`	Enter a unique name for the rule.

GUI option	CLI option	Description
Comments	`comment <var-string>`	Enter a comment (optional).
Protocols	`protocol {option1}, {option2}, ...`	Set the protocols to apply to the rule. By default, all protocols are configured: CIFS, FTP, HTTP, IMAP, POP3, and SMTP in flow mode. Additionally, MAPI and SSH are configured by default in proxy mode.
Traffic	`direction {incoming | outgoing | any}`	Set the traffic direction: • *Incoming*/`incoming`: match files transmitted in the session's reply direction. • *Outgoing*/`outgoing`: match files transmitted in the session's originating direction. • *Both*/`any`: match files transmitted in the session's originating and reply directions.
Password-protected only	`password-protected {yes | any}`	Enable (`yes`) to match password-protected files. If the setting is not enabled, any file is matched.
File types	`file-type <name1>, <name2>, ...`	Select the file type. See Supported file types on page 2444 for the list of available options.
Action	`action {log-only | block | warning}`	Set the action to take for a matched file: • *Monitor*/`log-only`: allow the content and write a log message. • *Block*/`block`: block the content and write a log message. • *Warning*/`warning`: allow content after warning the user and write a log message. This option is only available when *Feature set* is *Proxy-based*, and only applies to incoming HTTP traffic.

See the following for file filter profile configuration examples:

- Configuring a file filter profile on page 2447
- Configuring a file filter profile with the warning action NEW on page 2451

Supported file types

File filter allows the FortiGate to block files passing through based on file type based on the file's meta data only, and not on file size or file content. A DLP profile must be configured to block files based on size or content, such as SSN numbers, credit card numbers, or regexp.

The following file types are supported in file filter and DLP profiles:

Type	Description
.net	Match .NET files.
7z	Match 7-zip files.
activemime	Match activemime files.
arj	Match arj compressed files.
aspack	Match aspack files.
avi	Match avi files.
base64	Match base64 files.
bat	Match Windows batch files.
binhex	Match binhex files.
bmp	Match bmp files.
bzip	Match bzip files.
bzip2	Match bzip2 files.
c/cpp	Match c/cpp files.
cab	Match Windows cab files.
chm	Match Windows compiled HTML help files.
class	Match class files.
cod	Match cod files.
crx	Match Chrome extension files.
dll	Match dll files.
dmg	Match Apple disk image files.
elf	Match elf files.
exe	Match Windows executable files.
flac	Match flac files.
fsg	Match fsg files.
genscript	Match generic script files.
gif	Match gif files.
gzip	Match gzip files.
hlp	Match Windows help files.
hta	Match hta files.
html	Match html files.

Type	Description
hwp	Match hwp files.
iso	Match ISO archive files.
jad	Match jad files.
javascript	Match javascript files.
jnlp	Match jnlp files. Only supported in proxy inspection mode.
jpeg	Match jpeg files.
lzh	Match lzh compressed files.
lzip	Match lzip files.
mach-o	Match Mach object files.
mime	Match mime files.
mov	Match mov files.
mp3	Match mp3 files.
mpeg	Match mpeg files.
msi	Match Windows Installer msi files.
msoffice	Match legacy MS-Office files. doc, ppt, and xls.
msofficex	Match MS-Office XML files. docm, docx, pptm, pptx, xlsm, and xlsx.
pdf	Match Acrobat PDF files.
petite	Match petite files.
pfile	Match pfile files.
png	Match png files.
python	Match python files.
rar	Match rar archives.
registry	Match registry files.
rm	Match rm files.
rpm	Match rpm files.
shellscript	Match shell script files.
sis	Match sis files.
sylk	Match Microsoft symbolic link files.
tar	Match tar files.
tiff	Match tiff files.

Type	Description
torrent	Match torrent files.
unknown*	Match unknown files
upx	Match upx files.
uue	Match uue files.
wasm	Match WebAssembly files.
wav	Match wav files.
wma	Match wma files.
xar	Match xar archive files.
xz	Match xz files.
zip	Match zip files.

* This file type is only available in DLP profiles.

Configuring a file filter profile

In this example, a flow-based file filter profile is created that has two rules.

- Rule 1: applied to HTTP, FTP, SMTP, IMAP, POP3, and CIFS to monitor any matched .NET, 7-Zip, ActiveMime, ARJ, ASPack, AVI, Base64, Windows batch, BinHex, BMP, Bzip, and Bzip2 files transmitted in the session's originating and reply directions.
- Rule 2: applied to HTTP, FTP, SMTP, IMAP, POP3, and CIFS to block any matched SIS, TAR. TIFF, torrent, UPX, UUE, WAV, WMA. ZAR archive, XZ, and ZIP files transmitted in the session's originating direction.

To configure a file filter in the GUI:

1. Configure the filter profile:
   a. Go to *Security Profiles* > *File Filter* and click *Create New*.
   b. Enter a name.
   c. Set the *Feature set* to *Flow-based*.
   d. In the *Rules* table, click *Create New*.
   e. Configure rule 1 as follows:

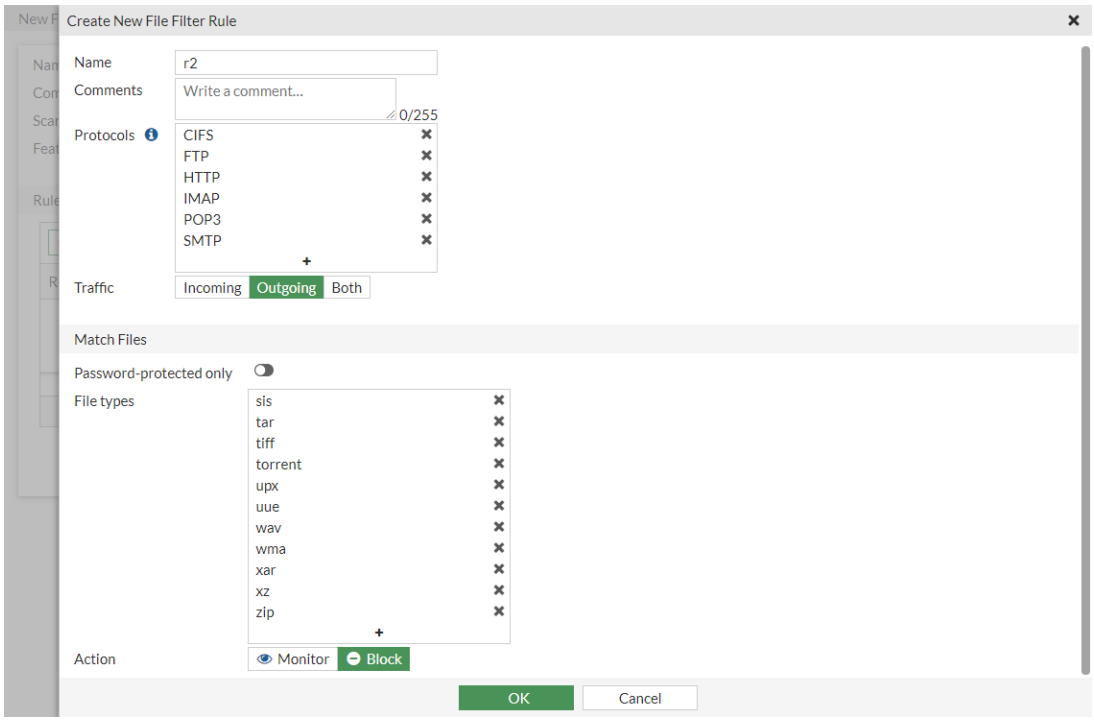
Name	r1
Protocols	HTTP, FTP, SMTP, IMAP, POP3, CIFS
Traffic	Both
Password-protected only	Deselect
File types	.net, 7z, activemime, arj, aspack, avi, base64, bat, binhex, bmp, bzip, bzip2

Action	Monitor

f. Click *OK* to save the rule.

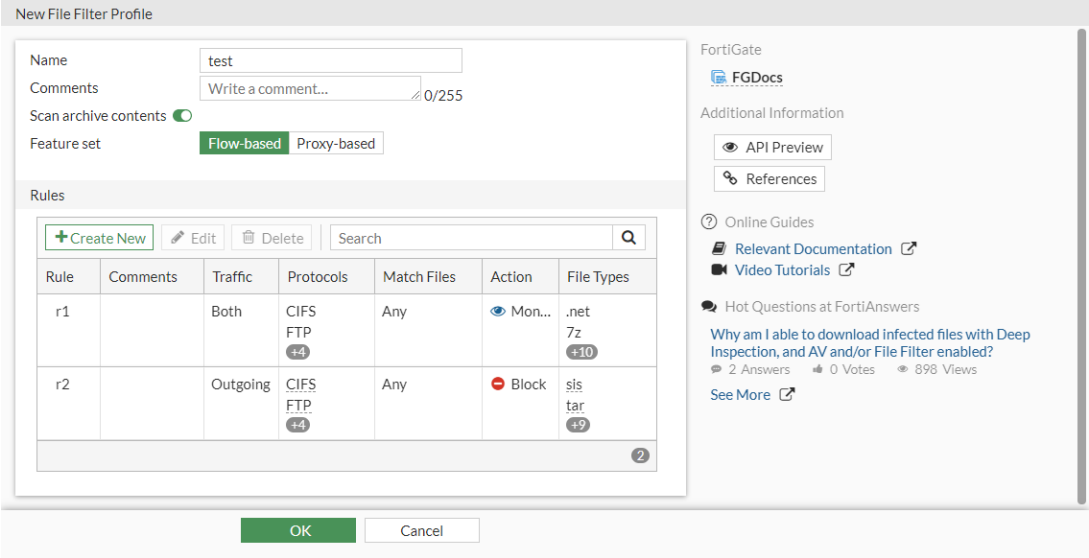
g. In the *Rules* table, click *Create New* and configure rule 2 as follows:

Name	r2
Protocols	HTTP, FTP, SMTP, IMAP, POP3, CIFS
Traffic	Outgoing
Password-protected only	Deselect
File types	sis, tar, tiff, torrent, upx, uue, wav, wma, xar, xz, zip
Action	Block



h. Click *OK* to save the rule.

i. Click *OK* to save the filter profile.



2. Apply the filter to a policy:
   a. Go to *Policy & Objects* > *Firewall Policy* and edit an existing policy or create a new one.
   b. In the *Security Profiles* section, enable *File Filter*.
   c. Select the filter from the dropdown box (*test*).
   d. Configure the other settings as needed.
   e. Click *OK*.

To configure a file filter in the CLI:

1. Configure the file filter profile:

```
config file-filter profile
    edit "test"
        set comment ''
        set feature-set flow
        set replacemsg-group ''
        set log enable
        set scan-archive-contents enable
        config rules
            edit "r1"
                set comment ''
                set protocol http ftp smtp imap pop3 cifs
                set action log-only
                set direction any
                set password-protected any
                set file-type ".net" "7z" "activemime" "arj" "aspack" "avi" "base64" "bat"
"binhex" "bmp" "bzip" "bzip2"
            next
            edit "r2"
                set comment ''
                set protocol http ftp smtp imap pop3 cifs
                set action block
                set direction outgoing
```

```
                set password-protected any
                set file-type "sis" "tar" "tiff" "torrent" "upx" "uue" "wav" "wma" "xar" "xz"
"zip"
            next
        end
    next
end
```

2. Apply the filter to a policy:

```
config firewall policy
    edit 1
        set name "filefilter-policy"
        set srcintf "port10"
        set dstintf "port9"
        set srcaddr "all"
        set dstaddr "all"
        set srcaddr6 "all"
        set dstaddr6 "all"
        set action accept
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set profile-protocol-options "protocol"
        set ssl-ssh-profile "protocols"
        set file-filter-profile "test"
        set auto-asic-offload disable
        set np-acceleration disable
        set nat enable
    next
end
```

To view file filter logs in the GUI:

1. Go to *Log & Report > Security Events*.
2. Select the *File Filter* card.

To view file filter logs in the CLI:

```
# execute log filter category utm-file-filter
# execute log display
```

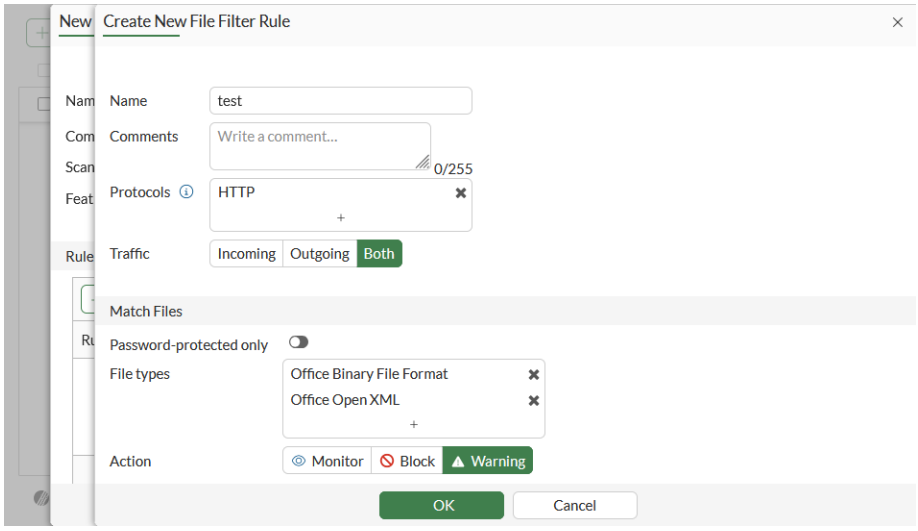
Configuring a file filter profile with the warning action NEW

In this example, a proxy-based file filter profile is created that has one rule. The rule is applied to HTTP traffic to warn about any matched Office Binary File Format or Office Open XML files.

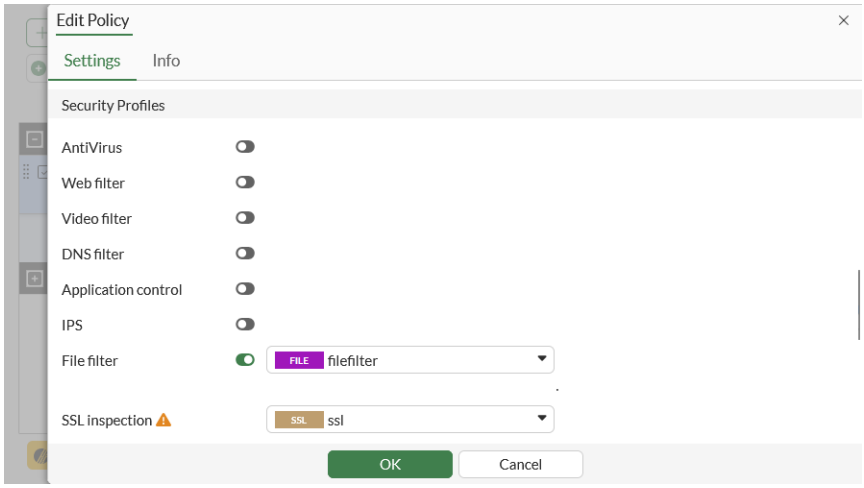
After the user acknowledges the warning, the content is allowed and access is logged. This behavior applies only to incoming HTTP traffic (eg. HTTP GET); outgoing HTTP traffic (eg. HTTP POST) and non-HTTP protocols are log-only, with no warning or blocking when applied to the same profile.

To configure and use a file filter profile with the warning action in the GUI:

1. Go to *Security Profiles* > *File Filter* and click *Create New*.
2. Set *Feature set* to *Proxy-based*.
3. In the *Rules* table, click *Create New*.
4. Set *Action* to *Warning*.
5. Configure the remaining settings as needed, then click *OK*.



6. Configure the remaining filter profile settings as needed, then click *OK*.
7. Go to *Policy & Objects* > *Firewall Policy* and create a new policy or edit an existing one.
8. In the *Security Profiles* section, enable *File filter* and select the file filter profile.



9. Configure the remaining settings as required, then click *OK*.

To configure and use a file filter profile with the warning action in the CLI:

1. Configure a file filter profile with the warning action:

```
config file-filter profile
  edit "filefilter"
        set feature-set proxy
        config rules
            edit "test"
                set protocol http
                set action warning
                set file-type "msoffice" "msofficex"
            next
        end
    next
end
```

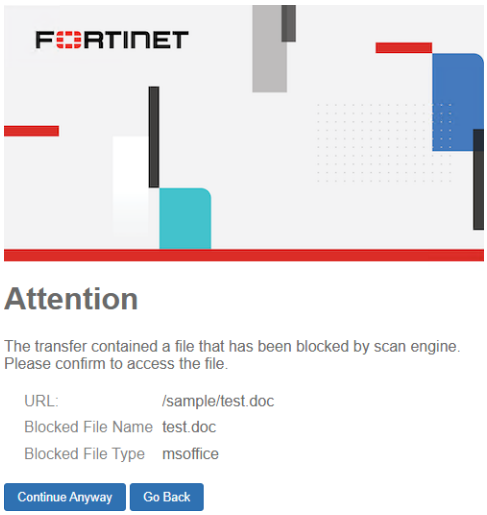
2. Apply the file filter profile to a firewall policy:

```
config firewall policy
    edit 1
        set name "filefilter"
        set srcintf "port1"
        set dstintf "port3"
        set action accept
        set srcaddr "all"
        set dstaddr "all"
        set srcaddr6 "all"
        set dstaddr6 "all"
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set inspection-mode proxy
        set profile-protocol-options "protocol"
        set ssl-ssh-profile "ssl"
        set file-filter-profile "filefilter"
        set logtraffic all
        set nat enable
    next
end
```

To test the file filter:

1. On a Windows client, access an absolute URL (http://<iP address>/sample/test.doc) to download file *test.doc*.

   A replacement message is shown that asks the user to authorize or cancel the file download, and a blocking UTM file filter log is generated.



```
2: date=2025-09-13 time=05:26:26 eventtime=1757697986602674439 tz="+1200" logid="1900064000"
type="utm" subtype="file-filter" eventtype="file-filter" level="warning" vd="vdom1" policyid=1
poluuid="61c636d2-5b59-51f0-b555-76579a0b21fa" policytype="policy" sessionid=1583
srcip=10.1.100.195 srcport=51426 srccountry="Reserved" srcintf="port1" srcintfrole="undefined"

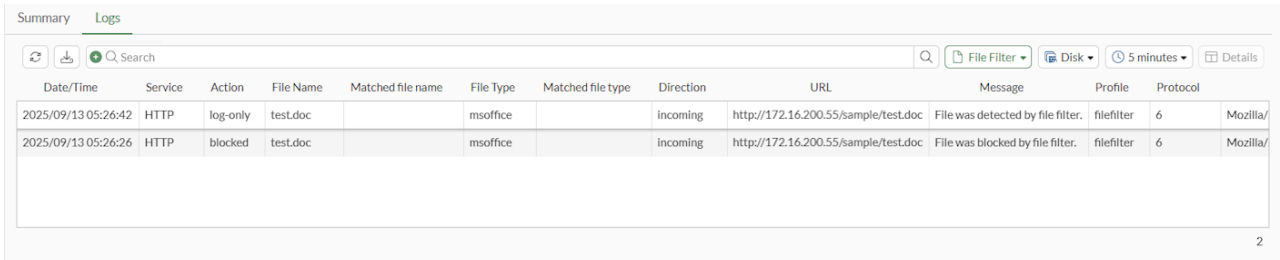
referralurl="http://172.16.200.55/sample/test.doc" rulename="test" filename="test.doc"
filesize=19456 filetype="msoffice" msg="File was detected by file filter."
```

3. Go to *Log & Report* > *Security Events* and view the *File Filter* logs.



Email filter

Email filters can be configured to perform spam detection and filtering. You can customize the default profile, or create your own and apply it to a firewall policy.

Two kinds of filtering can be defined in a single profile, and they will act independent of one another.

Filter options can be organized according to the source of the decision:

- Local options: the FortiGate qualifies the email based on local conditions, such as block/allowlists, banned words, or DNS checks using FortiGuard Antispam.
- FortiGuard-based options: the FortiGate qualifies the email based on the score or verdict returned from FortiGuard Antispam.
- Third-party options: the FortiGate qualifies the email based on information from a third-party source (like an ORB list).

Local and FortiGuard block/allowlists can be enabled and combined in a single profile. When combined, the local block/allowlist has a higher priority than the FortiGuard block list during a decision making process. For example, if a client IP address is blocklisted in the FortiGuard server, but you want to override this decision and allow the IP to pass through the filter, you can define the IP address or subnet in a local block/allowlist with the clear action. Because the information coming from the local list has a higher priority than the FortiGuard service, the email will be considered clean.

Some features of this functionality require a subscription to FortiGuard Antispam.

Protocol comparison between email filter inspection modes

The following table indicates which email filters are supported by their designated inspection modes.

	SMTP	POP3	IMAP	MAPI
Proxy	Yes	Yes	Yes	Yes (1)
Flow	Yes	Yes	Yes	No

1. Not available on FortiGate models with 2 GB RAM or less.

The following topics provide information about email filter profiles:

- Configuring an email filter profile on page 2456
- Local-based filters on page 2456
- FortiGuard-based filters on page 2464
- Third-party-based filters on page 2466
- Filtering order on page 2467
- Protocols and actions on page 2469

- Configuring webmail filtering on page 2470
- Spam email header on page 2471

Configuring an email filter profile

Email filters can be configured to perform spam detection and filtering.

To configure an email filter profile:

1. Go to *Security Profiles* > *Email filter* and click *Create New*.
2. Configure the following settings:

Name		Enter a unique name for the profile.
Comments		Enter a comment (optional).
Enable spam detection and filtering		Enable/disable spam detection and filtering.
	Spam Detection by Protocol	Configure settings for SMTP, POP3, IMAP, and MAPI protocols. See Protocols and actions on page 2469 and Filtering order on page 2467 for more information.
	FortiGuard Spam Filtering	The FortiGate consults FortiGuard servers to help identify spammer IP address or emails, known phishing and spam URLs, known spam email checksums, and others. See FortiGuard-based filters on page 2464 for more information.
	Local Spam Filtering	Enable and configure local spam filters. See Local-based filters on page 2456 for more information.

3. Click *OK*.

Local-based filters

There are six types of local spam filters:

- HELO DNS lookup
- Return email DNS check
- Block/allow list
- Banned words*
- Trusted IP addresses*
- MIME header*

* These filters can only be configured in the CLI.

By default, HELO DNS and return email DNS checks are done before the block/allow list check. In some situations, such as when configuring a block/allow list to clear an email from performing further filtering, configure the following to give precedence to the block/allow list:

```
config emailfilter profile
    edit <name>
        config smtp
            set local-override enable
        next
    end
end
```

HELO DNS lookup and return email DNS checking are not supported while in flow-based inspection mode. See Inspection mode feature comparison on page 2141.

HELO DNS lookup

Whenever a client opens an SMTP session with a server, the client sends a HELO command with the client domain name. The FortiGate takes the domain name specified by the client in the HELO and performs a DNS lookup to determine if the domain exists. If the lookup fails, the FortiGate determines that any emails delivered during the SMTP session are spam. The HELO DNS lookup is only available for SMTP traffic.

Return email DNS check

The FortiGate performs a DNS lookup on the return field. If no such record exists, the email is treated as spam. When return email DNS checking is enabled, the FortiGate takes the domain in the reply-to email address and reply-to domain, and checks the DNS servers to see if there is an A or MX record for the domain. If the domain does not exist, the FortiGate treats the email as spam.

Block/allow list

Block/allow lists can be made from emails or IP subnets to forbid or allow them to send or receive emails. The following table summarizes the configurable options in a block/allow list.

Type	Description	Pattern	Action
IP/Netmask and *IPv6/Netmask*	The FortiGate compares the IP address of the client delivering the email to the addresses in the IP address block/allow list specified in the email filter profile.	The filter is an IP address with a subnet mask.	• *Mark as Reject*: the email is dropped before reaching its destination. • *Mark as Spam*: the email is

Type	Description	Pattern	Action
	If a match is found, the FortiGate takes the action configured for the matching block/allow list entry against all delivered email. By default the `hdrip` setting under `config smtp` is disabled. If enabled, the FortiGate checks all the IP addresses in the header of SMTP email against the specified IP address block/allow list.		allowed through, but it will be tagged with an indicator marking the email as spam. • *Mark as Clear*: the email is allowed to go through to its destination on the assumption that it is not spam.
Recipient Address	The FortiGate compares the sender email address to the contents of the RCPT TO envelope header and To: mail header to the specified pattern. If a match is found, the FortiGate takes the action configured for the matching block/allow list entry.	• *Wildcard*: the filter is an email address with a wildcard symbol in place of the variable characters (such as **.example.com* or *fred@*.com*). • *Regular Expression*: the filter is a regular expression. For example, *^[_a-z0-9-]+(\.[_a-z0-9-]+)*@(example|xmple|examp).(com|org|net)* can be used to filter based on a number of email domain name combinations.	• *Mark as Spam*: the email is allowed through, but it will be tagged with an indicator marking the email as spam. • *Mark as Clear*: the email is allowed to go through to its destination on the assumption that it is not spam.
Sender Address	The FortiGate compares the sender email address to the contents of the MAIL FROM envelope header, From: mail header, and Sender: mail header to the specified pattern. If a match is found, the FortiGate takes the action configured for the matching block/allow list entry.		
Subject	The FortiGate compares the sender email address to the contents of the Subject: mail header to the specified pattern. If a match is found, the FortiGate takes the action configured for the matching block/allow list entry.		

Banned words

When banned word checking is enabled, the FortiGate examines emails for words that appear in the banned word list specified in the email filter profile.

The banned word pattern can be either wildcard or Perl regular expression, which could include part of a word, a whole word, a phrase, multiple words, or multiple phrases.

Each time the banned word filter detects a pattern in an email, it adds the pattern score to the sum of scores for the message. The score is set when creating a new pattern to block content (`set score`). Higher scores indicate more offensive content. If the total score of the discovered banned words in the email exceeds the threshold value set in the email filter profile, then the FortiGate treats the email as spam. The score for each pattern is counted only once, even if that pattern appears many times in the email. The default score for banned word patterns is 10, and the default threshold in the email filter is 10. This means that by default, an email message is blocked by a single match.

For example, if the FortiGate scans an email containing only this sentence: “The score for each word or phrase is counted only once, even if that word or phrase appears many times in the email message.” and the banned word list contains the following patterns:

Banned word pattern	Pattern type	Assigned score	Score added to sum for entire page	Comments
word	Wildcard	20	20	The pattern appears twice, but it is counted once.
word phrase	Wildcard	20	0	Both words appear in the email, but they do not appear together as specified in the pattern. There are no matches.
word*phrase	Wildcard	20	20	A match occurs as long as “word” appears before “phrase” regardless of what is in between them. The pattern appears twice, but it is counted once.
mail*age	Wildcard	20	20	This pattern is a match because “email message” appears in the email.

The email would be treated as spam if the banned word threshold is set to 60 or less.

To apply a banned word filter to an email filter profile:

1. Configure the banned words list:

```
config emailfilter bword
    edit 1
        set name "banned"
        config entries
            edit 23
                set pattern-type {wildcard | regexp}
```

```
                set pattern <string>
                set score <1 - 99999>
            next
        end
    next
end
```

2. Configure the email filter profile:

```
config emailfilter profile
    edit "myBannedWordsProfile"
        set spam-filtering enable
        set options bannedword
        set spam-bword-threshold <0 - 2147483647>
        set spam-bword-table 23
    next
end
```

Once a banned word list is configured in the CLI and applied to an email filter profile, some settings can be edited in the GUI for that particular email filter profile. A banned word profile can be selected, and its *Threshold* (`spam-bword-threshold`) can be edited.

Trusted IP addresses

When the FortiGate creates a list of trusted IP addresses, any incoming email traffic from these IP address is exempt from having IP-based checks, such as DNSBL, RBL, FortiGuard Antispam service, or locally-defined IP block lists.

If the FortiGate sits behind a company's mail transfer units, it may be unnecessary to check email IP addresses because they are internal and trusted. In this case, only external IP addresses would be checked. In some cases, external IP addresses may be added to the list if they are known to not be spam sources.

To configure a trusted IP address list:

1. Define the IP address list:

```
config emailfilter iptrust
    edit 1
        set name "trustedIP"
        config entries
            edit 33
                set addr-type {ipv4 | ipv6}
                set ipv4-subnet <IPv4_classnet>
                set ipv6-subnet <IPv6_network>
            next
        end
    next
end
```

2. Add the list to the email filter profile:

```
config emailfilter profile
    edit "email_filter_profile"
        set spam-iptrust-table 1
    next
end
```

MIME header

This feature filters by the MIME header.

To configure a MIME header check:

1. Define the header content:

```
config emailfilter mheader
    edit 100
        set name "mheader"
        config entries
            edit 1
                set fieldname <string>
                set fieldbody <string>
                set pattern-type {wildcard | regexp}
                set action {spam | clear}
            next
        end
    next
end
```

2. Add the header to the email filter profile:

```
config emailfilter profile
    edit "email_filter_profile"
        set options spamhdrcheck
        set spam-mheader-table 100
    next
end
```

Configuring a local-based email filter

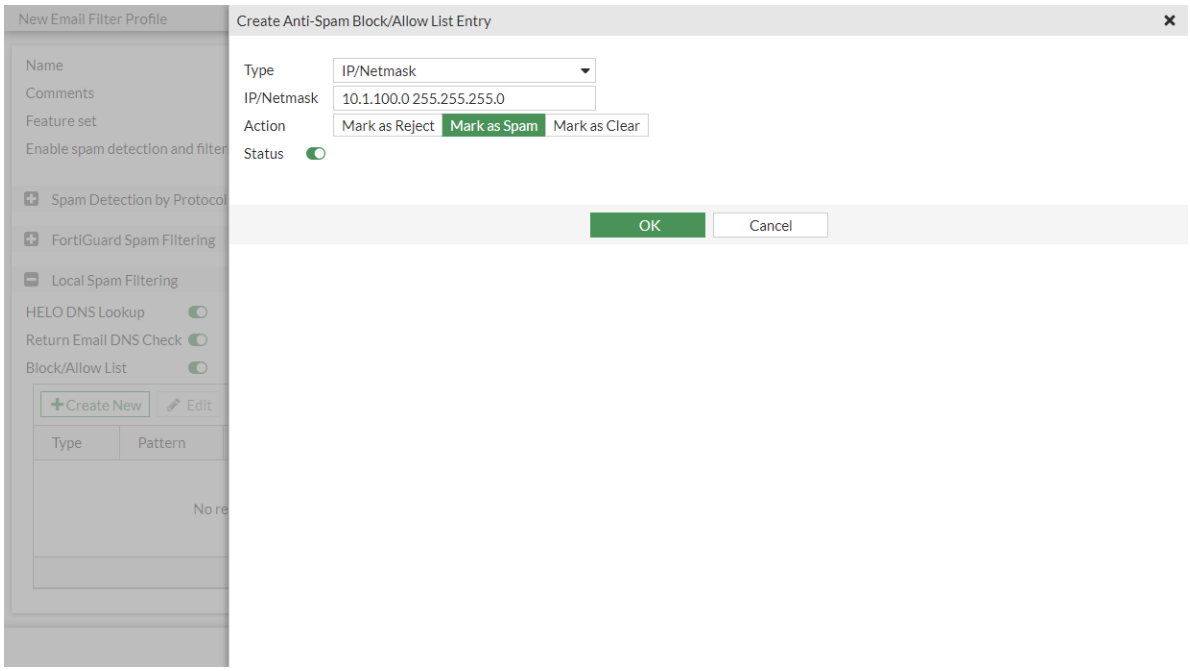
To configure a local-based email filter in the GUI:

1. Configure the email filter profile:
   a. Go to *Security Profiles* > *Email Filter* and click *Create New*, or edit an existing profile.
   b. Select a *Feature set* (*Proxy-based* is used in this example) and enable *Enable spam detection and filtering*.
   c. In the *Local Spam Filtering* section, enable the desired filters (*HELO DNS Lookup*, *Return Email DNS Check*, *Block/Allow List*).

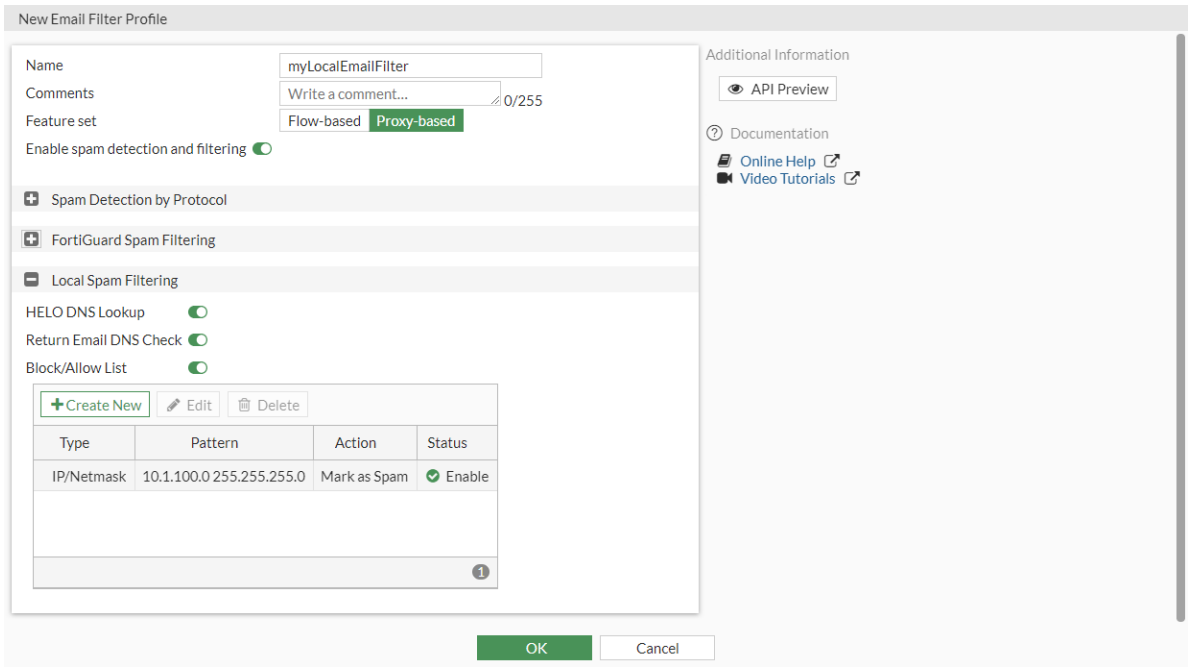
d. In the *Block/Allow List* table, click *Create New*. The *Create Anti-Spam Block/Allow List Entry* pane opens.

e. Set the *Type* to *IP/Netmask* and enter an *IP/Netmask*.

f. Select an *Action*.



g. Click *OK* to save the block/allow list.



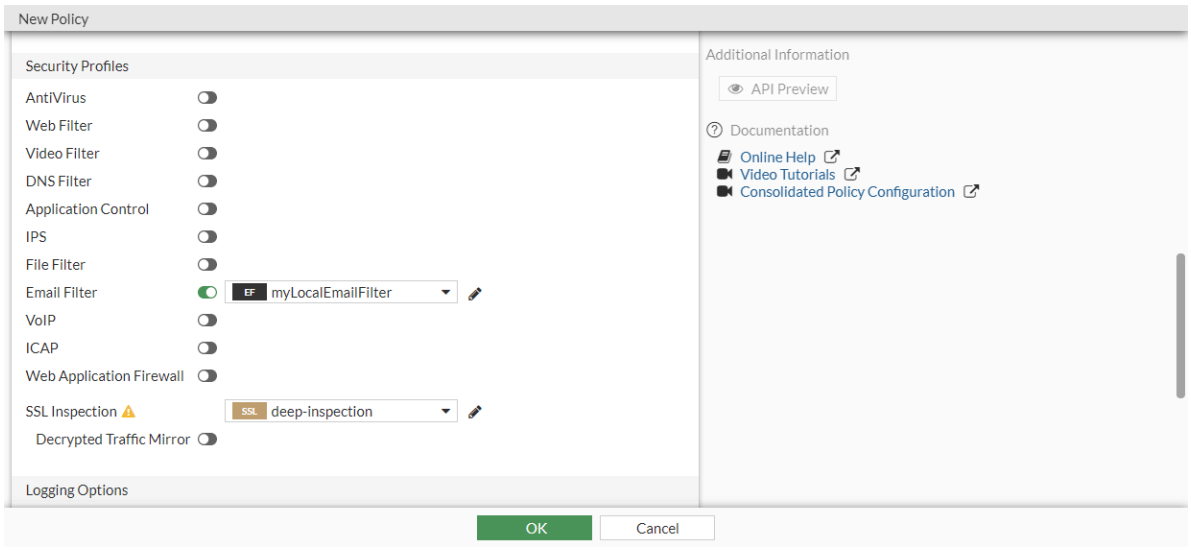
h. Click *OK* save the email filter profile.

2. Configure the firewall policy:

a. Go to *Policy & Objects* > *Firewall Policy* and click *Create New*, or edit an existing policy.

b. Set the inspection-mode to *Proxy-based*.

c. Enable the *Email Filter* option and select the previously created profile.



d. Set *SSL Inspection* to a profile that has deep SSL inspection enabled.
Deep inspection is required to filter SMTP, POP3, IMAP, or any SSL/TLS encapsulated protocol.

e. Configure the other settings as needed.

f. Click *OK*.

To configure a local-based email filter in the CLI:

1. Configure a block/allow list:

```
config emailfilter block-allow-list
    edit 1
        set name "myBAL"
        config entries
            edit 1
                set status enable
                set type ip
                set action spam
                set addr-type ipv4
                set ip4-subnet 10.1.100.0 255.255.255.0
            next
        end
    next
end
```

2. Configure an email filter profile:

```
config emailfilter profile
    edit "myLocalEmailFilter"
        set spam-filtering enable
        set options spambal spamhelodns spamraddrdns
        config smtp
            set action tag
        end
```

```
        set spam-bal-table 1
    next
end
```

3. Use the profile in a firewall policy:

```
config firewall policy
    edit 1
        set inspection-mode proxy
        set ssl-ssh-profile "deep-inspection"
        set emailfilter-profile "myLocalEmailFilter"
    next
end
```

FortiGuard-based filters

The FortiGate consults FortiGuard servers to help identify spammer IP address or emails, known phishing URLs, known spam URLs, known spam email checksums, and others. For more information, refer to the FortiGuard website.

There are five FortiGuard spam filtering options:

- IP address check
- URL check
- Detect phishing URLs in email (requires URL check to be enabled)
- Email checksum check
- Spam submission

FortiGuard-based filters are not supported while in flow-based inspection mode. See Inspection mode feature comparison on page 2141.

IP address check

The FortiGate queries the FortiGuard Antispam service to determine if the IP address of the client delivering the email is in the block list. If there is a match, the FortiGate treats delivered emails as spam.

The Spam-Spamming.Server category under the Internet Service Database (ISDB) also provides antispam protection, comprising the most recent and active spam IPs based on FortiGuard telemetry. Users may apply this ISDB address group in a firewall policy and specify the mail service to block. However, this category of the ISDB is only a subset of the IPs in the antispam service. For the most comprehensive spam IP reputation protection, use the IP address check feature.

URL check

The FortiGate submits all URLs that appear in the email body to the FortiGuard service for checking. If a URL exists in the FortiGuard URL block list, the FortiGate treats the email as spam.

Detect phishing URLs in email

The FortiGate submits all URL hyperlinks that appear in the email body to the FortiGuard service for checking. If a URL exists in the FortiGuard URL phishing list, the FortiGate removes the hyperlink from the message. The URL remains in place, but it is no longer a clickable hyperlink.

Email checksum check

The FortiGate submits a checksum of each email to the FortiGuard service for checking. If a checksum exists in the FortiGuard checksum block list, the FortiGate treats the email as spam.

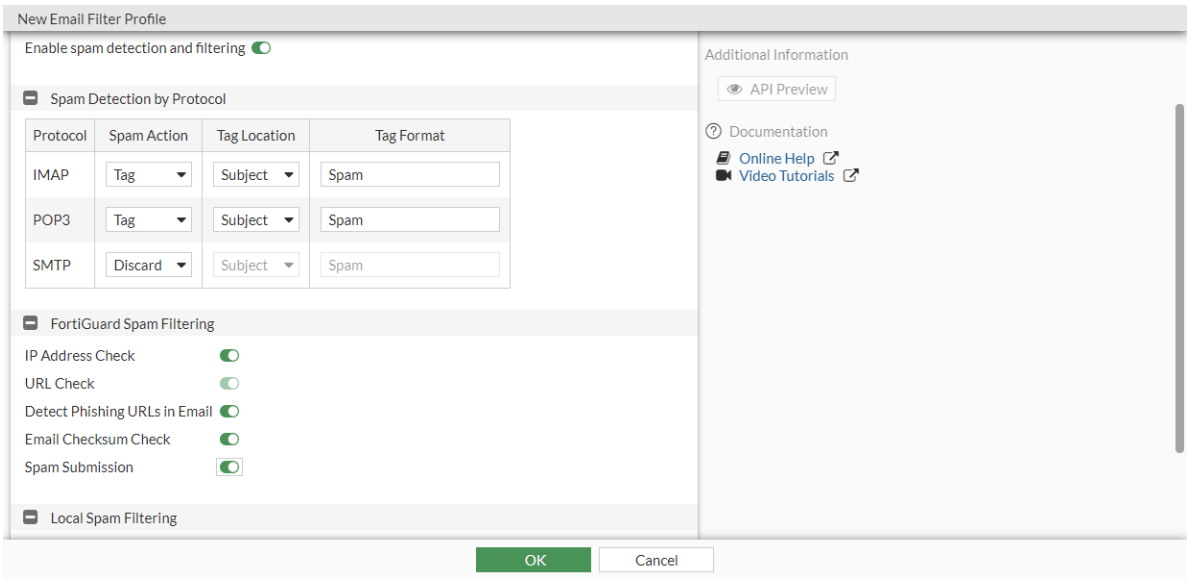
Spam submission

Spam submission is a way to inform the FortiGuard Antispam service of non-spam messages incorrectly marked as spam. When enabled, the FortiGate adds a link to the end of every email marked as spam. Click the link to notify the FortiGuard Antispam service if an email is marked incorrectly.

Configuring FortiGuard filters

To configure FortiGuard filters in the GUI:

1. Go to *Security Profiles* > *Email Filter* and click *Create New*.
2. Enable *Enable spam detection and filtering*.
3. In the *FortiGuard Spam Filtering* section, enable the following as needed:
   - *IP Address Check*
   - *URL Check*
   - *Detect Phishing URLs in Email*
   - *Email Checksum Check*
   - *Spam Submission*



4. Click *OK*.

To configure FortiGuard filters in the CLI:

```
config emailfilter profile
    edit <name>
        set spam-filtering enable
        set options spamfsip spamfsurl spamfsphish spamfschksum spamfssubmit
    next
end
```

Option	Description
`spamfsip`	Check email IP addresses
`spamfsurl`	Check email content URLs
`spamfsphish`	Check email content phishing URLs
`spamfschksum`	Check email checksums
`spamfssubmit`	Add FortiGuard Antispam spam submission text

Third-party-based filters

In addition to local and FortiGuard filters, FortiOS can leverage third-party sources, which are known as DNS-based blackhole lists (DNSBL) or Open Relay Behavior-modification Systems (ORBS). These are maintained lists of IP addresses that have been identified as associated with spamming.

The following example demonstrates how to configure a DNSBL. The `config emailfilter dnsbl` command is used to configure either DNSBL or ORBS.

To configure a DNSBL:

1. Define the server to get the DNSBL list from:

```
config emailfilter dnsbl
    edit 100
        set name "dnsbl"
        config entries
            edit 1
                set status enable
                set server <IP address or server name>
                set action {reject | spam}
            next
        end
    next
end
```

2. Add the DNSBL list to an email filter profile:

```
config emailfilter profile
    edit "email_filter_profile"
        set options spamrbl
        set spam-rbl-table 100
    next
end
```

Filtering order

The FortiGate checks for spam using various filtering techniques. The filtering order used by the FortiGate depends on which mail protocol is used.

Filters requiring a query to a server and a reply (FortiGuard Antispam service and DNSBL/ORDBL) are run simultaneously. To avoid delays, queries are sent while other filters are running. The first reply to trigger a spam action takes effect as soon as the reply is received.

Each spam filter passes the email to the next if no matches or problems are found. If the action in the filter is *Mark as Spam*, the FortiGate tags the email as spam according to the settings in the email filter profile. If the action in the filter is *Mark as Reject*, the email session is dropped. If the action in the filter is *Mark as Clear*, the email is exempt from any remaining filters. For SMTP and SMTPS, if the action is *Discard*, the email is discarded or dropped.

SMTP and SMTPS spam filtering order

The FortiGate scans SMTP and SMTPS email for spam in a specific order, which depends on whether or not the local override feature is enabled. This feature is disabled by default, but enabling it gives priority to local spam filters.

You can enable local override (`set local-override`) in an email filter profile to override SMTP or SMTPS remote checks, which includes checks for IP RBL, IP FortiGuard AntiSpam, and HELO DNS with the locally defined antispam block and/or allow lists.

SMTPS spam filtering is available on FortiGates that support SSL content scanning and inspection.

To configure local override of an antispam filter:

```
config emailfilter profile
    edit <name>
        set spam-filtering enable
        set options spambal spamfsip spamfsurl spamhelodns spamfsphish
        config smtp
            set local-override {enable | disable}
        end
        set spam-bal-table 1
    next
end
```

Local override disabled	Local override enabled
1. HELO DNS lookup, last hop IP check against ORDBL 2. Return email DNS check, FortiGuard email checksum check, FortiGuard URL check, FortiGuard IP address check, phishing URLs detection 3. Last hop IP checks local block/allow list 4. Envelope address checks local block/allow list 5. Headers IPs local block/allow list 6. Headers email address local block/allow list, MIME header checks based on local list of patterns (`mheader`) 7. Banned words (subject first, then body) based on local block/allow list (`bword`)	1. Last hop IP checks local block/allow list 2. Envelope address checks local block/allow list 3. Headers IPs local block/allow list, MIME header checks based on local list of patterns (`mheader`) 4. Headers email address local block/allow list 5. Banned words (subject first, then body) based on local list of patterns (`bword`) 6. HELO DNS lookup, last hop IP check against ORDBL 7. Return email DNS check, FortiGuard email checksum check, FortiGuard URL check, FortiGuard IP address check, phishing URLs detection

IMAP, IMAPS, POP3, and POP3S spam filtering order

The FortiGate scans IMAP, IMAPS, POP3, and POP3S email for spam in the following order:

1. MIME headers check, email address block/allow list check
2. Banned word check on email subject
3. IP block/allow list check
4. Banned word check on email body
5. Return email DNS check, FortiGuard email checksum check, FortiGuard URL check, DNSBL and ORDBL checks

IMAPS and POP3S spam filtering are available on FortiGates that support SSL content scanning and inspection.

Protocols and actions

In an email filter profile, there are options to configure settings for SMTP, POP3, IMAP, and MAPI protocols. For each protocol, you can set an action to either discard (block), tag, or pass the log for that protocol. The action options vary per protocol. For the tag action, the spam email can be tagged with configured text in the subject or header.

Some IMAP clients, such as Outlook Express and Mozilla Thunderbird, do not update the message subject when it is different from the IMAP envelope and the body. As a result, subjects are not tagged in the email list, but they are still tagged in the preview pane.

MAPI is only configurable in the CLI and with the proxy feature set.

To configure protocols in an email filer:

```
config emailfilter profile
    edit <name>
        set feature-set {flow | proxy}
        set spam-filtering enable
        set options {bannedword spambal spamfsip spamfssubmit spamfschksum spamfsurl spamhelodns
spamraddrdns spamrbl spamhdrcheck spamfsphish}
        config smtp
            set log-all {enable | disable}
            set action {pass | tag | discard}
            set tag-type {subject | header | spaminfo}
            set tag-msg <string>
            set hdrip {enable | disable}
            set local-override {enable | disable}
        end
        config imap
            set log-all {enable | disable}
            set action {pass | tag}
            set tag-type {subject | header | spaminfo}
            set tag-msg <string>
        end
        config pop3
            set log-all {enable | disable}
            set action {pass | tag}
            set tag-type {subject | header | spaminfo}
            set tag-msg <string>
        end
        config mapi
            set log-all {enable | disable}
            set action {pass | discard}
        end
    next
end
```

`options ...`	The following options are available: • bannedword: content block. • spambal: block/allow list. • spamfsip: email IP address FortiGuard antispam block list check. • spamfssubmit: add FortiGuard antispam spam submission text. • spamfschksum: email checksum FortiGuard antispam check. • spamfsurl: email content URL FortiGuard antispam check. • spamhelodns: email HELO/EHLO domain DNS check. • spamraddrdns: email return address DNS check. • spamrbl: email DNSBL and ORBL check. • spamhdrcheck: email MIME header check. • spamfsphish: email content phishing URL FortiGuard antispam check.
`tag-type {subject | header | spaminfo}`	Set the tag type: • subject: prepend text to the spam email subject. • header: append a user-defined MIME header to the spam email. • spaminfo: append spam information to the spam email header.
`tag-msg <string>`	Subject text or header added to the spam email.
`hdrip {enable | disable}`	Enable/disable SMTP email header IP checks for spamfsip, spamrbl, and spambal filters.
`local-override {enable | disable}`	Enable/disable local filter to override SMTP remote check result.

For more information, see config emailfilter profile in the FortiOS CLI Reference.

Configuring webmail filtering

You can configure an email filter to detect and log emails sent by Gmail and Hotmail. These interfaces do not use standard email protocols (SMTP, POP3, or IMAP) and use HTTPS instead. However, you can still configure the email filter to detect emails that pass through the FortiGate.

The FortiGate only detects and logs the emails, it does not discard or tag them.

To configure webmail filtering:

```
config emailfilter profile
    edit <name>
        set spam-filtering enable
        config msn-hotmail
            set log-all enable
        end
        config gmail
```

```
            set log-all enable
        end
    next
end
```

Spam email header

The following headers may be added to the x-spaminfo field of email headers:

Header	Description
ipbal, path block/allow ip <IP address>	IP address is contained in the local block/allow list
dnsbl, path block/allow ip <IP address>	Email is contained in configured third-party DNS-based blackhole lists (DNSBL), or Open Relay Behavior-modification Systems (ORBS).
FortiGuard-AntiSpam ip, path block/allow ip <IP address>	IP address is contained in the FortiGuard antispam block/allow list.
FortiGuard-AntiSpam ase,	FortiGuard antispam match (may match using: email checksum, URL check, phishing URL, and others).
email-address, no.<INT> pattern matched	Email address is contained in the local block/allow list.
mime-header, no.<INT> pattern matched	MIME header contains a match for a configured pattern.
bannedword, <listid-hexnum hexnum ... hexnum> bannedword, <hexnum hexnum ... hexnum>	Email contains one or more words listed in the local banned word list.
helo-dns	Whenever a client opens an SMTP session with a server, the client sends an HELO command with the client domain name. The FortiGate takes the domain name specified by the client in the HELO and performs a DNS lookup to determine if the domain exists. If the lookup fails, the FortiGate determines that any emails delivered during the SMTP session are spam.
return-email, domain <domain name> has neither MX nor A record	FortiGate performs a DNS lookup on the return field. If no such record exists, the email is treated as spam.
return-email, domain name <domain name> has invalid syntax	Invalid return email domain name.
return-email, DNS request error for domain <domain name>	Error when resolving domain name.

VoIP solutions

You can configure VoIP profiles to allow SIP and SCCP traffic and to protect your network from SIP- and SCCP-based attacks.

FortiOS includes two preloaded VoIP profiles:

- *default*
- *strict*

You can customize these profiles, or you can create your own and add them to firewall policies that allow VoIP.

VoIP profiles cannot be used in NGFW policy-based mode. See NGFW policy on page 1803 for more information.

The following topics provide information about VoIP profiles:

- General use cases on page 2472
- NAT46 and NAT64 for SIP ALG on page 2476
- SIP message inspection and filtering on page 2484
- SIP ALG and SIP session helper on page 2490
- SIP pinholes on page 2497
- SIP over TLS on page 2499
- Voice VLAN auto-assignment on page 2500
- Scanning MSRP traffic on page 2502

General use cases

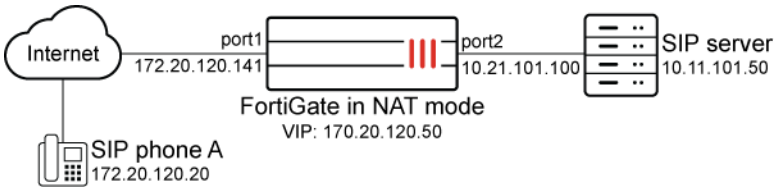
There are three scenarios in which the FortiOS session initiation protocol (SIP) solution is usually deployed:

1. The SIP server is in a private network that is protected from the internet by a FortiGate.
2. The SIP clients are in a private network that is protected from the internet by a FortiGate.
3. The SIP server is in a private network, such as a corporation's internal network or an ISP's network, that is protected from the internet by a FortiGate. The SIP clients are in a remote private network, such as a SOHO network, and behind a NAT device that is not aware of SIP applications.

The following VIP, NAT, and HNT examples show configurations for these common scenarios.

VIP

A FortiGate with SIP Application Layer Gateway (ALG) or SIP session helper protects the SIP server from the internet, while SIP phones from the internet need to register to the SIP server and establish calls through it.



A VIP needs to be configured for the SIP server, and the VIP must be applied in a firewall policy for the phones to send REGISTER messages through the FortiGate from port1 to port2.

Only one firewall policy needs to be configured for all SIP phones on both the internet and private network to register to the SIP server through port1 and set up SIP calls. This example assumes either SIP ALG or SIP session helper is enabled.

To configure the VIP for the SIP server:

```
config firewall vip
    edit "VIP_for_SIP_Server"
        set extip 172.20.120.50
        set extintf "port1"
        set mappedip "10.11.101.50"
    next
end
```

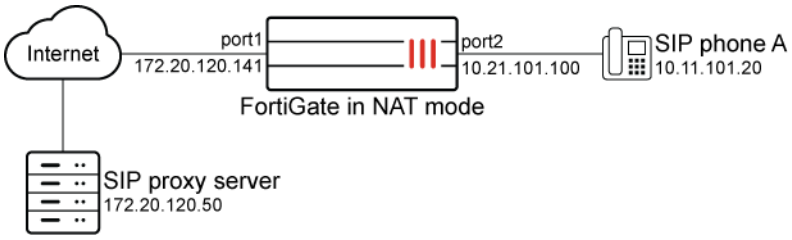
To configure the firewall policy:

```
config firewall policy
    edit 1
        set srcintf "port1"
        set dstintf "port2"
        set srcaddr "all"
        set dstaddr "VIP_for_SIP_Server"
        set action accept
        set schedule "always"
        set service "SIP"
    next
end
```

Setting `service` to `SIP` and not `all` in the firewall policy can improve protection by restricting the data traffic passing through the FortiGate to the SIP call traffic only.

NAT

A FortiGate with SIP ALG or SIP session helper protects the SIP phones and the internal network from the internet, while SIP phones in the internal network need to register to the SIP server installed on the internet and establish calls through it.



One firewall policy needs to be configured with NAT enabled for SIP phones to send REGISTER messages through the FortiGate from port2 to port1. This example assumes either SIP ALG or SIP session helper is enabled.

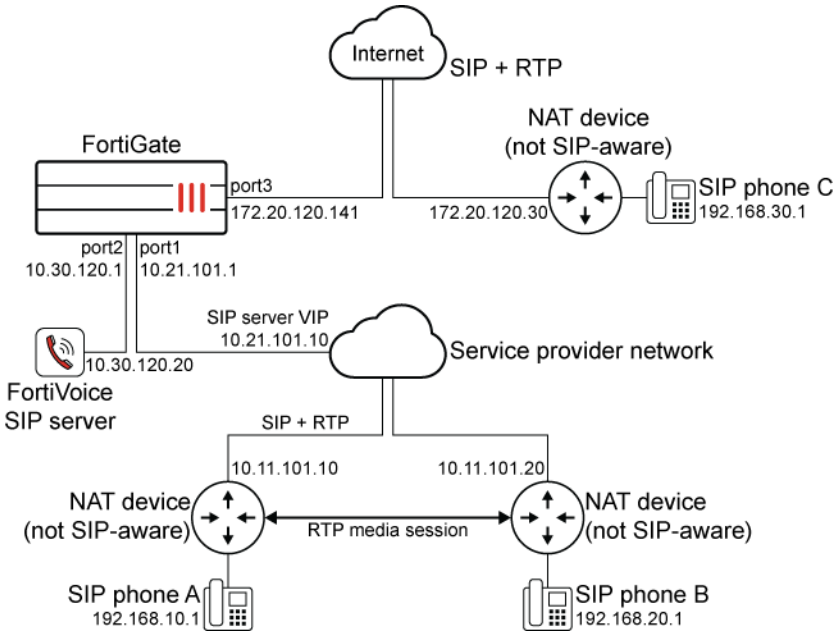
To configure the firewall policy:

```
config firewall policy
    edit 1
        set srcintf "port2"
        set dstintf "port1"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "SIP"
        set nat enable
    next
end
```

HNT

A FortiGate with SIP ALG protects the SIP server from the internet, while SIP phones are in remote private networks behind NAT devices that are not aware of the SIP application.

In this example, the SIP server is located in an ISP's service cloud that is protected by the FortiGate SIP ALG, and the SIP phones are installed in the home networks of the ISP's customers.



The SIP messages traversing the remote NAT devices might have their IP addresses translated by the NAT device at the network layer, but untranslated at the SIP application layer because those NAT devices are not aware of the SIP applications. This causes problems in a SIP session initiated process. Special configurations for the hosted NAT traversal (HNT) are required to resolve this issue.

To configure the FortiGate with HNT support for SIP phones A and B to set up calls with each other:

1. Identify port1 as the external interface:

```
config system interface
    edit "port1"
        set external enable
    next
end
```

2. Configure the VIP for the SIP server:

```
config firewall vip
    edit "VIP_for_SIP_Server"
        set extip 10.21.101.10
        set extintf "port1"
        set mappedip "10.30.120.20"
    next
end
```

3. Configure a VoIP profile with HNT enabled:

```
config voip profile
    edit "hnt"
        config sip
            set hosted-nat-traversal enable
            set hnt-restrict-source-ip enable
```

```
        end
    next
end
```

> `hosted-nat-traversal` must be enabled. `hnt-restrict-source-ip` does not have to be enabled, but can be enabled to restrict the RTP packets' source IP to be the same as the SIP packets' source IP.

4. Apply the VoIP profile and VIP in a firewall policy for phone A and B to register and set up SIP calls through the FortiGate and SIP server:

```
config firewall policy
    edit 1
        set srcintf "port1"
        set dstintf "port2"
        set srcaddr "all"
        set dstaddr "VIP_for_SIP_Server"
        set action accept
        set schedule "always"
        set service "SIP"
        set utm-status enable
        set voip-profile "hnt"
        set nat enable
    next
end
```

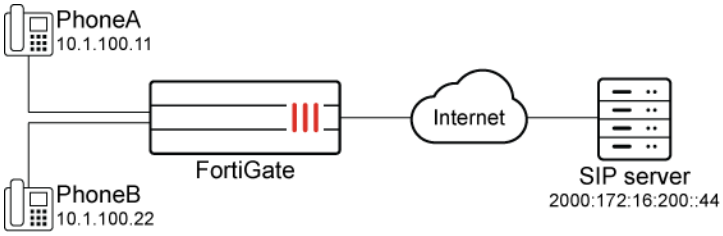
> `nat` must be enabled in the firewall policy.

NAT46 and NAT64 for SIP ALG

NAT46 and NAT64 are supported for SIP ALG. A mix of IPv4 and IPv6 networks can use SIP ALG, allowing for proper call handling.

NAT46 example

In this example, SIP phones on the internal network use IPv4, and the SIP server on an external network uses IPv6. NAT46 is used with SIP ALG to allow for seamless communication. A VoIP profile, `sip`, has already been created.



To configure the FortiGate:

1. Configure a firewall VIP with NAT46 enabled:

```
config firewall vip
    edit "vip46_server_asterisk"
        set extip 10.1.100.100
        set nat44 disable
        set nat46 enable
        set extintf "port1"
        set ipv6-mappedip 2000:172:16:200::44
    next
end
```

2. Configure an IPv6 pool:

```
config firewall ippool6
    edit "client_server_nat46"
        set startip 2000:172:16:200::200
        set endip 2000:172:16:200::207
        set nat46 enable
    next
end
```

3. Configure a firewall policy:

```
config firewall policy
    edit 1
        set name "policy46-1"
        set srcintf "port1"
        set dstintf "port9"
        set action accept
        set nat46 enable
        set srcaddr "all"
        set dstaddr "vip46_server_asterisk"
        set srcaddr6 "all"
        set dstaddr6 "all"
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set inspection-mode proxy
        set voip-profile "sip"
        set logtraffic all
        set auto-asic-offload disable
        set ippool enable
        set poolname6 "client_server_nat46"
    next
end
```

To check the SIP calls and session lists when the phones are registering to the SIP server:

1. View the SIP proxy SIP calls:

```
# diagnose sys sip-proxy calls
sip calls
  vdom 3 (vdom1) vrf 0 call 7f64bf044b00
    call-id: 1513782757
    txn 7f64bf048f00 (REGISTER)
      cseq 2 dir 0 state 5 status 200 expiry 868 HA 0

```

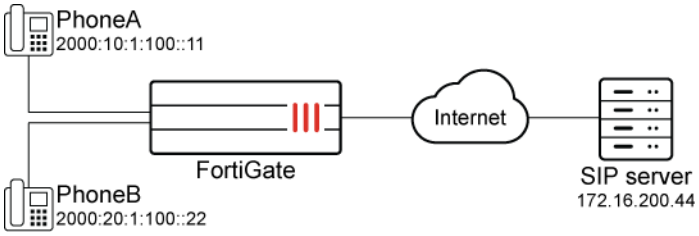
NAT64 example

In this example, SIP phones on the internal network use IPv6, and the SIP server on an external network uses IPv4. NAT64 is used with SIP ALG to allow for seamless communication. A VoIP profile, `sip`, has already been created.



To configure the FortiGate:

1. Configure a firewall VIP with NAT64 enabled:

```
config firewall vip
    edit "vip64-1-asterisk"
        set extip 2000:10:1:100::100
        set nat66 disable
        set nat64 enable
        set ipv4-mappedip 172.16.200.44
    next
end
```

2. Configure an IP pool:

```
config firewall ippool
    edit "client_server_nat46"
        set startip 172.16.200.2
        set endip 172.16.200.3
        set nat64 enable
    next
end
```

3. Configure a firewall policy:

```
config firewall policy
    edit 1
        set name "policy64-1"
        set srcintf "port1"
        set dstintf "port9"
```

```
        set action accept
        set nat64 enable
        set srcaddr "all"
        set dstaddr "all"
        set srcaddr6 "all"
        set dstaddr6 "vip64-1-asterisk"
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set inspection-mode proxy
        set voip-profile "sip"
        set logtraffic all
        set auto-asic-offload disable
        set ippool enable
        set poolname "client_server_nat64"
    next
end
```

SIP message inspection and filtering

There are two types of VoIP profiles that can be configured:

```
config voip profile
    edit <name>
        set feature-set {ips | voipd}
    next
end
```

`feature-set {ips | voipd}`	Set the inspection feature set. • `ips`: use the IPS Engine feature set for the `ips-voip-filter` firewall policy option. • `voipd`: use the SIP ALG feature set for `voip-profile` firewall policy option.

SIP ALG provides users with security features to inspect and control SIP messages that are transported through the FortiGate, including:

- Verifying the SIP message syntax.
- Blocking particular types of SIP requests.
- Restricting the rate of particular SIP requests.

Proxy-based SIP ALG (`feature-set voipd`) is also able to handle features such as pin hole creation and NAT that flow-based SIP inspection cannot. Flow-based SIP (`feature-set ips`) can handle features such as MSRP decoding and scanning that proxy-based SIP ALG cannot.

The two VoIP profile types can be configured separately or at the same time on a firewall policy:

```
config firewall policy
    edit 1
        set voip-profile "voip_sip_alg"
```

```
        set ips-voip-filter "voip_sip_ips"
    next
end
```

Where:

- `voip-profile` can select a `voip-profile` with `feature-set voipd`.
- `ips-voip-filter` can select a `voip-profile` with `feature-set ips`.

The IPS-based VoIP profile (`ips-voip-filter`) allows flow-based SIP to complement SIP ALG while working together.

When both SIP ALG and SIP IPS are used and configured with same block rules, SIP IPS will take priority and do the blocking.

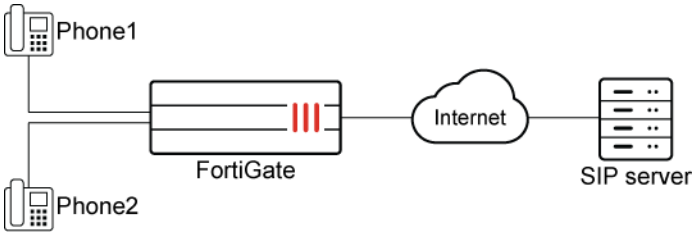
Unlike previous versions (7.0 and 7.2.0-7.2.4) where the firewall policy's inspection mode determines whether the SIP traffic is scanned by SIP ALG or flow-based SIP, the inspection mode does not matter in this version. A `voipd`-based VoIP profile will activate SIP ALG inspection, while an `ips`-based VoIP profile will activate IPS-based SIP inspection.

A `voip-profile` can be selected regardless of the `inspection-mode` used in the firewall policy.

For more information about the difference between SIP ALG and the SIP session helper, see SIP ALG and SIP session helper on page 2490.

Example

In this example, SIP ALG is required for pinhole creation, handling NAT, and controlling SIP messages that requires flow-based SIP. The administrator needs to configure two SIP profiles, one with each feature set (`voipd` and `ips`), and apply these SIP profiles in the same firewall policy.



To configure SIP ALG with SIP IPS:

1. Configure the VoIP profiles:

```
config voip profile
    edit "voip_sip_alg"
        set feature-set voipd
        set comment "sip_alg_simple"
        config sip
            set log-violations enable
            set log-call-summary enable
```

```
        end
    next
    edit "voip_sip_ips"
        set feature-set ips
        set comment "ips_voip_blocking"
        config sip
            set block-invite enable
            set log-violations enable
        end
    next
end
```

2. Configure the firewall policy:

```
config firewall policy
    edit 1
        set srcintf "port1"
        set dstintf "port9"
        set action accept
        set srcaddr "all"
        set dstaddr "all"
        set srcaddr6 "all"
        set dstaddr6 "all"
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set inspection-mode proxy
        set ips-sensor "g-default"
        set voip-profile "voip_sip_alg"
        set ips-voip-filter "voip_sip_ips"
        set logtraffic all
        set nat enable
    next
end
```

To verify the SIP proxy SIP calls:

1. Verify the register request:

```
# diagnose sys sip-proxy calls
sip calls
  vdom 1 (vdom1) vrf 0 call 7f2b99828300
    call-id: 619216389
    txn 7f2b998ad600 (REGISTER)
      cseq 2 dir 0 state 5 status 200 expiry 527 HA 0
      i_session: 7f2b998aac00  r_session: 7f2b998aac00
      register: present
      from: sip:2001@172.16.200.44
      to: sip:2001@172.16.200.44
      src: 10.1.100.11:5060
      dst: 172.16.200.44:5060
```

2. Verify the invite request:

```
# diagnose sys sip-proxy calls
sip calls
  vdom 1 (vdom1) vrf 0 call 7f2b99828300
    call-id: 619216389
    txn 7f2b998ad600 (REGISTER)
      cseq 2 dir 0 state 5 status 200 expiry 316 HA 0
      i_session: 7f2b998aac00  r_session: 7f2b998aac00
      register: present
      from: sip:2001@172.16.200.44
      to: sip:2001@172.16.200.44
      src: 10.1.100.11:5060
      dst: 172.16.200.44:5060
```

Sample logs

Register request:

```
date=2023-01-13 time=09:46:03 eventtime=1673631963477298677 tz="-0800" logid="0814044032"

to="<sip:2002@172.16.200.44>" attackid=50083 attack="SIP.Invite.Method"
```

SIP message syntax inspection

For syntax verification, the following attributes are available for configuration in the VoIP profile to determine what action is taken when a specific syntax error or attack based on invalid syntax is detected. For example, the action can be set to pass or discard it.

```
malformed-request-line
malformed-header-via
malformed-header-from
malformed-header-to
malformed-header-call-id
malformed-header-cseq
malformed-header-rack
malformed-header-rseq
malformed-header-contact
malformed-header-record-route
```

```
malformed-header-route
malformed-header-expires
malformed-header-content-type
malformed-header-content-length
malformed-header-max-forwards
malformed-header-allow
malformed-header-p-asserted-identity
malformed-header-sdp-v
malformed-header-sdp-o
malformed-header-sdp-s
malformed-header-sdp-i
malformed-header-sdp-c
malformed-header-sdp-b
malformed-header-sdp-z
malformed-header-sdp-k
malformed-header-sdp-a
malformed-header-sdp-t
malformed-header-sdp-r
malformed-header-sdp-m
malformed-header-no-require*
malformed-header-no-proxy-require*
```

* = only available in flow mode

SIP message blocking

The following options are available in the VoIP profile to block SIP messages:

```
block-long-lines
block-unknown
block-ack
block-bye
block-cancel
block-info
block-invite
block-message
block-notify
block-options
block-prack
block-publish
block-refer
block-register
block-subscribe
block-update
block-geo-red-options**
```

** = only available in proxy mode

SIP message rate limiting

The rate of certain types of SIP requests that are passing through the SIP ALG can be restricted:

```
register-rate
invite-rate
subscribe-rate
message-rate
notify-rate
refer-rate
update-rate
options-rate
ack-rate
prack-rate
info-rate
publish-rate
bye-rate
cancel-rate
```

Additionally, flow-based SIP supports the following rate tracking features:

```
register-rate-track none
invite-rate-track none
subscribe-rate-track none
message-rate-track none
notify-rate-track none
refer-rate-track none
update-rate-track none
options-rate-track none
ack-rate-track none
prack-rate-track none
info-rate-track none
publish-rate-track none
bye-rate-track none
cancel-rate-track none
```

Call-Id and Content-Type regex

When the `ips` VoIP profile feature set is selected, options for Call-Id and Content-Type header values can be configured.

```
config voip profile
    edit <name>
        config sip
            set call-id-regex <string>
            set call-id-regex <string>
        end
    next
end
```

`call-id-regex <string>`	Enter a validation PCRE regular expression for the Call-Id header value.
`call-id-regex <string>`	Enter a validation PCRE regular expression for the Content-Type header value.

SIP ALG and SIP session helper

The SIP session helper is a legacy solution that provides basic support for SIP calls passing through the FortiGate by opening SIP and RTP pinholes, and by performing NAT of the addresses in SIP messages.

SIP Application Layer Gateway (ALG) provides the same basic SIP support as the SIP session helper. In addition, SIP ALG provides a wide range of features that protect your network from SIP attacks, apply rate limiting to SIP sessions, check the syntax of SIP and SDP content of SIP messages, and provide detailed logging and reporting of SIP activity.

By default, all SIP traffic is processed by the SIP ALG. If the policy that accepts the SIP traffic includes a VoIP profile, the SIP traffic is processed by that profile. If the policy does not include a VoIP profile, the SIP traffic is processed by the SIP ALG using the default VoIP profile.

To change between SIP ALG mode and SIP session helper mode:

```
config system settings
    set default-voip-alg-mode {proxy-based | kernel-helper-based}
end
```

`default-voip-alg-mode {proxy-based | kernel-helper-based}`	Set how the FortiGate handles VoIP traffic when a policy that accepts the traffic does not include a VoIP profile. • `proxy-based`: use SIP ALG to process SIP traffic (default). • `kernel-helper-based`: use the SIP session helper to process SIP traffic.

The `default-voip-alg-mode` setting works together with the VoIP profile configured in a firewall policy to determine whether SIP ALG, SIP ALG with IPS SIP, or the SIP session helper are used to process the SIP traffic. The following firewall policy settings correspond to the VoIP profiles (see also SIP message inspection and filtering on page 2484).

```
config firewall policy
    edit <id>
        set voip-profile <voipd-based_profile>
        set ips-voip-filter <ips-based_profile>
    next
end
```

The following table explains the results of configuring different combinations of the preceding settings.

Firewall policy setting		Default VoIP ALG mode setting	
voip-profile	**ips-voip-filter**	**kernel-helper-based**	**proxy-based**
Yes	Yes	SIP ALG + IPS SIP	SIP ALG + IPS SIP
Yes	No	SIP ALG	SIP ALG
No	Yes	SIP ALG + IPS SIP	SIP ALG + IPS SIP
No	No	SIP session helper	SIP ALG

SIP ALG configurations

SIP ALG can be enabled in several ways. The following configuration examples demonstrate different settings.

Example 1

In this example, a `voipd`-based profile is configured and applied to a firewall policy. The `default-voip-alg-mode` remains as the default setting (`proxy-based`).

To configure SIP ALG:

1. Configure the default VoIP ALG mode:

```
config system settings
    set default-voip-alg-mode proxy-based
end
```

2. Configure the VoIP profile:

```
config voip profile
    edit "sip-alg-profile"
        set feature-set voipd
        config sip
            set status enable
        end
    next
end
```

3. Configure the firewall policy:

```
config firewall policy
    edit 0
        set name "VoIP-Proxy"
        set utm-status enable
        set voip-profile "sip-alg-profile"
    next
end
```

Example 2

In this example, the `default-voip-alg-mode` is set to `kernel-helper-based`. A VoIP profile (VoIP-Proxy) has SIP enabled and is applied to a firewall policy.

To configure SIP ALG:

1. Configure the default VoIP ALG mode:

```
config system settings
    set default-voip-alg-mode kernel-helper-based
end
```

2. Configure the VoIP profile:

```
config voip profile
    edit "sip-alg-profile"
        set feature-set voipd
        config sip
            set status enable
        end
    next
end
```

3. Configure the firewall policy:

```
config firewall policy
    edit 0
        set name "VoIP-Proxy"
        set utm-status enable
        set voip-profile "sip-alg-profile"
    next
end
```

Example 3

In this example, no VoIP profile is selected in the firewall policy. However, the `default-voip-alg-mode` is set to `proxy-based`. The default `voip-profile` is implicitly applied.

To configure SIP ALG to implicitly use the default VoIP profile:

1. Configure the default VoIP ALG mode:

```
config system settings
    set default-voip-alg-mode proxy-based
end
```

2. Configure the firewall policy:

```
config firewall policy
    edit 0
        set name "VoIP-Proxy"
        set utm-status enable
        set voip-profile ""
    next
end
```

SIP session helper configurations

In some instances, SIP providers may recommend that customers disable SIP ALG on their edge firewall. This is how you can disable SIP ALG and enable the SIP session helper.

Example 1

In this example, the `default-voip-alg-mode` is set to `kernel-helper-based`, and a VoIP profile is not applied in a firewall policy. Session helper 13 is enabled by default.

To configure the SIP session helper:

1. Configure the default VoIP ALG mode:

```
config system settings
    set default-voip-alg-mode kernel-helper-based
end
```

2. Configure the firewall policy:

```
config firewall policy
    edit 0
        set name "VoIP-session-helper"
        set utm-status enable
        set voip-profile ""
    next
end
```

3. Configure the session helper:

```
config system session-helper
    edit 13
        set name sip
        set protocol 17
        set port 5060
    next
end
```

Example 2

In this example, the `default-voip-alg-mode` is set to either `proxy-based` or `kernel-helper-based`. A VoIP profile that has SIP disabled is applied to the firewall policy.

To configure the SIP session helper:

1. Configure the default VoIP ALG mode:

```
config system settings
    set default-voip-alg-mode {proxy-based | kernel-helper-based}
end
```

2. Configure the VoIP profile:

```
config voip profile
    edit "sip-disabled-profile"
        set feature-set voipd
        config sip
```

```
            set status disable
        end
    next
end
```

3. Configure the firewall policy:

```
config firewall policy
    edit 0
        set name "VoIP-session-helper"
        set utm-status enable
        set voip-profile "sip-disabled-profile"
    next
end
```

4. Configure the session helper:

```
config system session-helper
    edit 13
        set name sip
        set protocol 17
        set port 5060
    next
end
```

Example 3

In certain scenarios, especially when advised by your SIP provider, it may be necessary to disable the SIP ALG and SIP session helper to ensure proper SIP traffic handling and avoid call issues.

To disable the SIP ALG and SIP session helper from managing SIP traffic:

1. Identify the SIP session helper entry:

```
# show system session-helper
```

Look for an entry similar to the following:

```
edit 13
    set name sip
    set protocol 17
    set port 5060
next
```

2. Once identified, remove the SIP session helper:

```
config system session-helper
    delete 13
end
```

Repeat this step for other ports if SIP traffic uses different ports.

3. Change the default SIP mode to set how the FortiGate handles VoIP traffic when a policy that accepts the traffic does not include a VoIP profile.

```
config system settings
    set default-voip-alg-mode kernel-helper-based
end
```

4. Inspect the firewall policy that governs SIP traffic:

```
# show firewall policy 1
config firewall policy
    edit 1
        set name "voip to internet"
        set srcintf "port1"
        set dstintf "wan1"
        set action accept
        set srcaddr "all"
        set dstaddr "all"
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set voip-profile "default"
        set logtraffic all
        set nat enable
    next
end
```

If no VoIP profile is configured in the policy, skip to the next step.

5. Modify or remove the VoIP profile:
   - Disable SIP ALG in the VoIP profile:

```
config voip profile
    edit default
        config sip
            set status disable
            set rtp disable
        end
    next
end
```

   - Remove the VoIP profile from the firewall policy:

```
config firewall policy
    edit 1
        unset voip-profile
    next
end
```

6. To ensure changes take effect, clear any existing SIP sessions:

```
# diagnose sys session filter dport 5060
# diagnose sys session clear
```

```
# diagnose sys session filter sport 5060
# diagnose sys session clear
```

Clearing sessions on port 5060 will terminate all active SIP calls passing through the FortiGate.

7. To ensure your FortiGate device is no longer utilizing SIP Session Helper or the SIP ALG, check the active sessions:

```
# diagnose sys session list | grep sip
```

Check for the following flags:

Flag	Description
`ndr`	Flow SIP (IPS) handles the traffic.
`redir and local`	SIP ALG handles the traffic.
`helper=sip`	SIP kernel helper (session-helper) handles the traffic.
`helper=20 or helper=24`	SIP ALG handles the traffic.

If you see any flags other than `ndr`, it indicates that either the SIP session helper or the SIP ALG is handling the traffic.

Modifying the SIP port

Most SIP configurations use TCP or UDP port 5060 for SIP sessions and port 5061 for SIP SSL sessions. If your SIP network uses different ports for SIP sessions, the SIP port can be changed. You can also listen to two TCP and UDP ports .

To change the SIP port:

```
config system settings
    set sip-tcp-port 5064
    set sip-udp-port 5065
    set sip-ssl-port 5066
end
```

To listen to two TCP and UDP ports:

```
config system settings
    set sip-tcp-port 5060 5064
    set sip-udp-port 5061 5065
end
```

To modify the SIP ports for the default SIP session helper:

```
config system session-helper
    edit 13
        set name sip
        set protocol 17
        set port 5065
    next
end
```

To add a new session helper to listen on UDP and TCP 5064:

```
config system session-helper
    edit 0
        set name sip
        set port 5064
    next
end
```

SIP pinholes

When SIP ALG processes a SIP call, it usually opens pinholes for SIP signaling and RTP/RTCP packets. NAT usually takes place during the process at both the network and SIP application layers. SIP ALG ensures that, with NAT happening, corresponding SIP and RTP/RTCP pinholes are created during the process when it is necessary for call sessions to be established through FortiOS devices.

By default, SIP ALG manages pinholes automatically, but some special configurations can be used to restrict the pinholes if required.

SIP pinhole restriction

The `strict-register` attribute is enabled by default. When enabled, after a SIP endpoint registers to the SIP server through a firewall policy on the FortiGate, only the SIP messages sent from the same IP address as the SIP server are allowed to pass through the SIP pinhole that is created in the FortiGate to reach the SIP endpoints. If the attribute is disabled, SIP messages from any IP addresses can pass through the pinhole created after the registration.

SIP pinhole restriction is only supported by SIP ALG and in proxy mode.

To configure registrar connection ability:

```
config voip profile
    edit <name>
        config sip
            set strict-register {enable | disable}
        end
```

```
    next
end
```

RTP/RTCP pinhole restriction

The `nat-port-range` setting is used to specify a port range in the VoIP profile to restrict the NAT port range for Real-time Transport Protocol/Real-time Transport Control Protocol (RTP/RTCP) packets in a Session Initiation Protocol (SIP) call session that is handled by the SIP application layer gateway (ALG) in a FortiGate.

When NAT is enabled, or VIP is used in a firewall policy for SIP ALG to handle a SIP call session established through a FortiGate, the SIP ALG can perform NAT to translate the ports used for the RTP/RTCP packets when they are flowing through the device between the external and internal networks.

To edit the translated port range for RTP/RTCP packets:

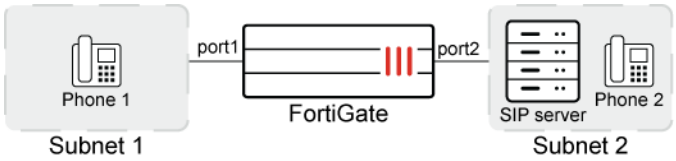
```
config voip profile
    edit <name>
        config sip
            set nat-port-range <start_port_number>-<end_port_number>
        end
    next
end
```

`nat-port-range <start_port_number>-<end_port_number>`	Enter the NAT port range (minimum port number = 5117, default = 5117-65535).

Example

In this example, Phone 1 is in Subnet 1, and the SIP server and Phone 2 are in Subnet 2. All SIP signaling messages and RTP/RTCP packets go through the SIP server. The RTP/RTCP ports on Phone 1 are configured as 17078/17079.

The FortiGate administrator wants to use NAT for the port 17078/17079 to 30000/30001. If Phone 1 and Phone 2 are registered to the SIP server, and they establish a call session between them through the FortiGate and the SIP server, then the RTP/RTCP ports 17078/17079 of Phone 1 will be translated to ports 30000/30001. All RTP/RTCP packets going out of port2 have source ports of 30000/30001, and all RTP/RTCP packets going into port2 also have destination ports of 30000/30001.



To configure the custom port range:

1. Edit the VoIP profile:

```
config voip profile
    edit "natPortRange"
        config sip
            set nat-port-range 30000-30001
        end
    next
end
```

> It is best practice to configure the starting port as an even number and the ending port as an odd number.

2. Configure the firewall policy:

```
config firewall policy
    edit 1
        set srcintf port1
        set dstintf port2
        set srcaddr all
        set dstaddr all
        set service SIP
        set action accept
        set schedule always
        set voip-profile natPortRange
        set nat enable
    next
end
```

SIP over TLS

Some SIP phones and servers can communicate using TLS to encrypt the SIP signaling traffic. To allow SIP over TLS calls to pass through the FortiGate, the encrypted signaling traffic must be unencrypted and inspected. The FortiGate SIP ALG intercepts, unencrypts, and inspects the SIP packets, which are then re-encrypted and forwarded to their destination.

The SIP ALG only supports full mode TLS. This means that the SIP traffic between SIP phones and the FortiGate, and between the FortiGate and the SIP server, is always encrypted. The highest TLS version supported by SIP ALG is TLS 1.3.

To enable SIP over TLS support, the SSL mode in the VoIP profile must be set to `full`. The SSL server and client certificates can be provisioned so that the FortiGate can use them to establish connections to SIP phones and servers, respectively.

> This configuration is only supported in proxy mode.

To configure SIP over TLS:

1. Configure a VoIP profile with SSL enabled:

```
config voip profile
    edit "tls"
        config sip
            set ssl-mode full
            set ssl-client-certificate "ssl_client_cert"
            set ssl-server-certificate "ssl_server_cert"
        end
    next
end
```

   The `ssl_server_cert`, `ssl_client_cert`, and key files can be generated using a certification tool, such as OpenSSL, and imported to the local certificate store of the FortiGate from *System* > *Certificates* in the GUI. Existing local certificates in the certificate store can also be used. As always for TLS connections, the certificates used must be verified and trusted at the other end of the connection when required.

   For example, the CA certificate of the SIP server's certificate should be imported to the FortiGate as an external CA certification, so that the FortiGate can use it to verify the SIP server's certificate when setting up the TLS connection. The CA certificate configured as the `ssl_server_cert` should be installed as the trusted certificate on the SIP phones. The deployment of the certificates across the network depends on the SIP client and server devices that are used in the system.

2. Apply the profile to the firewall policy:

```
config firewall policy
    edit 1
        set srcintf "port1"
        set dstintf "port2"
        set srcaddr "all"
        set dstaddr "vip_sip_server"
        set action accept
        set schedule "always"
        set service "SIP"
        set utm-status enable
        set voip-profile "tls"
    next
end
```

Voice VLAN auto-assignment

You can leverage LLDP-MED to assign voice traffic to the desired voice VLAN. After detection and setup, the IP phone on the network is segmented to its own VLAN for policy, prioritization, and reporting. The LLDP reception capabilities in FortiOS include LLDP-MED assignment for voice, voice signaling, guest, guest voice signaling, softphone, video conferencing, streaming video, and video signaling.

You can configureVLAN auto-assignment using the following steps:

1. Set up the VLAN for the voice device
2. Set up the DHCP server for the voice VLAN

3. Sett up the LLDP network policy
4. Enable LLDP on the physical interface that the VLAN belongs to
5. Apply the LLDP network policy on the physical interface
6. Confirm that the VLAN was assigned

To set up the VLAN for the voice device:

```
config system interface
    edit "vlan_100"
        set vdom "root"
        set ip 192.168.1.99 255.255.255.0
        set alias "voice_vlan"
        set device-identification enable
        set role lan
        set snmp-index 25
        set interface "port10"
        set vlanid 100
    next
end
```

To set up the DHCP server for the voice VLAN:

```
config system dhcp server
    edit 1
        set dns-service default
        set default-gateway 192.168.1.99
        set netmask 255.255.255.0
        set interface "vlan_100"
        config ip-range
            edit 1
                set start-ip 192.168.1.110
                set end-ip 192.168.1.210
            next
        end
    next
end
```

To set up the LLDP network policy:

```
config system lldp network-policy
    edit "1"
        config voice
            set status enable
            set tag dot1q
            set vlan 100
        end
    next
end
```

To enable LLDP on the physical interface that the VLAN belongs to:

```
config system interface
    edit "port10"
        set vdom "root"
        set type physical
        set lldp-reception enable
        set lldp-transmission enable
        set snmp-index 14
    next
end
```

To apply the LLDP network policy on the physical interface:

```
config system interface
    edit "port10"
        set lldp-network-policy "1"
    next
end
```

To confirm that the VLAN was assigned as expected:

1. Connect an IP phone to the network.
2. Check the IP address on the phone.
   The IP address should belong to the voice VLAN.
3. Sniff on the FortiGate incoming interface to see if traffic from the IP phone has the desired VLAN tag.
   In this example, the voice traffic from the IP phone should be in VLAN 100.

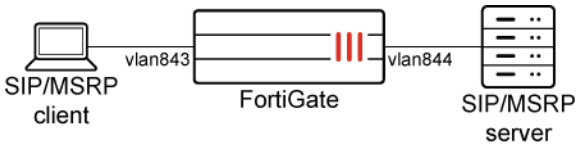
Scanning MSRP traffic

An MSRP (Message Session Relay Protocol) decoder in the IPS engine scans for IPS signatures against the application data. Malicious payload in the text message can be blocked. A VoIP profile using flow inspection mode must be configured in the firewall policy. An IPS profile must be configured in the firewall policy to inspect the payload.

```
config voip profile
    edit <name>
        set feature-set flow
        config msrp
            set status {enable | disable}
            set log-violations {enable | disable}
            set max-msg-size <integer>
            set max-msg-size-action {pass | block | reset | monitor}
        end
    next
end
```

`status {enable | disable}`	Enable/disable MSRP.
`log-violations {enable | disable}`	Enable/disable logging of MSRP violations.
`max-msg-size <integer>`	Maximum allowable MSRP message size, in bytes (0 - 65535, default = 0).
`max-msg-size-action {pass | block | reset | monitor}`	Action for violating maximum MSRP message size: • pass: pass or allow matching traffic (default) • block: block or drop matching traffic • reset: reset sessions for matching traffic • monitor: pass and log matching traffic

Examples



In this first example, MSRP messages larger than 10 bytes will be blocked. The client sends an oversized MSRP message to the server. Message Automation & Protocol Simulation (MAPS™) is used, and a client-server model was configured to use the software to send MSRP traffic from vlan843 (client) to vlan844 (server) with plain text placed in the message field. The software uses the content of the MsrpInputMessage.txt file located in the default folder, where anything in that file will be sent by MSRP. The following text is used:

> GL's Message Automation & Protocol Simulation (MAPS™) is a protocol simulation and conformance test tool that supports a variety of protocols such as SIP, MEGACO, MGCP, SS7, ISDN, GSM, MAP, CAS, LTE, UMTS, SS7 SIGTRAN, ISDN SIGTRAN, SIP I, GSM AoIP, Diameter and others. This message automation tool covers solutions for both protocol simulation and protocol analysis. The application includes various test plans and test cases to support the testing of real-time entities. Along with automation capability, the application gives users the unlimited ability to edit messages and control scenarios (message sequences).

To configure MSRP traffic scanning:

1. Configure the VoIP profile:

```
config voip profile
    edit msrp_test
        set feature-set flow
        config msrp
            set status enable
            set log-violations enable
            set max-msg-size 10
            set max-msg-size-action block
        end
    next
end
```

2. Configure the firewall policy:

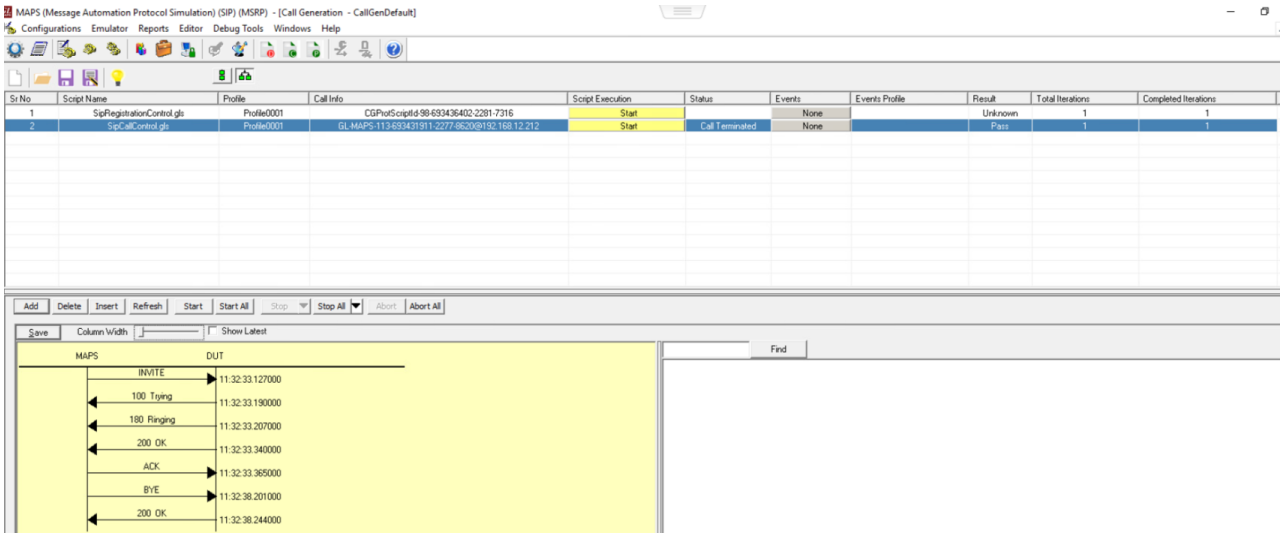
```
config firewall policy
    edit 1
        set name "vdom3"
        set srcintf "vlan843"
        set dstintf "vlan844"
        set action accept
        set srcaddr "all"
        set dstaddr "all"
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set ssl-ssh-profile "certificate-inspection"
        set voip-profile "msrp_test"
        set logtraffic all
    next
end
```

3. Verify the log:

```
# execute log filter category 4
# execute log display
1 logs found.
1 logs returned.

1: date=2021-06-10 time=17:21:19 eventtime=1623370879840284165 tz="-0700" logid="0419016384"
type="utm" subtype="ips" eventtype="signature" level="alert" vd="vdom3" severity="info"
srcip=192.168.12.212 srccountry="Reserved" dstip=192.168.12.213 srcintf="vlan843"
srcintfrole="lan" dstintf="vlan844" dstintfrole="lan" sessionid=27700 action="dropped" proto=6
service="MSRP" policyid=1 attack="MSRP.Max.Message.Size.Exceeded" srcport=20036 dstport=20036
direction="outgoing" attackid=1000000 profile="g-default"
ref="http://www.fortinet.com/ids/VID1000000" incidentserialno=189792275 psrcport=0 pdstport=0
msg="msrp_decoder: MSRP.Max.Message.Size.Exceeded, msg_size=270 exceeds config maximum=10"
```

4. In MAPS, verify that the call was terminated:



In this second example, malicious files will be blocked. The client sends an EICAR test sample to the server in an MSRP message. Message Automation & Protocol Simulation (MAPS™) is used, and a client-server model was configured to use the software to send MSRP traffic from vlan843 (client) to vlan844 (server) with a plain text EICAR file containing a virus in the message field. The following text is used:

X5O!P%@AP[4\PZX54(P^)7CC)7}$EICAR-STANDARD-ANTIVIRUS-TEST-FILE!$H+H*

To configure MSRP traffic scanning:

1. Configure the VoIP profile:

```
config voip profile
    edit msrp_test
        set feature-set flow
        config msrp
            set status enable
            set log-violations enable
            set max-msg-size 0
            set max-msg-size-action pass
        end
    next
end
```

2. Configure the IPS profile:

```
config ips sensor
    edit "msrp"
        set extended-log enable
        config entries
            edit 1
                set rule 7470 29844
                set status enable
                set action block
            next
        end
    next
end
```

3. Configure the firewall policy:

```
config firewall policy
    edit 1
        set name "vdom3"
        set srcintf "vlan843"
        set dstintf "vlan844"
        set action accept
        set srcaddr "all"
        set dstaddr "all"
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set ssl-ssh-profile "certificate-inspection"
        set ips-sensor "msrp"
```

```
        set voip-profile "msrp_test"
        set logtraffic all
    next
end
```

4. Verify the log:

```
# execute log filter category 4
# execute log display
1 logs found.
1 logs returned.

1: date=2021-09-16 time=11:29:48 eventtime=1631816988947762597 tz="-0700" logid="0419016384"

ICAP

Internet Content Adaptation Protocol (ICAP) is an application layer protocol that is used to offload tasks from the firewall to separate, specialized servers. For more information see RFC 3507.

ICAP profiles can only be applied to policies that use proxy-based inspection. If you enable ICAP in a policy, HTTP and HTTPS (if HTTPS inspection is supported) traffic that is intercepted by the policy is transferred to the ICAP server specified by the selected ICAP profile. Responses from the ICAP server are returned to the FortiGate, and then forwarded to their destination.

By default, *ICAP* is not visible in the GUI. See Feature visibility on page 3820 for instructions on making it visible.

ICAP filter profiles cannot be used in NGFW policy-based mode. See NGFW policy on page 1803 for more information.

This feature is not supported on FortiGate models with 2 GB RAM or less. See Proxy-related features not supported on FortiGate 2 GB RAM models on page 126 for more information.

To configure ICAP:

1. Set up your ICAP server.
2. On the FortiGate, add an ICAP server.
3. Create an ICAP profile.
4. Use the ICAP profile in a firewall policy that covers the traffic that needs to be offloaded to the ICAP server.

The following topics provide information about ICAP:

- ICAP configuration example on page 2507
- ICAP response filtering on page 2510
- Secure ICAP clients on page 2512
- ICAP scanning with SCP and FTP on page 2513
- Domain name in XFF with ICAP on page 2516
- Protocol transparency for ICAP on page 2520
- Selective forwarding to ICAP server on page 2521

TCP connection pool for connections to ICAP server

A TCP connection pool can maintain local-out TCP connections to the external ICAP server due to a backend update in FortiOS. TCP connections will not be terminated once data has been exchanged with the ICAP server, but instead are reused in the next ICAP session to maximize efficiency.

For example, consider a scenario where an ICAP profile is used as a UTM profile in an explicit web proxy policy, and a client visits web servers through this proxy policy.

Once the WAD is initialized, when a HTTP request is sent from the client to the server through the FortiGate with an ICAP profile applied to the matched proxy policy, a TCP connection is established between the FortiGate and the ICAP server to exchange data.

When an ICAP session is finished, the TCP connection is kept in the WAD connection pool. When another ICAP session needs to be established, the WAD will check if there are any idle connections available in the connection pool. If an idle connection is available, then it will be reused; otherwise, a new TCP connection is established for the ICAP session. This process can be checked in the WAD debug log.

ICAP configuration example

In this example, the ICAP server performs proprietary content filtering on HTTP and HTTPS requests. If the content filter is unable to process a request, then the request is blocked. Streaming media is not considered by the filter, so it is allowed through and is not processed.

To configure the ICAP setup in the GUI:

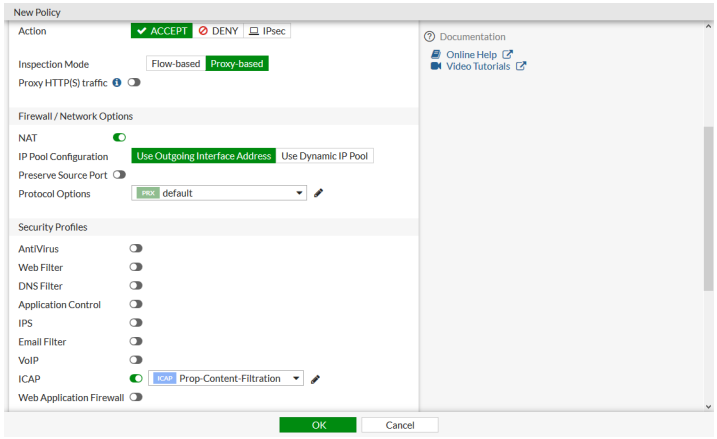
1. Add the ICAP server:
   a. Go to *Security Profiles* > *ICAP Servers* and click *Create New*.
   b. In the *Name* field, enter a name for the ICAP server, such as *content-filtration-server4*.
   c. Select the *IP Version*.
   d. In the *IP Address* field, enter the IP address of the ICAP server.
   e. In the *Port* field, enter a new port number if required. The default value is *1344*.

   f. Click *OK*.

> The maximum number of concurrent connections to ICAP server can be configured in the CLI (`set max-connections`). The default setting is 100 connections.

2. Create the ICAP profile:
   a. Go to *Security Profiles* > *ICAP* and click *Create New*.
   b. In the *Name* field, enter a name for the ICAP profile, such as *Prop-Content-Filtration*.
   c. Enable *Request Processing* and set the following:
      - *Server*: select the ICAP server (*content-filtration-server4*).
      - *Path*: enter the path to the processing component on the server, such as */proprietary_code/content-filter/*.
      - *On Failure*: select *Error* to block the request. If the message cannot be processed, it will be blocked.
   d. Enable *Response Processing* and set the following:
      - *Server*: select the ICAP server (*content-filtration-server4*).
      - *Path*: enter the path to the processing component on the server, such as */proprietary_code/content-filter/*.
      - *On Failure*: select *Error* to block the request. If the message cannot be processed, it will be blocked.
   e. Enable *Streaming Media Bypass* to not offload streaming media to the ICAP server.

   f. Click *OK*.
3. Add the ICAP profile to a policy:
   a. Go to *Policy & Objects* > *Firewall Policy* and click *Create New*.
   b. Set *Inspection Mode* to *Proxy-based*.
   c. Under *Security Profiles*, enable *ICAP* and select the ICAP server.



d. Configure the other settings as needed.

e. Click *OK*.

To configure the ICAP setup in the CLI:

1. Add the ICAP server:

```
config icap server
    edit "content-filtration-server4"
        set ip-version 4
        set ip-address 172.16.100.55
        set port 1344
        set max-connections 200
    next
end
```

2. Create the ICAP profile:

```
config icap profile
    edit "Prop-Content-Filtration"
        set request enable
        set response enable
        set streaming-content-bypass enable
        set request-server "content-filtration-server4"
        set response-server "content-filtration-server4"
        set request-failure error
        set response-failure error
        set request-path "/proprietary_code/content-filter/"
        set response-path "/proprietary_code/content-filter/"
        set methods delete get head options post put trace other
    next
end
```

3. Add the ICAP profile to a policy:

```
config firewall policy
    edit 5
        set name "icap_filter3"
        set srcintf "virtual-wan-link"
        set dstintf "virtual-wan-link"
        set srcaddr "FABRIC_DEVICE"
        set dstaddr "FABRIC_DEVICE"
        set dstaddr-negate enable
        set action accept
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set inspection-mode proxy
        set ssl-ssh-profile "certificate-inspection"
        set icap-profile "Prop-Content-Filtration"
        set logtraffic disable
        set fsso disable
```

```
        set nat enable
    next
end
```

ICAP response filtering

ICAP HTTP responses can be forwarded or bypassed based on the HTTP header value and status code.

When configuring the ICAP profile, if `response` is enabled, the `respmod-default-action` option can be configured:

- If `respmod-default-action` is set to `forward`, FortiGate will treat every HTTP response and send ICAP requests to the ICAP server.
- If `respmod-default-action` is set to `bypass`, FortiGate will only send ICAP requests if the HTTP response matches the defined rules, and the rule's action is set to forward.

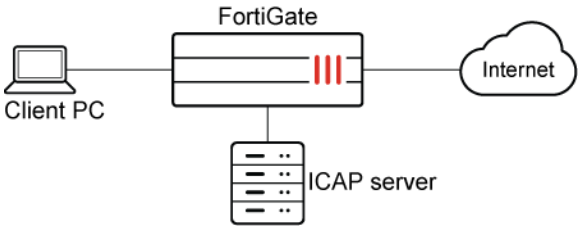
When configuring a response rule:

- The `http-resp-status-code` option is configured to specific HTTP response codes. If the HTTP response has any one of the configured values, then the rule takes effect.
- Multiple header value matching groups can be configured. If the header value matches one of the groups, then the rule takes effect.
- If both status codes and header values are specified in a rule, the response must match at least one of each.

The UTM ICAP log category is used for logging actions when FortiGate encounters errors with the ICAP server, such as no service, unreachable, error response code, or timeout. If an error occurs, a traffic log and an associated UTM ICAP log will be created.

Example

The FortiGate acts as a gateway for the client PC and connects to a reachable ICAP server. The ICAP server can be in NAT, transparent, or proxy mode.



In this example, client request HTTP responses will be forwarded to the ICAP server from all hosts if they have an HTTP status code of 200, 301, or 302, and have `content-type: image/jpeg` in the their header.

To configure an ICAP profile with HTTP response rules:

```
config icap profile
    edit "icap_profile2"
        set request disable
```

```
        set response enable
        set streaming-content-bypass disable
        set preview disable
        set response-server "icap_server1"
        set response-failure error
        set response-path ''
        set methods delete get head options post put trace other
        set response-req-hdr disable
        set respmod-default-action bypass
        config respmod-forward-rules
            edit "rule2"
                set host "all"
                set action forward
                set http-resp-status-code 200 301 302
                config header-group
                    edit 2
                        set header-name "content-type"
                        set header "image/jpeg"
                    next
                end
            next
        end
    next
end
```

To view the logs if an error occurs:

1. View the traffic log:

```
# execute log filter category 0
# execute log display
1 logs found.
1 logs returned.

 1: date=2019-10-25 time=17:43:47 logid="0000000013" type="traffic" subtype="forward"

```

2. View the UTM ICAP log:

```
# execute log filter category 20
# execute log display
1 logs found.
1 logs returned.

 1: date=2019-10-25 time=17:43:46 logid="2000060000" type="utm" subtype="icap"
```

```
eventtype="icap" level="warning" vd="vdom1" eventtime=1572050626010097145 tz="-0700"
msg="Request blocked due to ICAP server error" service="HTTP" srcip=10.1.100.145
dstip=172.16.200.46 srcport=47968 dstport=80 srcintf="port1" srcintfrole="undefined"
dstintf="port2" dstintfrole="undefined" policyid=1 sessionid=43549 proto=6 action="blocked"
profile="icap_profile1" url="/icap_test/"
```

The logs show that the ICAP services stopped before the access. When the client tried to access HTTP and ICAP took effect, the FortiGate sent the ICAP request to the ICAP server and received an error. The client sees a *502 Bad Gateway* message, and FortiGate writes the two logs. In the GUI, the logged traffic is displayed as *Result: Deny: UTM Blocked*.

Secure ICAP clients

A secure SSL connection from the FortiGate to the ICAP server can be configured as follows:

```
config icap server
    edit <name>
        set secure {enable | disable}
        set ssl-cert <certificate>
    next
end
```

To configure a secure ICAP client:

1. Configure the ICAP server:

```
config icap server
    edit "icap_server1"
        set ip-version 4
        set ip-address 192.168.10.2
        set port 11344
        set max-connections 100
        set secure enable
        set ssl-cert "ACCVRAIZ1"
    next
end
```

> Port 11344 is the standard port for secure ICAP. This must be configured manually if the secure connection is enabled.

2. Configure the ICAP profile:

```
config icap profile
    edit "icap_profile1"
        set request enable
        set response enable
        set streaming-content-bypass enable
        set request-server "icap_server1"
        set response-server "icap_server1"
```

```
    next
end
```

3. Configure the firewall policy:

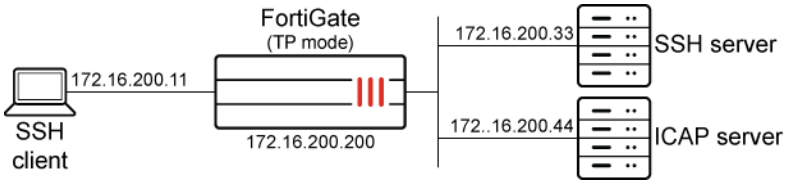
```
config firewall policy
    edit 1
        set utm-status enable
        set inspection-mode proxy
        set ssl-ssh-profile "protocols"
        set icap-profile "icap_profile1"
    next
end
```

ICAP scanning with SCP and FTP

A FortiGate can forward files transferred by SCP and FTP to an ICAP server for further scanning. Previously, only HTTP and HTTPS were supported for ICAP forwarding.

Example

The FortiGate used in this example is operating in transparent mode. The SSH client, 172.16.200.11, sends a file named `today` to the SSH server at 172.16.200.33 using SCP. Since SCP transfers are encrypted inside an SSH tunnel, for the FortiGate to scan the traffic, deep inspection must be enabled in the SSL SSH profile.



To configure ICAP scanning with SCP:

1. Configure the ICAP server settings:

```
config icap server
    edit "icap_server1"
        set ip-address 172.16.200.44
    next
end
```

2. Configure the ICAP profile for SSH:

```
config icap profile
    edit "icap_profile1"
        set file-transfer ssh
        set file-transfer-server "icap_server1"
        set file-transfer-path "ssh_test"
```

```
    next
end
```

If the file transfer is over FTP, configure the profile as follows:

```
config icap profile
    edit "icap_profile1"
        set file-transfer ftp
        set streaming-content-bypass enable
        set file-transfer-server "icap_server1"
        set file-transfer-path "ftp_test"
    next
end
```

3. Configure the SSL SSH profile:

```
config firewall ssl-ssh-profile
    edit "protocols"
        config ssh
            set ports 22
            set status deep-inspection
        end
    next
end
```

4. Configure the firewall policy:

```
config firewall policy
    edit 1
        set name "ICAP"
        set srcintf "lan"
        set dstintf "mgmt"
        set action accept
        set srcaddr "all"
        set dstaddr "all"
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set inspection-mode proxy
        set profile-protocol-options "protocol"
        set ssl-ssh-profile "protocols"
        set icap-profile "icap_profile1"
    next
end
```

To test the configuration:

1. On a Linux client, copy a filed named `today` to the SSH server using SCP:

```
scp today fosqa@172.16.200.33:/home/fosqa/ssh_depot/
```

2. Capture a sniffer trace between the FortiGate and ICAP server, then verify the output from the ICAP protocol session.
   a. The client request and the file to be inspected:

```
Icap_client REQMOD:
172.016.200.200.13185-172.016.200.044.01344: REQMOD icap://172.16.200.44:1344/ssh_test
ICAP/1.0
Host: 172.16.200.44:1344
X-Client-IP: 172.16.200.11
X-Server-IP: 172.16.200.33
X-Authenticated-User: TG9jYWw6Ly9hbm9ueW1vdXM=
X-Authenticated-Groups: TG9jYWw6Ly9sb2NhbGhvc3Qvbm8gYXV0aGVudGljYXRpb24=
User-Agent: FortiOS v7.2.0
Encapsulated: req-hdr=0, req-body=116

PUT /scp/today HTTP/1.1
Host: 172.16.200.11
Content-Type: application/octet-stream
Transfer-Encoding: chunked

1d
Tue Sep 20 04:01:50 UTC 2022
```

   Where:
   - `X-Client-IP` = the client sending the file
   - `X-Server-IP` = the server receiving the file
   - `Tue Sep 20 04:01:50 UTC 2022` = the content of the file, which is in clear text after the FortiGate performs deep inspection

   b. The ICAP server response that the file is cleared and allowed to pass without modifications:

```
Icap-server reply:
172.016.200.044.01344-172.016.200.200.13185: ICAP/1.0 200 OK
ISTag: "GreasySpoon-1.0.7-b03"
Host: 0.0.0.0:1344
Encapsulated: req-hdr=0, req-body=136
Connection: keep-alive

PUT /scp/today HTTP/1.1
Host: 172.16.200.11
Content-Type: application/octet-stream
Transfer-Encoding: chunked
Content-Length: 29

1d
Tue Sep 20 04:01:50 UTC 2022
```

3. On a Linux client, copy the file from the server locally using SCP:

```
scp fosqa@172.16.200.33:/home/fosqa/ssh_depot/today2/
```

4. Similar outputs are observed. The ICAP client request indicates that the file is copied from the SSH server:

```
PUT /scp/today2 HTTP/1.1
Host: 172.16.200.33
```

Domain name in XFF with ICAP

The FortiGate can forward additional domain-related information to the ICAP server. Once domain information is gathered from an external authentication server (such as LDAP or an FSSO collector agent), FortiOS incorporates this domain information in `WinNT://DOMAIN/Username` format and forwards it to the ICAP server.

Basic ICAP configuration

The ICAP server and profile are configured on the FortiGate. The ICAP profile's header settings uses the `WinNT://$domain/$user` variable for the user information provided by the remote authentication server.

To configure the ICAP settings:

1. Configure the ICAP server:

```
config icap server
    edit "content-filtration-server4"
        set ip-address 10.1.100.41
        set max-connections 200
    next
end
```

2. Configure the ICAP profile:

```
config icap profile
    edit "Prop-Content-Filtration"
        set request enable
        set response enable
        set streaming-content-bypass enable
        set request-server "content-filtration-server4"
        set response-server "content-filtration-server4"
        set request-path "/proprietary_code/content-filter/"
        set response-path "/proprietary_code/content-filter/"
        set methods delete get head options post put trace other
        config icap-headers
            edit 1
                set name "X-Authenticated-User"
                set content "WinNT://$domain/$user"
            next
        end
    next
end
```

3. Configure the firewall policy:

```
config firewall policy
    edit 4
        set name "icap_filter3"
        set srcintf "port10"
        set dstintf "port9"
        set action accept
        set srcaddr "all"
        set dstaddr "all"
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set inspection-mode proxy
        set ssl-ssh-profile "deep-inspection"
        set icap-profile "Prop-Content-Filtration"
        set logtraffic all
        set nat enable
        set groups "ldap group" "AD-group"
    next
end
```

LDAP example

In this example, an AD LDAP server and remote user group are configured. When successful user authentication occurs, FortiOS retrieves all the user information (such as the domain name) from the UserPrincipalName attribute. A packet capture is used to compare the user and domain information before and after authentication in the ICAP REQMOD message.

To configure the LDAP authentication:

1. Configure the LDAP server:

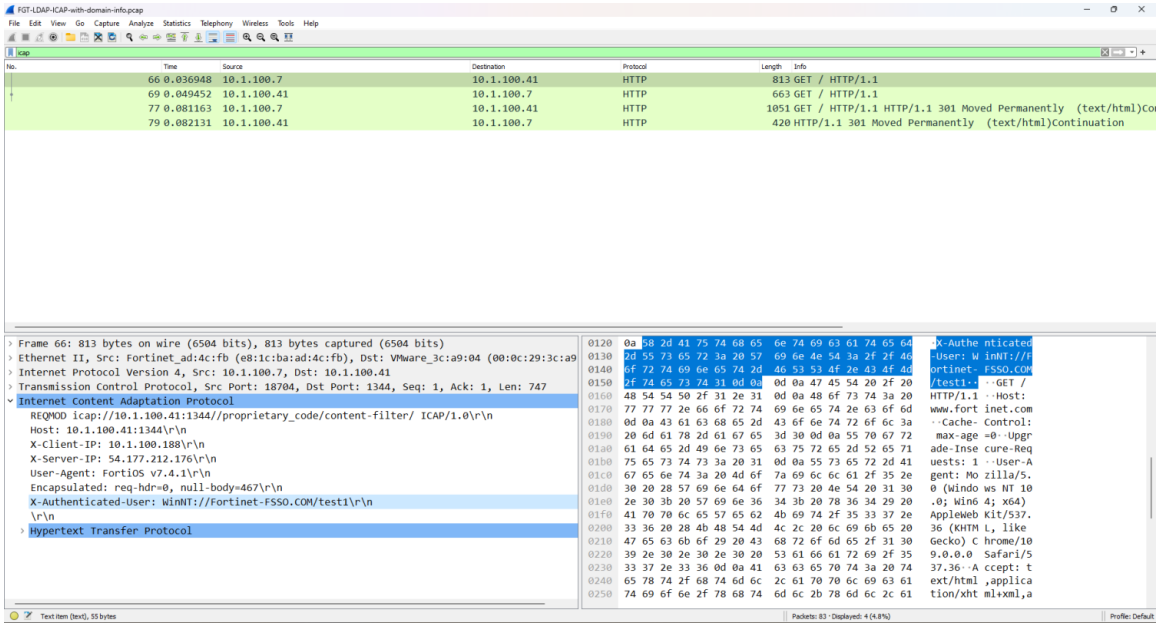
```
config user ldap
    edit "AD-ldap"
        set server "10.1.100.131"
        set cnid "cn"
        set dn "dc=fortinet-fsso,dc=com"
        set type regular
        set username "cn=Administrator,cn=users,dc=fortinet-fsso,dc=com"
        set password **********
    next
end
```

2. Configure the LDAP user group:

```
config user group
    edit "ldap group"
        set member "AD-ldap"
        config match
            edit 1
                set server-name "AD-ldap"
```

```
            set group-name "CN=group1,OU=Testing,DC=Fortinet-FSSO,DC=COM"
        next
        edit 2
            set server-name "AD-ldap"
            set group-name "CN=group2,OU=Testing,DC=Fortinet-FSSO,DC=COM"
        next
    end
next
end
```

3. Start local traffic dump between the FortiGate and ICAP server before a user authenticates and save it in a PCAP file.
4. Verify the PCAP file. The Fortinet-fsso.com domain appears in the ICAP REQMOD message.



5. Optionally, run the following command to verify WAD debugs:

```
# diagnose wad debug enable category icap
```

FSSO example

In this example, a local FSSO agent and remote user group are configured. When successful user authentication occurs, FortiOS retrieves all the user information (such as the domain name). A packet capture is used to compare the user and domain information before and after authentication in the ICAP REQMOD message.

To configure the FSSO authentication:

1. Configure the FSSO agent:

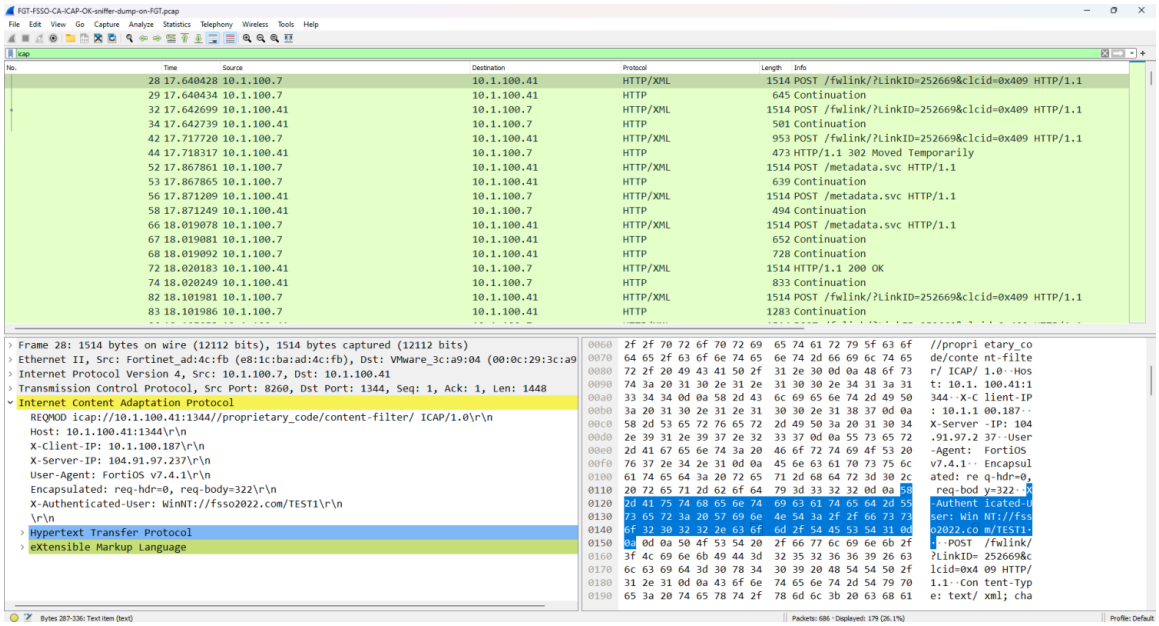
```
config user fsso
    edit "AD-fsso"
        set server "10.1.100.199"
```

```
        set password **********
    next
end
```

2. Configure the FSSO user group:

```
config user group
    edit "AD-group"
        set group-type fsso-service
        set member "FORTINET-FSSO/GROUP1" "FORTINET-FSSO/GROUP2"
    next
end
```

3. Start local traffic dump between the FortiGate and ICAP server before a user authenticates and save it in a PCAP file.
4. Verify the PCAP file. The fsso2022.com domain appears in the ICAP REQMOD message.



5. Optionally, verify the FSSO log file and search for the `get_dns_domain` lines:

```
...
06/20/2023 14:58:58 [ 1484] FortiGate connection accepted, auth OK.

```

Protocol transparency for ICAP

FortiGate incorporates the original client protocol type (such as, HTTP, HTTPS, FTP, FTPS, SFTP, and SCP) into the ICAP header through the `X-Forwarded-Proto` field, enhancing integration with FortiData as the ICAP server. This enables FortiData to have full information about the client protocol used, allowing it to enforce security according to corporate security policies.

For example, the client-side ICAP packet captures includes the `X-Forwarded-Proto` field, as follows:

```
172.016.200.200.02467-172.016.200.044.01344: RESPMOD icap://172.16.200.44:1344/ ICAP/1.0
Host: 172.16.200.44:1344
X-Client-IP: 10.1.100.11
X-Server-IP: 172.16.200.33
X-Forwarded-Proto: HTTPS
User-Agent: FortiOS v7.6.1
X-Scan-Progress-Interval: 10
Encapsulated: req-hdr=0, res-hdr=103, res-body=354

Selective forwarding to ICAP server

The ICAP profile can allow the selective forwarding of only image files, such as JPEG, JPG, and PNG, to an ICAP (Internet Content Adaptation Protocol) server for OCR (optical character recognition) scanning. When enabled, FortiGate forwards only image files that are relevant for OCR scanning to the ICAP server. This selective forwarding applies only to image files in HTTP responses; it does not apply to image files in HTTP requests. By reducing processing time and optimizing resource usage, this feature enhances overall system efficiency.

```
config icap profile
    edit <name>
        set ocr-only {enable | disable}
    next
end
```

Command	Description
`ocr-only {enable | disable}`	Enable/disable only passing OCR scan requests of images files to ICAP server (default = disabled). When enabled, also enable `response` to allow FortiGate to forward images to the ICAP server.

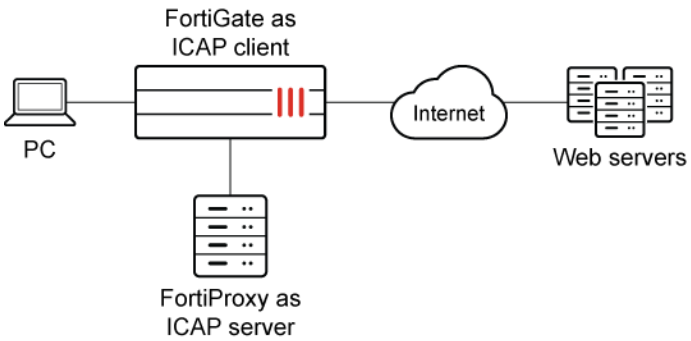
You cannot enable the `ocr-only` and `streaming-content-bypass` options in an ICAP profile at the same time. When `ocr-only` is enabled, the `streaming-content-bypass` option is removed from the CLI.

The ocr-only feature applies only to HTTP. FTP and SCP are not supported. In addition, this feature applies only to HTTP downloads. HTTP uploads are not supported.

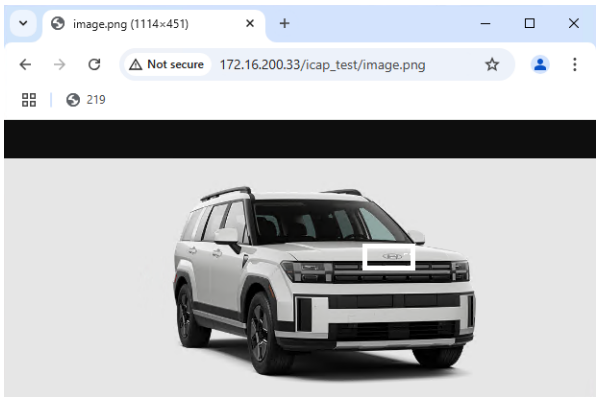
Example

In this example, FortiGate acts as the ICAP client, and FortiProxy acts as the ICAP server. An ICAP profile is configured on FortiGate with *ocr-only* enabled. An ICAP server is configured on FortiProxy with the `icap-service` configured to use an image-analyzer ICAP profile.

When a client HTTP response includes an image that is of interest to OCR, FortiGate forwards only the image file to the ICAP server for OCR scanning, and the scan results determine whether the image is passed or blocked.



When OCR scanning passes the image in the HTTP response, the image is displayed to the client, for example:



When OCR scanning blocks the image in the HTTP response, an alert message is displayed instead of the image:

Only configurations relevant to selective forwarding are described.

To enable selective forwarding on the ICAP client:

1. On FortiGate, enable `ocr-only` in the ICAP profile:
   In this example, `ocr-only` and `response` are enabled. Responses are enabled to allow FortiGate to forward images files to the ICAP server.

```
config icap profile
    edit "ocr"
        set request enable
        set response enable
        set ocr-only enable
        set request-server "icap_server1"
        set response-server "icap_server1"
    next
end
```

To enable image scanning on the ICAP server:

1. On FortiProxy acting as an ICAP server, create an image-analyzer ICAP profile:
   In this example, an image-analyzer profile named default is created.

```
config image-analyzer profile
    edit "default"
        set comment "Analyze image content"
        set alcohol-status allow
        set drugs-status allow
```

```
        set extremism-status allow
        set gambling-status allow
        set gore-status allow
        set porn-status allow
        set swim_underwear-status allow
        set weapons-status allow
        set log-option all
        set blocked-img-cache enable
        set rating-err-action block
        set optical-character-recognition enable
        set ocr-activation-threshold 100
    next
end
```

2. On FortiProxy, configure the ICAP service to use the image-analyzer profile:
   The *icap-service* is configured to use the image-analyzer profile named default.

```
config icap local-server
    edit 1
        set interface "port1"
        set incoming-ip 10.211.255.147
        set srcaddr "all"
        config icap-service
            edit 1
                set name "profile"
                set dlp-profile "default"
                set image-analyzer-profile "default"
            next
        end
    next
end
```

Web application firewall

Web application firewall (WAF) profiles can detect and block known web application attacks. You can configure WAF profiles to use signatures and constraints to examine web traffic. You can also enforce an HTTP method policy, which controls the HTTP method that matches the specified pattern.

You can customize the default profile, or you can create your own profile to apply access rules and HTTP protocol constraints to traffic. You can apply WAF profiles to firewall policies when the inspection mode is set to proxy-based.

WAF signatures are pre-loaded on the FortiGate and do not require a license to use. However, signatures are static and do not receive updates. For most updated WAF signatures, please use FortiWeb.

Web application firewall profiles cannot be used in NGFW policy-based mode. See NGFW policy on page 1803 for more information.

This feature is not supported on FortiGate models with 2 GB RAM or less. See Proxy-related features not supported on FortiGate 2 GB RAM models on page 126 for more information.

The following topic provides information about WAF profiles:

- Protecting a server running web applications on page 2524

Protecting a server running web applications

You can use a web application firewall profile to protect a server that is running a web application, such as webmail.

Web application firewall profiles are created with a variety of options called signatures and constraints. Once these options are enabled, the action can be set to allow, monitor, or block. The severity can be set to high, medium, or low.

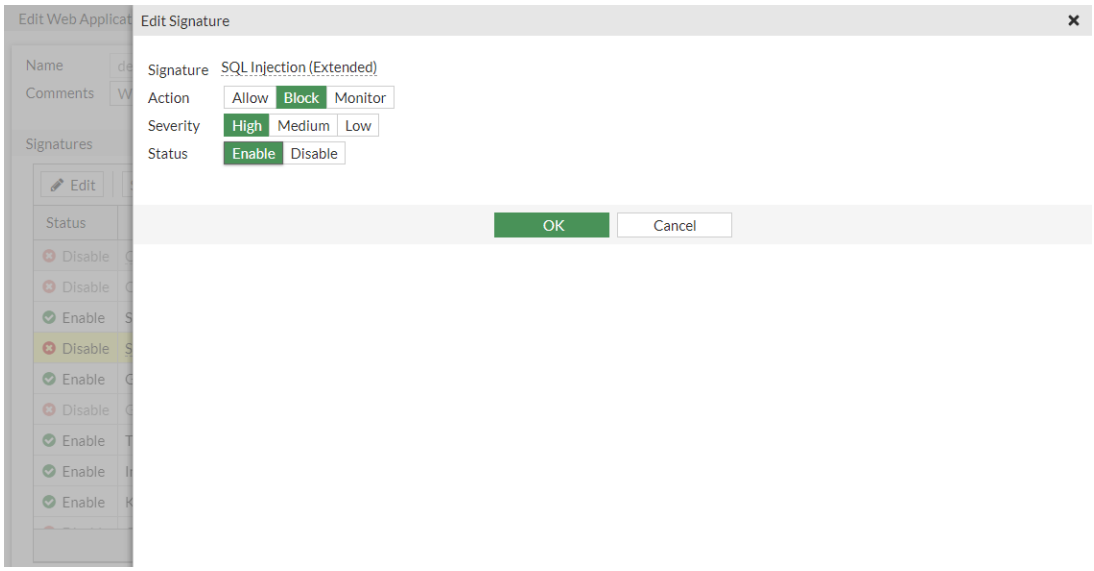
In the following example, the default profile will be targeted to block SQL injection attempts and generic attacks.

The web application firewall feature is only available when the policy inspection mode is proxy-based.

To protect a server running web applications:

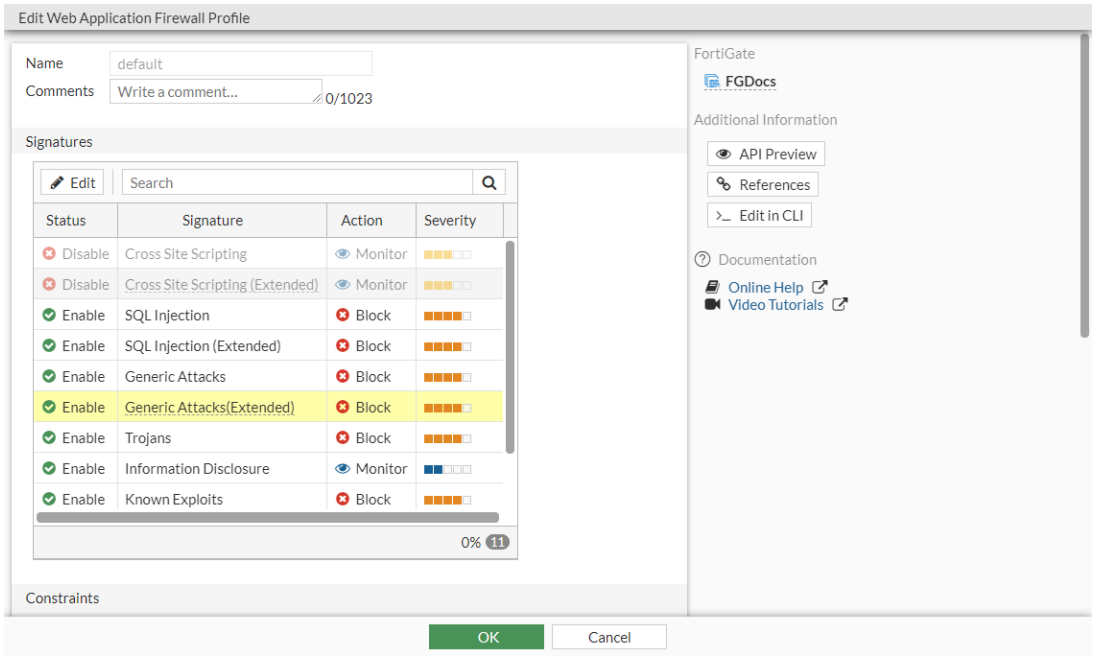
1. Enable the web application firewall:
   a. Go to *System* > *Feature Visibility*.
   b. Under *Security Features*, enable *Web Application Firewall*.
   c. Click *Apply*.
2. Edit the default web application firewall profile (*Trojans* and *Known Exploits* are blocked by default):
   a. Go to *Security Profiles* > *Web Application Firewall* and edit the *default* profile signature.
   b. Select *SQL Injection (Extended)* and edit it so that it is enabled, the *Action* is set to *Block*, and the *Severity* is set to *High*.

c. Click *OK*.



d. Enable *Generic Attacks (Extended)* and edit it so that it is enabled, the *Action* is set to *Block*, and the *Severity* is set to *High*.

e. Click *OK*.



f. Click *OK*.

3. Apply the profile to a security policy:
   a. Go to *Policy & Objects* > *Firewall Policy* and edit the policy that allows access to the web server.
   b. For *Firewall / Network Options*, select the appropriate *Protocol Option*.
   c. For *Security Profiles*, enable *Web Application Firewall* and set it to use the *default* profile.
   d. Set the *SSL Inspection* to use the *deep-inspection* profile.
   e. Configure the other settings as needed.
   f. Click *OK*.

4. Verify that the web application firewall blocks traffic:
   a. Use the following URL to simulate an attack on your web server and substitute the IP address of your server: `http://<server IP>/index.php?username=1'%20or%20'1'%20=%20'1&password=1'%20or%20'1'%20=%20'1`
   An error message appears, stating that the web application firewall has blocked the traffic:

Using FortiWeb for protection

Another way of protecting web applications is to forward HTTP traffic to a FortiWeb for scanning and inspection. A typical use case is to use a one-arm topology with FortiWeb running in reverse proxy mode to scan traffic before accessing the webpage on the web servers. See Planning the network topology in the FortiWeb Administration Guide for more information.

Data loss prevention

The FortiGate data loss prevention (DLP) system prevents sensitive data from leaving or entering your network by scanning for various patterns while inspecting traffic passing through the FortiGate. Data that matches defined sensitive data patterns is blocked, logged, allowed, or quarantined when it passes through the FortiGate.

The DLP system is configured based on the following components:

Component	Description
Data type	Define the type of pattern that DLP is trying to match. For example, this can be a predefined type such as keyword, regex, hex, credit card, US social security number (SSN), or other patterns. You can also create custom data types.
Dictionary	A collection of data type entries. When selecting a data type such as keyword, regex or hex, define the pattern that you are looking for.
Label	The following types of labels are supported to help classify and protect sensitive information: • Microsoft Information Protection (MPIP) • FortiData MPIP labels can be defined locally by configuring the Globally Unique Identifier (GUID) or synchronized automatically from a Microsoft Purview account through the Azure SDN connector. FortiData labels are defined by FortiData and used by FortiGate when the two products are integrated.

Component	Description
EDM template	An exact data match (EDM) template pairs the data from an external file, such as a data external feed file, with built-in FortiGate data types. The EDM template can link to a file on an external server to support dynamic updates, or the file can be uploaded to the EDM template.
Sensor	Define which dictionaries and/or EDM templates to check. Sensors can consist of dictionaries and EDM templates. You can match any dictionary or EDM template, all dictionaries and/or EDM templates, or a special logical combination of the dictionaries and/or EDM templates. Sensors can also count the number of matches to trigger the sensor.
File pattern	Define groups of file patterns based on predefined file types, or define your own pattern to match the file name.
DLP profile	Define rules for matching a sensor based on a file type or a message, and the type of protocol being used. It also allows you to choose the action to allow, log, block, or quarantine the address.

A DLP profile selects one or more sensors, and applies the sensor's pattern matching against the file type or message that is passing through selected protocols. The profile can be applied to a firewall policy where the traffic will be inspected.

In the backend, DLP uses Hyperscan to perform a one-parse algorithm for scanning multiple patterns. This allows DLP to scale up without any performance downgrade.

The FortiGuard Data Loss Prevention service enables the identification, monitoring, and protection of an organization's data through data breaches, insider threats, and data exfiltration. It uses a customizable database of more than 500 predefined data patterns and policies to simplify and expedite DLP deployment and integration into existing environments (see FortiGuard DLP service on page 2543 for more information).

Protocol comparison between DLP inspection modes

The following table indicates which protocols can be inspected by DLP based on the specified inspection modes.

	HTTP	FTP	IMAP	POP3	SMTP	NNTP	MAPI	CIFS	SFTP/SCP
Proxy	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes
Flow	Yes	Yes	Yes	Yes	Yes	Yes	No	Yes	No

DLP can be configured in both the CLI and the GUI irrespective or firewall policy inspection mode.

When using DLP in flow-based inspection mode, only file scanning is supported. As a result, any DLP profile applied under a flow-based firewall policy must have its *Match type* set to *File* in the rule configuration under the DLP profile.

To use DLP profiles in a flow-based firewall policy, `set feature-set flow` must be set from the CLI. See Configuring DLP from the CLI on page 2533 for more information.

DLP profiles can only be added to a flow-based firewall policy from the CLI.

Archiving

DLP can archive some or all of the content that passes through the DLP system. There are two forms of DLP archiving.

- Summary only: a summary of all the activity detected by the profile is recorded. For example, when an email message is detected, the sender, recipient, message subject, and total size are recorded. When a user accesses a web browser, every URL that they visit is recorded.
- Full: detailed records of all the activity detected by the profile is recorded. For example, when an email message is detected, the message itself, including any attachments, is recorded. When a user accesses a web browser, every page that they visit is archived.

You can configure the type of archiving per protocol.

Logging and blocking files by file name

Sometimes, file names are not accurately recorded in DLP logs, even though the files are blocked correctly based on the DLP profile. This is particularly apparent on cloud-based services, such as Google Drive or SharePoint.

For HTTP file uploads, some cloud services use proprietary encodings and APIs to transfer files and exchange metadata, instead of standard HTTP mechanisms, requiring custom handling of the proprietary API. If a cloud service changes the API without notice, the custom handling becomes outdated and file names might not be logged properly. Due to this, special consideration must be taken when using DLP to block files by file pattern. To block a specific file type, it is better to block by file type, and not by file name pattern.

The following topics provide information about DLP:

- DLP techniques on page 2529
- Basic DLP settings on page 2530
- Advanced DLP configurations on page 2536
- DLP fingerprinting on page 2539
- FortiGuard DLP service on page 2543
- Sensitivity labels on page 2547
- Exact data matching on page 2555
- DLP examples on page 2564

DLP techniques

The security of sensitive data is a top priority for organizations. A range of techniques and tools are used to maintain the confidentiality and accessibility of data.

The following table describes some of the industry standard techniques that are used for data loss protection, and if they can be configured in the GUI or CLI.

Technique	Description	GUI	CLI
Indexed Document Matching (IDM)	IDM creates unique fingerprints for your organization's crucial documents that hold sensitive information. This process involves analyzing the content of these documents and generating a checksum for each one. See DLP fingerprinting on page 2539 for more information.		✓
Exact Data Matching (EDM)	EDM identifies particular data values within an indexed data source that require safeguarding. See Exact data matching on page 2555 for more information.	✓	✓
Described Content Matching (DCM)	DCM scans through data to identify the presence of specific patterns using regular expressions (Regex). See Built-in DLP data type on page 2536 for more information.	✓	✓
Optical Character Recognition (OCR)	OCR scans and analyzes the content embedded within images for sensitive information, extending data protection to image-based content.		
Predefined data patterns	Default DLP patterns that classify private and confidential data that should be regulated in accordance with regulatory compliance requirements. See Built-in DLP data type on page 2536 for more information.	✓	✓
Custom data classification tags (data pattern)	FortiGate allows you to create patterns for your custom data type. See Custom DLP data type on page 2537 for more information.	✓	✓
True file type filtering	Identify a file by the data type in its meta data. See DLP file pattern on page 2538 for more information.	✓	✓
File size filtering	Identify a file based on its size. See Block HTTPS downloads of EXE files and log HTTPS downloads of files larger than 500 KB on page 2572 for an example.		✓
Microsoft Purview sensitivity labels	Sensitivity labels provide a mechanism to categorize and safeguard your data. They function as identifiers and highlight the significance of the data that they are attached to. See Sensitivity labels on page 2547 for more information.	✓	✓

Technique	Description	GUI	CLI
FortiData labels	A Fortinet product that discovers, classifies, and labels files with sensitive data in your file storage system. Integration of FortiData with FortiGate lets you use FortiData labels for DLP processing in FortiGate policies. See FortiData labels on page 2586 for more information.		✓
FortiGuard DLP service	A database of predefined DLP patterns, such as data types, dictionaries, and sensors, that are dynamically managed by FortiGuard. A valid DLP license is required. See FortiGuard DLP service on page 2543 for more information.	✓	✓

Basic DLP settings

DLP settings can be configured for data types, dictionaries, EDM templates, sensors, file patterns, and profiles. DLP can be configured in both the CLI and the GUI irrespective of firewall policy inspection mode.

When using DLP in flow-based inspection mode, only file scanning is supported. As a result, any DLP profile applied under a flow-based firewall policy must have its *Match type* set to *File* in the rule configuration under the DLP profile.

To use DLP profiles in a flow-based firewall policy, `set feature-set flow` must be set from the CLI. See Configuring DLP from the CLI on page 2533 for more information.

DLP profiles can only be added to a flow-based firewall policy from the CLI.

On the *Security Profiles* > *Data Loss Prevention* page, there are *Profile*, *Sensor*, *Dictionary*, and *EDM Template* tabs to configure those DLP settings. DLP profiles can be added to proxy-based firewall policies and proxy policies from the GUI.

If *Data Loss Prevention* is not visible in the tree menu, go to *System* > *Feature Visibility* and enable it.

This section breaks down the DLP configuration into a sequence of steps:

1. Configure the DLP dictionary, DLP labels, and/or EDM template:
   - A DLP dictionary is a collection of data type entries. See Built-in DLP data type on page 2536 for more information.
   - A DLP label is used to configure MPIP labels, which help classify and protect sensitive information.
   - An EDM template pairs the data from an external file, such as a data external feed file, with built-in data types.
2. Configure the DLP sensor:
   - A DLP sensor defines which dictionary and/or EDM template to check. It counts the number of matches to trigger the sensor.
3. Configure the DLP profile:
   - A DLP profile allows for filtering by size and file type. See DLP file pattern on page 2538 for custom file type.
4. Add the DLP profile to a firewall policy.

All the steps mentioned above should be configured in the exact order given for ease of configuration.

Configuring DLP from the GUI

Use the following steps to configure DLP from the GUI.

To configure a DLP dictionary:

1. Go to *Security Profiles* > *Data Loss Prevention*.
2. Select the *Dictionary* tab and click *Create New*.
3. Enter a name.
4. In the *Dictionary Entries* section, click *Create New*.
5. Set the *Type* and click *OK*.
6. Click *OK* to save the dictionary.

To configure an EDM template:

1. Go to *Security Profiles* > *Data Loss Prevention*.
2. Select the *EDM Template* tab and click *Create New*.
3. Enter a name.
4. In the *Resource settings* section, select one of the following:

File upload	Select to upload an external file of data to use with built-in data types. The external file can be in text (TXT) or comma-separated value (CSV) format.
External feed	Select to provide the URL to a file of data on an external server to use with built-in data types. The external file must be in comma-separated value (CSV) format. FortiGate will periodically fetch entries from the external file using HTTPS.
External feed URL	Specify the URL to the data file in CSV format on the external server.
HTTP basic authentication	Enable to use basic HTTP authentication when accessing the file on the external server. Specify the username and password for the external server.
Refresh rate	Specify the time interval to refresh the external resource (minutes).

5. Set the *Match criteria* section:
   Each column in the external file represents data for a built-in data type. The patterns in the data file must be valid for the data type. If the patterns are invalid, FortiGate cannot use them, and no warning is displayed.

+All of these fields	Click to pair each column in the external data file with a built-in data type. All of the specified data in this section must match for FortiGate to take an action.

Column index	Specify the column number in the external file that contains the data.
Data type	Indicate which built-in data type pairs with the column index. Choose from: • credit-card • edm-keyword • mip-label • ssn-us
+Any of these fields	Click to pair the column in the external data file with a built-in data type, and to specify how many of these pairs must match for FortiGate to take an action.
Minimum number of fields matched	Specify how many of the fields in the *Any of these fields* section must match for FortiGate to take an action.
Column index	Specify the column number in the external file that contains the data.
Data type	Indicate which built-in data type pairs with the column index. Choose from: • credit-card • edm-keyword • mip-label • ssn-us • fg-edm-can-natl_id-sin The data type *fg-edm-can-natl_id-sin*, which represents the Canadian Social Insurance Number (SIN), is dynamically managed by FortiGuard. It is available for use as one of the data types in EDM templates, provided the user has a valid FortiGuard DLP service license.

6. Click *OK* to save the EDM template.

To configure a DLP sensor:

1. Go to *Security Profiles* > *Data Loss Prevention*.
2. Select the *Sensor* tab and click *Create New*.
3. Enter a name.
4. In the *Sensors Entries* section, click *Add*. The *Select Entries* pane is displayed.
5. Select the management method from the dropdown menu.
6. From the list, select the dictionary or EDM template.
7. Click *Apply*.
8. Click *OK* to save the sensor.

To configure a DLP profile:

1. Go to *Security Profiles* > *Data Loss Prevention*.
2. Select the *Profile* tab and click *Create New*.

3. Enter a name.
4. In the *Rules* table, click *Create New*.
5. Configure the following settings:

Name	Filter name.
Type	Specify what type of data source to use: • *Sensor*: Use DLP sensors, such as dictionaries or EDM templates to match content. • *Label*: Use DLP label to match content.
Sensors	Select one or more DLP sensors when *Type* is set to *Sensor*.
DLP label	Select one of the DLP label from the drop-down list when *Type* is set to *Label*.
Severity	Select the severity or threat level that matches this filter.
Action	Action to take with content that this DLP profile matches.
Match type	Select whether to check the content of messages (an email message) or files (downloaded files or email attachments).
File type	Select the number of a DLP file pattern table to match.
Protocol	Check messages or files over one or more of these protocols.

6. Click *OK*.
7. Click *OK* to save the profile.

To add the DLP profile to a firewall policy:

1. Go to *Policy & Objects* > *Firewall Policy*.
2. Click *Create New*.
3. Set the *Inspection Mode* to *Proxy-based*.
4. In the *Security Profiles* section, enable *DLP Profile* and select the desired profile.
5. Configure the other settings as needed.
6. Click *OK*.

Configuring DLP from the CLI

Use the following steps to configure DLP from the CLI.

To configure a DLP dictionary:

```
config dlp dictionary
    edit <name>
        config entries
            edit 1
                set type {credit-card | hex | keyword | regex | ssn-us}
                set pattern <string>
```

```
                set repeat {enable | disable}
                set status {enable | disable}
            next
        end
    next
end
```

To configure a DLP label:

```
config dlp label
    edit <name>
        set type mpip
        set mpip-type {remote | local}
        set connector <string>
        config entries
            edit <id>
                set guid <string>
                set mpip-label-name <string>
            next
        end
    next
end
```

`guid` is only configurable when `mpip-type` is set to `local`. `mpip-label-name` is only configurable when `mpip-type` is set to `remote`.

For the remote MPIP label, the Azure SDN connector needs to be configured with Microsoft 365 enabled. See Azure SDN connector using service principal on page 4470 for more information.

To configure an EDM template:

When configuring an EDM template from the CLI, you must link to a data file in CSV format on an external server; you cannot upload the data file to FortiGate.

1. Add the URL for the data external feed file to FortiGate.

```
config system external-resource
    edit <name>
        set type data
        set resource <URL to resource file on external server>
        end
    next
end
```

2. Configure the EDM template.

```
config dlp exact-data-match
    edit <name>
        set optional <number of optional columns that must match>
        set data <name of external resource file>
        config columns
            edit <column index number>
```

```
                set type {credit-card | edm-keyword | mip-label | ssn-us | fg-edm-can-natl_id-
sin}
            next
        end
    next
end
```

The data type `fg-edm-can-natl_id-sin`, which represents the Canadian Social Insurance Number (SIN), is dynamically managed by FortiGuard. It is available for use as one of the data types in EDM templates, provided the user has a valid FortiGuard DLP service license.

To configure a DLP sensor:

```
config dlp sensor
    edit <name>
        set match-type {match-all | match-any | match-eval}
        set eval <string>
        config entries
            edit <id>
                set dictionary <dlp dictionary or EDM template>
                set count <integer>
                set status {enable | disable}
            next
        end
    next
end
```

See Evaluation by logical relationship on page 2538 for more information about `match-eval`.

To configure a DLP profile:

```
config dlp profile
    edit <name>
        set feature-set {flow | proxy}
        config rule
            edit <id>
                set proto <protocol> <protocol> ...
                set sensor <dlp_sensor>
                set action {allow | log-only | block | quarantine-ip}
            next
        end
    next
end
```

To add the DLP profile to a firewall policy:

```
config firewall policy
    edit <id>
        set srcintf <interface>
```

```
        set dstintf <interface>
        set action accept
        set srcaddr <address>
        set dstaddr <address>
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set inspection-mode proxy
        set dlp-profile <string>
    next
end
```

See DLP examples on page 2564 for sample configurations.

Advanced DLP configurations

The following topic provides information on advanced DLP configurations.

Built-in DLP data type

Built-in DLP data type includes predefined data types to match for keyword, regex, hex, mip label, credit card, and social security number (SSN). See Predefined data patterns on page 2529 for more information. The built-in DLP data type regex employs DCM to detect patterns. See Described Content Matching (DCM) on page 2529 for more information.

```
config dlp data-type
    edit "keyword"
        set pattern "built-in"
    next
    edit "regex"
        set pattern "built-in"
    next
    edit "hex"
        set pattern "built-in"
    next
    edit "mip-label"
        set pattern "^[[:xdigit:]]{8}-[[:xdigit:]]{4}-[[:xdigit:]]{4}-[[:xdigit:]]{4}-[[:xdigit:]]
{12}$"
        set transform "built-in"
    next
    edit "credit-card"
        set pattern "\\b([2-6]{1}\\d{3})[- ]?(\\d{4})[- ]?(\\d{2})[- ]?(\\d{2})[- ]?(\\d{2,4})\\b"
        set verify "built-in"
        set look-back 20
        set transform "\\b\\1[- ]?\\2[- ]?\\3[- ]?\\4[- ]?\\5\\b"
    next
    edit "ssn-us"
        set pattern "\\b(\\d{3})-(\\d{2})-(\\d{4})\\b"
        set verify "(?<!-)\\b(?!666|000|9\\d{2})\\d{3}-(?!00)\\d{2}-(?!0{4})\\d{4}\\b(?!-)"
```

```
        set look-back 12
        set transform "\\b\\1-\\2-\\3\\b"
    next
end
```

Custom DLP data type

Custom data types can be added. See Custom data classification tags (data pattern) on page 2529 for more information.

Custom DLP data type allows for both the proximity keyword check and data validation check within the same data type. The data type simultaneously supports two verification checks and one proximity match check to significantly lower the occurrence of false positives, enhancing the precision and dependability of the search.

To configure a custom DLP data type used by DLP scans:

```
config dlp data-type
    edit <name>
        set verify <string>
        set verify2 <string>
        set look-ahead <integer>
        set look-back <integer>
        set match-around <string>
        set match-ahead <integer>
        set match-back <integer>
        set pattern <string>
    next
end
```

Command	Description
`<name>`	The name of the table containing the data type.
`pattern <string>`	Specify the regular expression pattern string without look around
`verify <string>`	Specify the regular expression pattern string used to verify the data type.
`verify2 <string>`	Specify the extra regular expression pattern string used to verify the data type.
`look-ahead <integer>`	Specify the number of character to obtain in advance for verification (1 - 255, default = 1).
`look-back <integer>`	Specify the number of characters required to save for verification (1 - 255, default = 1).
`match-around <string>`	Dictionary to check whether it has a match around (only support match-any and basic types, no repeat supported).
`match-back <integer>`	Specify the number of characters in front for `match-around` (1 - 4096, default = 1).
`match-ahead <integer>`	Specify the number of characters behind for `match-around` (1 - 4096, default = 1).

The `set pattern` command can be used to define a regular expression for use with Hyperscan. However, Hyperscan does not fully support Perl Compatible Regular Expressions (PCRE), such as `look-ahead` and `look-behind`. To use advanced features supported by PCRE, you can use the `set verify` or `set verify2` commands.

To use "?" in a regex pattern, see CLI basics on page 76. This method only supports direct console connection and SSH. It does not support the CLI console in the GUI.

See Proximity search on page 2578 for a sample configuration.

DLP file pattern

A DLP file pattern can block, allow, log, or quarantine a file based on the specified file type in the file filter list (see Supported file types on page 2444). It employs True file type filtering to identify a file. See True file type filtering on page 2529 for more information.

To configure a DLP file pattern:

```
config dlp filepattern
    edit <id>
        set name <name>
        config entries
            edit <file name pattern>
                set filter-type {type | pattern}
                set file-type <file_type>
            next
        end
    next
end
```

Command	Description
`filter-type {type | pattern}`	Filter by file name pattern or by file type.
`file-type <file_type>`	Select a file type. This option is only available when `filter-type` is set to `type`.

See config dlp filepattern in the CLI Reference guide for a comprehensive list of commands.

Evaluation by logical relationship

Evaluation by logical relationship is a powerful tool used to combine multiple dictionary entries to define an accurate DLP sensor using logical expression.

Syntax examples:

1. `set eval "dict(1) == 2"`
   Match DLP sensor only when dictionary one match count is two.

2. `set eval "(dict(1) + dict(2)) == 3"`
   Match DLP sensor only when dictionary one and dictionary two combined match count is three.
3. `set eval "(dict(1) == 2) && (dict(2) == 1)"`
   Match DLP sensor only when dictionary one match count is equal to two and dictionary two match count is equal to one.
4. `set eval "(dict(1) == 2) || (dict(2) == 1)"`
   Match DLP sensor only when dictionary one match count is equal to two or dictionary two match count is equal to one.
5. `set eval "dict(1) > dict(2)"`
   Match DLP sensor only when dictionary one match count is greater than dictionary two match count.

See Block HTTPS upload traffic that includes Visa or Mastercard information using evaluation through logical expression on page 2574.

DLP fingerprinting

DLP fingerprinting employs Indexed Document Matching (IDM) to detect sensitive data. See Indexed Document Matching (IDM) on page 2529 for more information. The file that the DLP profile filters is uploaded and the FortiGate generates and stores a checksum fingerprint. The FortiGate generates a fingerprint for all the files that are detected in network traffic, and compares all the checksums stored in its database. If a match is found, the configured action is taken. Any type of file can be detected by DLP fingerprinting, and fingerprints can be saved for each revision of a file as it is updated.

Using fingerprinting requires:

1. Creating a DLP fingerprint database by allowing the FortiGate to access a file server containing files from which to create fingerprints.
2. Adding fingerprinting filters to DLP profiles.
3. Adding the profiles to firewall policies that accept traffic that the fingerprinting will be applied on.

See Fingerprinting example on page 2541 for a sample configuration.

The document fingerprint feature requires a FortiGate that has internal storage.

To configure a DLP fingerprint document:

```
config dlp fp-doc-source
    edit <name>
        set server <string>
        set username <string>
        set password <password>
        set file-path <string>
        set sensitivity <Critical | Private | Warning>
    next
end
```

Command	Description
`server <string>`	Enter the IPv4 or IPv6 address of the file server.
`username <string>`	Enter the user name required to log into the file server.
`password <password>`	Enter the password required to log into the file server.
`file-path <string>`	Enter the path on the server to the fingerprint files.
`sensitivity <Critical | Private | Warning>`	Set the sensitivity or threat level for matches with this fingerprint database.

See config dlp fp-doc-source in the FortiOS CLI Reference for a comprehensive list of commands and supported FortiGate models.

A file server is required for the user to upload files. Each uploaded file will have a fingerprint generated by FortiGate, and will be stored locally as a checksum. Currently, only servers that are using the Samba (SMB) protocol are compatible.

To configure a DLP fingerprint profile:

```
config dlp profile
    edit <name>
        set feature-set proxy
        config rule
            edit <id>
                set proto {smtp | pop3 | imap | http-get | http-post | ftp | nntp | mapi | ssh |
cifs}
                set filter-by fingerprint
                set sensitivity {Critical | Private | Warning}
                set match-percentage <integer>
                set action {allow | log-only | block | quarantine-ip}
            next
        end
    next
end
```

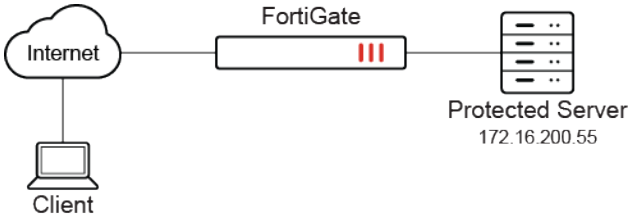
Command	Description
`proto {smtp | pop3 | imap | http-get | http-post | ftp | nntp | mapi | ssh | cifs}`	Set the protocol to inspect.
`filter-by fingerprint`	Set to match against a fingerprint sensitivity.
`sensitivity {Critical | Private | Warning}`	Set the DLP file pattern sensitivity to match.
`match-percentage <integer>`	Set the percentage of the checksum required to match before the profile is triggered.
`action {allow | log-only | block | quarantine-ip}`	Set the action to take with content that matches the DLP profile.

Fingerprinting example

This configuration will block HTTPS download traffic that matches the checksums that are stored in the FortiGate fingerprint database.

When utilizing commonly-used SSL-encrypted protocols, such as HTTPS, SMTPS, POP3S, IMAPS, and FTPS, SSL inspection must be set to Deep Inspection. See Deep inspection on page 2621 for more information.

The client machine must also have the corresponding deep inspection Certificate Authority (CA) certificate installed.



In this example, a text document with sensitive data is being downloaded by the client using the HTTP GET method. The term *Protected Server* refers to the Samba file server that stores the fingerprint files. It is assumed that you already have a configured Samba file server.

The FortiGate intercepts the traffic using deep inspection and blocks the traffic as it matches the DLP profile configured on this FortiGate. See Sample log on page 2543 for a log sample.

To block network traffic that matches the checksums stored in the FortiGate fingerprint database:

1. Configure the DLP fingerprint database:

```
config dlp fp-doc-source
    edit "test"
        set server "172.16.200.55"
        set username "kiki"
        set password *****
        set file-path "/sambashare/upload/"
        set sensitivity "Critical"
    next
end
```

   This step can only be configured in the CLI.

2. Configure the DLP profile:

```
config dlp profile
    edit "fingerprint"
        set feature-set proxy
        config rule
            edit 1
                set proto http-get
                set filter-by fingerprint
```

```
                set sensitivity "Critical"
                set action block
            next
        end
    next
end
```

DLP profiles that filter by fingerprint can only be configured in the CLI.

3. Add the DLP profile to a firewall policy:

```
config firewall policy
    edit 1
        set srcintf "port2"
        set dstintf "port1"
        set action accept
        set srcaddr "all"
        set dstaddr "all"
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set inspection-mode proxy
        set ssl-ssh-profile "deep-inspection"
        set dlp-profile "fingerprint"
        set nat enable
    next
end
```

This can also be configured in the GUI. See To add the DLP profile to a firewall policy.

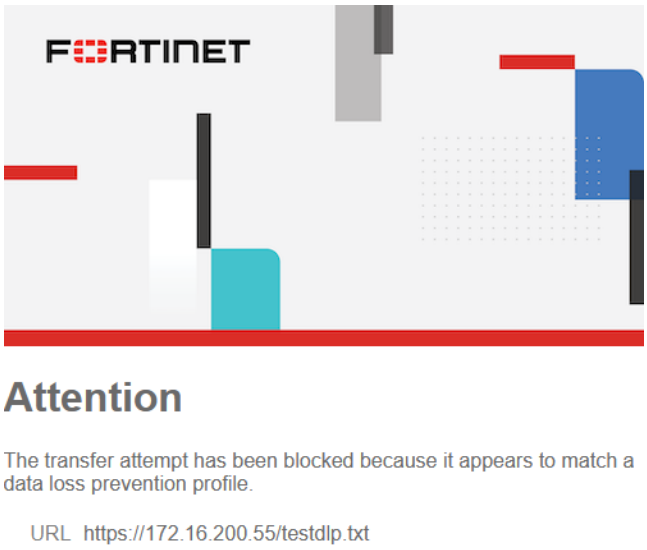
To verify the results:

1. Verify that the DLP fingerprint database is present on the FortiGate:

```
# diagnose test application dlpfingerprint 3
File DB:
----------------------------------------
id,     filename,       vdom,   archive,        deleted,        scanTime,       docSourceSrvr,
 sensitivity,    chunkCnt,       reviseCnt,
1,      /sambashare/upload/testdlp,     root,   0,      0,      1706727347,     test,   2,
 1,      0,
2,      /sambashare/upload/testdlp.txt, root,   0,      0,      1706728230,     test,   2,
 1,      0,
```

2. Verify HTTP GET traffic that matches the checksums stored in the FortiGate fingerprint database is being blocked:

   A download attempt of a text file from a Windows device was made using Chrome browser. This text file is located on the protected server and its fingerprint is saved in the FortiGate fingerprint database.



The download was unsuccessful, leading to the creation of a sample log. See Sample log on page 2543.

Sample log

To view the sample log:

1. Go to *Log & Report* > *Security Events* and select *AntiVirus*.
2. View the log details in the GUI, or download the log file:

```
1: date=2024-02-01 time=08:47:25 eventtime=1706734045777192462 tz="+1200" logid="0954024576"
type="utm" subtype="dlp" eventtype="dlp" level="warning" vd="root" ruleid=1
dlpextra="Critical" filtertype="fingerprint" filtercat="file" severity="medium" policyid=1
poluuid="f4fe48a4-938c-51ee-8856-3e84e3b24af4" policytype="policy" sessionid=308873
epoch=813849496 eventid=0 srcip=13.13.13.13 srcport=51058 srccountry="United States"
srcintf="port2" srcintfrole="undefined" srcuuid="d2f06fda-15e7-51ee-0d22-faaf5170dad2"
dstip=172.16.200.55 dstport=443 dstcountry="Reserved" dstintf="port1" dstintfrole="undefined"
dstuuid="d2f06fda-15e7-51ee-0d22-faaf5170dad2" proto=6 service="HTTPS" filetype="unknown"
direction="incoming" action="block" hostname="172.16.200.55"
url="https://172.16.200.55/testdlp.txt" agent="Mozilla/5.0 (Windows NT 10.0; Win64; x64)
AppleWebKit/537.36 (KHTML, like Gecko) Chrome/121.0.0.0 Safari/537.36 Edg/121.0.0.0"
httpmethod="GET" filename="testdlp.txt" filesize=20 profile="fingerprint"
```

FortiGuard DLP service

The FortiGuard DLP service offers a database of predefined DLP patterns such as data types, dictionaries, and sensors. Example include:

- Drivers licenses for various countries, various states in the USA, and various provinces in Canada
- Tax numbers for various countries
- Credit card numbers
- Bank statements

When enabled, the DLP database (DLDB) is downloaded to the FortiGate and its predefined patterns can be configured in DLP profiles.

To configure DLP database updates:

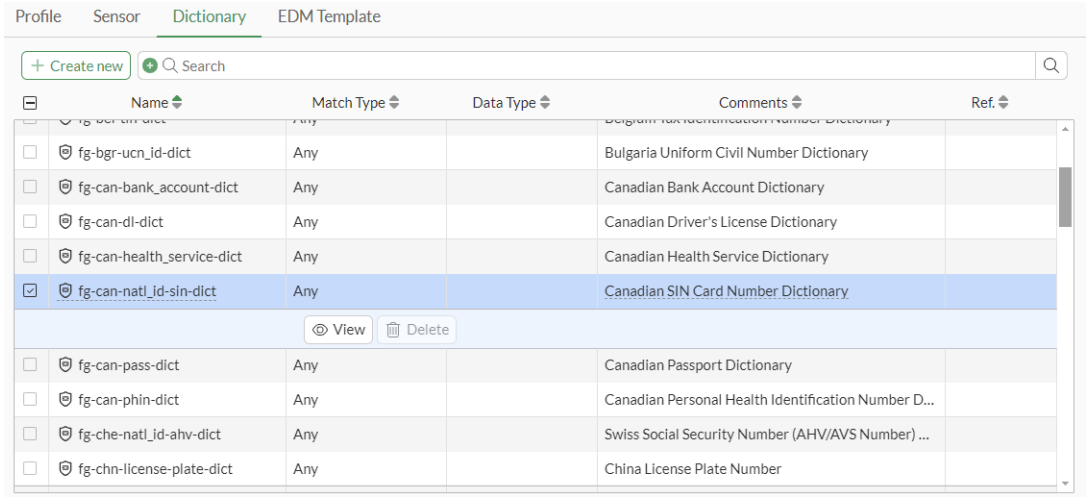
```
config system fortiguard
    set update-dldb {enable | disable}
end
```

To verify the database signature status:

```
# diagnose autoupdate versions
...
DLP Signature
---------
Version: 1.00010 signed
Contract Expiry Date: n/a
Last Updated using manual update on Fri Jan 27 15:25:00 2023
Last Update Attempt: Mon Jan 30 15:18:39 2023
Result: No Updates
```

Example

In this example, the administrator wants to look for data leakage of Canadian social insurance number (SIN) information and block this traffic. A DLP profile is created that uses the predefined dictionary, *fg-can-natl_id-sin-dict*, to check for Canadian Social Insurance Numbers (SINs).



To verify that the Canadian SIN data type is added to the list of predefined data types:

```
show dlp data-type
config dlp data-type
    ...
    edit "fg-can-natl_id-proximity"
```

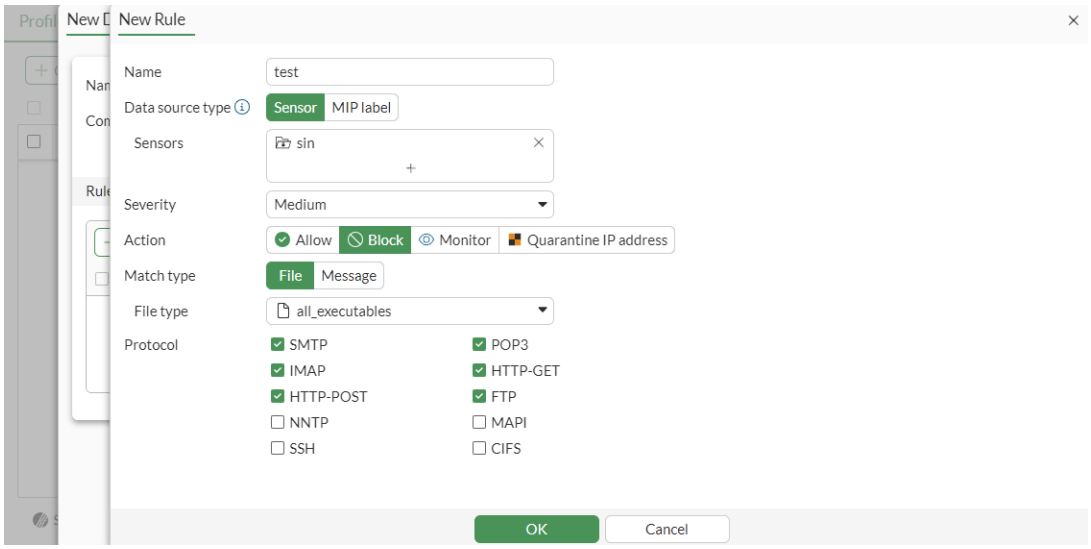
```
        set pattern "fortiguard dlp signature"
    next
end
```

To configure the DLP profile in the GUI:

1. Configure the DLP sensor using the predefined dictionary from FortiGuard:
   a. Go to *Security Profiles* > *Data Loss Prevention*, select the *Sensor* tab, and click *Create New*.
   b. Enter a name (*sin*).
   c. In the *Sensor Entries* section, click *Add*. The *Select Entries* pane is displayed.
   d. Select *Managed by FortiGuard* from the dropdown menu.
   e. Select *fg-can-natl_id-sin-dict* and click *Apply*.

   f. Click *OK* to save the sensor.
2. Configure the DLP profile:
   a. Go to *Security Profiles* > *Data Loss Prevention*, select the *Profile* tab, and click *Create New*.
   b. Enter a name (*test*).
   c. In the *Rules* section, click *Create New*.
   d. Configure the following settings:

Name	*test*
Sensors	*sin*
Severity	*Medium*
Action	*Block*
Type	*File*
File type	*all_executables*
Protocol	*SMTP*, *POP3*, *IMAP*, *HTTP-GET*, *HTTP-POST*, *FTP*



e. Click *OK*.

f. Click *OK* to save the profile.

To configure the DLP profile in the CLI:

1. Configure the DLP sensor using the predefined dictionary from FortiGuard:

```
config dlp sensor
    edit "sin"
        config entries
            edit 1
                set dictionary "fg-can-natl_id-sin-dict"
            next
        end
    next
end
```

2. Configure the DLP profile:

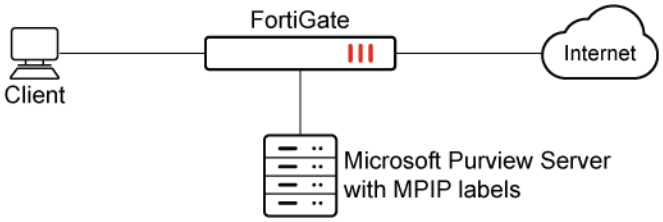
```
config dlp profile
    edit "test"
        set feature-set proxy
        config rule
            edit 1
                set name "test"
                set proto smtp pop3 imap http-get http-post ftp
                set filter-by sensor
                set file-type 2
                set sensor "sin"
                set action block
            next
        end
    next
end
```

Sensitivity labels

In order to safeguard your organization's data, labels can be employed as markers for sensitive information. Microsoft provides sensitivity labels, which act as identifiers emphasizing the importance of the data they're associated with, thereby enhancing the security measures in place. See Protect your sensitive data with Microsoft Purview (formerly MIP) for more information.

Any data traffic that includes a sensitivity label can be effectively managed using FortiGate. This is made possible through the utilization of a predefined label type, *mpip*, specifically designed for Microsoft Purview Information Protection. See Microsoft Purview sensitivity labels on page 2529 for more information.

MPIP labels have their own settings and can be used directly with DLP profiles without needing a dictionary. Additionally, remote MPIP labels can be synchronized automatically from a Microsoft Purview account through the Azure SDN connector, complementing locally defined labels.



Prerequisites

The following procedures should be completed before configuring the FortiGate:

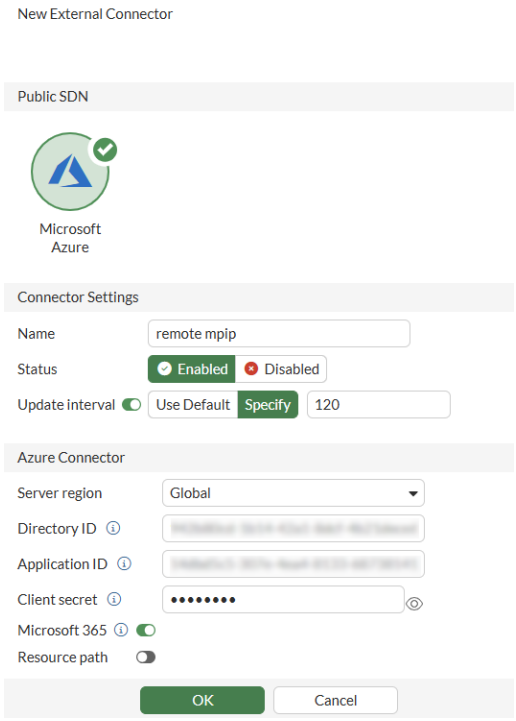
1. Create and configure sensitivity labels and their policies. See Create sensitivity labels for more information.
2. Apply a sensitivity label to content. See Apply sensitivity labels to your files and email for more information.

Example 1: Verifying that a user's attempt to post a file matching the remote MPIP label through HTTPS will be blocked

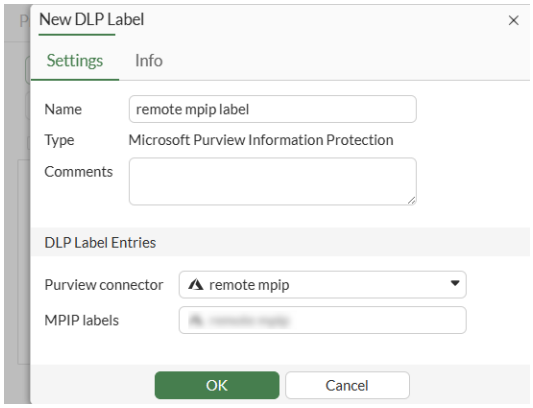
The following example demonstrates configuring a remote MPIP label to block HTTPS-POST actions.

To configure remote MPIP labels in the GUI:

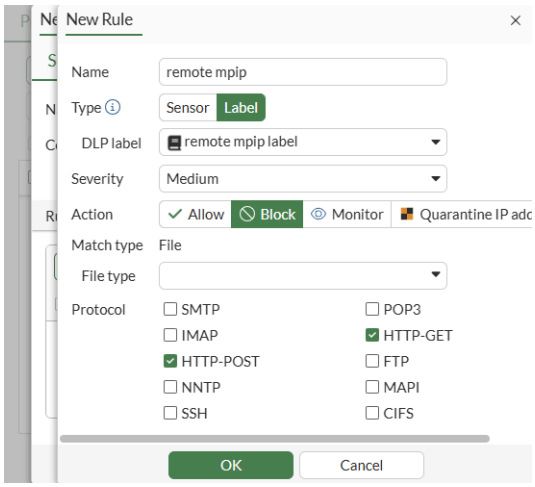
1. Configure the external connector:
   a. Go to *Security Fabric* > *External Connectors*.
   b. Click *Create New*.
   c. Configure a *Microsoft Azure* connector with *Microsoft 365* enabled. See Azure SDN connector using service principle for more information.



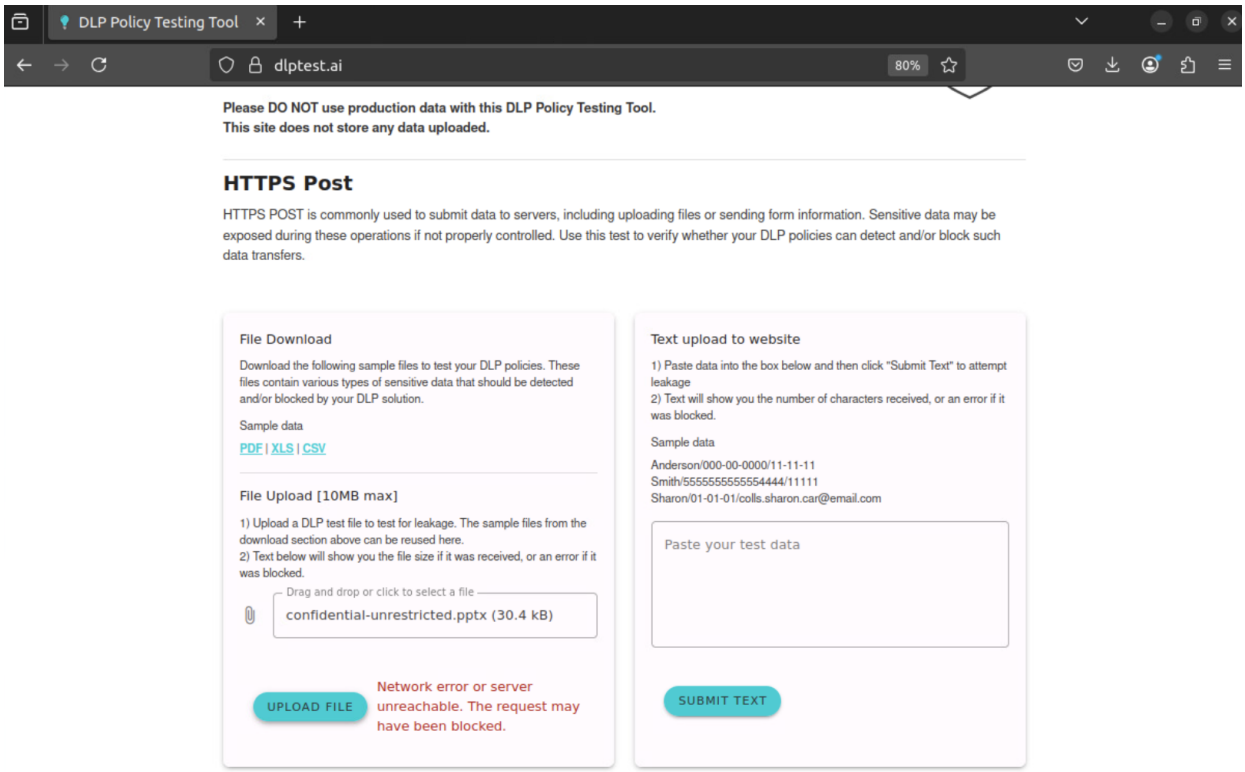
2. Configure the DLP label:
   a. Go to *Security Profiles* > *Data Loss Prevention*.
   b. Select the *Label* tab.
   c. Click *Create New*.
   d. Set *Purview connector* to the new connector.
   e. Select the *MPIP labels* synced from the connector to match sensitive files.
   f. Click *OK*.



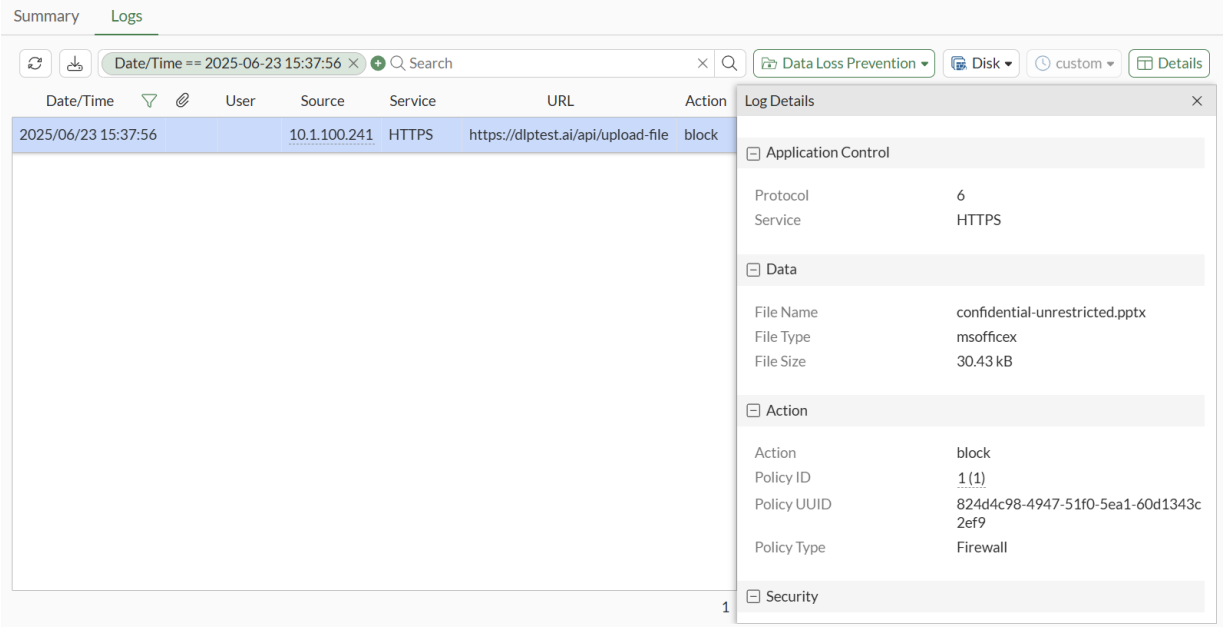
3. Configure the DLP profile:
   a. Go to *Security Profiles* > *Data Loss Prevention*.
   b. Select the *Profile* tab.
   c. Click *Create New*.
   d. Configure the DLP profile with the new DLP label applied in a rule set to block *HTTP-POST* and *HTTP-GET*. See Basic DLP settings for more information.



4. Add the DLP profile to a firewall policy:
   a. Go to *Policy & Objects* > *Firewall Policy*.
   b. Click *Create New*.
   c. Set the *Inspection Mode* to *Proxy-based*.
   d. In the *Security Profiles* section, enable *DLP Profile* and select the new DLP profile.
   e. Set *SSL Inspection* to *deep-inspection*.
   f. Configure the other settings as needed.
   g. Click *OK*.
5. Attempt an HTTPS-POST action.



The action matches the remote MPIP label and is blocked by the FortiGate.



To configure remote MPIP labels in the CLI:

1. Configure the external connector with Microsoft 365 enabled:

```
config system sdn-connector
    edit remote-mpip
        set type azure
        set azure-region global
        set tenant-id eca3011d-89ec-481d-9ed0-a0f7d2bb9b45
        set client-id 44ac574f-227a-4e90-a33b-820f2d7230b2
        set client-secret XXXXXXXX
        set update-interval 30
        set microsoft-365 enable
    next
end
```

2. Configure the DLP label:

```
config dlp label
    edit "remote-mpip-label"
        set type mpip
        set mpip-type remote
        set connector "remote-mpip"
        config entries
            edit 1
                set mpip-label-name "Confidential/Anyone (unrestricted)"
            next
        end
    next
end
```

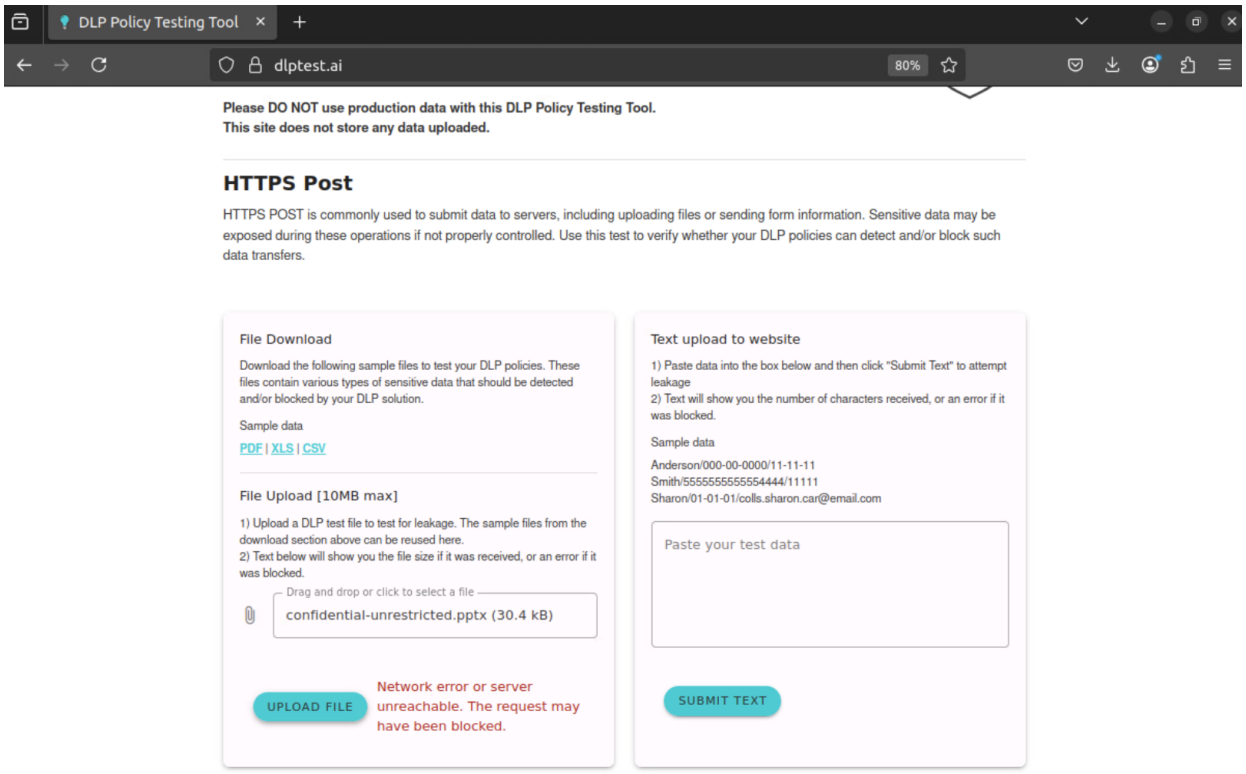
3. Configure the DLP profile to block HTTP-POST and HTTP-GET:

```
config dlp profile
    edit "remote-mpip-profile"
        config rule
            edit 1
                set proto http-get http-post
                set filter-by label
                set label "remote-mpip-label"
                set action block
            next
        end
    next
end
```

4. Add the DLP profile to a firewall policy:

```
config firewall policy
    edit 1
        set srcintf "port2"
        set dstintf "port1"
        set action accept
        set srcaddr "all"
        set dstaddr "all"
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set inspection-mode proxy
        set ssl-ssh-profile "deep-inpsection"
        set dlp-profile "remote-mpip-profile"
        set nat enable
    next
end
```

5. Attempt an HTTPS-POST action.



The action matches the remote MPIP label and is blocked by the FortiGate:

```
1: date=2025-06-23 time=15:36:53 eventtime=1750718213619030708 tz="-0700" logid="0954024576"
type="utm" subtype="dlp" eventtype="dlp" level="warning" vd="vdom1" ruleid=1 dlpextra="remote-
mpip-label" filtertype="label" filtercat="file" severity="medium" policyid=1
poluuid="824d4c98-4947-51f0-5ea1-60d1343c2ef9" policytype="policy" sessionid=720
epoch=1656654802 eventid=1 srcip=10.1.100.241 srcport=41346 srccountry="Reserved"
srcintf="port2" srcintfrole="undefined" srcuuid="4a1017e8-4947-51f0-55cb-8c18f3765a3f"
dstip=206.47.132.132 dstport=443 dstcountry="Canada" dstintf="port1" dstintfrole="undefined"
dstuuid="4a1017e8-4947-51f0-55cb-8c18f3765a3f" proto=6 service="HTTPS" filetype="msofficex"
direction="outgoing" action="block" hostname="dlptest.ai" url="https://dlptest.ai/api/upload-
file" agent="Mozilla/5.0 (X11; Ubuntu; Linux x86_64; rv:139.0) Gecko/20100101 Firefox/139.0"
httpmethod="POST" referralurl="https://dlptest.ai/" filename="confidential-unrestricted.pptx"
filesize=30427 profile="remote-mpip-profile" infectedfilename="docProps/custom.xml"
infectedfilesize=2025 infectedfilelevel=1
```

Example 2: Verifying that a user's attempt to post a file matching the local MPIP label's GUID will be monitored through FTPS

The following example demonstrates configuring a local MPIP label with a Globally Unique Identifier (GUID) that will monitor files posted through FTPS.

Local MPIP label configuration is not supported in the GUI. However, once the local MPIP label has been configured in the CLI, it can be applied to a DLP profile in the GUI. See Basic DLP settings on page 2530.

To configure and apply a local MPIP label:

1. Obtain a GUID for your sensitivity labels. See Search for documents by sensitivity label for more information.
2. Configure the local MPIP label:

```
config dlp label
    edit "local-mpip-label"
        set type mpip
        set mpip-type local
        config entries
            edit 1
                set guid "c0ef495a-6714-4056-a44b-a9cb63fa9161"
            next
        end
    next
end
```

3. Configure the DLP profile:

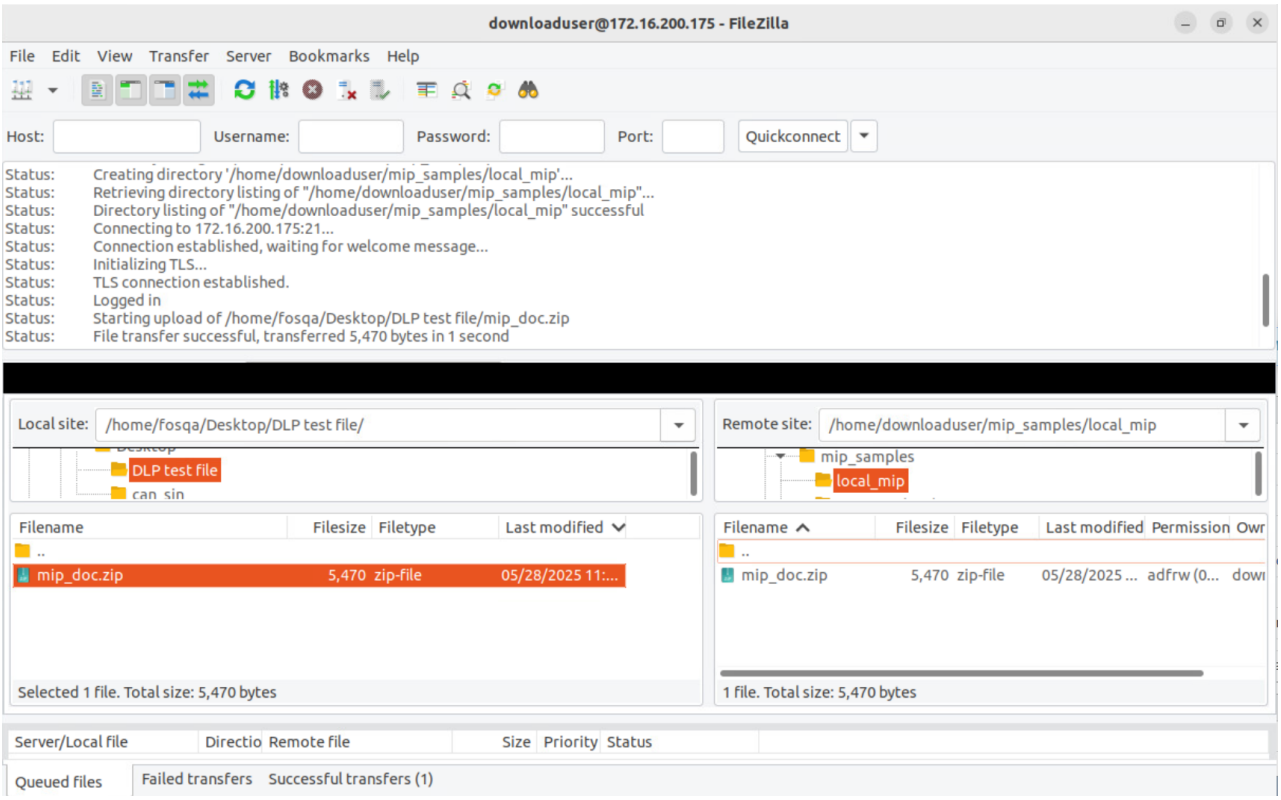
```
config dlp profile
   edit "local-mpip-profile"
        config rule
            edit 1
                set proto ftp
                set filter-by label
                set label "local-mpip-label"
                set action log-only
            next
        end
    next
end
```

4. Add the DLP profile to a firewall policy:

```
config firewall policy
    edit 2
        set srcintf "port2"
        set dstintf "port1"
        set action accept
        set srcaddr "all"
        set dstaddr "all"
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set inspection-mode proxy
        set ssl-ssh-profile "deep-inpsection"
```

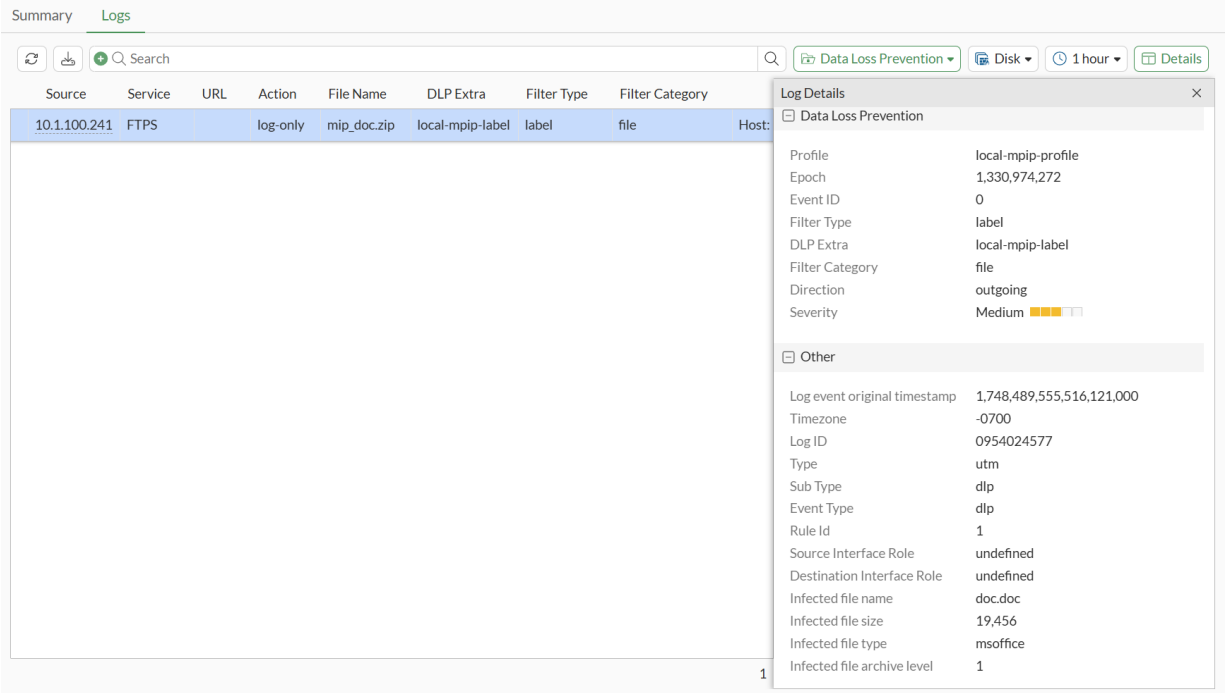
```
        set dlp-profile "local-mpip-profile"
        set nat enable
    next
end
```

5. Attempt to transfer a file matching the remote MPIP label through FTPS.



The file passes and DLP monitor logs are generated:

- A GUI log can be reviewed:



- A CLI log can be reviewed:

```
1: date=2025-05-28 time=20:32:35 eventtime=1748489555516121022 tz="-0700"
logid="0954024577" type="utm" subtype="dlp" eventtype="dlp" level="notice" vd="vdom1"
ruleid=1 dlpextra="local-mpip-label" filtertype="label" filtercat="file" severity="medium"
policyid=1 poluuid="319d6e9e-3c23-51f0-3a27-434de0e559ee" policytype="policy"
sessionid=8379 epoch=1330974272 eventid=0 srcip=10.1.100.241 srcport=57865
srccountry="Reserved" srcintf="port2" srcintfrole="undefined" srcuuid="f9cd0f6a-3c22-51f0-
b75c-6fad5f412db5" dstip=172.16.200.175 dstport=38353 dstcountry="Reserved"
dstintf="port1" dstintfrole="undefined" dstuuid="f9cd0f6a-3c22-51f0-b75c-6fad5f412db5"
proto=6 service="FTPS" filetype="zip" direction="outgoing" action="log-only"
filename="mip_doc.zip" filesize=5470 profile="local-mpip-profile"
infectedfilename="doc.doc" infectedfilesize=19456 infectedfiletype="msoffice"
infectedfilelevel=1
```

Exact data matching

Exact Data Matching (EDM) identifies particular data values within an indexed data source that require safeguarding. It offer precise detection and handling of sensitive data based on user-defined criteria. This enhances security and improves efficiency by reducing false-positive detections.

Administrators can define a dataset in a CSV or TXT file on a server, upload file directly on FortiGate or point FortiGate to the external resource. See EDM template on page 2556 for more information.

CSV file example:

Jason	Valentino	120 Jefferson St.	Riverside	CA	92504

Marry	Baxter	415 W Willow Grove Ave	Philadelphia	PA	19118
David	Solace	555 Pierce Street APT #123	Albany	CA	94706
Thomas	Jefferson	1600 Pennsylvania Avenue NW	Washington	DC	20500

TXT file example:

```
213321,john,doe
201111,karen,smith
322122,rick,wong
```

A CSV or TXT file can have a maximum of 32 columns. Each indexed column in the external file represents data (or patterns) for a built-in data type that you want to match using EDM template.

EDM template

The EDM template is used to specify the URL location of the data external feed file or upload the file directly on to the FortiGate. Once the data is imported, it can be utilized with an EDM template to map individual columns of data (or patterns) from a file to built-in data types to match credit card, keyword, mip label, social insurance number (SIN), and social security number (SSN) data. When the data passing through FortiGate matches with the EDM template, FortiGate responds according to the preset rules.

A CSV or TXT file can be uploaded directly to FortiGate using the File Upload option. However, this option is exclusively available through the GUI. It's important to note that file upload is only possible if your FortiGate unit is equipped with a hard disk. In the absence of a hard disk, the File Upload option will be grayed out. See Feature Platform Matrix.

Please note that if the CSV or TXT file is uploaded using the File Upload option, it will not be dynamically synchronized nor periodically updated. This means that any changes made to the file will not be imported by FortiOS. Therefore, users are required to manually update the file again on the FortiGate using the Update file option. This option is located under Resource Type and is only visible if the file was previously uploaded via the File Upload option.

The sequence of steps for configuring EDM is consistent with other DLP configurations. See Basic DLP settings on page 2530 for more information.

Data external feed

A data external feed is a dynamic list that contains data. The data is patterns for DLP data types. The dynamic list is stored in a text (TXT) or comma-separated value (CSV) file format on an external server and periodically updated. After FortiGate can access the file, the patterns can be used with an EDM template.

```
config system external-resource
    edit <name>
        set type data
        set resource <string>
        set refresh-rate <integer>
```

```
    next
end
```

Command	Description
`type {category | domain | malware | address | mac-address | data}`	Specify the type of user resource. • `data`: Specify a data file as the user source.
`resource <string>`	Specify the URL of the external resource.
`refresh-rate <integer>`	Time interval to refresh the external resource (minutes).

The size of the Data External Feed file varies depending on the device model. The maximum file size limit for each model is as follows:

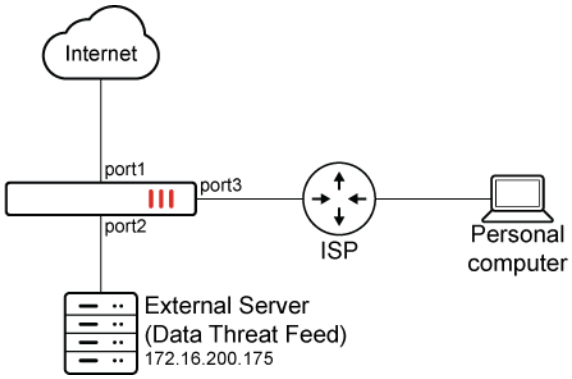
- 128 MB for High-End (Data Center) models
- 64 MB for Mid-Range (Campus) models
- 32 MB for Entry-Level (Branch) models.

Example

This configuration will block HTTPS upload traffic that matches the DLP profile.

When utilizing commonly-used SSL-encrypted protocols such as HTTPS, SMTPS, POP3S, IMAPS, and FTPS, SSL inspection must be set to Deep Inspection. See Deep inspection for more information.

Additionally, the client machine must have the corresponding deep inspection Certificate Authority (CA) certificate installed.



In this example, an EDM template named Customer SSN EDM is created on the FortiGate. During this process, a CSV file (customer_data.csv) located on an external server is imported using the data thread feed.

Sample CSV file:

SSN	Last Name	First Name	Address	City	State	ZIP	Phone	Email	CCN
172-32-1176	Doe	John	10932 Big Rd	Malibu	CA	94025	408-497-7223	jdoe@domain.com	5270-4267-6450-5516
514-14-8905	Bard	Ashley	4469 Sher St	Golf	KS	66428	785-939-6046	abard@domain.com	5370-4638-8881-302

In this example, the EDM template specifies:

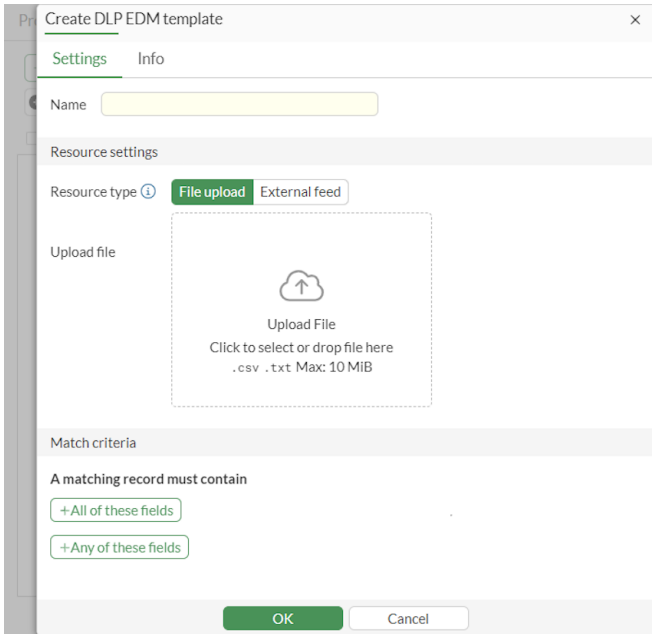
- Column index 1 in the external data feed file contains patterns for the `ssn-us` data type.
- Column index 3 and 9 contain patterns for the `edm-keyword` data type.
- The patterns from column index 1 must match for FortiGate to take an action.
- The pattern from either column index 3 or 9 must match for FortiGate to take an action.

Based on the aforementioned template, the DLP profile will match any traffic containing data that corresponds to the SSN in column 1, and either the First Name in column 3 or the Email in column 9. For instance, if the HTTPS upload traffic sent from personal computer contains '172-32-1176' AND 'John', or '172-32-1176' AND 'jdoe@domain.com', the traffic will be blocked and a DLP log is generated. See Sample log for a log sample.

To configure EDM for DLP in the GUI:

1. Ensure that *Data Loss Prevention* is enabled.
   a. Go to *System* > *Feature Visibility*.
   b. Under *Security Features*, enable *Data Loss Prevention*, and click *Apply*.
2. Create an EDM template with matching criteria:

a. Go to *Security Profiles* > *Data Loss Prevention* > *EDM Template*, and click *Create New*.



b. Specify a name for the template, such as *Customer SSN EDM*.

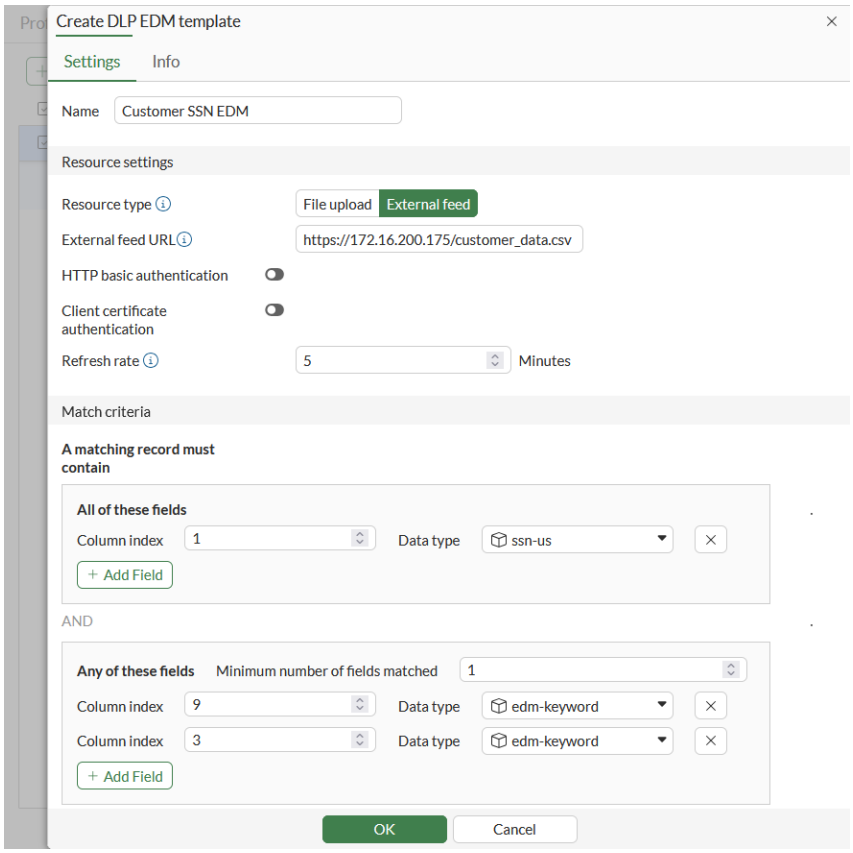
c. Set *Resource type* to *External feed*, and set *External feed URL* to the location of the file on the external server, such as *https://172.16.200.175/customer_data.csv*.

d. Click *+All of these fields* to pair the column index of patterns with a DLP data type. All of the specified data in this section must match for FortiGate to take an action.

In this example, column 1 in the external resource file contains the patterns for the *ssn-us* data type.

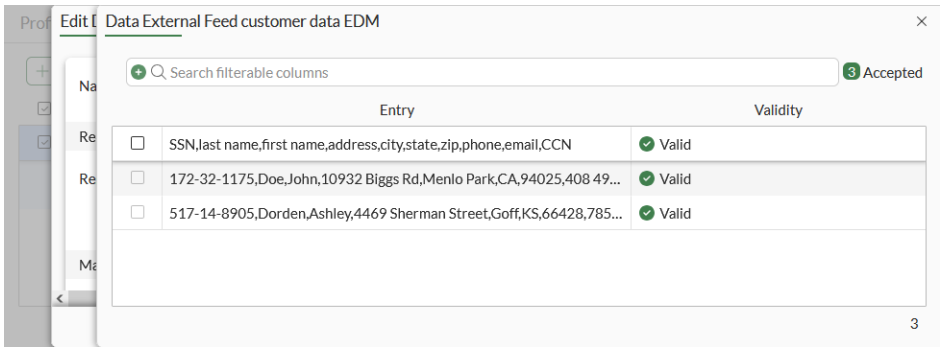
e. Click *+Any of these fields* to pair the column index of patterns with a DLP data type, and to specify how many of these pairs must match for FortiGate to take an action.

In this example, columns 3 and 9 in the external resource file contains the patterns for the *edm-keyword* data type. Only one pattern from the two columns must match.



f. Click *OK*.

g. Edit the DLP EDM template and click *View Entries* to view the data entries in the field.



When viewing EDM entries, the GUI currently does not validate the entries and displays all entries as Valid. However, a Valid entry must have all values matching the data-type of the specific column. If one value does not match, the entry is invalid and will not be used for pattern matching.

3. Configure a DLP sensor for the EDM template.

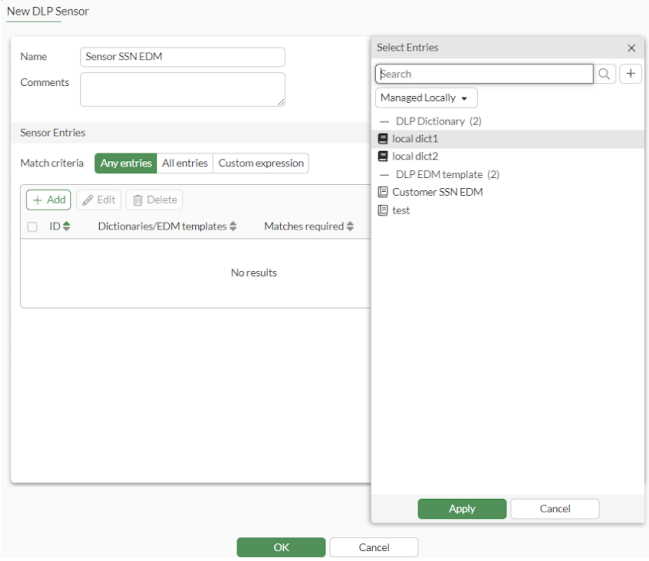
a. In *Security Profiles* > *Data Loss Prevention*, click *Sensor* > *Create New*.

b. Specify a name for the DLP sensor, such as *Sensor SSN EDM*.

c. Click *Add*. The *Select Entries* pane is displayed.

d. Select *Managed Locally* from the dropdown menu.

e. From the list, select *Customer SSN EDM*, and click *Apply*.



f. Click *OK*.

4. Create a DLP profile and select the DLP sensor for the EDM template.
   a. In *Security Profiles* > *Data Loss Prevention*, click *Profile* > *Create New*.
   b. Specify a name for the DLP profile, such as *Profile SSN EDM*.
   c. Click *Create New*. The *New Rule* pane is displayed.
   d. Specify a name for the rule, such as *Rule SSN EDM*.
   e. Set *Data source type* to *Sensor*, and select *Sensor SSN EDM*.
   f. Set *Action* to *Block*.
   g. Set *Match type* to *Message*.
   h. Select *HTTP-POST* protocol.
   i. Click *OK*. The *New DLP Profile* pane is displayed.
   j. Click *OK* to save the profile.
5. Add the DLP profile to a firewall policy:
   a. Go to *Policy & Objects* > *Firewall Policy*.
   b. Click *Create New*.
   c. Set the *Inspection Mode* to *Proxy-based*.
   d. In the *Security Profiles* section, enable *DLP Profile* and select *Profile SSN EDM*.
   e. Set *SSL Inspection* to *deep-inspection*.
   f. Configure the other settings as needed.
   g. Click *OK*.

To configure EDM for DLP in the CLI:

1. Add the URL for the data external feed file to FortiGate.

   In this example, an external resource named `customer data EDM` is created, and it defines the location of the data external feed file in CSV format on an external server.

```
config system external-resource
    edit "customer data EDM"
        set type data
        set resource "https://172.16.200.175/customer_data.csv"
    next
end
```

2. Configure the EDM template.

   In this example, an exact data-match template named `Customer SSN EDM` is created for the external resource named `customer data EDM`. The matching record must contain the pattern for the data type from column index 1 (`ssn-us`) and at least one pattern for the data type from column index 3 (`edm-keyword`) or 9 (`edm-keyword`).

```
config dlp exact-data-match
    edit "Customer SSN EDM"
        set optional 1
        set data "customer data EDM"
        config columns
            edit 1
                set type "ssn-us"
            next
            edit 3
                set type "edm-keyword"
                set optional enable
            next
            edit 9
                set type "edm-keyword"
                set optional enable
            next
        end
    next
end
```

3. Add the EDM template to a DLP sensor.

```
config dlp sensor
    edit "Sensor SSN EDM"
        config entries
            edit 1
                set dictionary "Customer SSN EDM"
            next
        end
    next
end
```

4. Configure a DLP profile to use the DLP sensor.

```
config dlp profile
    edit "Profile SSN EDM"
        set feature-set proxy
        config rule
            edit 1
```

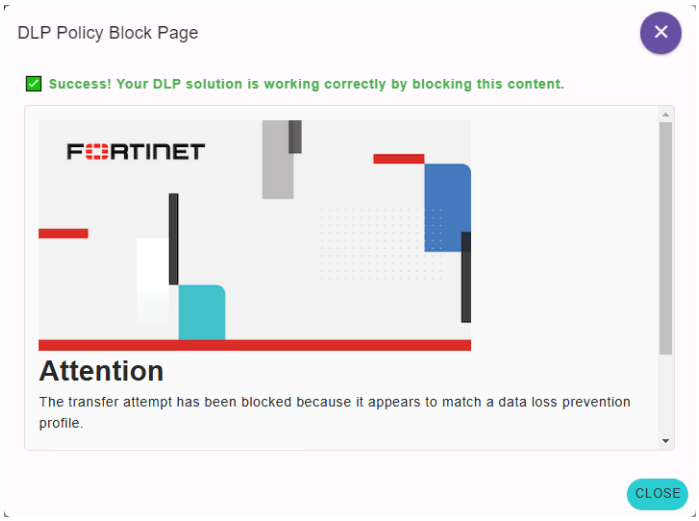
```
                set name "Rule SSN EDM"
                set type message
                set proto http-post
                set filter-by sensor
                set sensor "Sensor SSN EDM"
                set action block
            next
        end
    next
end
```

5. Add the DLP profile to a firewall policy.

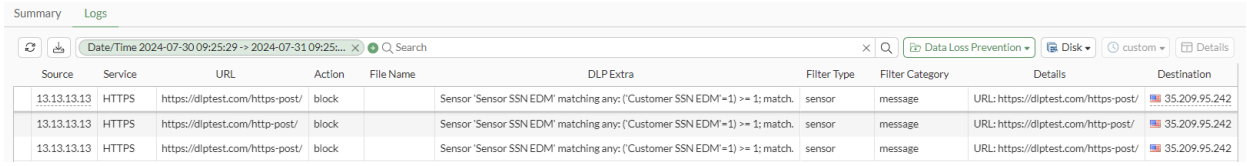
```
config firewall policy
    edit 1
        set name "Internet"
        set srcintf "port3"
        set dstintf "port1"
        set action accept
        set srcaddr "all"
        set dstaddr "all"
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set inspection-mode proxy
        set ssl-ssh-profile "deep-inspection"
        set dlp-profile "Profile SSN EDM"
    next
end
```

To verify:

1. A user attempts to post a sensitive message through HTTPS to dlptest.ai, and the message content matches the EDM template.
2. FortiGate blocks the user's attempt and displays a replacement message:



3. FortiGate generates a DLP log:



```
1: date=2024-07-31 time=09:24:44 eventtime=1722443083953870602 tz="-0700" logid="0954024576"
type="utm" subtype="dlp" eventtype="dlp" level="warning" vd="root" ruleid=1 rulename="Rule SSN
EDM" dlpextra="Sensor 'Sensor SSN EDM' matching any: ('Customer SSN EDM'=1) >= 1; match."
filtertype="sensor" filtercat="message" severity="medium" policyid=1 poluuid="1696f98a-3413-

profile="Profile SSN EDM"
```

DLP examples

The following topics provide examples of DLP:

- Block HTTPS upload traffic that includes credit card information on page 2564
- Log FTP upload traffic with a specific pattern on page 2568
- Block HTTPS downloads of EXE files and log HTTPS downloads of files larger than 500 KB on page 2572
- Block HTTPS upload traffic that includes Visa or Mastercard information using evaluation through logical expression on page 2574
- Proximity search on page 2578
- Assign confidence levels in FortiGuard managed DLP dictionaries on page 2582
- FortiData labels on page 2586
- Prevent sensitive token leakage in HTTPS uploads using EDM on page 2594

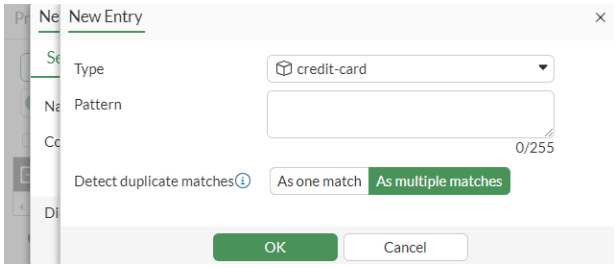
Block HTTPS upload traffic that includes credit card information

This configuration will block HTTPS upload traffic that includes credit card information. The predefined data type for credit card is used in the dictionary.

To block HTTPS upload traffic that includes credit card information in the GUI:

1. Configure the DLP dictionary:
   a. Go to *Security Profiles* > *Data Loss Prevention*, select the *Dictionary* tab, and click *Create New*.
   b. Enter a name (*dic-case1*).
   c. In the *Dictionary Entries* section, click *Create New*.

d. Set the *Type* to *credit-card* and click *OK*.



e. Click *OK*.

f. Click *OK* to save the dictionary.

2. Configure the DLP sensor:

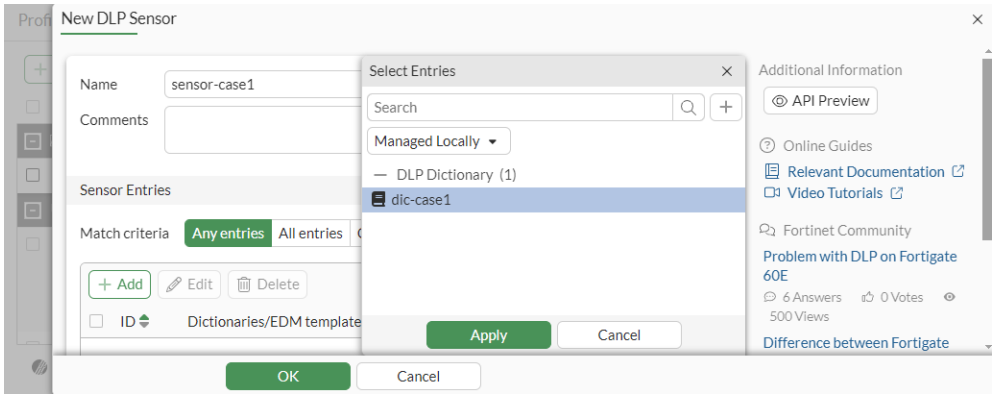
a. Go to *Security Profiles* > *Data Loss Prevention*, select the *Sensor* tab, and click *Create New*.

b. Enter a name (*sensor-case1*).

c. In the *Sensor Entries* section, click *Add*. The *Select Entries* pane is displayed.

d. Select *Managed Locally* from the dropdown menu.

e. Select *dic-case1* and click *Apply*.



f. Click *Apply*.

g. Click *OK* to save the sensor.

3. Configure the DLP profile:

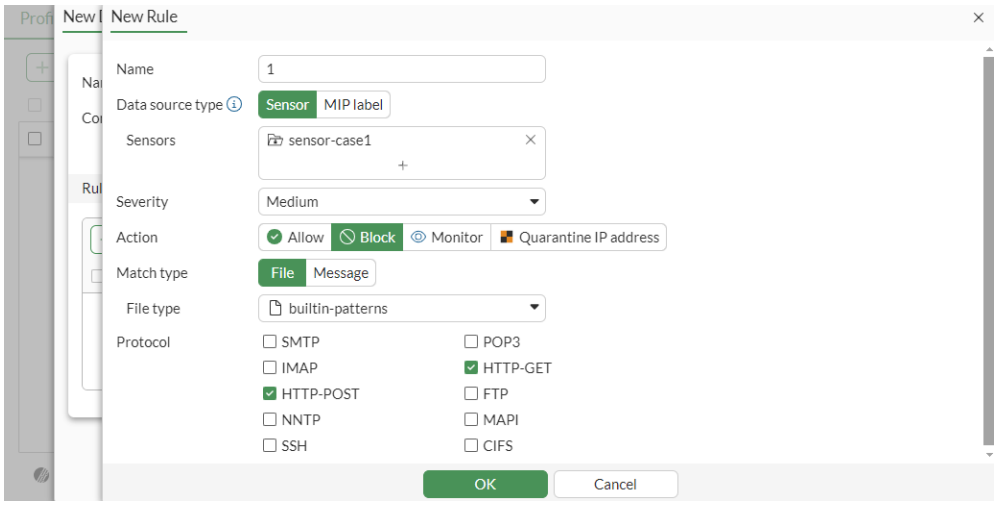
a. Go to *Security Profiles* > *Data Loss Prevention*, select the *Profile* tab, and click *Create New*.

b. Enter a name (*profile-case1*).

c. In the *Rules* section, click *Create New*.

d. Configure the following settings:

Name	*1*
Sensors	*sensor-case1*
Severity	*Medium*
Action	*Block*
Type	*File*
File type	*builtin-patterns*
Protocol	*HTTP-POST*, *HTTP-GET*



e. Click *OK*.

f. Click *OK* to save the profile.

4. Add the DLP profile to a firewall policy:

a. Go to *Policy & Objects* > *Firewall Policy* and click *Create New*.

b. Set the *Inspection Mode* to *Proxy-based*.

c. In the *Security Profiles* section, enable *DLP Profile* and select *profile-case1*.

d. Configure the other settings as needed.

e. Click *OK*.

When a credit card is included in HTTP POST traffic, the file is blocked and a DLP log is generated.

To block HTTPS upload traffic that includes credit card information in the CLI:

1. Configure the DLP dictionary:

```
config dlp dictionary
    edit "dic-case1"
        config entries
            edit 1
                set type "credit-card"
            next
        end
    next
end
```

2. Configure the DLP sensor:

```
config dlp sensor
    edit "sensor-case1"
        config entries
            edit 1
                set dictionary "dic-case1"
            next
        end
```

```
    next
end
```

3. Configure the DLP profile:

```
config dlp profile
    edit "profile-case1"
        set feature-set proxy
        config rule
            edit 1
                set name "1"
                set proto http-get http-post
                set filter-by sensor
                set file-type 1
                set sensor "sensor-case1"
                set action block
            next
        end
    next
end
```

4. Add the DLP profile to a firewall policy:

```
config firewall policy
    edit 1
        set srcintf "port2"
        set dstintf "port1"
        set action accept
        set srcaddr "all"
        set dstaddr "all"
        set srcaddr6 "all"
        set dstaddr6 "all"
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set inspection-mode proxy
        set profile-protocol-options "protocol"
        set ssl-ssh-profile "protocols"
        set dlp-profile "profile-case1"
        set nat enable
    next
end
```

When a credit card is included in HTTP POST traffic, a replacement message appears because it is blocked. A DLP log is generated.

Sample log

From Windows, the following command below can be used to generate a sample log, using the cURL tool to post data, which contains a sample credit card number. See sample-data for sample credit card numbers.

```
# curl –k -d 4024007149133315 https://172.16.200.55/card.doc -o?
```

```
1: date=2022-10-26 time=11:25:01 eventtime=1666808700281057923 tz="-0700" logid="0954024576"
type="utm" subtype="dlp" eventtype="dlp" level="warning" vd="root" ruleid=1 rulename="1"
dlpextra="builtin-patterns;sensor-case1" filtertype="sensor" filtercat="file" severity="medium"
policyid=1 poluuid="891a526a-51cd-51ed-577a-6505bec88af9" policytype="policy" sessionid=3905

action="block" hostname="172.16.200.55" url="https://172.16.200.55/card.doc" agent="curl/7.83.1"
httpmethod="POST" filename="card.doc" filesize=108 profile="profile-case1"
```

Log FTP upload traffic with a specific pattern

This configuration will log FTP upload traffic with the following patterns:

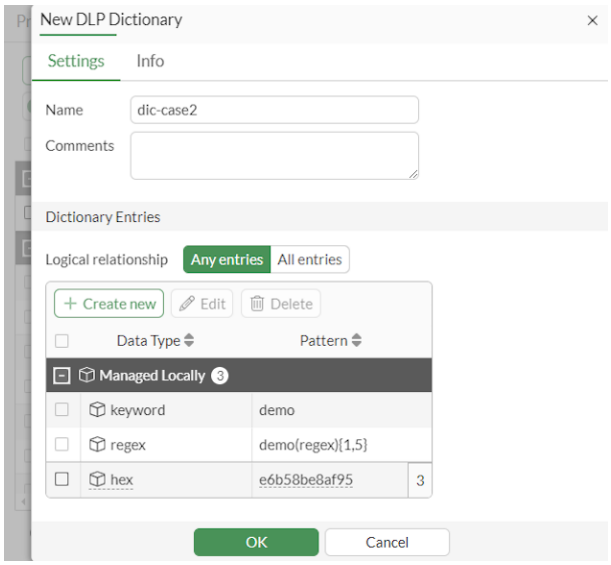
- keyword = demo
- regex = demo(regex){1,5}
- hex = e6b58be8af95

The dictionary entries have repeat match enabled. The DLP sensor is set so this is repeated five times.

To log FTP upload traffic that has specific keyword, regex, and hex patterns repeated for five times in the GUI:

1. Configure the DLP dictionary with three entries:
   a. Go to *Security Profiles* > *Data Loss Prevention*, select the *Dictionary* tab, and click *Create New*.
   b. Enter a name (*dic-case2*).
   c. In the *Dictionary Entries* section, click *Create New*.
   d. Set the *Type* to *keyword* and the *Pattern* to *demo*.
   e. Set *Detect duplicate matches* to *As multiple matches*.

   f. Click *OK*.
   g. Repeat these steps to add dictionary entries for the following (with *Repeats* enabled):
      i. Set the *Type* to *regex* and the *Pattern* to *demo(regex){1,5}*.
      ii. Set the *Type* to *hex* and the *Pattern* to *e6b58be8af95*.

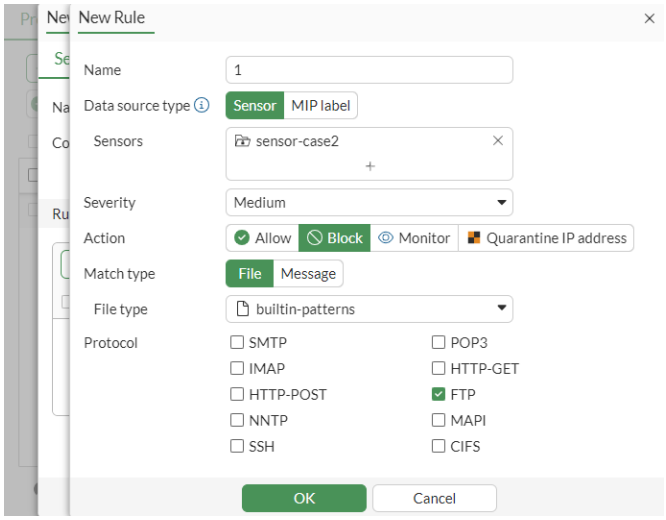


h. Click *OK* to save the dictionary.

2. Configure the DLP sensor:
   a. Go to *Security Profiles* > *Data Loss Prevention*, select the *Sensor* tab, and click *Create New*.
   b. Enter a name (*sensor-case2*).
   c. In the *Sensor Entries* section, click *Add*. The *Select Entries* pane is displayed.
   d. Select *Managed Locally* from the dropdown menu.
   e. Select *dic-case2* and click *Apply*.

   f. Edit the new entry and set the *Number of matches required* to *5*.
   g. Click *OK*.
   h. Click *OK* to save the sensor.
3. Configure the DLP profile:
   a. Go to *Security Profiles* > *Data Loss Prevention*, select the *Profile* tab, and click *Create New*.
   b. Enter a name (*profile-case2*).
   c. In the *Rules* section, click *Create New*.
   d. Configure the following settings:

Name	*1*
Sensors	*sensor-case2*
Severity	*Medium*
Action	*Block*
Type	*File*
File type	*builtin-patterns*
Protocol	*FTP*



e. Click *OK*.
f. Click *OK* to save the profile.

4. Add the DLP profile to a firewall policy:
   a. Go to *Policy & Objects* > *Firewall Policy* and click *Create New*.
   b. Set the *Inspection Mode* to *Proxy-based*.
   c. In the *Security Profiles* section, enable *DLP Profile* and select *profile-case2*.
   d. Configure the other settings as needed.
   e. Click *OK*.
5. Upload a Word document that contains "demo, demo, demo, demoregexregex," using FTP.
   A DLP log is generated after the FTP traffic passes.

To log FTP upload traffic that has specific keyword, regex, and hex patterns repeated for five times in the CLI:

1. Configure the DLP dictionary:

```
config dlp dictionary
    edit "dic-case2"
        config entries
            edit 1
                set type "keyword"
```

```
                set pattern "demo"
                set repeat enable
            next
            edit 2
                set type "regex"
                set pattern "demo(regex){1,5}"
                set repeat enable
            next
            edit 3
                set type "hex"
                set pattern "e6b58be8af95"
                set repeat enable
            next
        end
    next
end
```

2. Configure the DLP sensor:

```
config dlp sensor
    edit "sensor-case2"
        config entries
            edit 1
                set dictionary "dic-case2"
                set count 5
            next
        end
    next
end
```

3. Configure the DLP profile:

```
config dlp profile
    edit "profile-case2"
        set feature-set proxy
        config rule
            edit 1
                set proto ftp
                set filter-by sensor
                set file-type 1
                set sensor "sensor-case2"
                set action block
            next
        end
    next
end
```

4. Add the DLP profile to a firewall policy:

```
config firewall policy
    edit 1
        set srcintf "port2"
```

```
        set dstintf "port1"
        set action accept
        set srcaddr "all"
        set dstaddr "all"
        set srcaddr6 "all"
        set dstaddr6 "all"
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set inspection-mode proxy
        set profile-protocol-options "protocol"
        set ssl-ssh-profile "protocols"
        set dlp-profile "profile-case2"
        set nat enable
    next
end
```

5. Upload a Word document that contains "demo, demo, demo, demoregexregex," using FTP.
   A DLP log is generated after the FTP traffic passes.

Sample log

```
1: date=2022-10-26 time=12:37:57 eventtime=1666813077679725858 tz="-0700" logid="0954024576"
type="utm" subtype="dlp" eventtype="dlp" level="warning" vd="root" ruleid=1 rulename="1"
dlpextra="builtin-patterns;sensor-case2" filtertype="sensor" filtercat="file" severity="medium"
policyid=1 poluuid="891a526a-51cd-51ed-577a-6505bec88af9" policytype="policy" sessionid=6267

dstport=43411 dstcountry="Reserved" dstintf="port1" dstintfrole="undefined" dstuuid="502d2c8e-
51cd-51ed-a24e-a091f4ff6fed" proto=6 service="FTP" filetype="msoffice" direction="outgoing"
action="block" filename="realizedDoc.doc" filesize=26624 profile="profile-case2"
```

Block HTTPS downloads of EXE files and log HTTPS downloads of files larger than 500 KB

FortiGate can detect any file larger than the configured limit. See File size filtering on page 2529 for more information.

This configuration will block HTTPS downloads of EXE files and log HTTPS downloads of files larger than 500 KB.

To block HTTPS download of EXE files and log downloads larger than 500 KB:

1. Configure the DLP file pattern:

```
config dlp filepattern
    edit 3
        set name "case3-exe"
        config entries
```

```
            edit "exe"
                set filter-type type
                set file-type exe
            next
        end
    next
end
```

2. Configure the DLP profile:

```
config dlp profile
    edit "profile-case3-type-size"
        config rule
            edit 1
                set proto http-get
                set filter-by none
                set file-type 3
                set action block
            next
            edit 2
                set proto http-get
                set filter-by none
                set file-size 500
                set action log-only
            next
        end
    next
end
```

3. Add the DLP profile to a firewall policy:

```
config firewall policy
    edit 1
        set srcintf "port2"
        set dstintf "port1"
        set action accept
        set srcaddr "all"
        set dstaddr "all"
        set srcaddr6 "all"
        set dstaddr6 "all"
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set inspection-mode proxy
        set ssl-ssh-profile "custom-deep-inspection"
        set dlp-profile "profile-case3-type-size"
        set logtraffic all
        set nat enable
    next
end
```

4. Download an EXE file using HTTPS. The download is blocked, a replacement message appears, and a DLP log is generated.

Sample log

```
1: date=2022-02-15 time=11:54:29 eventtime=1644954869682887856 tz="-0800" logid="0954024577"
type="utm" subtype="dlp" eventtype="dlp" level="notice" vd="root" ruleid=2 dlpextra="500 kB"
filtertype="none" filtercat="file" severity="medium" policyid=1 poluuid="905fb604-7ed4-51ec-0853-

url="https://2.na.dl.wireshark.org/win64/Wireshark-win64-3.6.2.exe" agent="curl/7.61.1"
filename="Wireshark-win64-3.6.2.exe" filesize=10502090 profile="profile-case3-type-size"
```

Block HTTPS upload traffic that includes Visa or Mastercard information using evaluation through logical expression

This example will allow users to create a subset of the existing DLP data type, *credit-card*. It can be very beneficial for an organization that wants to prevent only certain types of credit cards and not all.

This configuration will block HTTPS traffic that includes Visa or Mastercard information. Two dictionary entries with DLP data-type regex are created with custom patterns to match Visa and Mastercard numbers respectively, and a third dictionary entry is created with predefined data type *credit-card*. All three entries are used in the sensor using evaluation via logical expression to further supplement the detection.

In the CLI, evaluation via logical expression can be defined using the command `match-eval`. It is a tool used to combine multiple entries to define an accurate DLP sensor.

Sample topology

In this example, a Microsoft Office document with Visa credit card information is sent securely to the receiver using the HTTP POST method. The FortiGate intercepts the traffic using deep inspection and blocks the traffic as it matches the DLP profile configured on this FortiGate.

To block HTTPS upload traffic that includes Visa or Mastercard credit card information in the GUI:

1. Configure the DLP dictionary:
   a. Go to *Security Profiles* > *Data Loss Prevention*, select the *Dictionary* tab, and click *Create New*.
   b. Create an entry for Visa:
      i. Enter a name (*Finance_Credit_Card_Visa*).
      ii. In the *Dictionary Entries* section, click *Create New*.
      iii. Set the *Type* to *regex*.
      iv. Set *Pattern* to *4[0-9]{12}(?:[0-9]{3})* and click *OK*.
      v. Click *OK* to save the dictionary.
   c. Create an entry for Mastercard:

i. Enter a name (*Finance_Credit_Card_Mastercard*).
ii. In the *Dictionary Entries* section, click *Create New*.
iii. Set the *Type* to *regex*.
iv. Set *Pattern* to *(?:5[1-5][0-9]{2}|222[1-9]|22[3-9][0-9]|2[3-6][0-9]{2}|27[01][0-9]|2720)[0-9]{12}* and click *OK*.
v. Click *OK* to save the dictionary.

d. Create an entry for Credit Card:
i. Enter a name (*CC_Number*).
ii. In the *Dictionary Entries* section, click *Create New*.
iii. Set the *Type* to *credit-card* and click *OK*.
iv. Click *OK* to save the dictionary.

2. Configure the DLP sensor:
a. Go to *Security Profiles* > *Data Loss Prevention*, select the *Sensor* tab, and click *Create New*.
b. Enter a name (*Finance_Credit_Card_High*).
c. In the *Sensor Entries* section, click *Add*. The *Select Entries* pane is displayed.
d. Select *Managed Locally* from the dropdown menu.
e. Select *Finance_Credit_Card_Visa* and click *Apply*.
f. Repeat the previous step twice to add *Finance_Credit_Card_Mastercard* and *CC_Number* in this order.
g. Click *OK* to save the sensor.
h. Edit the newly created sensor.
i. Set the *Match criteria* to *Custom expression*.
j. In the *Evaluated by* field, enter *(dict(1) > 0 && dict(3) > 0) || (dict(2) > 0 && dict(3) > 0)*.
k. Click *OK* to save the sensor.

For the DLP sensor with the *Logical relationship* set to *Evaluate*, *Count* and *Status* of any sensor entry will be ignored.

3. Configure the DLP profile:
a. Go to *Security Profiles* > *Data Loss Prevention*, select the *Profile* tab, and click *Create New*.
b. Enter a name (*cc-block*).
c. In the *Rules* section, click *Create New*.
d. Configure the following settings:

Name	*1*
Sensors	*Finance Credit Card High*
Severity	*Critical*
Action	*Block*
Type	*File*
File type	*builtin-patterns*
Protocol	*HTTP-POST*, *HTTP-GET*

e. Click *OK*.

f. Click *OK* to save the profile.

4. Add the DLP profile to a firewall policy:
   a. Go to *Policy & Objects* > *Firewall Policy* and click *Create New*.
   b. Set the *Inspection Mode* to *Proxy-based*.
   c. In the *Security Profiles* section, enable *DLP Profile* and select *cc-block*.
   d. Set *SSL Inspection* to *deep-inspection* to inspect HTTPS traffic.
   e. Configure the other settings as needed.
   f. Click *OK*.

When a Visa or Mastercard credit card is included in HTTP GET or POST traffic, the file is blocked and a DLP log is generated. See the Sample log on page 2578 for details on how to test this configuration.

To block HTTPS upload traffic that includes Visa or Mastercard credit card information in the CLI:

1. Configure the DLP dictionary:

```
config dlp dictionary
    edit "Finance_Credit_Card_Visa"
        config entries
            edit 1
                set type "regex"
                set pattern "4[0-9]{12}(?:[0-9]{3})"
                set repeat enable
                set comment "Visa"
            next
        end
    next
    edit "Finance_Credit_Card_Mastercard"
        config entries
            edit 1
                set type "regex"
                set pattern "(?:5[1-5][0-9]{2}|222[1-9]|22[3-9][0-9]|2[3-6][0-9]{2}|27[01][0-
9]|2720)[0-9]{12}"
                set repeat enable
                set comment "Mastercard"
            next
        end
    next
    edit "CC_Number"
        config entries
            edit 1
                set type "credit-card"
            next
        end
    next
end
```

To use "?" in a regex pattern, see CLI basics on page 76. This method only supports direct console connection and SSH. It does not support the CLI console in the GUI.

2. Configure the DLP sensor:

```
config dlp sensor
    edit "Finance_Credit_Card_High"
        config entries
            edit 1
                   set dictionary "Finance_Credit_Card_Visa"
            next
            edit 2
                set dictionary "Finance_Credit_Card_Mastercard"
            next
            edit 3
                set dictionary "CC_Number"
            next
        end
        set match-type match-eval
        set eval "(dict(1) > 0 && dict(3) > 0) || (dict(2) > 0 && dict(3) > 0)"
    next
end
```

3. Configure the DLP profile:

```
config dlp profile
    edit "cc_block"
        set feature-set proxy
        config rule
            edit 1
                set name "1"
                set severity critical
                set proto http-get http-post
                set filter-by sensor
                set file-type 1
                set sensor "Finance_Credit_Card_High"
                set action block
            next
        end
    next
end
```

4. Add the DLP profile to a firewall policy:

```
config firewall policy
    edit 1
        set srcintf "port2"
        set dstintf "port3"
        set action accept
        set srcaddr "all"
        set dstaddr "all"
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set inspection-mode proxy
        set ssl-ssh-profile "deep-inspection"
        set dlp-profile "cc_block"
```

```
        set nat enable
    next
end
```

When a Visa or Mastercard credit card is included in HTTP GET or POST traffic, a replacement message appears because it is blocked. A DLP log is generated. See the Sample log on page 2578 for details on how to test this configuration.

Sample log

From Windows, the following command below can be used to generate a sample log via HTTP POST traffic, using the cURL tool to post data, which contains a sample Visa credit card number. See sample-data for sample credit card numbers.

```
# curl –k -d 4024007149133315 https://192.168.10.13/cc.doc -o?

1: date=2023-03-17 time=15:37:41 eventtime=1679092660998869199 tz="-0700" logid="0954024576"
type="utm" subtype="dlp" eventtype="dlp" level="warning" vd="root" ruleid=1 rulename="1"
dlpextra="builtin-patterns;Finance_Credit_Card_High" filtertype="sensor" filtercat="file"
severity="critical" policyid=1 poluuid="26540ed0-ae54-51ed-80eb-89af8af4d53f" policytype="policy"
sessionid=14854 epoch=570215534 eventid=0 srcip=172.20.120.13 srcport=58012 srccountry="Reserved"
srcintf="port2" srcintfrole="undefined" srcuuid="3342cb44-9140-51ed-5dbe-8e0787bedeec"
dstip=192.168.10.13 dstport=443 dstcountry="Reserved" dstintf="port3" dstintfrole="wan"
dstuuid="3342cb44-9140-51ed-5dbe-8e0787bedeec" proto=6 service="HTTPS" filetype="msoffice"
direction="incoming" action="block" hostname="192.168.10.13" url="https://192.168.10.13/cc.doc"
agent="curl/7.83.1" httpmethod="POST" filename="cc.doc" filesize=12288 profile="cc-block"
```

Proximity search

In this example, any HTTPS upload traffic containing both a keyword and a username within a specified proximity can be identified. The FortiGate intercepts this traffic through deep inspection. When HTTPS upload traffic includes both a keyword and a username, which match the criteria defined on the data loss prevention (DLP) profile configured on the FortiGate, the traffic is blocked. This action subsequently generates a DLP log. See Verification on page 2582 for a log sample.

To block HTTPS upload traffic that match the DLP profile in the GUI:

1. Configure the DLP dictionary:
   a. Go to *Security Profiles* > *Data Loss Prevention* and select the *Dictionary* tab.
   b. Select *Create New*.
   c. Set *Name* to: *matcharound*.
   d. In the *Dictionary Entries* table, click *Create New*:
      i. Set *Type* to *keyword*
      ii. Set *Pattern* to *user*
      iii. Enable *Case sensitive*
      iv. Click *OK*.
   e. Click *OK*.
   f. Select the newly created dictionary and click *Edit*.

g. Select *Edit in CLI* and enter the following command:
```
#set match-around enable
end
```
h. Close the CLI Console and click *Cancel*.

> DLP data types can only be configured in the CLI. See step 2 of To block HTTPS upload traffic that match the DLP profile in the CLI: on page 2580.

2. Configure the DLP dictionary:
   a. Go to *Security Profiles* > *Data Loss Prevention* and select the *Dictionary* tab.
   b. Click *Create New*.
   c. Set *Name* to *username*.
   d. In the *Dictionary Entries* table, click *Create New*:
      i. Set *Type* to *user*
      ii. Click *OK*.
   e. Click *OK*.
3. Configure the DLP sensor:
   a. Go to *Security Profiles* > *Data Loss Prevention* and select the *Sensor* tab.
   b. Click *Create New*.
   c. Enter a name *(user)*.
   d. In the *Sensor Entries* section, click *Add*. The *Select Entries* pane is displayed.
   e. Select *Managed Locally* from the dropdown menu.
   f. Select *username* and click *Apply*.
   g. Click *OK* to save the sensor.
4. Configure the DLP profile:
   a. Go to *Security Profiles* > *Data Loss Prevention* and select the *Profile* tab.
   b. Click *Create New*.
   c. Enter a name *(keyword)*.
   d. In the *Rules* section, click *Create New*.
   e. Configure the following settings:

Name	keyword
Data source type	Sensor
Sensors	user
Severity	Critical
Action	Block
Match Type	Message
Protocol	HTTP-POST

   f. Click *OK*.
   g. Click *OK* to save the profile.
5. Add the DLP profile to a firewall policy:

a. Go to *Policy & Objects* > *Firewall Policy* and click *Create New*.
b. Set the *Inspection Mode* to *Proxy-based*.
c. In the *Security Profiles* section, enable *DLP Profile* and select *keyword*.
d. Set *SSL Inspection* to *deep-inspection* to inspect HTTPS traffic.
e. Configure the other settings, as needed.
f. Click *OK*.

To block HTTPS upload traffic that match the DLP profile in the CLI:

1. Configure the DLP dictionary:

```
config dlp dictionary
    edit "matcharound"
        set match-around enable
        config entries
            edit 1
                set type "keyword"
                set pattern "user"
                set ignore-case enable
            next
        end
    next
end
```

2. Configure the DLP data type:

```
config dlp data-type
    edit "user"
        set pattern "\\b[a-zA-Z]{6,12}\\b"
        set verify "(?<=@)\\w+"
        set match-around "matcharound"
        set look-back 13
        set match-back 15
    next
end
```

The pattern specified using the `set pattern` command, is designed to match any word, irrespective of case sensitivity, that contains between 6 and 12 characters. On the other hand, the pattern specified using the `set verify` command employs a positive lookbehind assertion. This assertion checks for the presence of the @ symbol preceding the word, without including it in the match. This is a feature supported in PCRE but not in Hyperscan. For a match to occur, the content must satisfy all parameters defined in the DLP Data type.

3. Configure the DLP dictionary:

```
config dlp dictionary
    edit "username"
        config entries
            edit 1
```

```
                set type "user"
            next
        end
    next
end
```

4. Configure the DLP sensor:

```
config dlp sensor
    edit "user"
        config entries
            edit 1
                set dictionary "username"
            next
        end
    next
end
```

5. Configure the DLP profile:

```
config dlp profile
    edit "keyword"
        set feature-set proxy
        config rule
            edit 1
                set name "keyword"
                set severity critical
                set type message
                set proto http-post
                set filter-by sensor
                set sensor "user"
                set action block
            next
        end
    next
end
```

6. Add the DLP profile to a firewall policy:

```
config firewall policy
    edit 1
        set name "keyword"
        set srcintf "port2"
        set dstintf "port1"
        set action accept
        set srcaddr "all"
        set dstaddr "all"
        set schedule "always"
        set service "ALL"
        set utm-status enable
```

```
        set inspection-mode proxy
        set ssl-ssh-profile "deep-inspection"
        set dlp-profile "keyword"
        set logtraffic all
        set nat enable
    next
end
```

Verification

1. Visit https://dlptest.ai/http-post/com.
2. Enter any phrase that will match the DLP profile configured on the FortiGate and click *Submit*.
   Example:
   user: @kikinaynay
3. Verify that the replacement message indicates the transfer attempt has been blocked.
4. Review the log that was generated when the attempt was made to send an HTTP POST request containing sensitive keywords:

```
1: date=2024-05-17 time=13:12:33 eventtime=1715908352455559762 tz="+1200"
logid="0954024576" type="utm" subtype="dlp" eventtype="dlp" level="warning" vd="root"
ruleid=1 rulename="keyword" dlpextra="Sensor 'user' matching any: ('username'=1) >= 1;
match." filtertype="sensor" filtercat="message" severity="critical" policyid=1
poluuid="8abe7a4e-08ae-51ef-edb0-45c05b514641" policytype="policy" sessionid=18462

AppleWebKit/537.36 (KHTML, like Gecko) Chrome/124.0.0.0 Safari/537.36" httpmethod="POST"
referralurl="https://dlptest.ai/http-post/" profile="keyword"
```

Assign confidence levels in FortiGuard managed DLP dictionaries

Users can select a FortiGuard dictionary with varying confidence levels based on their specific requirements.

- The high level provides maximum precision to minimize false positives.
- The medium level balances match quantity and precision.
- The low level captures the most matches, but may result in more false positives.

> A valid DLP license is required to obtain the latest package.
>
> When applying a FortiGuard built-in dictionary to a custom sensor, the dictionary with the highest confidence level is selected by default.

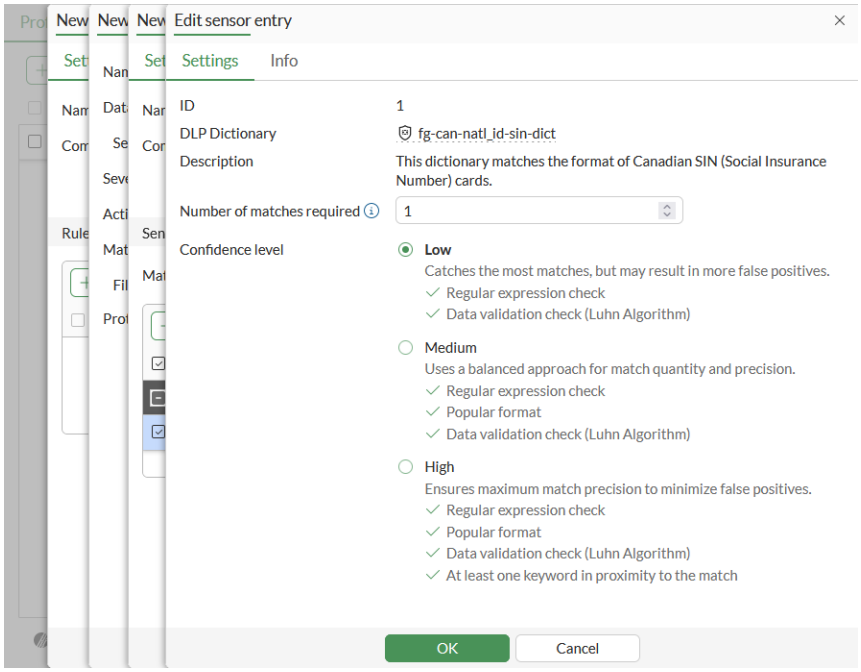
Use case examples

In these use case examples, various Canadian Social Insurance Number (SIN) formats are tested at different confidence levels using different protocols.

SIN format	Low Confidence Matching criteria: regular expression, data validation	Medium Confidence Matching criteria: regular expression, data validation SIN format validation	High Confidence Matching criteria: regular expression, data validation, SIN format validation, Match-around data
815489034	match	does not match	does not match
193849270	match	match	does not match
sin# 193849270	match	match	match

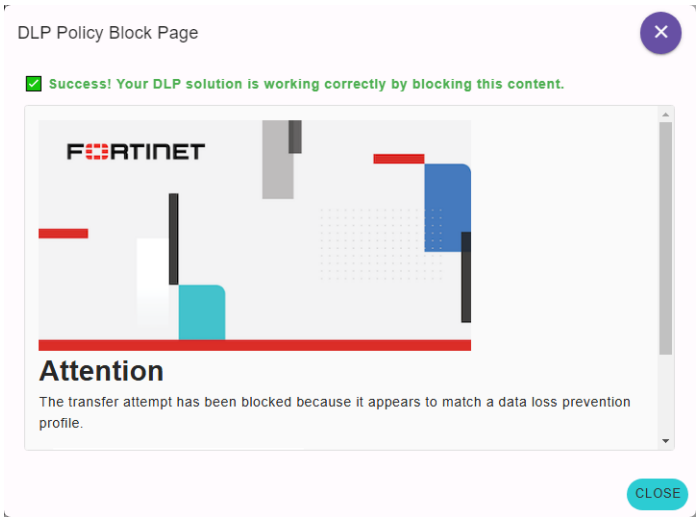
To verify that a FortiGuard dictionary with the low confidence level will block matching message through an HTTPS post:

1. Configure a DLP profile with a DLP sensor that uses the Canadian SIN card dictionary (`fg-can-natl_id-sin-dict`) DLP dictionary with the *Confidence level* set to *Low* and then use the profile in a policy.



2. Test that an HTTPS message containing a SIN is blocked. DLP Test > HTTPS Post can be used to send a test message.

   The message is blocked:

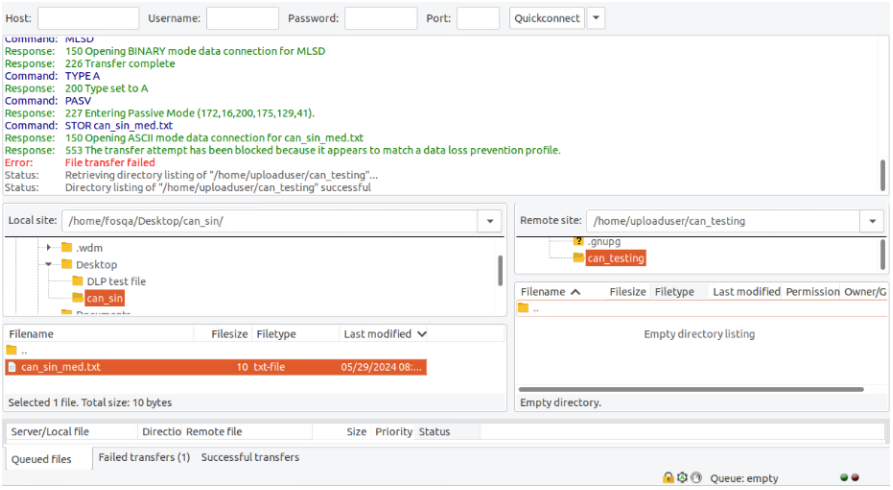


3. Go to *Log & Report > Security Events* and view the *Data Loss Prevention* logs matching the *can-natl_id-sin-dict-low* dictionary.
4. Check the raw logs:

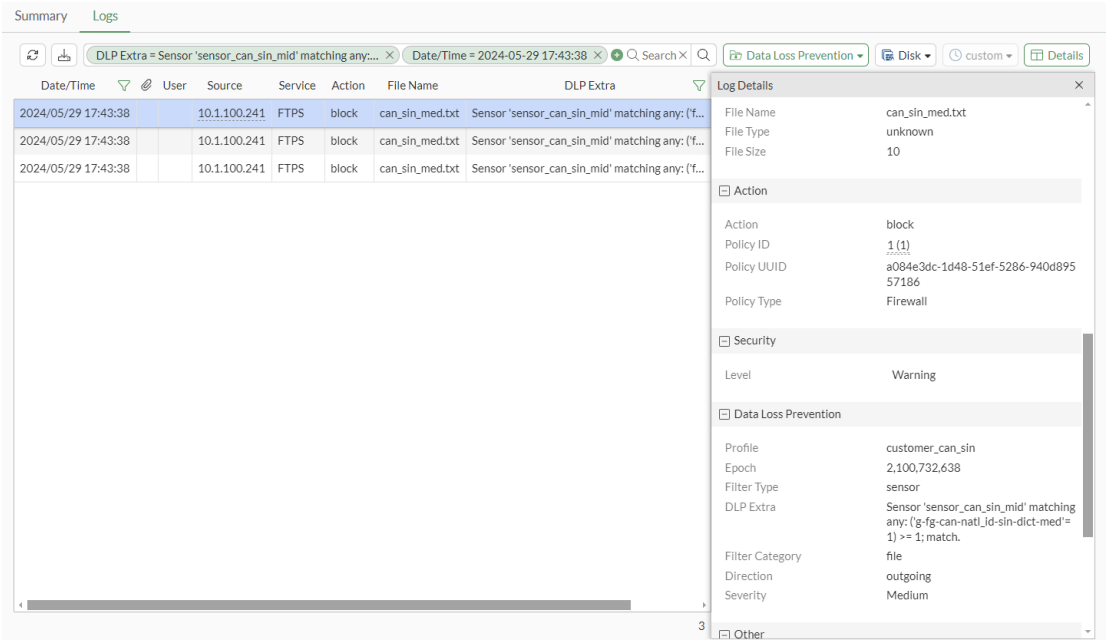
```
1: date=2024-05-29 time=16:55:27 eventtime=1717026926501493215 tz="-0700" logid="0954024576"
type="utm" subtype="dlp" eventtype="dlp" level="warning" vd="vdom1" ruleid=1 rulename="sensor_
can_sin_low" dlpextra="Sensor 'sensor_can_sin_low' matching any: ('g-fg-can-natl_id-sin-dict-
low'=1) >= 1; match." filtertype="sensor" filtercat="message" severity="medium" policyid=1
poluuid="a084e3dc-1d48-51ef-5286-940d89557186" policytype="policy" sessionid=64304
epoch=2100732550 eventid=1 srcip=10.1.100.241 srcport=34184 srccountry="Reserved"
srcintf="port2" srcintfrole="undefined" srcuuid="5a9d01f6-1d48-51ef-1c5f-c5a49f106988"
dstip=35.209.95.242 dstport=443 dstcountry="United States" dstintf="port1"
dstintfrole="undefined" dstuuid="5a9d01f6-1d48-51ef-1c5f-c5a49f106988" proto=6 service="HTTPS"
filetype="N/A" direction="outgoing" action="block" hostname="dlptest.ai"
url="https://dlptest.ai/https-post/" agent="Mozilla/5.0 (X11; Linux x86_64) AppleWebKit/537.36
(KHTML, like Gecko) Chrome/122.0.0.0 Safari/537.36" httpmethod="POST"
referralurl="https://dlptest.ai/https-post/" profile="customer_can_sin"
```

To verify that a FortiGuard dictionary with medium confidence level will block matching message through a FTPS post:

1. Configure a DLP profile with a DLP sensor that uses the Canadian SIN card dictionary (`fg-can-natl_id-sin-dict`) DLP dictionary with the *Confidence level* set to *Medium* and then use the profile in a policy.
2. Test that posting a file that contains `193849270` is blocked.



3. Go to *Log & Report > Security Events* and view the *Data Loss Prevention* logs matching the *can-natl_id-sin-dict-med* dictionary.



4. Check the raw logs:

```
1: date=2024-05-29 time=17:43:38 eventtime=1717029818309788622 tz="-0700" logid="0954024576"
type="utm" subtype="dlp" eventtype="dlp" level="warning" vd="vdom1" ruleid=2 rulename="sensor_
can_sin_med" dlpextra="Sensor 'sensor_can_sin_mid' matching any: ('g-fg-can-natl_id-sin-dict-
med'=1) >= 1; match." filtertype="sensor" filtercat="file" severity="medium" policyid=1
poluuid="a084e3dc-1d48-51ef-5286-940d89557186" policytype="policy" sessionid=65893
epoch=2100732638 eventid=0 srcip=10.1.100.241 srcport=37561 srccountry="Reserved"
srcintf="port2" srcintfrole="undefined" srcuuid="5a9d01f6-1d48-51ef-1c5f-c5a49f106988"
dstip=172.16.200.175 dstport=33065 dstcountry="Reserved" dstintf="port1"
dstintfrole="undefined" dstuuid="5a9d01f6-1d48-51ef-1c5f-c5a49f106988" proto=6 service="FTPS"
filetype="unknown" direction="outgoing" action="block" filename="can_sin_med.txt" filesize=10
profile="customer_can_sin"
```

To verify that the FortiGuard dictionary with a high confidence level will block matching message through an SMTP post:

1. Configure a DLP profile with a DLP sensor that uses the Canadian SIN card dictionary (`fg-can-natl_id-sin-dict`) DLP dictionary with the *Confidence level* set to *High* and then use the profile in a policy.
2. Test that sending email with an attached file that contains `sin# 193849270` is blocked.
3. Go to *Log & Report > Security Events* and view the *Data Loss Prevention* logs matching the *can-natl_id-sin-dict-high* dictionary.
4. Check the raw logs:

```
1: date=2024-05-30 time=11:37:18 eventtime=1717094238851929893 tz="-0700" logid="0954024576"
type="utm" subtype="dlp" eventtype="dlp" level="warning" vd="vdom1" ruleid=3 rulename="sensor_
can_sin_high" dlpextra="Sensor 'sensor_can_sin_high' matching any: ('g-fg-can-natl_id-sin-
dict-high'=1) >= 1; match." filtertype="sensor" filtercat="file" severity="medium" policyid=1
poluuid="a084e3dc-1d48-51ef-5286-940d89557186" policytype="policy" sessionid=96838

```

FortiData labels

When FortiData and FortiGate are integrated, you can use FortiData labels for DLP processing in FortiGate proxy-based firewall policies. For information about integrating FortiData with FortiGate, see FortiData on page 133.

FortiData is used to create labels by discovering, classifying, and labeling files with sensitive in your file storage system. See the *FortiData Administration Guide* for information.

Once FortiData labels are created, you can configure DLP labels in FortiOS, reference the FortiData labels in a DLP profile, and then apply the DLP profile to a proxy-based firewall policy.

To use FortiData labels in FortiOS:

1. Configure a DLP label of the FortiData type:

```
config dlp label
    edit "fortidata"
        set type fortidata
        config entries
            edit 1
                set fortidata-label-name "Critical"
            next
        end
    next
end
```

2. Reference the FortiData DLP label in your DLP profile:

```
config dlp profile
    edit "fortidata"
        set feature-set proxy
        config rule
            edit 1
                set proto
                set filter-by label
                set name fortidata
                set action block
            next
        end
    next
end
```

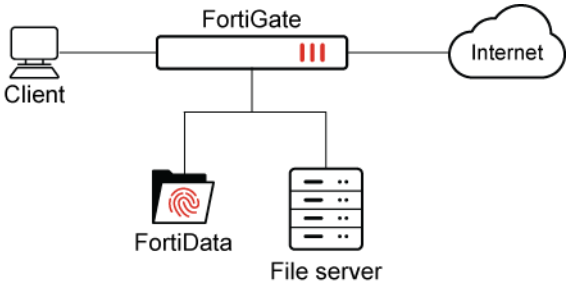
3. Apply your DLP profile into a proxy-based firewall policy on your FortiGate to scan your traffic and detect any data loss based on the label of your document.

```
config firewall policy
    edit 1
        set inspection-mode proxy
        set dlp-profile fortidata
    next
end
```

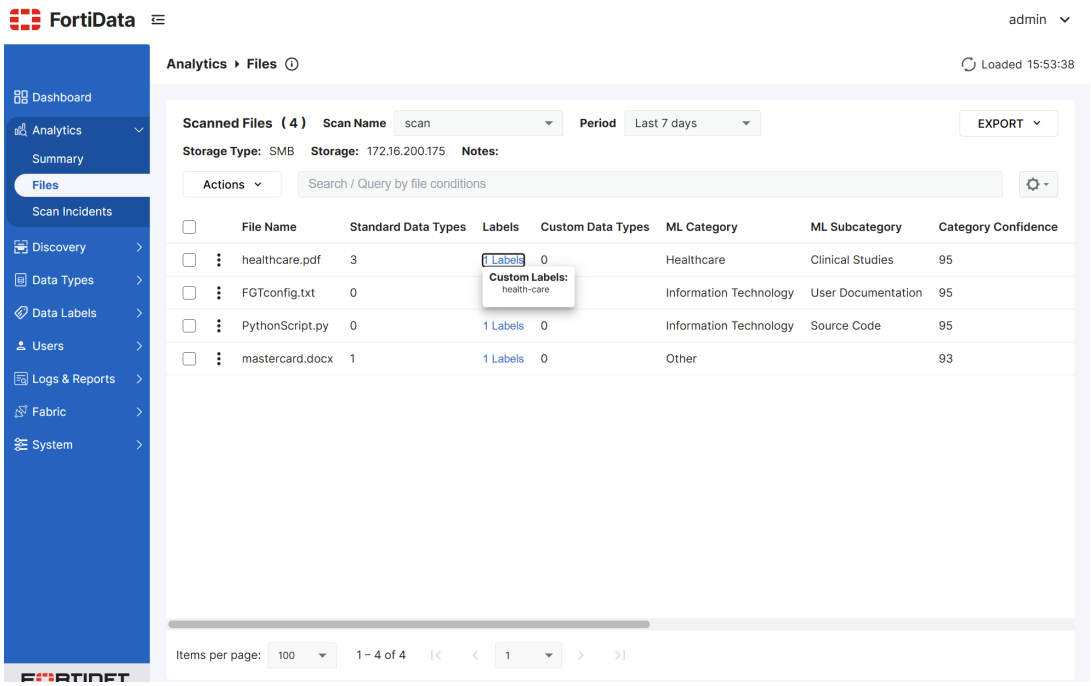
Example

This example describes how to use following FortiData labels in FortiOS DLP processing: health-care, credit-card, and python-source-code.

A file server is configured, and labels are selected in FortiData. FortiData scans the file server and applies labels to matching files.



Following is an example FortiData file source with the labels health-care, credit-card, and python-source-code. Only the *health-care* label is visible in the screen shot:



The next step is to configure FortiGate to use the FortiData labels. See Configuring FortiGate to use FortiData labels on page 2588.

With FortiData and FortiGate configured, the labels can be used for DLP processing in FortiGate policies. The results of DLP processing are described in the following example scenarios:

- Scenario 1: FortiData error action on page 2590
- Scenario 2: DLP action quarantine on page 2591
- Scenario 3: DLP action monitor on page 2593

Configuring FortiGate to use FortiData labels

Configure the following FortiData labels in FortiOS: health-care, credit-card, and python-source-code.

To configure FortiGate to use FortiData labels:

1. In FortiOS, configure DLP FortiData labels:

```
config dlp label
    edit "fortidata-label"
        set type fortidata
        config entries
            edit 1
                set fortidata-label-name "python-source-code"
            next
            edit 2
                set fortidata-label-name "credit-card"
            next
```

```
            edit 3
                set fortidata-label-name "health-care"
            next
        end
    next
end
```

2. Configure a DLP profile:
   In this example, `action` is set to `block`, and `fortidata-error-action` is set to `block`:

```
config dlp profile
    edit "fortidata-sensitive"
        set feature-set proxy
        config rule
            edit 1
                set type file
                set proto http-get http-post ftp
                set filter-by label
                set label "fortidata-label"
                set action block
            next
        end
        set fortidata-error-action block
    next
end
```

3. Create a firewall policy:

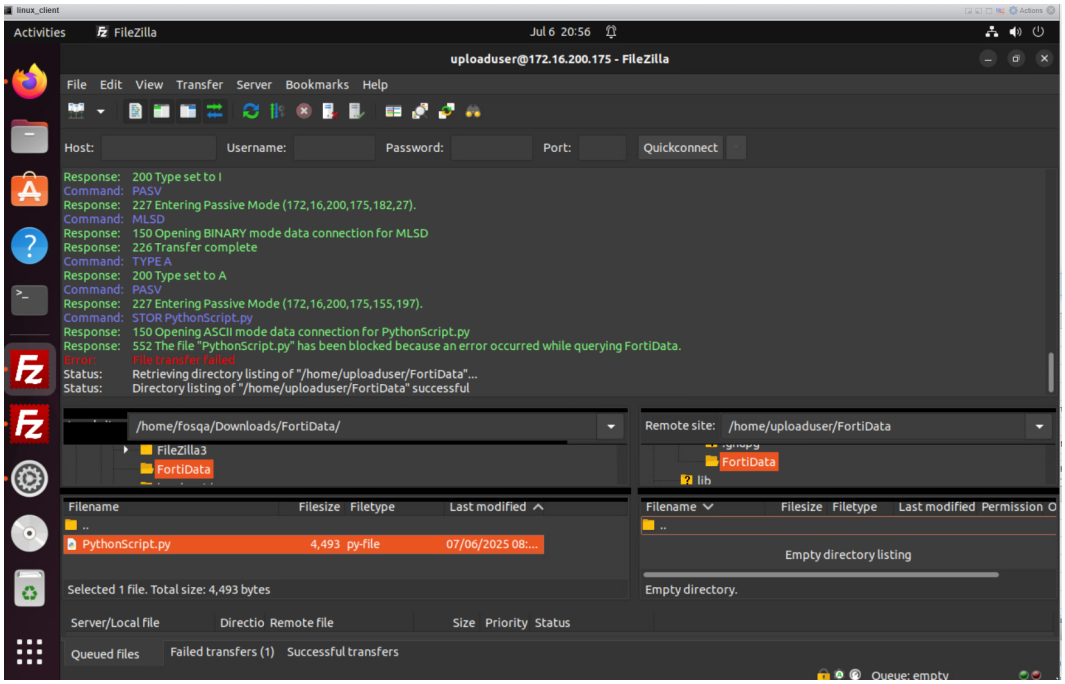
```
config firewall policy
    edit 1
        set uuid 19e776e0-5c63-51f0-9d68-3053988cbc21
        set srcintf "port2"
        set dstintf "port1"
        set action accept
        set srcaddr "all"
        set dstaddr "all"
        set srcaddr6 "all"
        set dstaddr6 "all"
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set inspection-mode proxy
        set profile-protocol-options "protocol"
        set ssl-ssh-profile "protocols"
        set dlp-profile "fortidata-sensitive"
        set nat enable
    next
end
```

Scenario 1: FortiData error action

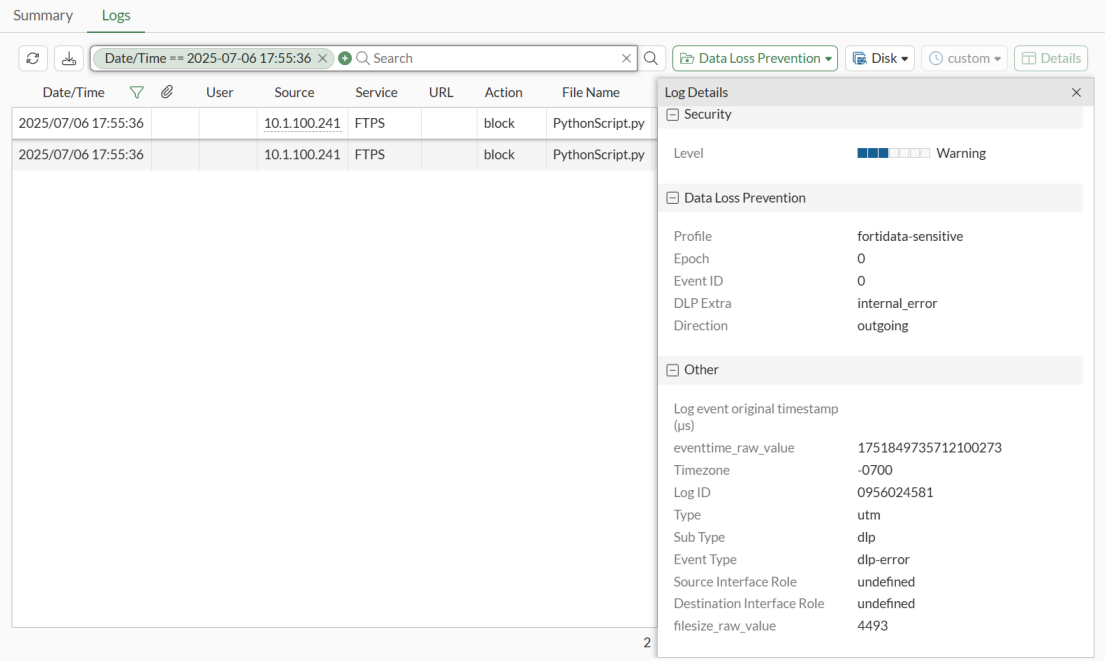
This scenario demonstrates what happens when the FortiGate DLP profile has `fortidata-error-action` set to `block`, and the FortiData query fails.

When the user attempts to post a `PythonScript.py` file through FTPS and the FortiData query fails, FortiGate blocks the attempt with an error message.

The following screen shot shows the `PythonScript.py` file has been blocked:



A DLP log with block action is generated on FortiGate, and you can view the log in the GUI on the *Log & Report > Security Events > Data Loss Prevention* pane:



You can also view the log in the CLI:

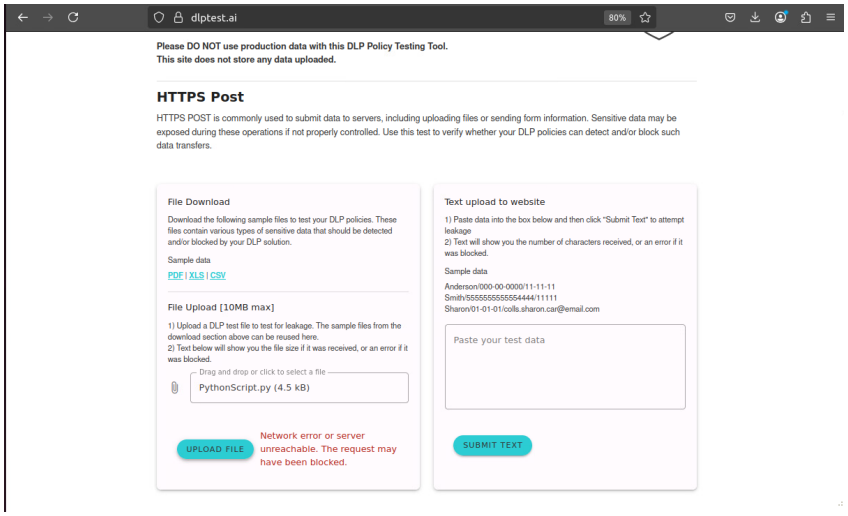
```
30: date=2025-07-06 time=17:55:24 eventtime=1751849724254438363 tz="-0700" logid="0956024581"
type="utm" subtype="dlp" eventtype="dlp-error" level="warning" vd="vdom1" error="fortidata"
dlpextra="internal_error" policyid=1 poluuid="8a20ddd4-5abf-51f0-3fcd-80a21a2eac18"
policytype="policy" sessionid=3142 epoch=0 eventid=0 srcip=10.1.100.241 srcport=58837
srccountry="Reserved" srcintf="port2" srcintfrole="undefined" srcuuid="5146e274-5abf-51f0-48e4-
5a4728500b83" dstip=172.16.200.175 dstport=40325 dstcountry="Reserved" dstintf="port1"
dstintfrole="undefined" dstuuid="5146e274-5abf-51f0-48e4-5a4728500b83" proto=6 service="FTPS"
filetype="python" direction="outgoing" action="block" filename="PythonScript.py" filesize=4493
profile="fortidata-sensitive"
```

Scenario 2: DLP action quarantine

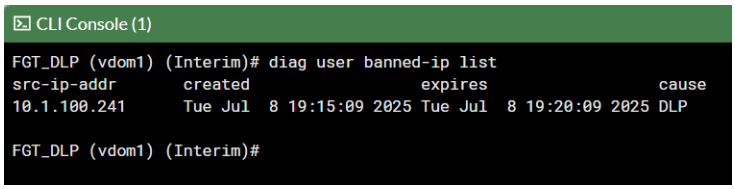
This scenario demonstrates what happens when the FortiGate DLP profile has `action` set to `quarantine-ip`:

```
config dlp profile
    edit "fortidata-sensitive"
        set feature-set proxy
        config rule
            edit 1
                set proto http-get http-post ftp ssh
                set filter-by label
                set label "fortidata-label"
                set action quarantine-ip
            next
        end
    next
end
```

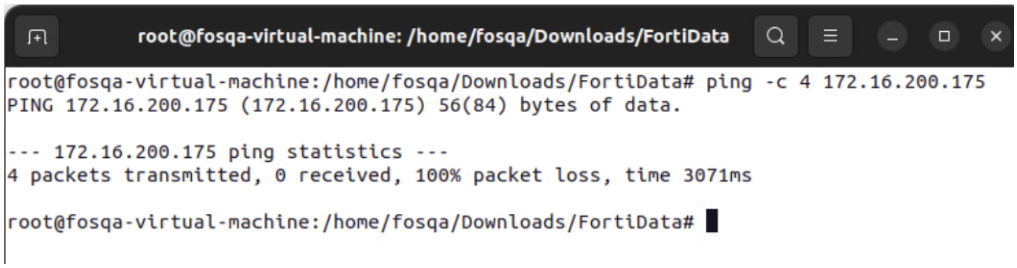
When the user attempts to post a `PythonScript.py` file through dlptest.ai that matches `python-source-code` FortiData label, FortiGate blocks the file and quarantines the IP:



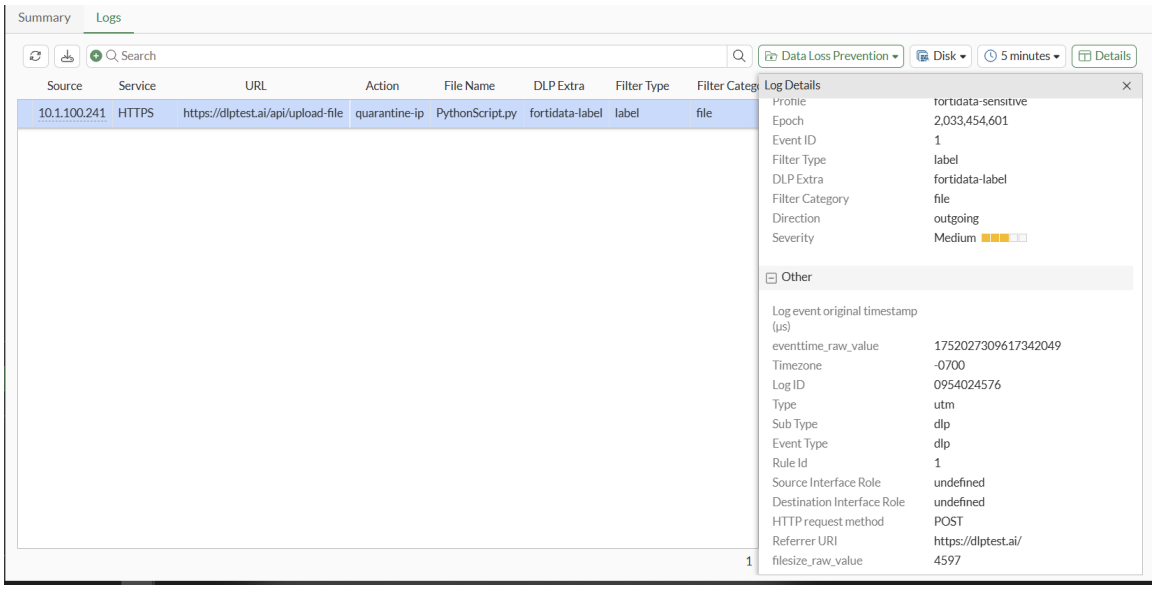
In FortiGate, the client is banned:



The client cannot ping the server through FortiGate:



A DLP log with quarantine-ip action is generated on FortiGate, and you can view the log in the GUI on the *Log & Report > Security Events > Data Loss Prevention* pane:



You can view the log in the CLI:

```
1: date=2025-07-08 time=19:15:09 eventtime=1752027309617342049 tz="-0700" logid="0954024576"
type="utm" subtype="dlp" eventtype="dlp" level="warning" vd="vdom1" ruleid=1 dlpextra="fortidata-
label" filtertype="label" filtercat="file" severity="medium" policyid=1 poluuid="19e776e0-5c63-
51f0-9d68-3053988cbc21" policytype="policy" sessionid=3465 epoch=2033454601 eventid=1
srcip=10.1.100.241 srcport=37258 srccountry="Reserved" srcintf="port2" srcintfrole="undefined"
srcuuid="dea915de-5c62-51f0-b993-090ad249da82" dstip=206.47.132.132 dstport=443
dstcountry="Canada" dstintf="port1" dstintfrole="undefined" dstuuid="dea915de-5c62-51f0-b993-
090ad249da82" proto=6 service="HTTPS" filetype="python" direction="outgoing" action="quarantine-
ip" hostname="dlptest.ai" url="https://dlptest.ai/api/upload-file" agent="Mozilla/5.0 (X11;
Ubuntu; Linux x86_64; rv:139.0) Gecko/20100101 Firefox/139.0" httpmethod="POST"
referralurl="https://dlptest.ai/" filename="PythonScript.py" filesize=4597 profile="fortidata-
sensitive"
```

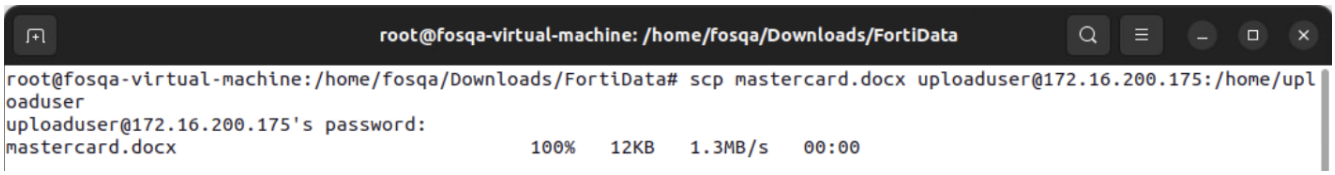
Scenario 3: DLP action monitor

This scenario demonstrates what happens when the FortiGate DLP profile has `action` set to `monitor`:

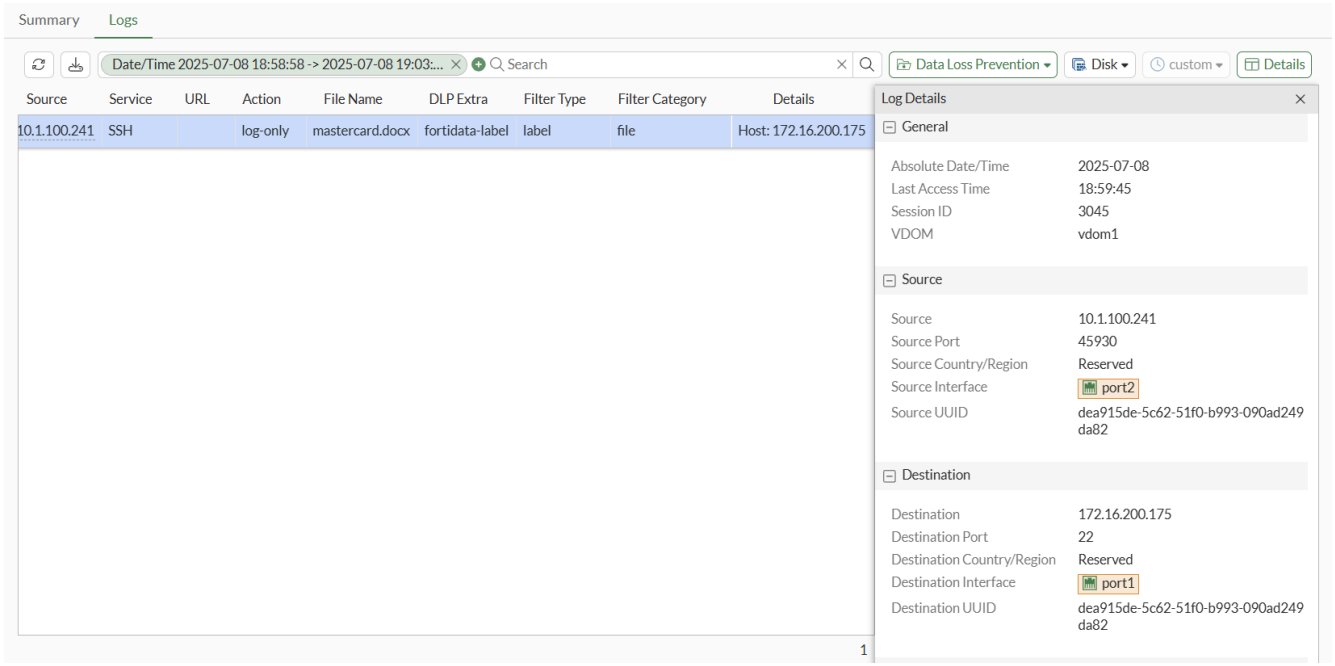
```
config dlp profile
    edit "fortidata-sensitive"
        set feature-set proxy
        config rule
            edit 1
                set proto http-get http-post ftp ssh
                set filter-by label
                set label "fortidata-label"
                set action monitor
            next
        end
    next
end
```

When the user attempts to post a file (`mastercard.docx`) that matches a FortiData label, FortiGate passes the file through.

User secure copy to upload the `mastercard.docx` file to the server:



A DLP log with log-only action is generated on FortiGate, and you can view the log in the GUI on the *Log & Report > Security Events > Data Loss Prevention* pane



You can view the log in the CLI:

```
1: date=2025-07-08 time=18:59:45 eventtime=1752026384529707336 tz="-0700" logid="0954024577"
type="utm" subtype="dlp" eventtype="dlp" level="notice" vd="vdom1" ruleid=1 dlpextra="fortidata-
label" filtertype="label" filtercat="file" severity="medium" policyid=1 poluuid="19e776e0-5c63-
51f0-9d68-3053988cbc21" policytype="policy" sessionid=3045 epoch=2033454538 eventid=0
srcip=10.1.100.241 srcport=45930 srccountry="Reserved" srcintf="port2" srcintfrole="undefined"
srcuuid="dea915de-5c62-51f0-b993-090ad249da82" dstip=172.16.200.175 dstport=22
dstcountry="Reserved" dstintf="port1" dstintfrole="undefined" dstuuid="dea915de-5c62-51f0-b993-
090ad249da82" proto=6 service="SSH" subservice="SCP" filetype="msofficex" direction="outgoing"
action="log-only" filename="mastercard.docx" filesize=12604 profile="fortidata-sensitive"
```

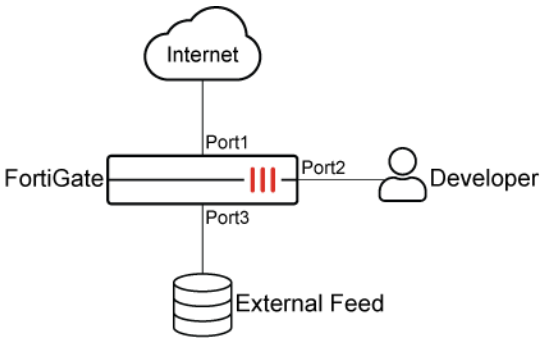
Prevent sensitive token leakage in HTTPS uploads using EDM

Exact Data Matching (EDM) enables precise matching of patterns or keywords from a predefined dataset, ensuring high accuracy. FortiGate can be configured to reference external resources containing lists of sensitive tokens, such as AWS Access Keys, JWTs (JSON Web Tokens), OAuth tokens, or other application secrets, that

are used in your organization. These resources are dynamically synchronized and periodically updated, so any changes are automatically imported by FortiOS.

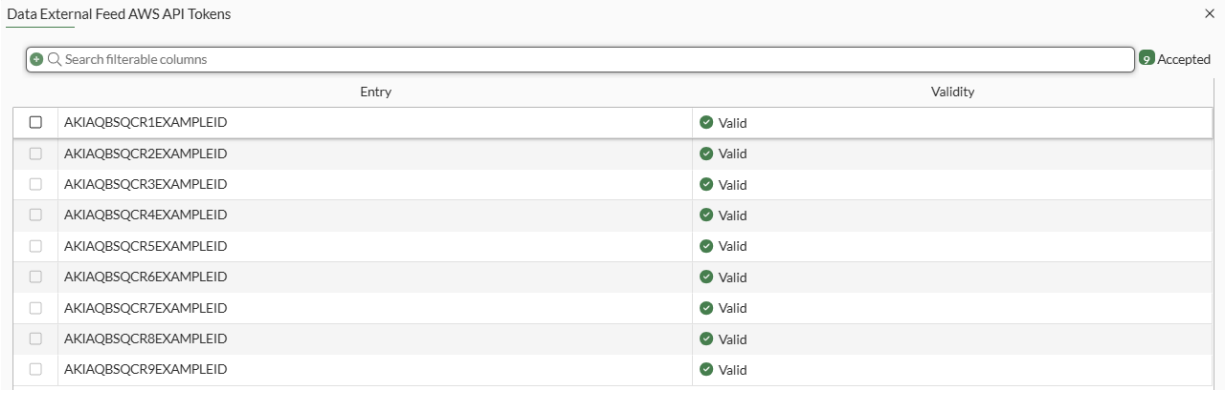
This configuration helps prevent accidental or intentional leakage of API keys, authentication tokens, or other secrets by blocking any code snippet containing these values when users attempt to upload files to external platforms such as GitHub, GitLab, or cloud storage services.

In this example, a file containing an AWS access token is being uploaded to an external GitHub repository using the HTTP POST method. FortiGate intercepts the traffic through deep inspection and blocks the upload because it matches the DLP profile configured on the device. This ensures that sensitive credentials, such as AWS Access Tokens, are not accidentally or intentionally leaked outside the organization.



To block HTTPS upload traffic that includes AWS access tokens in the GUI:

1. 1. Ensure that *Data Loss Prevention* is enabled:
   a. Go to *System* > *Feature Visibility*.
   b. Under *Security Features*, enable *Data Loss Prevention*.
   c. Click Apply.
2. Create an EDM template with matching criteria:
   a. Go to *Security Profiles* > *Data Loss Prevention*, select the *EDM Template* tab, and click *Create New*.
   b. Enter a name for the template, such as *AWS API Tokens*.
   c. Set *Resource type* to *External feed*, and set *External feed URL* to the location of the file on the external server, such as *https://13.13.13.13/aws_api_tokens.csv*.
   d. Click *+All of these fields* to pair the column index of patterns with a DLP data type.
      In this example, column 1 in the external resource file contains the patterns for the edm-keyword data type.
   e. Click *OK*.
   f. Edit the DLP EDM template and click *View Entries* to view the data entries in the field.



3. Configure a DLP sensor for the EDM template:
   a. Go to *Security Profiles* > *Data Loss Prevention*, select the *Sensor* tab, and click *Create New*.
   b. Enter a name for the DLP sensor, such as *AWS API Sensor*.
   c. In the *Sensor Entries* table, click *Add*.
   d. In the drop-down list, select *Managed Locally*.
   e. Select *AWS API Tokens* then click *Apply*.
   f. Click *OK*.
4. Create a DLP profile and select the DLP sensor for the EDM template:
   a. Go to *Security Profiles* > *Data Loss Prevention*, select the *Profile* tab, and click *Create New*.
   b. Enter a name for the DLP profile, such as *AWS API Profile*.
   c. In the *Rules* tables, click *Create New*.
   d. Enter a name for the rule, such as *AWS API Rule*.
   e. Configure the following, then click *OK*.

Field	Value
Type	Sensor
Sensors	AWS API Sensor
Severity	Critical
Action	Block
Match type	File
File type	(leave blank)
Protocol	HTTP-POST

   f. Click *OK*.
5. Add the DLP profile to a firewall policy:
   a. Go to *Policy & Objects* > *Firewall Policy*. and click *Create New*.
   b. Set *Inspection mode* to *Proxy-based*.
   c. Under *Security Profiles*, enable *DLP Profile* and select *AWS API Profile*.
   d. Set *SSL inspection* to *deep-inspection*.
   e. Configure the other settings as needed.
   f. Click *OK*.

To block HTTPS upload traffic that includes AWS access tokens in the CLI:

1. Create an EDM template with matching criteria:

```
config dlp exact-data-match
    edit "AWS API Tokens"
        set data "AWS API Tokens"
        config columns
            edit 1
                set type "edm-keyword"
            next
        end
    next
end
```

2. Configure a DLP sensor for the EDM template:

```
config dlp sensor
    edit "AWS API Sensor"
        config entries
            edit 1
                set dictionary "AWS API Tokens"
            next
        end
    next
end
```

3. Create a DLP profile and select the DLP sensor for the EDM template:

```
config dlp profile
    edit "AWS API Profile"
        set feature-set proxy
        config rule
            edit 1
                set name "AWS API Profile"
                set severity critical
                set proto http-post
                set filter-by sensor
                set sensor "AWS API Sensor"
                set action block
            next
        end
    next
end
```

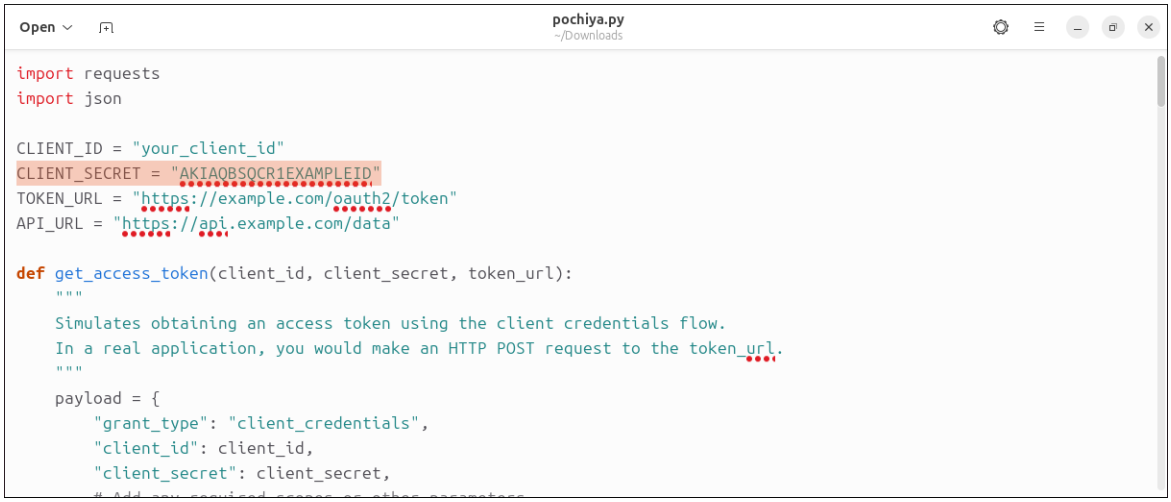
4. Add the DLP profile to a firewall policy:

```
config firewall policy
    edit 1
        set name "AWS_Token_Block"
        set srcintf "port2"
        set dstintf "port1"
        set action accept
```

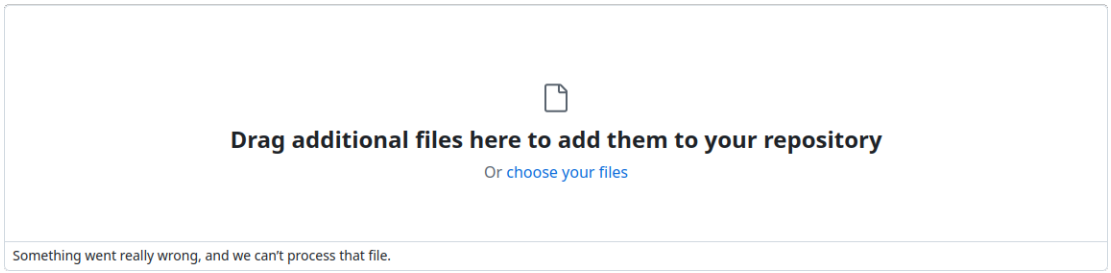
```
        set srcaddr "all"
        set dstaddr "all"
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set inspection-mode proxy
        set ssl-ssh-profile "deep-inspection"
        set dlp-profile "AWS API Profile"
        set logtraffic all
        set nat enable
    next
end
```

To verify the configuration:

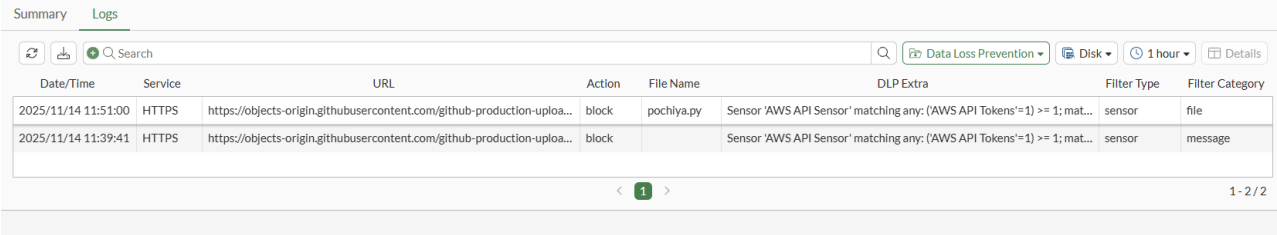
1. A developer attempts to upload a file containing AWS access tokens through HTTPS to github.com, and the file content matches the EDM template.



2. FortiGate blocks the user's attempt and displays an error message:



3. FortiGate generates a DLP log:



1: date=2025-11-14 time=11:51:00 eventtime=1763077860331286861 tz="+1200" logid="0954024576" type="utm" subtype="dlp" eventtype="dlp" level="warning" vd="root" ruleid=1 **rulename="AWS API Profile" dlpextra="Sensor 'AWS API Sensor' matching any: ('AWS API Tokens'=1) >= 1; match."** filtertype="sensor" filtercat="file" severity="critical" policyid=1 poluuid="3c57da8c-c0de-51f0-6f4a-95b898d269b3" policytype="policy" sessionid=28834 epoch=834063557 eventid=1 srcip=10.10.10.10 srcport=53912 srccountry="United States" srcintf="port2" srcintfrole="undefined" srcuuid="d2f06fda-15e7-51ee-0d22-faaf5170dad2" dstip=140.82.113.21 dstport=443 dstcountry="United States" dstintf="port1" dstintfrole="undefined" dstuuid="d2f06fda-15e7-51ee-0d22-faaf5170dad2" proto=6 **service="HTTPS" filetype="python"** direction="outgoing" **action="block"** hostname="objects-origin.githubusercontent.com" url="https://objects-origin.githubusercontent.com/github-production-upload-manifest-file-7fdce7" agent="Mozilla/5.0 (X11; Ubuntu; Linux x86_64; rv:135.0) Gecko/20100101 Firefox/135.0" **httpmethod="POST" referralurl="https://github.com/" filename="pochiya.py"** filesize=2338 **profile="AWS API Profile"**

Virtual patching

Virtual patching is a method for mitigating vulnerability exploits against OT and IoT devices by applying patches virtually on the FortiGate. This is done in several steps:

1. A FortiGate uses the OT Detection Signatures and Service to collect device information from OT and IoT devices that are connected to an interface.
2. The device information is used to perform a vulnerability lookup by querying FortiGuard for device-specific vulnerabilities and mitigation rules.

   FortiGuard returns OT virtual patching signatures and IPS signatures.
3. The FortiGate caches the applicable signatures and mitigation rules that apply to each device. The signatures and rules are mapped to the MAC address of the device.
4. When a virtual patching profile is applied to a firewall policy, traffic that enters the firewall policy is subject to signature matching on a per-device basis.
   a. The IPS engine uses the MAC address of the device to match any mitigation rules that should apply.
   b. If the MAC address is in the exempted list, then patching is exempted or skipped.
   c. If the signature rule is in the exempted list, then patching is also exempted or skipped for that signature.
   d. Otherwise, all applicable rules for the device will be applied.

OT and IoT device detection

When device detection is enabled on a LAN interface, FortiGate detects OT and IoT devices that are connected to the interface by using the OT Detection Signatures and Service.

Device detection can be enabled in the GUI and CLI. In the GUI, go to *Network* > *Interfaces*, edit a LAN interface, enable *Device detection*, and click *OK*. In the CLI:

```
config system interface
    edit <name>
        set device-identification enable
    next
end
```

You can further refine OT and IoT device detection by excluding OT and/or IoT application control signatures in the CLI.

```
config system interface
    edit <name>
        set device-identification enable
        set exclude-signatures {iot ot}
    next
end
```

Command	Description
device-identification {enable | disable}	Enable/disable passively gathering of device identity information about the devices on the network connected to this interface (default = disable).
exclude-signatures {iot ot}	Exclude OT and/or IoT application control signatures. This option is hidden when device-identification is disabled.

For example, when an IoT application control signature is excluded from device detection (`exclude-signatures iot`), IoT devices are not detected.

When OT and IoT signatures are included in the policy interfaces, FortiGate automatically creates and applies a built-in application list to ensure relative IoT and OT device categories are active.

A firewall policy with `utm-status` enabled must be configured for the LAN interface for OT and IoT device detection to occur.

Virtual patching profiles

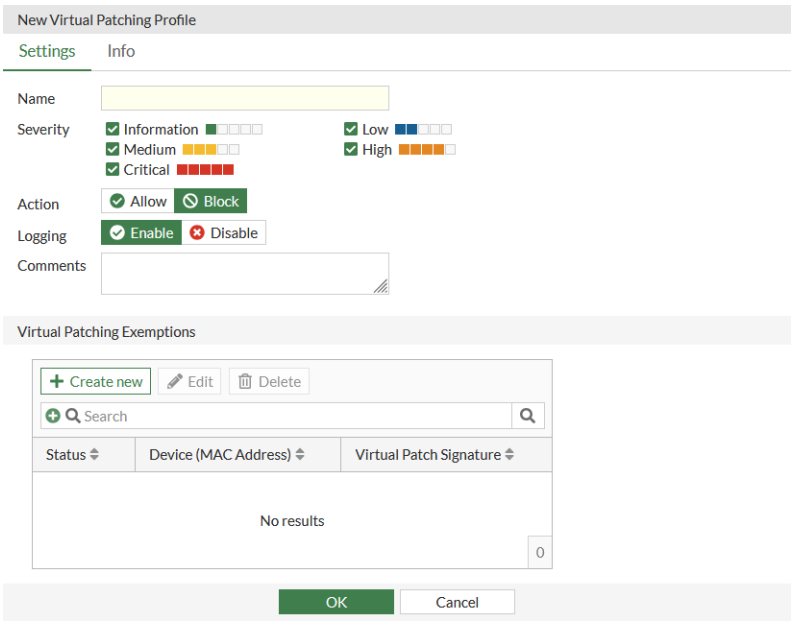
A virtual patching profile can be applied to firewall policies in any direction, protecting traffic from or to the vulnerable OT and IoT devices. Virtual patching profiles can also be combined with virtual patching on NAC policies, so that vulnerable OT and IoT devices are first assigned to a protected VLAN, and then firewall policies associated with the VLAN will apply the virtual patching profile. See OT and IoT virtual patching on NAC policies on page 2611 for more information.

The following are requirements for the virtual patching feature:

- Purchase the appropriate OT-related license (virtual patching only applies to OT devices). See License and entitlement information for more details.
- Enable device detection on the LAN interface.
- Configure a firewall policy with `utm-status` enabled in order for device detection to occur.

The following options can be configured in a virtual patching profile (see also OT virtual patching basic examples on page 2605):

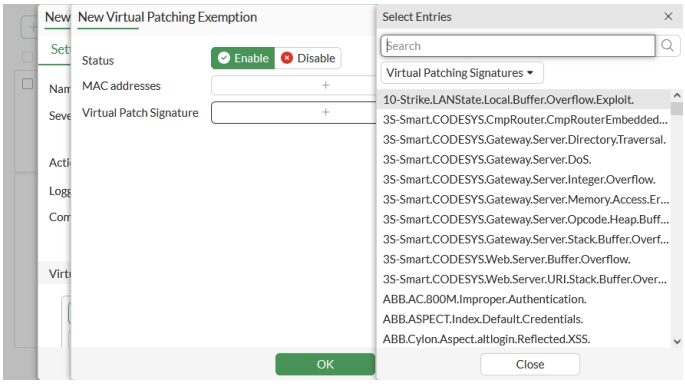
GUI option	CLI option	Description
Basic profile settings		
Name	`name <string>`	Enter a unique name for the profile.
Severity	`severity {info low medium high critical}`	Relative severity of the signature.
Action	`action {pass | block}`	Set the action to take for a matched device: • *Pass*/`pass`: allow sessions that match the profile. • *Block*/`block`: block sessions that match the profile (default).
Logging	`log {enable | disable}`	Enable/disable detection logging. This setting is enabled by default.
Comments	`comment <var-string>`	Enter a comment (optional).
Virtual patching exemptions settings		
Status	`status {enable | disable}`	Enable/disable the exemption.
MAC addresses	`device <mac_address1>, <mac_address2>, ...`	Select the device MAC addresses to exempt.
Virtual Patch Signature	`rule <id1>, <id2>, ...`	Select the signatures to exempt. See Virtual patching exemptions for more details.



To configure virtual patching in the GUI, ensure that *Virtual Patching* is enabled on the *System > Feature Visibility* page.

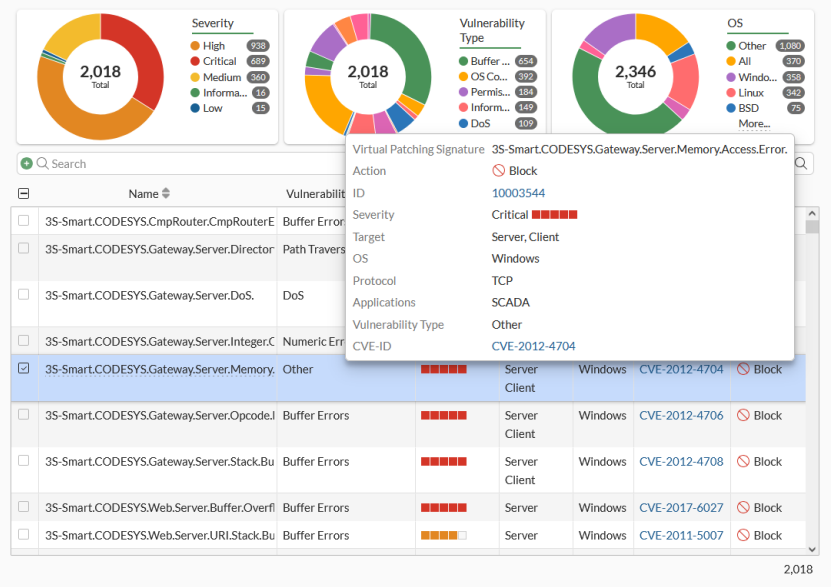
Virtual patching exemptions

Set the device MAC addresses and virtual patch signatures to exempt.

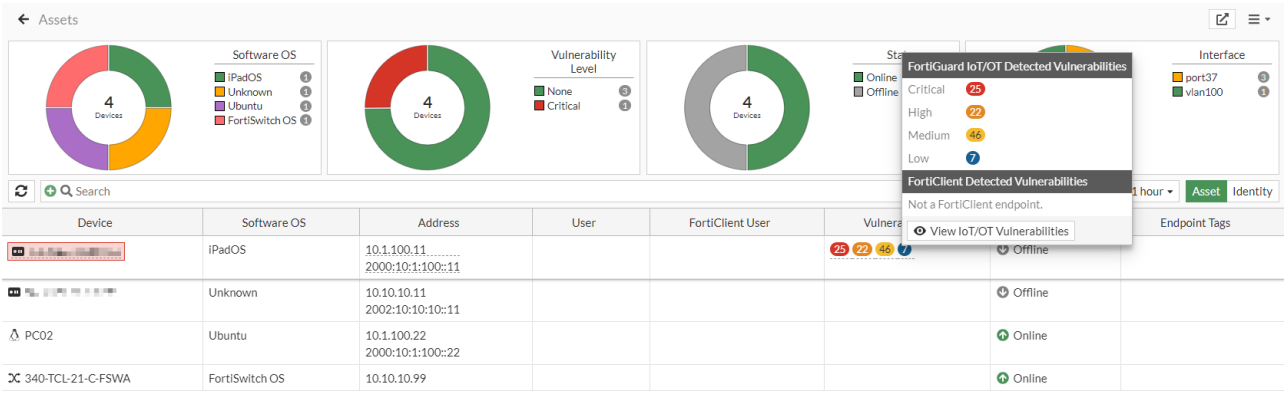


Virtual patching signatures

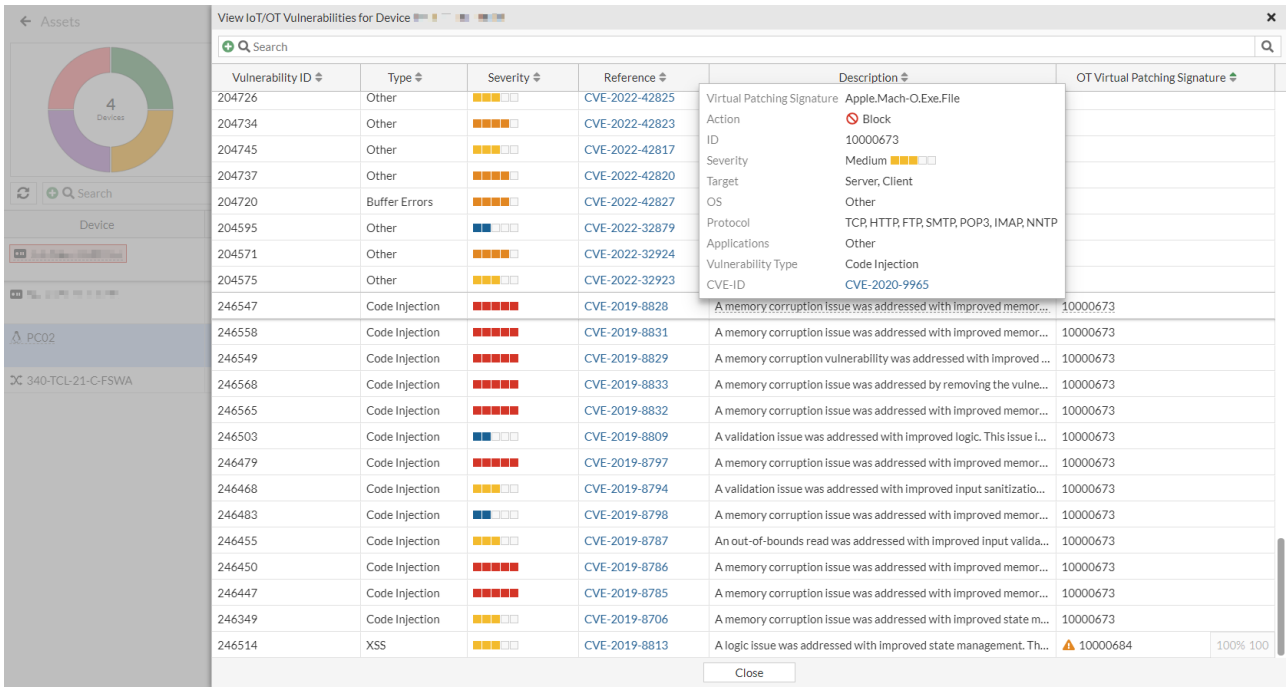
The *Security Profiles > Virtual Patching Signatures* page displays all OT virtual patching signatures. When using multi-VDOM mode, the OT virtual patching signatures are displayed per VDOM.



The *Dashboard* > *Assets & Identities* > *Assets* widget displays a tooltip for detected IoT and OT vulnerabilities when hovering over the *Vulnerabilities* column.



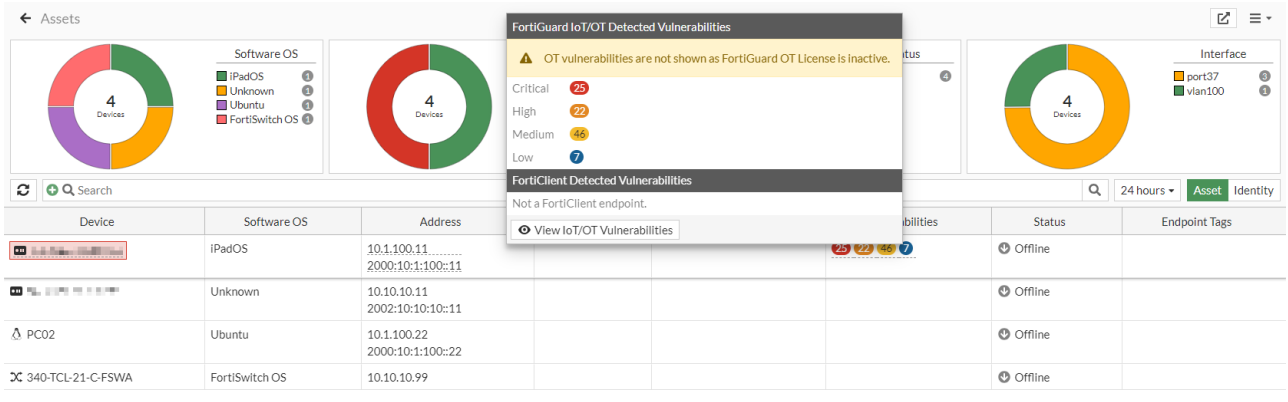
Clicking *View IoT/OT Vulnerabilities* in the tooltip displays a list of vulnerabilities retrieved from the FortiGuard API server for the device. The *OT Virtual Patching Signature* column includes the virtual patch signature ID that is mapped to the *Vulnerability ID*.



License and entitlement information

If a FortiGate does not have a valid OT license, a warning message is included in top of the IoT and OT vulnerabilities tooltip (*Assets* widget), indicating that OT vulnerabilities will not be detected.

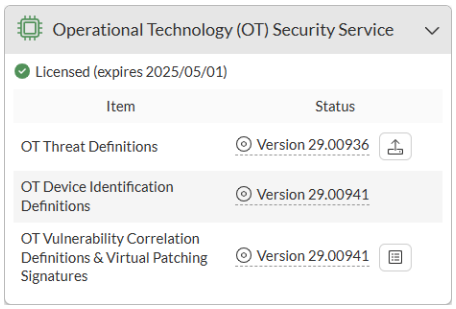
In a Security Fabric, each device must have a license.



The right-side gutter of virtual patching profile pages includes information about the following:

- *Operational Technology (OT) Security Service* entitlement status
- *OT Detection Definitions Package* version
- *OT Virtual Patching Signatures Package* version

The *System > FortiGuard > Subscriptions* tab also includes the list of signatures under the *Operational Technology (OT) Security Service* entitlement.

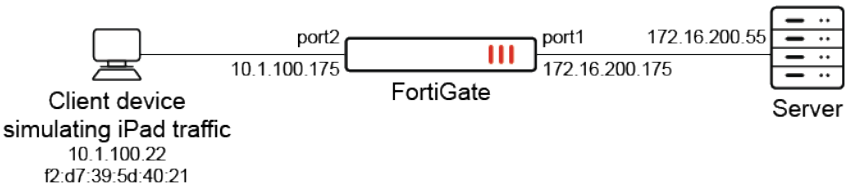


OT virtual patching basic examples

This topic contains two OT virtual patching examples: a basic configuration, and configuration that uses a NAC policy.

Example 1: basic configuration

This example demonstrates the flow for OT virtual patching from start to finish. First, a device (10.1.100.22) goes through device detection, which matches an OT detection signature downloaded on the FortiGate. Next, known vulnerabilities and OT patch signatures for this device are mapped to its MAC address. When traffic is generated by this device, IPS scans the traffic to identify any traffic patterns that match known OT patch signatures for this device. If a match is found, traffic is blocked by the FortiGate.



For demonstrative purposes, the simulated vulnerable OT device is a PC simulating web traffic from an iPad. An OT detection signature is specially crafted to match this Apple iPad traffic to the OT device category. To simulate vulnerable traffic, a test OT patch signature is used to match a generic cross-site scripting (XSS) attack over HTTP.

To verify the status of the OT related definitions:

1. Verify the current contracts licensed to the FortiGate:

```
# diagnose test update info
…
OTDT,Mon Sep 24 17:00:00 2029
OTVP,Mon Sep 24 17:00:00 2029
…
```

2. Verify the versions and status of the OT definitions:

```
# diagnose autoupdate versions
…
```

```
OT Detect Definitions
---------
Version: 23.00545 signed
Contract Expiry Date: Sun Sep 23 2029
Last Updated using manual update on Thu Jul 20 09:40:03 2023
Last Update Attempt: n/a
Result: Updates Installed
--
OT Patch Definitions
---------
Version: 23.00505 signed
Contract Expiry Date: Sun Sep 23 2029
Last Updated using manual update on Thu Jul 20 09:39:50 2023
Last Update Attempt: n/a
Result: Updates Installed
…
```

3. View the OT detection rules downloaded on the FortiGate. In this example, the OT detection rule ID 10000870 is a specially crafted signature to match Apple iPad traffic to the OT category:

```
# get rule otdt status
app-name: "Apple.iPad"
id: 10000870
category: "OT"
cat-id: 34
popularity: 5.low
risk: 1.medium
weight: 10
shaping: 0
protocol: 1.TCP, 9.HTTP
vendor: 7.Apple
technology: 0.Network-Protocol
behavior:
dev_cat: Other
```

4. View the OT patch rules downloaded on the FortiGate. In this example, the OT patch rule is a specially crafted signature to match a generic XSS attack to a vulnerability:

```
# get rule otvp status
rule-name: "WAP.Generic.XSS"
rule-id: 10000684
rev: 20.321
date: 1653379200
action: pass
status: enable

```

To configure virtual patching in the GUI:

1. Enable device detection on port2 :
   a. Go to *Network* > *Interfaces* and edit port2.
   b. In the *Network* section, enable *Device detection*.
   c. Click *OK*.
2. Configure the virtual patching profile:
   a. Go to *Security Profiles* > *Virtual Patching* and click *Create New*.
   b. Configure the following settings:

Name	*test*
Severity	Select *Info*, *Low*, *Medium*, *High*, and *Critical*
Action	*Block*
Logging	*Enable*

   c. Click *OK*.
3. Apply the virtual patching profile to a firewall policy for traffic from port2 to port1:
   a. Go to *Policy & Objects* > *Firewall Policy* and click *Create New*.
   b. In the *Security Profiles* section, enable *Virtual Patching* and select the virtual patch profile (*test*).
   c. Set *SSL Inspection* to a profile that uses deep inspection profile in order to scan SSL encrypted traffic.
   d. Configure the other settings as needed.
   e. Click *OK*.

To configure virtual patching in the CLI:

1. Enable device detection on port2:

```
config system interface
    edit "port2"
        set device-identification enable
    next
end
```

2. Configure the virtual patching profile:

```
config virtual-patch profile
    edit "test"
        set comment ''
        set severity info low medium high critical
        set action block
```

```
        set log enable
    next
end
```

3. Apply the virtual patching profile to a firewall policy:

```
config firewall policy
    edit 1
        set srcintf "port2"
        set dstintf "port1"
        set action accept
        set srcaddr "all"
        set dstaddr "all"
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set ssl-ssh-profile "custom-deep-inspection"
        set virtual-patch-profile "default"
        set nat enable
    next
end
```

To test the virtual patching:

1. On the PC, generate traffic that simulates web traffic from an iPad. This traffic is generated in order for the FortiGate to perform device detection on port2. The OT detection signature 10000870 will be triggered, which considers this traffic from an OT device in this simulated scenario:

```
# curl 172.16.200.55 -H "User-Agent: Mozilla/5.0 (iPad; CPU OS 12_5_5 like Mac OS X)
AppleWebKit/605.1.15 (KHTML, like Gecko) Version/10.1.2 Mobile/15E148 Safari/604.1"
```

   A log is generated, indicating the traffic that triggered the match:

```
3: date=2023-07-24 time=15:31:26 eventtime=1690237885960202460 tz="-0700" logid="1059028704"
type="utm" subtype="app-ctrl" eventtype="signature" level="information" vd="root"
appid=10000870 srcip=10.1.100.22 srccountry="Reserved" dstip=172.16.200.55
dstcountry="Reserved" srcport=51548 dstport=80 srcintf="port2" srcintfrole="undefined"
dstintf="port1" dstintfrole="undefined" proto=6 service="HTTP" direction="outgoing" policyid=1
poluuid="a3424268-1ffc-51ed-3ba9-f3a60e2271cf" policytype="policy" sessionid=7284
applist="default" action="pass" appcat="OT" app="Apple.iPad" hostname="172.16.200.55"
incidentserialno=18882457 url="/" agent="Mozilla/5.0 (iPad; CPU OS 12_5_5 like Mac OS X)
AppleWebKit/605.1.15 (KHTML, like Gecko) Version/10.1.2 Mobile/15E148 Safari/604.1"
httpmethod="GET" msg="OT: Apple.iPad" clouddevice="Vendor=Apple, Product=ipados,
Version=12.5.5, Firmware=IOS" apprisk="low"
```

   The FortiGate queries the FortiGuard OT query service with information about the OT device vendor and product. The service responds with the vulnerabilities and patch_sign_id applicable to this device. IPS caches this information in its device vulnerability database.

2. Verify the vulnerability by device MAC and IP address:

```
# diagnose user-device-store device memory vulnerability-query f2:d7:39:5d:40:21 10.1.100.22
Got 28 vulnerabilities, response size:1792
```

```
[Vulnerability-0]
        'vulnerability_id' = '110977'
        'severity' = '2'
        'signature' = '10000684'
```

3. Verify the virtual patch signatures stored and enabled on the FortiGate:

```
# diagnose ips share list otvp_cfgcache
f2:d7:39:5d:40:21 1 10000684
```

4. Using the vulnerable device 10.1.100.22, generate vulnerable traffic to the destination server 172.16.200.55. The traffic from this IP and MAC address triggers OT patch signature 1000684 to match and is subsequently blocked by the firewall policy:

```
# curl -X POST http://172.16.200.55/'index.html?<javascript>'
```

5. Verify the UTM virtual patch log that was recorded with information about the vulnerability that was virtually patched:

```
# execute log filter category 24
# execute log display
2 logs found.
2 logs returned.

1: date=2023-07-20 time=16:03:00 eventtime=1689894179977743851 tz="-0700" logid="2400064600"

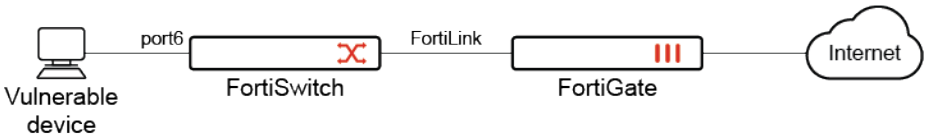
```

Example 2: NAC policy

In this example, a NAC policy is pre-configured to detect devices with information or higher vulnerabilities, as demonstrated in OT and IoT virtual patching on NAC policies on page 2611. The NAC policy assigns the devices to vlan300.



A virtual patching profile is created to block any vulnerabilities with low, medium, high, or critical severity. The profile is applied to a firewall policy for outbound traffic.

To configure virtual patching in the GUI:

1. Enable device detection on vlan300:
   a. Go to *Network* > *Interfaces* and edit vlan300.
   b. In the *Network* section, enable *Device detection*.
   c. Click *OK*.
2. Configure the virtual patching profile:
   a. Go to *Security Profiles* > *Virtual Patching* and click *Create New*, or edit an existing profile.
   b. Configure the following settings:

Name	*OT_check*
Severity	Select *Info*, *Low*, *Medium*, *High*, and *Critical*
Action	*Block*
Logging	*Enable*

   c. Click *OK*.
3. Apply the virtual patching profile to a firewall policy:
   a. Go to *Policy & Objects* > *Firewall Policy* and click *Create New*, or edit an existing policy.
   b. In the *Security Profiles* section, enable *Virtual Patching* and select the virtual patch profile (*OT_check*).
   c. Configure the other settings as needed.
   d. Click *OK*.

To configure virtual patching in the CLI:

1. Enable device detection on vlan300:

```
config system interface
    edit "vlan300"
        set device-identification enable
    next
end
```

2. Configure the virtual patching profile:

```
config virtual-patch profile
    edit "OT_check"
        set severity info low medium high critical
    next
end
```

3. Apply the virtual patching profile to a firewall policy:

```
config firewall policy
    edit 1
        set name "virtualpatch-policy"
        set srcintf "vlan300"
        set dstintf "port1"
        set srcaddr "all"
```

```
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set virtual-patch-profile "OT_check"
        set logtraffic all
    next
end
```

4. Verify the logs:

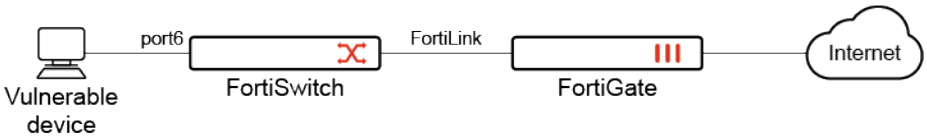
```
# execute log filter category utm-virtual-patch
# execute log display
...
1: date=2023-06-20 time=16:21:00 eventtime=1686180059982988434 tz="-0700" logid="2400064600"
type="utm" subtype="virtual-patch" eventtype="virtual-patch" level="warning" vd="root"
severity="medium" srcip=10.1.100.11 srccountry="Reserved" dstip=172.16.200.55
dstcountry="Reserved" srcintf="vlan300" srcintfrole="undefined" dstintf="port1"
dstintfrole="undefined" sessionid=1445 action="dropped" proto=6 service="HTTP" policyid=1
poluuid="ce6b724c-0558-51ee-e9d3-f0b8ef1c115f" policytype="policy" attack="WAP.Generic.XSS"
srcport=37062 dstport=80 hostname="172.16.200.55" url="/index.html?<javascript>"
agent="curl/7.61.1" httpmethod="POST" direction="outgoing" attackid=10000684
ref="http://www.fortinet.com/ids/VID10000684" incidentserialno=214959182 msg="vPatch:
WAP.Generic.XSS" crscore=10 craction=16384 crlevel="medium"
```

OT and IoT virtual patching on NAC policies

OT and IoT virtual patching can be applied to a NAC policy by setting the category to *Vulnerability* and configuring the *Match* criteria based on severity. Devices that match the criteria can be assigned and isolated to a NAC VLAN.

Example

In this example, a device with a certain vulnerability severity is detected by the NAC policy on the FortiGate. Subsequently, the FortiSwitch port in which it is connected to is moved to vlan300 where traffic can be controlled for vulnerable devices. For more information about NAC policies, see Defining a FortiSwitch NAC policy in the FortiLink Administration Guide. This example assumes the vlan300 has already been configured.



The following settings are required for IoT device detection:

- A valid Attack Surface Security Rating service license to download the IoT signature package.
- Enable device detection on the LAN interface used by IoT devices.

- In the GUI, go to *Network* > *Interfaces*, edit a LAN interface, enable *Device detection*, and click *OK*.
- In the CLI, enter:

```
config system interface
    edit <name>
        set device-identification enable
    next
end
```

- Configure a firewall policy with `utm-status` enabled in order for device detection to occur.

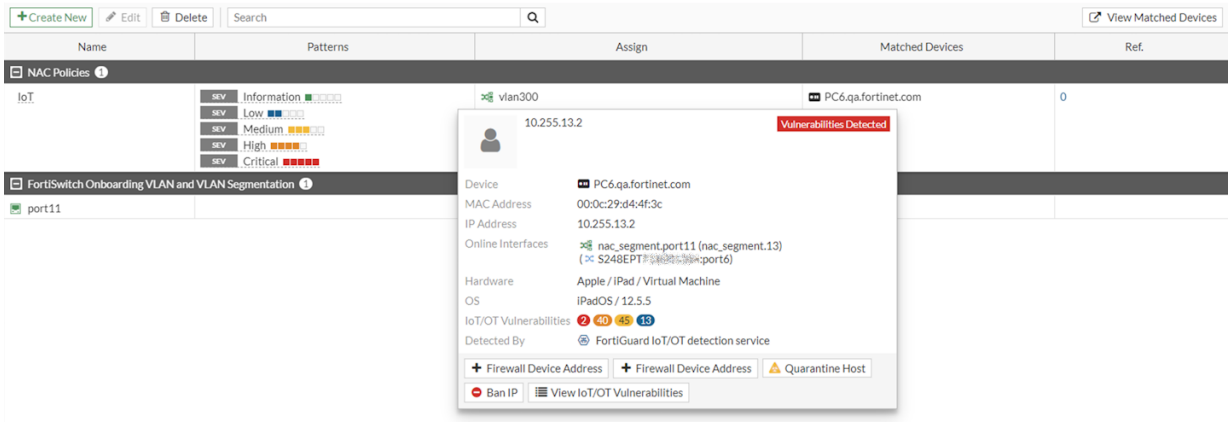
To configure virtual patching on NAC policies

1. Configure the NAC policy:
   a. Go to *WiFi & Switch Controller* > *NAC Policies* and click *Create New*, or edit an existing policy.
   b. In the *Device Patterns* section, set *Category* to *Vulnerability*.
   c. Set *Match* to *Severity is at least* and select a severity level (*Information* is used in this example).
   d. In the *Switch Controller Action* section, enable *Assign VLAN* and select *vlan300*.

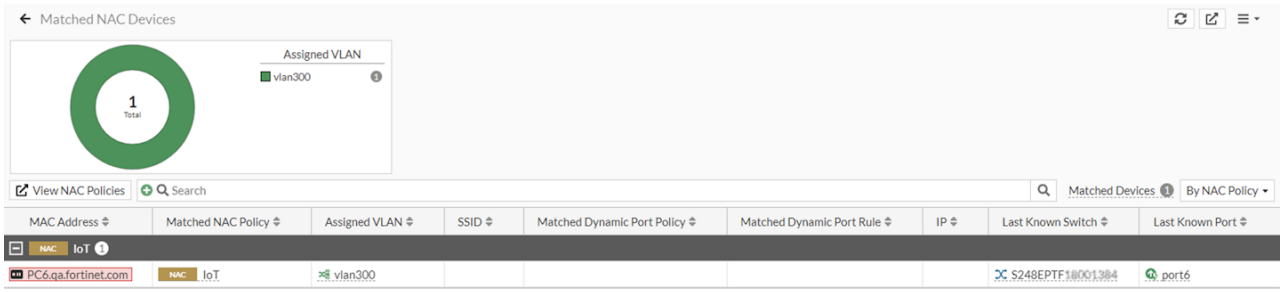
   e. Configure the other settings as needed.
   f. Click *OK*.
2. Enable NAC mode on the desired FortiSwitch ports (port6 in this example):
   a. Go to *WiFi & Switch Controller* > *FortiSwitch Ports*.
   b. Select *port6*, then right-click and set the *Mode* to *NAC*.
3. Enable utm-status on the firewall policy that is used to control outbound internet access for vulnerable devices (vlan300 to port1).

```
config firewall policy
    edit <name>
        set utm-status enable
    next
end
```

4. Generate traffic on the vulnerable client device.
5. Once the NAC policy is matched, go to *WiFi & Switch Controller > NAC Policies* to view the device matched to the policy.



The vulnerable device is also shown on *Dashboards > Assets & Identities* in the *Matched NAC Devices* widget.



To configure virtual patching on NAC policies in the CLI:

1. Configure the VLAN in the MAC policy:

```
config switch-controller mac-policy
    edit "IoT"
        set fortilink "fortilink"
        set vlan "vlan300"
    next
end
```

2. Configure the NAC policy:

```
config user nac-policy
    edit "IoT"
        set category vulnerability
        set severity 0 1 2 3 4
        set switch-fortilink "fortilink"
        set switch-mac-policy "IoT"
    next
end
```

3. Enable NAC mode on the desired FortiSwitch ports:

```
config switch-controller managed-switch
    edit "S248E***********"
        config ports
            edit "port6"
                set access-mode nac
            next
        end
    next
end
```

4. Configure a firewall policy with `utm-status` enabled to limit access for devices in this VLAN (vlan300).

SSL & SSH Inspection

Secure Sockets Layer (SSL) content scanning and inspection allows you to apply antivirus scanning, web filtering, and email filtering to encrypted traffic. You can apply SSL inspection profiles to firewall policies.

FortiOS includes four preloaded SSL/SSH inspection profiles, three of which are read-only and can be cloned:

- *certificate-inspection*
- *deep-inspection*
- *no-inspection*

The *custom-deep-inspection* profile can be edited, or you can create your own SSL/SSH inspection profiles.

Deep inspection (also known as SSL/SSH inspection) is typically applied to outbound policies where destinations are unknown. Depending on your policy requirements, you can configure the following:

- Which CA certificate will be used to decrypt the SSL encrypted traffic
- Which SSL protocols will be inspected
- Which ports will be associated with which SSL protocols for inspection
- Whether or not to allow invalid SSL certificates
- Whether or not SSH traffic will be inspected
- Which addresses or web category allowlists can bypass SSL inspection

The following topics provide information about SSL & SSH Inspection:

- Configuring an SSL/SSH inspection profile on page 2615
- Certificate inspection on page 2618
- Deep inspection on page 2621
- Protecting an SSL server on page 2624
- Handling SSL offloaded traffic from an external decryption device on page 2625
- SSH traffic file scanning on page 2627
- Redirect to WAD after handshake completion on page 2630
- HTTP/2 support in proxy mode SSL inspection on page 2630
- Define multiple certificates in an SSL profile in replace mode on page 2632
- Disabling the FortiGuard IP address rating on page 2634
- Block or allow ECH TLS connections on page 2635

- Configuring certificate probe failure option on page 2644
- Hybrid PQC support in proxy mode SSL deep inspection on page 2645

Configuring an SSL/SSH inspection profile

The *custom-deep-inspection* profile can be edited or new SSL/SSH inspection profiles can be configured to be used in firewall policies.

To configure an SSL/SSH inspection profile in the GUI:

1. Go to *Security Profiles* > *SSL/SSH Inspection* and click *Create New*.
2. Configure the following settings:

Name		Enter a unique name for the profile.
Comments		Enter a comment (optional).
SSL Inspection Options		
	Enable SSL Inspection of	Enable SSL inspection of: • *Multiple Clients Connecting to Multiple Servers*: Use this option for generic policies where the destination is unknown. This is normally used when inspecting outbound internet traffic. Other *SSL Inspection Options* become available to configure if this option is selected. • *Protecting SSL Server*: Use this option when setting up a profile customized for a specific SSL server with a specific certificate. Define the certificate using the *Server certificate* field. See Protecting an SSL server on page 2624 for more information.
	Inspection method	Define the inspection method: • *SSL Certificate Inspection*: Only inspects the certificate, by way of the headers up to the SSL/TLS layer, and not the contents of the traffic. Allows Encrypted Client Hello (ECH) to be allowed or blocked. • *Full SSL Inspection*: Inspects the SSL/TLS encrypted traffic payload. See Deep inspection on page 2621.
	CA certificate	Use the dropdown menu to select one of the installed certificates for the inspection of the packets. Click *Download* to save the certificate.
	Blocked certificates	Block or allow potentially malicious certificates. Select *View Blocked Certificates* for a detailed list of blocked certificates, including the listing reason and date.
	Untrusted SSL certificates	Configure the action to take when a server certificate is not issued by a trusted CA. • *Allow*: Allow the untrusted server certificate. This is the default value. • *Block*: Block the session.

		• *Ignore*: This option is for *Full SSL inspection* only. It re-signs the server certificate as trusted. When configured in the GUI for certificate inspection it has no effect and the setting is not saved. Click *View Trusted CAs List* to see a list of the factory bundled and user imported CAs that are trusted by the FortiGate.
	Server certificate SNI check	Check the SNI in the hello message with the CN or SAN field in the returned server certificate: • *Enable*: If it is mismatched, use the CN in the server certificate for URL filtering. • *Strict*: If it is mismatched, close the connection. • *Disable*: Server certificate SNI check is disabled.
	Enforce SSL cipher compliance	Enable/disable SSL cipher compliance. This option is for *Full SSL inspection* only.
	Enforce SSL negotiation compliance	Enable/disable SSL negotiation compliance. This option is for *Full SSL inspection* only.
	RPC over HTTPS	Enable/disable inspection of Remote Procedure Calls (RPC) over HTTPS traffic. This option is for *Full SSL inspection* only.
	MAPI over HTTPS	Enable/disable inspection of Messaging Application Programming Interface (MAPI) over HTTPS traffic.
Protocol Port Mapping		
	Inspect all ports	Inspect all ports with the IPS engine by enabling *Inspect all ports*. Choose whether to disable *DNS over TLS*.
	HTTPS, SMTPS, POP3S, IMAPS, FTPS	If *Inspect all ports* is disabled, specify the port through which traffic will be inspected in the field next to the listed protocols. See Inspecting all ports on page 2618 for details.
	DNS over TLS	Enable/disable inspection of DNS over TLS.
	Encrypted Client Hello	Allow or block TLS connections that use Encrypted Client Hello (ECH).
	HTTP/3	When *Inspection method* is set to *SSL Certificate Inspection* or *HTTPS* is disabled, *HTTP/3* is set to *Bypass* and cannot be changed. When *Inspection method* is set to *Full SSL Inspection*, choose whether to *Inspect*, *Bypass*, or *Block* HTTP/3.
	DNS over QUIC	Available when *Inspection method* is set to *Full SSL Inspection*. Choose whether to *Inspect*, *Bypass*, or *Block* DNS over QUIC.
Exempt from SSL Inspection		These options are for *Full SSL inspection* only. Use the menus in this section to specify any reputable websites, FortiGuard Web Categories, or addresses that will be exempt from SSL inspection: • *Reputable Websites*: Enable this option to exempt any websites identified by FortiGuard as reputable.

	• *Web Categories*: The categories of *Finance and Banking*, *Health and Wellness*, and *Personal Privacy* have been added by default. These categories are the most likely to have applications that will require a specific certificate. • *Addresses*: These can be any of the address objects that have an interface of *any*. • *Log SSL exemptions*: Enable this option to log all SSL exemptions. See Exempt web sites from deep inspection on page 2623 for more information.
SSH Inspection Options	
SSH deep scan	Enable/disable SSH protocol packet deep scanning capabilities. *SSH port* will become available if *SSH deep scan* is enabled.
SSH port	Define what ports will search for SSH protocol packets: • *Any*: Select this option to search all traffic regardless of service or TCP/IP port for packets that conform to the SSH protocol. • *Specify*: Select this option and enter the port number to restrict the search for SSH protocol packets to the TCP/IP port number specified. This is not as comprehensive but it is easier on the performance of the firewall.
Common Options	
Invalid SSL certificates	Allow or block the passing of traffic in invalid certificates. Additional common options that provide more granularity with actions for different types of invalid SSL certificates will become available if *Invalid SSL certificates* is set to *Custom*: • *Expired certificates*: Action to take when the server certificate is expired. The default action is block. • *Revoked certificates*: Action to take when the server certificate is revoked. The default action is block. • *Validation timed-out certificates*: Action to take when the server certificate validation times out. For certificate inspection, the default action is allow. For deep inspection, the default action is Keep Untrusted & Allow. • *Validation failed certificates*: Action to take when the server certificate validation fails. The default action is block. For deep inspection, the above options have the following actions: • *Keep Untrusted & Allow*: Allow the server certificate and keep it untrusted. • *Block*: Block the certificate. • *Trust & Allow*: Allow the server certificate and re-sign it as trusted.
Log SSL anomalies	Enable this feature to record and log traffic sessions containing invalid certificates. By default, SSL anomalies logging is enabled. Logs are generated in the UTM log type under the SSL subtype when invalid certificates are detected.

3. Click *OK*.

Inspecting all ports

The behavior of inspecting all ports can be different between flow and proxy mode inspection when the inspection mode is configured in a firewall policy.

In proxy mode inspection, when deep inspection is enabled:

- If *Inspect all ports* is disabled, only the ports specified in the *Protocol Port Mapping* section will be scanned.
- If *Inspect all ports* is enabled, all ports will be scanned.

In flow mode inspection, when deep-inspection is enabled:

- All ports will be scanned, regardless of whether or not *Inspect all ports* is enabled or disabled.

When performing certificate inspection instead of deep inspection, flow and proxy mode inspection behave the same:

- If *Inspect all ports* is disabled, only the ports specified in the *Protocol Port Mapping* section will be scanned.
- If *Inspect all ports* is enabled, all ports will be scanned.

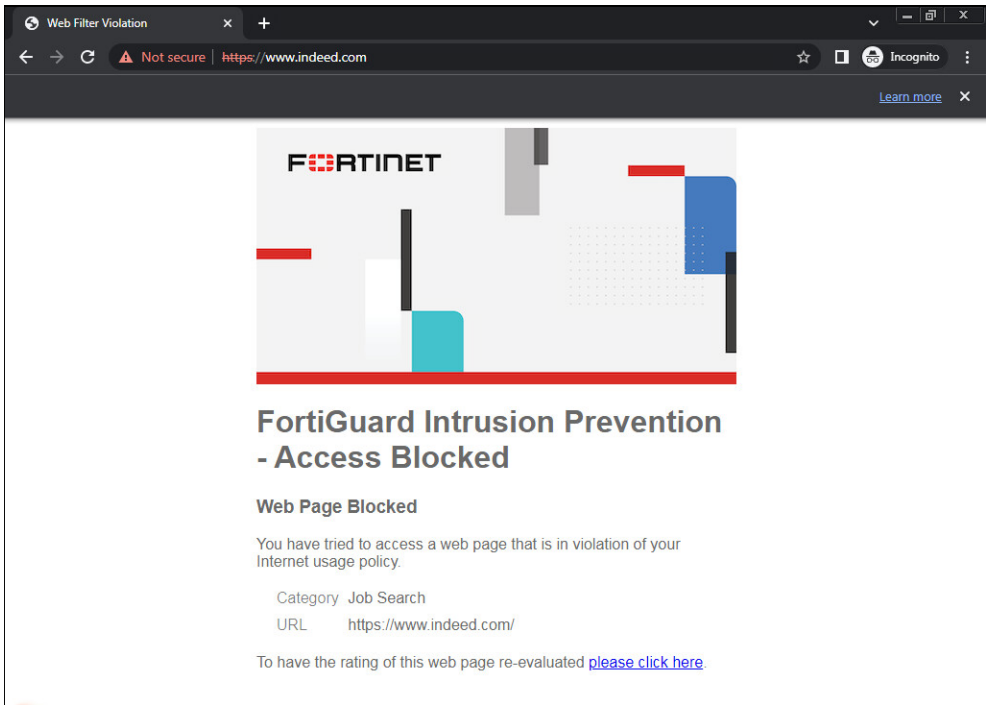
Certificate inspection

FortiGate supports certificate inspection. The default configuration has a built-in *certificate-inspection* profile which you can use directly. When you use certificate inspection, the FortiGate only inspects the headers up to the SSL/TLS layer.

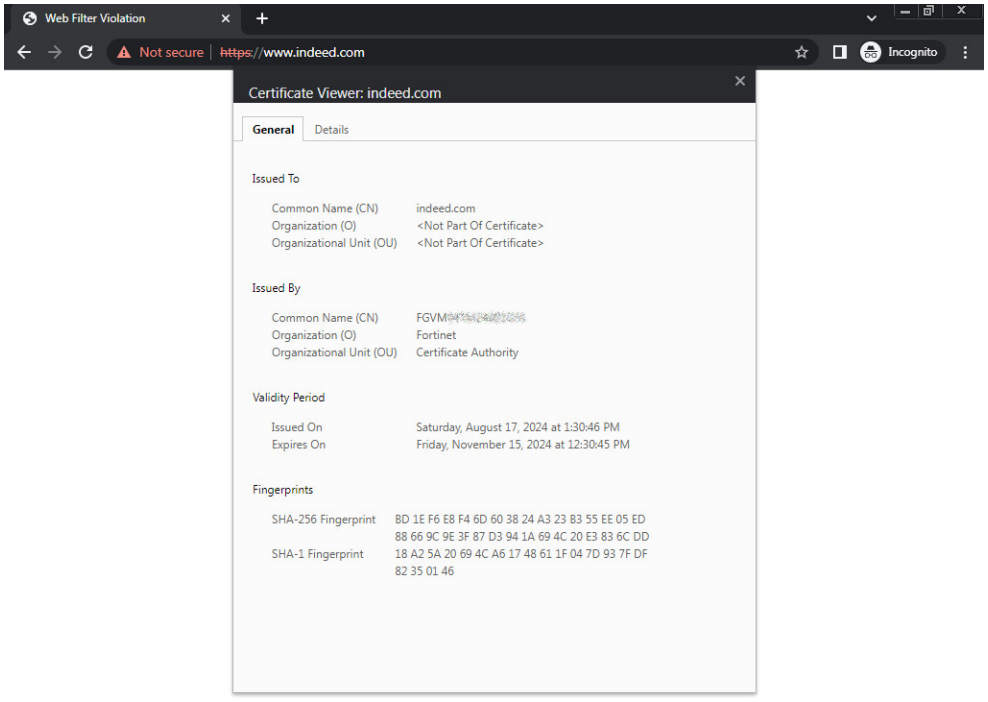
If you do not want to deep scan for privacy reasons but you want to control web site access, you can use *certificate-inspection*.

Replacement messages for HTTPS connections

When using certificate inspection in a firewall policy, a user will encounter a block page served in HTTPS when accessing an HTTPS web page that triggers a replacement message.



The replacement message can display for many reasons, such as a page being blocked by a web filter category, a page displaying a warning for a web filter category, a page requiring authentication, and so on. If you examine the certificate, it shows that the replacement page is signed by the FortiGate CA.



For your clients to no longer see a warning message for an invalid certificate, install the respective CA certificate in the client's certificate store.

To download the CA certificate:

1. Go to *Security Profiles* > *SSL/SSH Inspection*.
2. Edit the SSL/SSH inspection profile that is being used in the firewall policy.
3. Beside the *CA Certificate* field, click *Download*.
4. Share and install this certificate on the client endpoints devices.

By default, the SSL/SSH inspection profile uses the *Fortinet_CA_SSL* certificate. You can customize this certificate by changing the selection in the *CA Certificate* field to another certificate in the FortiGate's certificate store.

Inspect non-standard HTTPS ports

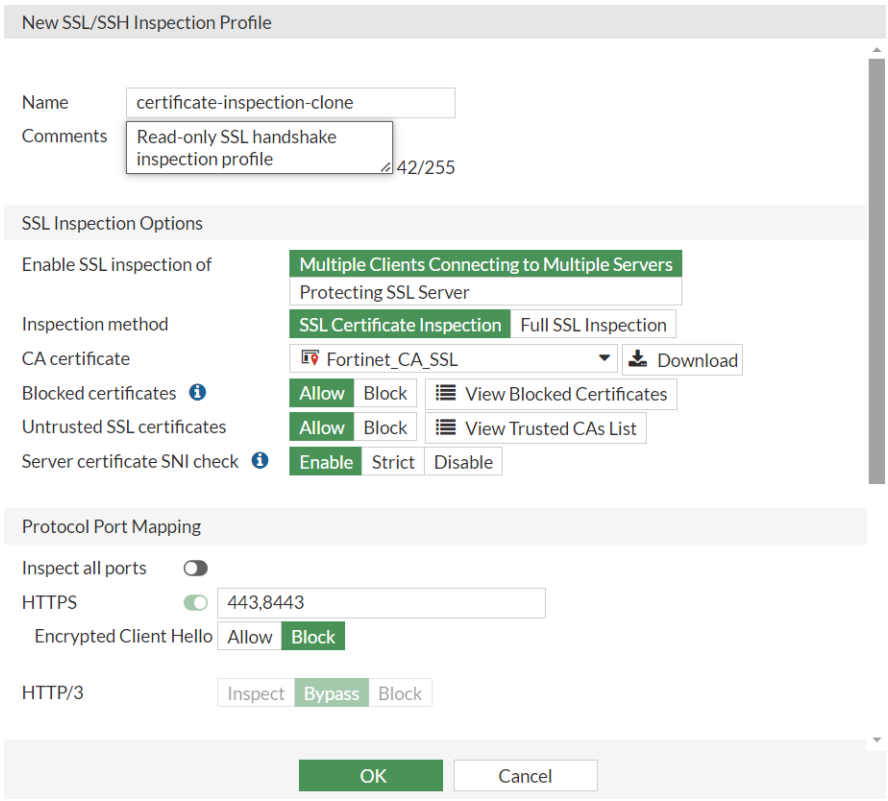
The built-in *certificate-inspection* profile is read-only and only listens on port 443. If you want to make changes, you must create a new certificate inspection profile.

If you know the non-standard port that the web server uses, such as port 8443, you can add this port to the *HTTPS* field.

To add a port to the inspection profile in the GUI:

1. Go to *Security Profiles* > *SSL/SSH Inspection*.
2. Create a new profile, or clone the default profile.
3. If you do no know what port is used in the HTTPS web server, under *Protocol Port Mapping*enable *Inspect All Ports*.

   If you know the port, such as port 8443, then set *HTTPS* to *443,8443*.



4. Configure the remaining setting as needed.
5. Click *OK*.

Common options

Invalid SSL certificates can be blocked, allowed, or a different actions can be configured for the different invalid certificates types. See Configuring an SSL/SSH inspection profile on page 2615.

Deep inspection

You can configure address and web category allowlists to bypass SSL deep inspection.

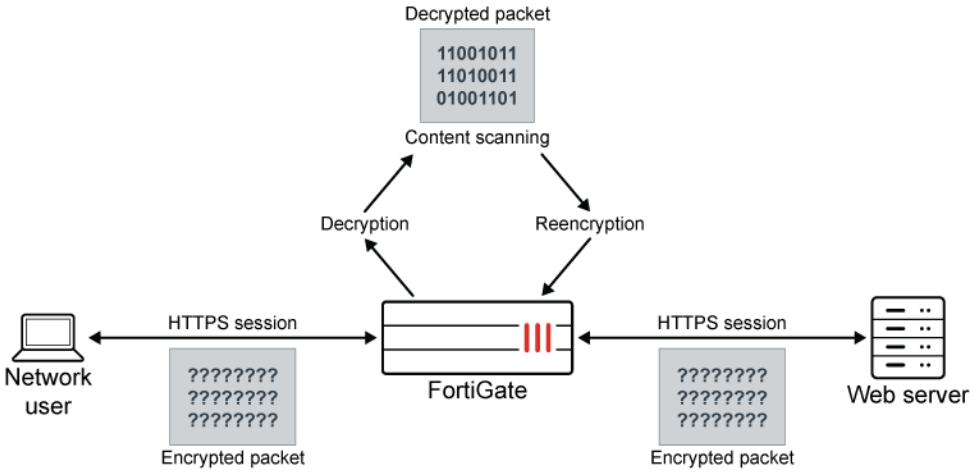
Reasons for using deep inspection

While Hypertext Transfer Protocol Secure (HTTPS) offers protection on the Internet by applying Secure Sockets Layer (SSL) encryption to web traffic, encrypted traffic can be used to get around your network's normal defenses.

For example, you might download a file containing a virus during an e-commerce session, or you might receive a phishing email containing a seemingly harmless download that, when launched, creates an encrypted session to a command and control (C&C) server and downloads malware onto your computer. Because the sessions in these attacks are encrypted, they might get past your network's security measures.

When you use deep inspection, the FortiGate impersonates the recipient of the originating SSL session, then decrypts and inspects the content to find threats and block them. It then re-encrypts the content and sends it to the real recipient.

Deep inspection not only protects you from attacks that use HTTPS, it also protects you from other commonly-used SSL-encrypted protocols such as SMTPS, POP3S, IMAPS, and FTPS.



Protocol port mapping

To optimize the FortiGate's resources, the mapping and inspection of the following protocols can be enabled or disabled:

- HTTPS
- SMTPS
- POP3S
- IMAPS
- FTPS
- DNS over TLS

Each protocol has a default TCP port. The ports can be modified to inspect any port with flowing traffic. The packet headers indicate which protocol generated the packet.

Protocol port mapping only works with proxy-based inspection. Flow-based inspection inspects all ports regardless of the protocol port mapping configuration.

Browser messages when using deep inspection

When the FortiGate re-encrypts the content, it uses a stored certificate, such as *Fortinet_CA_SSL*, *Fortinet_CA_Untrusted*, or your own CA certificate that you uploaded.

Because there is no *Fortinet_CA_SSL* in the browser trusted CA list, the browser displays an untrusted certificate warning when it receives a FortiGate re-signed server certificate. To stop the warning messages, trust the FortiGate-trusted CA *Fortinet_CA_SSL* and import it into your browser.

If you still get messages about untrusted certificates after importing *Fortinet_CA_SSL* into your browser, it is due to *Fortinet_CA_Untrusted*. Never import the *Fortinet_CA_Untrusted* certificate into your browser.

To import *Fortinet_CA_SSL* into your browser:

1. On the FortiGate, go to *Security Profiles* > *SSL/SSH Inspection* and edit the *deep-inspection* profile.
   The default *CA Certificate* is *Fortinet_CA_SSL*.
2. Click *Download* and save the certificate to the management computer.
3. On the client PC, use the *Certificate Import Wizard* to install the certificate into the *Trusted Root Certificate Authorities* store.
   If a security warning appears, select *Yes* to install the certificate.

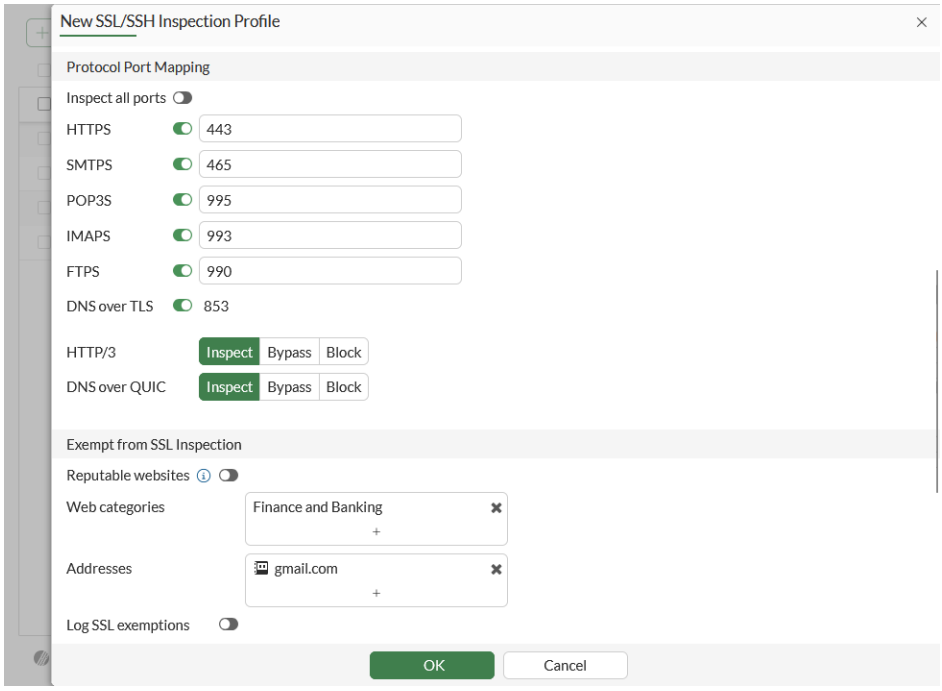
> You can upload and distribute CA certificates using a group policy on multiple Windows devices that are part of an Active Directory. See Distribute certificates to Windows devices by using Group Policy.

Exempt web sites from deep inspection

If you do not want to apply deep inspection for privacy or other reasons, you can exempt the session by address, category, or allowlist.

If you know the address of the server you want to exempt, you can exempt that address. You can exempt specific address type including IP address, IP address range, IP subnet, FQDN, wildcard-FQDN, and geography.

If you want to exempt all bank web sites, an easy way is to exempt the *Finance and Banking* category, which includes all finance and bank web sites identified in FortiGuard. For information about creating and using custom local and remote categories, see Web rating override on page 2660 and External feeds on page 4554.



If you want to exempt commonly trusted web sites, you can bypass the SSL allowlist in the SSL/SSH profile by enabling *Reputable websites*. The allowlist includes common web sites trusted by FortiGuard.

SSL version support

There are two ways to limit which SSL versions deep inspection is applied to.

- In the global attributes:

```
config system global
    set strong-crypto enable
end
```

- In the protocol configuration of a deep inspection profile:

```
config firewall ssl-ssh-profile
    edit <name>
        config {ssl | https | ftps}
            set min-allowed-ssl-version {ssl-3.0 | tls-1.0 | tls-1.1 | tls-1.2 | tls-1.3}
        end
    next
end
```

Enabling `strong-crypto` in the global attributes sets the `min-allowed-ssl-version` to `tls-1.1` by default.

When a session is attempted using an SSL version below the minimum allowed version, the session can be blocked (default) or allowed.

The setting `min-allowed-ssl-version` is not available when the inspection status in the profile is `certificate-inspection`. When performing certificate inspection, the proxy is unable to negotiate with the server on the version of SSL/TLS to use.

To configure the action based on the SSL version used being unsupported:

```
config firewall ssl-ssh-profile
    edit <name>
        config {ssl | https | ftps | imaps | pop3s | smtps | dot}
            set unsupported-ssl-version {allow | block}
        end
    next
end
```

HTTPS and DOT options can enable QUIC inspection using the `set quic inspect` command. See DNS over QUIC and DNS over HTTP3 for transparent and local-in DNS modes on page 2343 for more information.

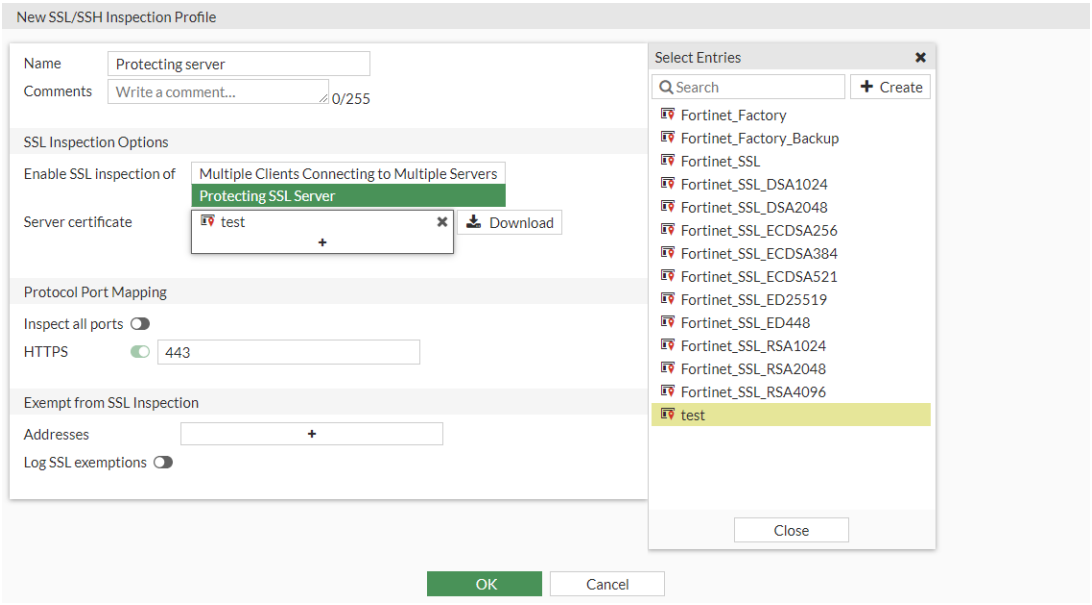
Protecting an SSL server

The *Protecting SSL Server* option of the SSL/SSH Inspection profile is typically applied to an inbound firewall policy for clients on the internet that access a server behind the FortiGate. FortiGate uses the server certificate of the protected server to simulate the real server, which enables FortiGate to decrypt and inspect traffic

destined to the real server. Therefore, a valid server certificate must be installed on the FortiGate to enable traffic inspection.

To upload a server certificate into FortiGate and use that certificate in the SSL/SSH inspection profile:

1. Go to *System* > *Certificates*.
2. Select *Import* > *Local Certificate* and upload the certificate.
3. Go to *Security Profiles* > *SSL/SSH Inspection* and edit or create a new profile.
4. For *Enable SSL Inspection of*, select *Protecting SSL Server*.
5. For *Server Certificate*, click the *+* and select the local certificate you imported.



6. Click *OK*.

When you apply the *Protecting SSL Server* profile in a policy, the FortiGate will send the server certificate to the client as your server does.

Handling SSL offloaded traffic from an external decryption device

In scenarios where the FortiGate is sandwiched between load-balancers and SSL processing is offloaded on the external load-balancers, the FortiGate can perform scanning on the unencrypted traffic by specifying the `ssl-offloaded` option in firewall `profile-protocol-options`. This option is supported in proxy and flow mode (previous versions only supported proxy mode).

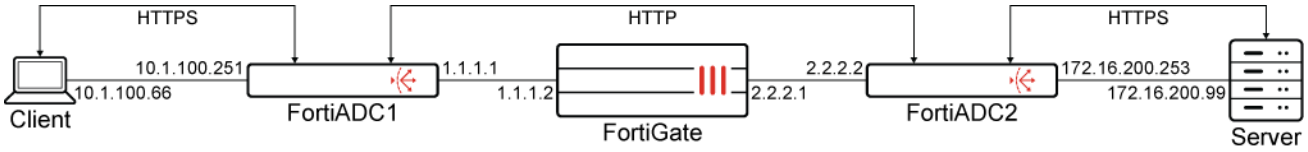
If the FortiGate receives an AUTH TLS, PBSZ, or PROT command before receiving plain text traffic from a decrypted device, by default, it will expect encrypted traffic, determine that the traffic belongs to an abnormal protocol, and bypass the traffic.

When the `ssl-offloaded` command is enabled, the AUTH TLS command is ignored, and the traffic is treated as plain text rather than encrypted data. SSL decryption and encryption are performed by the external device.

Sample topology

In this example, the FortiGate is between two FortiADCs and in SSL offload sandwich mode. The FortiGate receives plain text from ADC1 and forwards plain text to ADC2. There is no encrypted traffic passing through the FortiGate.

The client sends HTTPS traffic to ADC1, which then decrypts the traffic and sends HTTP to the FortiGate. The FortiGate forwards HTTP to ADC2, and the ADC2 re-encrypts the traffic to HTTPS.

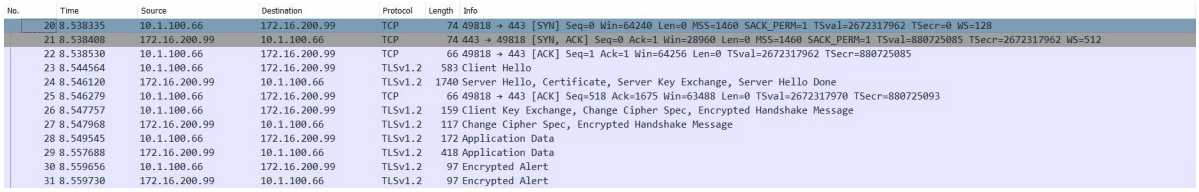


To configure SSL offloading:

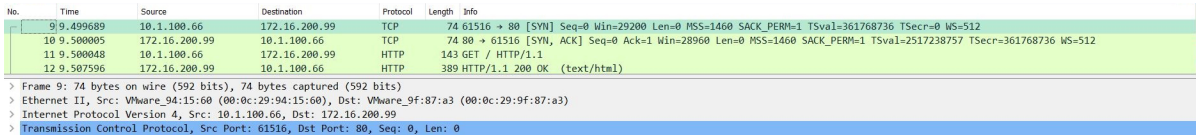
```
config firewall profile-protocol-options
    edit "default-clone"
        config http
            set ports 80
            unset options
            unset post-lang
            set ssl-offloaded yes
        end
        config ftp
            set ports 21
            set options splice
            set ssl-offloaded yes
        end
        config imap
            set ports 143
            set options fragmail
            set ssl-offloaded yes
        end
        config pop3
            set ports 110
            set options fragmail
            set ssl-offloaded yes
        end
        config smtp
            set ports 25
            set options fragmail splice
            set ssl-offloaded yes
        end
    next
end
```

Verifying the packet captures

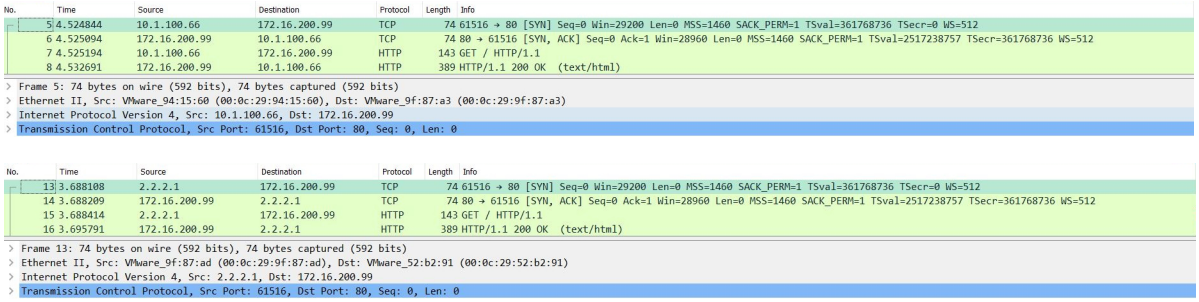
The ADC1 incoming port capture shows that ADC1 receives HTTPS traffic:



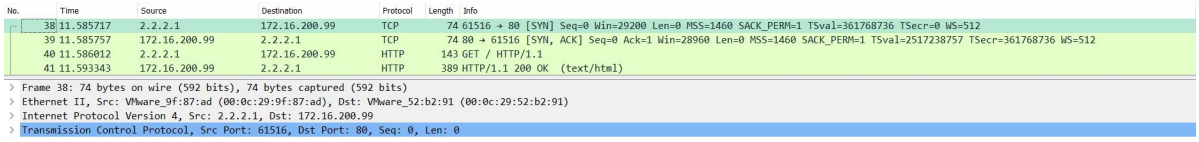
The ADC1 outgoing port capture shows that ADC1 decrypts traffic and forwards HTTP traffic to the FortiGate:



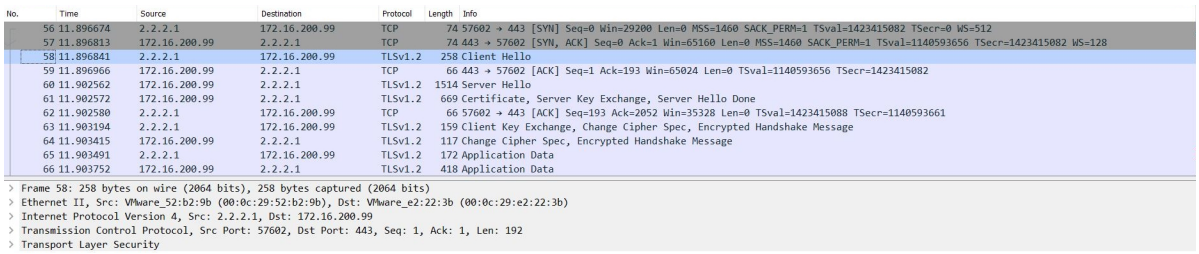
The FortiGate's incoming and outgoing port captures show that HTTP traffic passes through the FortiGate:



The ADC2 incoming port capture shows that the ADC2 receives HTTP traffic:



The ADC2 outgoing port capture shows that ADC2 forwards HTTPS traffic to the server:



SSH traffic file scanning

FortiGates can buffer, scan, log, or block files sent over SSH traffic (SCP and SFTP) depending on the file size, type, or contents (such as viruses or sensitive content).

This feature is supported in proxy-based inspection mode. It is currently not supported in flow-based inspection mode.

This feature is not supported on FortiGate models with 2 GB RAM or less. See Proxy-related features not supported on FortiGate 2 GB RAM models on page 126 for more information.

You can configure the following SSH traffic settings in the CLI:

- Protocol options
- DLP profile
- Antivirus (profile and quarantine options)

To configure SSH protocol options:

```
config firewall profile-protocol-options
    edit <name>
        config ssh
           set options {oversize clientcomfort servercomfort}
           set comfort-interval <1 - 900>
           set comfort-amount <1 - 65535>
           set oversize-limit <1 - 798>
           set uncompressed-oversize-limit <0 - 798>
           set uncompressed-nest-limit <2 - 100>
           set scan-bzip2 {enable | disable}
        end
    next
end
```

To configure SCP block and log options:

```
config ssh-filter profile
    edit <name>
        set block scp
        set log scp
    next
end
```

To configure the DLP profile:

```
config dlp profile
    edit <name>
        set full-archive-proto ssh
        set summary-proto ssh
        config filter
            edit 1
                set proto ssh
            next
        end
    next
end
```

To configure the antivirus profile options:

```
config antivirus profile
    edit <name>
        config ssh
            set av-scan {disable | block | monitor}
            set outbreak-prevention {disable | block | monitor}
            set external-blocklist {disable | block | monitor}
            set fortindr {disable | block | monitor}
            set quarantine {enable | disable}
            set archive-block {encrypted corrupted partiallycorrupted multipart nested mailbomb
timeout unhandled}
            set archive-log {encrypted corrupted partiallycorrupted multipart nested mailbomb
timeout unhandled}
            set emulator {enable | disable}
        end
    next
end
```

To configure the antivirus quarantine options:

```
config antivirus quarantine
    set drop-infected ssh
    set store-infected ssh
    set drop-machine-learning ssh
    set store-machine-learning ssh
end
```

To configure SCP block and log options:

```
config ssh-filter profile
    edit <name>
        set block scp
        set log scp
    next
end
```

To apply the ssh-filter to a policy:

```
config firewall policy
    edit <id>
        set utm-status enable
        set inspection-mode proxy
        set ssh-filter-profile <ssh-filter profile>
    next
end
```

Redirect to WAD after handshake completion

In a proxy-based policy, the TCP connection is proxied by the FortiGate. A TCP three-way handshake can be established with the client even though the server did not complete the handshake.

This option uses IPS to handle the initial TCP three-way handshake. It rebuilds the sockets and redirects the session back to proxy only when the handshake with the server is established.

To enable proxy after a TCP handshake in an SSL/SSH profile:

```
config firewall ssl-ssh-profile
    edit "test"
        config https
            set ports 443
            set status certificate-inspection
            set proxy-after-tcp-handshake enable
        end
   next
end
```

To enable proxy after a TCP handshake in protocol options:

```
config firewall profile-protocol-options
    edit "test"
        config http
            set ports 80
            set proxy-after-tcp-handshake enable
            unset options
            unset post-lang
        end
   next
end
```

HTTP/2 support in proxy mode SSL inspection

Security profiles in proxy mode can perform SSL inspection on HTTP/2 traffic that is secured by TLS 1.2 or 1.3 using the Application-Layer Protocol Negotiation (ALPN) extension.

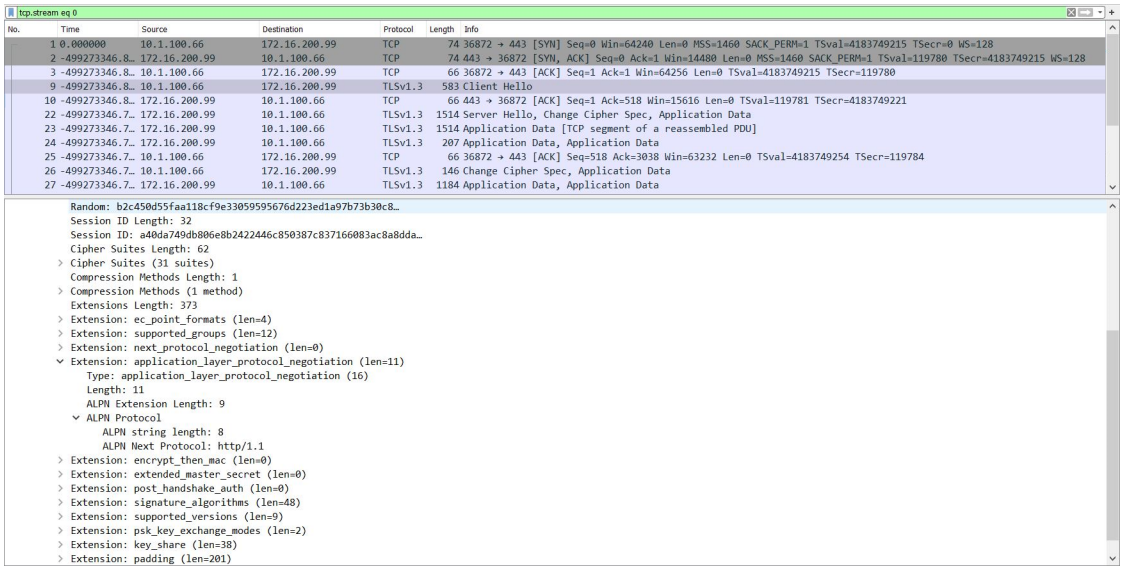
To set the ALPN support:

```
config firewall ssl-ssh-profile
    edit <profile>
        set supported-alpn {all | http1-1 | http2 | none}
    next
end
```

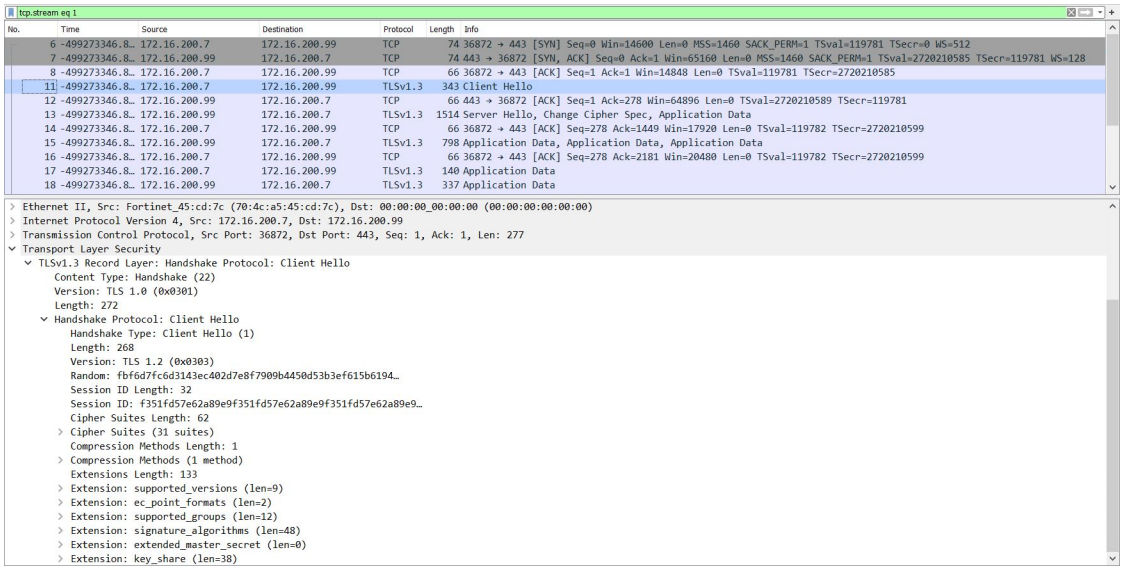
`all`	The FortiGate forwards all ALPN extensions, except SPDY. This is the default value.
`http1-1`	The FortiGate only forwards ALPN extensions that use HTTP/1.1. If the ALPN extension uses HTTP/2 or SPDY, then the FortiGate strips the ALPN header from the Client Hello.
`http2`	The FortiGate only forwards ALPN extensions that use HTTP/2. If the ALPN extension uses HTTP/1.1 or SPDY, then the FortiGate strips the ALPN header from the Client Hello.
`none`	The FortiGate always strips the ALPN header from the Client Hello when forwarding.

For example, if `supported-alpn` is set to `http2`, but the extension uses HTTP/1.1 or SPDY, the ALPN header is stripped from the Client Hello:

- Incoming packet capture:



- Outgoing packet capture:

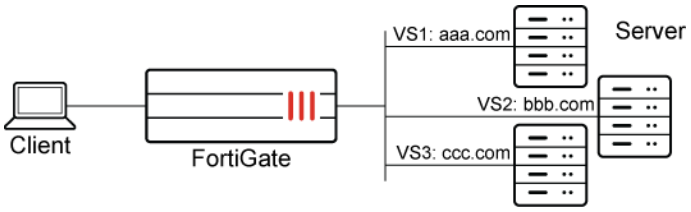


Define multiple certificates in an SSL profile in replace mode

Multiple certificates can be defined in an SSL inspection profile in replace mode (*Protecting SSL Server*). This allows multiple sites to be deployed on the same protected server IP address, and inspection based on matching the SNI in the certificate.

When the FortiGate receives the client and server hello messages, it will compare the server name identification (SNI) and the common name (CN) with the certificate list in the SSL profile, and use the matched certificate as a replacement. If there is no matched server certificate in the list, then the first server certificate in the list is used as a replacement.

Example



To configure an SSL profile in replace mode with multiple certificates:

```
config firewall ssl-ssh-profile
    edit "multi-cert"
        set server-cert-mode replace
        set server-cert "bbb" "aaa"
    next
end
```

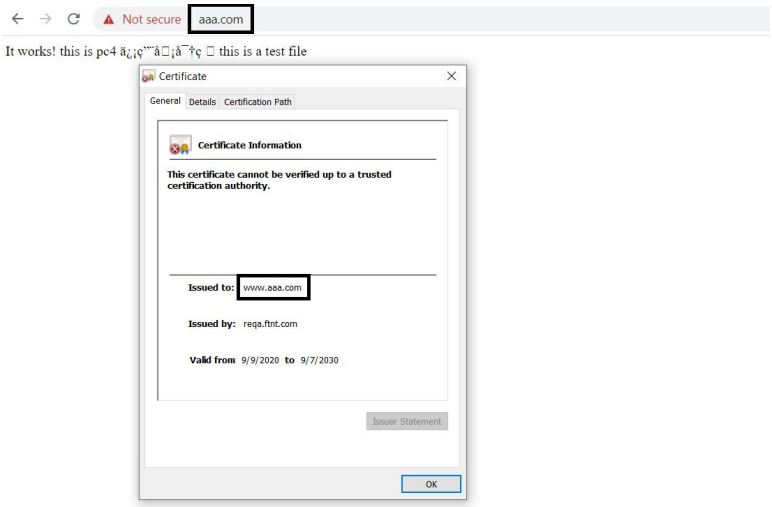
To configure a policy that uses the SSL profile:

```
config firewall policy
    edit 1
        set name "multi-cert"
        set srcintf "port6"
        set dstintf "port11"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set ssl-ssh-profile "multi-cert"
        set av-profile "default"
        set webfilter-profile "default"
        set logtraffic all
```

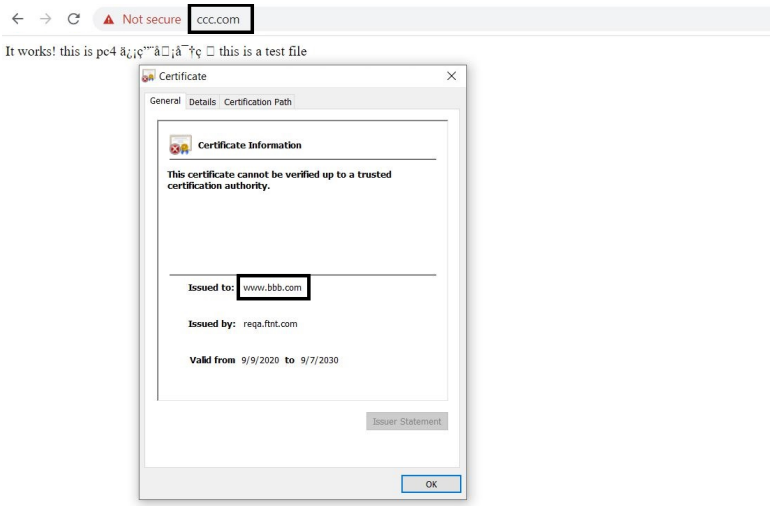
```
        set nat enable
    next
end
```

Results

If the SNI matches the CN in the certificate list in the SSL profile, then the FortiGate uses the matched server certificate. In this example, when the client accesses *www.aaa.com*, the FortiGate will use the *aaa* certificate as a replacement.



If the SNI does not match the CN in the certificate list in the SSL profile, then the FortiGate uses the first server certificate in the list. In this example, when the client accesses *www.ccc.com*, because there is no certificate for *www.ccc.com*, the FortiGate will use the *bbb* certificate as a replacement.



Disabling the FortiGuard IP address rating

The FortiGuard IP address rating for SSL exemptions and proxy addresses can be disabled using the `ssl-exemption-ip-rating` and `address-ip-rating` options.

To disable using the FortiGuard IP address rating for SSL exemptions:

```
config firewall ssl-ssh-profile
    edit <name>
        set ssl-exemption-ip-rating {enable | disable}
    next
end
```

To disable using the FortiGuard IP address rating for proxy addresses:

```
config firewall profile-protocol-options
    edit <name>
        config http
            set address-ip-rating {enable | disable}
        end
    next
end
```

The `ssl-exemption-ip-rating` and `address-ip-rating` options are enabled by default, so when both a website domain and its IP address return different categories after being rated by FortiGuard, the IP address category takes precedence when evaluating SSL exemptions associated with the SSL inspection profile and proxy addresses associated with the proxy protocol options profile. SSL exemptions and the `ssl-exemption-ip-rating` option work in both inspection modes (proxy and flow).

When the categories associated with the website domain and IP address are different, disabling the FortiGuard IP rating ensures that the FortiGuard domain category takes precedence when evaluating the preceding objects. For most websites, the domain category is valid when its IP address is unrated by FortiGuard. Since being unrated is considered as not having a category, the FortiGate uses the domain category as the website category.

A website might have an IP category that differs from its domain category. If they are different, the FortiGate uses the rating weight of the IP address or domain name to determine the rating result and decision. The rating weight is hard-coded in the FortiGate and depending on the relative category weights, the FortiGate may use the IP category instead of the website category. If the `ssl-exemption-ip-rating` option is disabled in the SSL inspection profile, then the FortiGate uses the domain category as the website category, which ensures SSL exemption operation as intended.

The `address-ip-rating` option in a proxy protocol options profile functions the same way as the `ssl-exemption-ip-rating` option. If the `address-ip-rating` option is disabled in a profile that is used in an explicit proxy policy that also uses a web filter profile, for HTTP or HTTPS traffic to a website that has different IP and domain categories and that matches the policy, the FortiGate will use the domain category when it evaluates categories for the web filter.

Block or allow ECH TLS connections

Encrypted Client Hello (ECH) is an extension to TLS that allows TLS to effectively hide information that is exposed in the unencrypted TLS ClientHello message. The ClientHello is one of the first messages sent in a TLS handshake, containing information inside the Server Name Indication (SNI) field about the destination host. By encrypting the ClientHello, this information is not exposed in plaintext.

Using the ECH extension, the client queries DNS for the DNS record of the destination host containing the ECH configuration and public key for encrypting the ClientHello message. To prevent the identity from being exposed within the DNS query, clients usually use DoH or DoT to encrypt the DNS packets.

With the public key returned from the DNS server, the client can encrypt the ClientHello message, now called the inner ClientHello. An outer, unencrypted ClientHello must still be present to route to the server, often a CDN, that can unpack and reroute the traffic to the final destination.

support for inspecting TLS connections that utilize ECH is supported in both proxy and flow mode.

Impact on the firewall

When a FortiGate does certificate inspection, for example for web category filtering, the FortiGate relies on the SNI field in the ClientHello to accurately determine the hostname of the server it is connecting to, and then performs category filtering based on this hostname. When ECH is used, this is equivalent to looking up the encrypted SNI field in the inner ClientHello. This means that applying ECH can break certificate inspection.

If the FortiGate is performing deep inspection, it always strips the ECH extension from an ECH, effectively forcing the client browser to use a non-ECH TLS connection.

Prevent ECH from affecting certificate inspection

By preventing the use of ECH, the destination hostname is not encrypted and certificate inspection can be performed accurately on the SNI on the unencrypted ClientHello. There are two ways to do this:

1. Blocking the ClientHello that uses ECH, allowing TLS to fallback to using a plaintext ClientHello.
2. Stripping the ECH response that is returned from the DNS server, preventing TLS from receiving the ECH encryption key to encrypt the ClientHello.

This feature is supported in both proxy and flow inspection mode.

Configuration

To configure blocking/allowing ECH and filtering on the SNI string in the TLS connection in the CLI:

```
config firewall ssl-ssh-profile
    edit <name>
        config https
```

```
            set status certificate-inspection
            set encrypted-client-hello {block | allow}
        end
        config ech-outer-sni
            edit <name>
                set sni <string>
            next
        end
    next
end
```

`encrypted-client-hello {block | allow}`	Block/allow session based on existence of encrypted-client-hello.
`ech-outer-sni`	Filtering on the ClientHelloOuter Server Name Indications (SNIs) to be blocked.
`sni <string>`	ClientHelloOuter SNI to be blocked.

To configure stripping ECH information from DNS responses in the CLI:

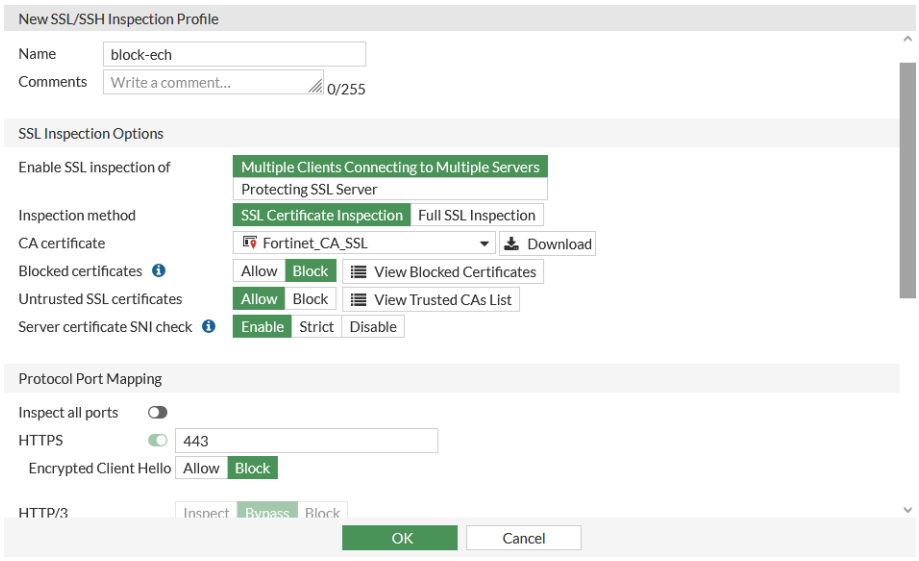
```
config dnsfilter profile
    edit <name>
        set strip-ech {enable | disable}
    next
end
```

`strip-ech {enable | disable}`	Enable/disable removal of the ECH service parameter from supporting DNS RRs.

To configure blocking/allowing ECH and filtering on the SNI string in the TLS connection GUI:

Blocking/allowing ECH is only configurable in an SSL/SSH inspection profile with *Inspection method* set to *SSL Certificate Inspection*.

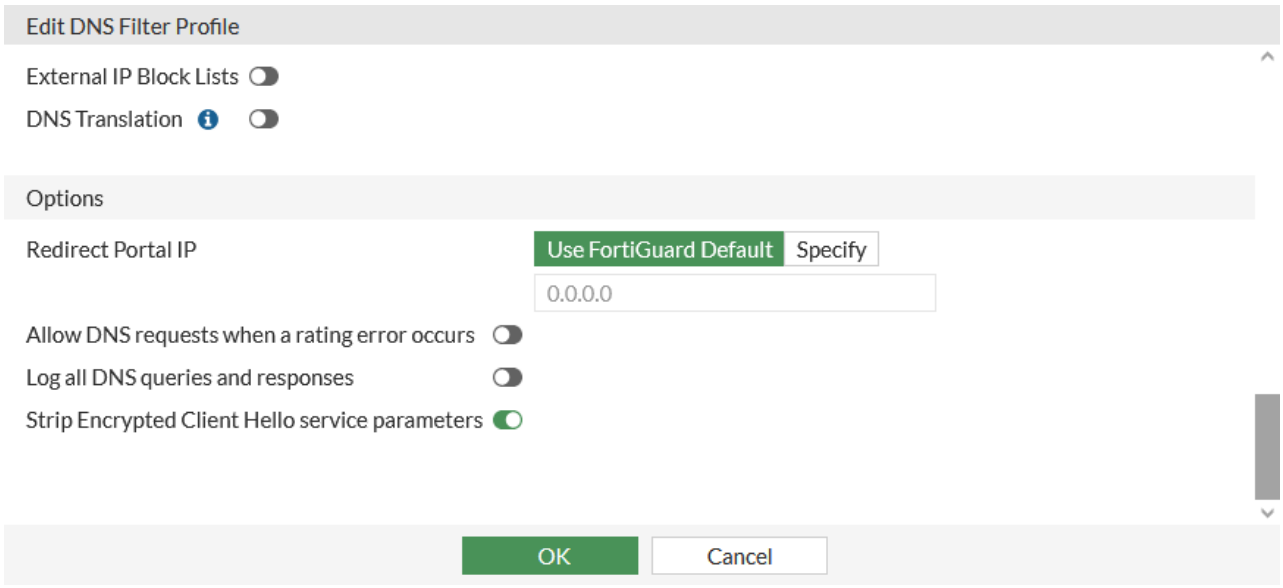
1. Go to *Security Profiles* > *SSL/SSH Inspection* and edit an existing profile or click *Create New*.
2. Set *Inspection method* to *SSL Certificate Inspection*.
3. Set *Encrypted Client Hello* to *Block*.



4. Click *OK*.
   SNIs cannot be configured in the GUI.

To configure stripping ECH information from DNS responses in the GUI:

1. Go to *Security Profiles* > *DNS Filter* and edit an existing profile or click *Create New*.
2. Enable *Strip Encrypted Client Hello service parameters*.



3. Click *OK*.

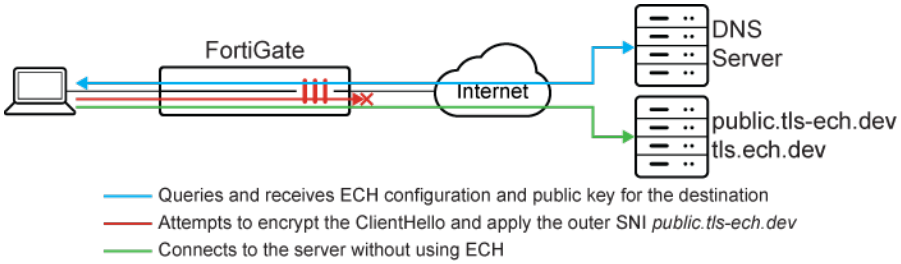
Examples

- Blocking TLS connections with certificate inspection when ECH is used in the TLS handshake through the FortiGate on page 2638

- Allowing TLS connections with certificate inspection when ECH is used in the TLS handshake through the FortiGate on page 2640
- Stripping ECH information from DoH responses on page 2642

Blocking TLS connections with certificate inspection when ECH is used in the TLS handshake through the FortiGate

In this example, an SSL/SSH inspection profile is configured to block TLS connections from some SNIs when ECH is used in the TLS handshake. Client messages with the outer SNI `public.tls-ech.dev` are blocked.



A webfilter block message will be shown when trying to connect directly to public.tls-ech.dev. Accessing the webpage tls-ech.dev, which uses public.tls-ech.dev in its outer SNI, will show that the client is not using ECH.

To configure blocking a TLS connection that uses ECH:

1. Configure an SSL/SSH inspection profile to block ECH and set the SNIs to match the outer SNI in the ECH message during the TLS handshake:

```
config firewall ssl-ssh-profile
    edit "block-ech"
        config https
            set status certificate-inspection
            set encrypted-client-hello block
        end
        config ech-outer-sni
            edit "cloudflare"
                set sni "cloudflare-ech.com"
            next
            edit "tls-ech"
                set sni "public.tls-ech.dev"
            next
            edit "defo.ie"
                set sni "cover.defo.ie"
            next
        end
    next
end
```

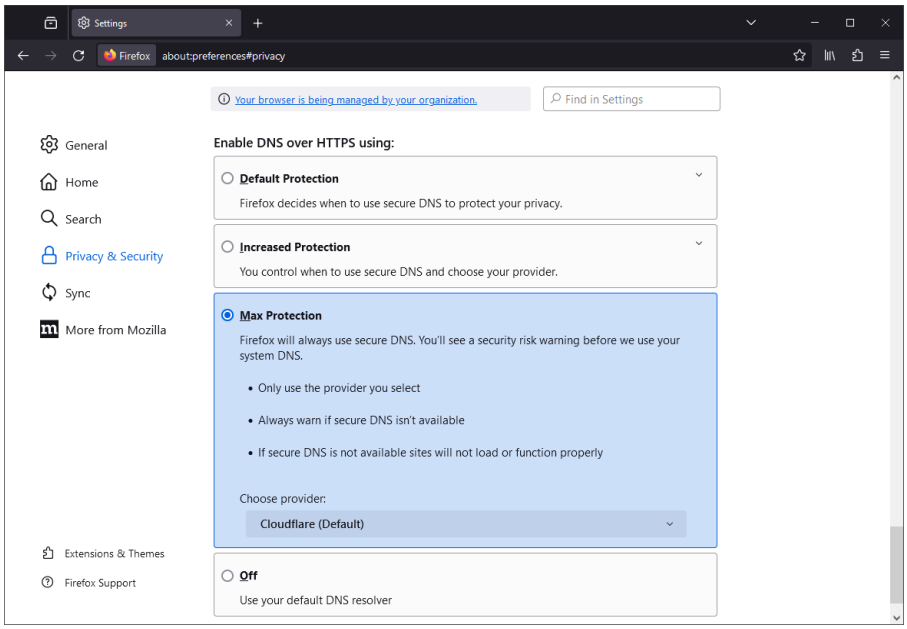
2. Apply the profile in a firewall policy:

```
config firewall policy
    edit 1
        set ssl-ssh-profile "block-ech"
```

```
    next
end
```

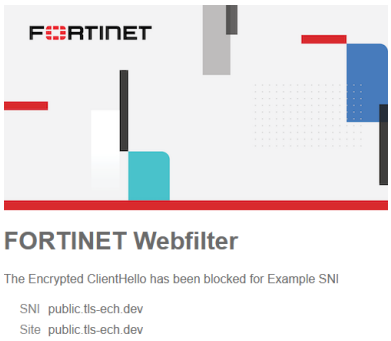
To check the results:

1. In a browser, enable DNS over HTTPS. For example, in Firefox go to *Settings* > *Privacy & Security* and under *DNS over HTTPS* enable *Max Protection*.



2. Visit a website, such as *https://public.tls-ech.dev*.

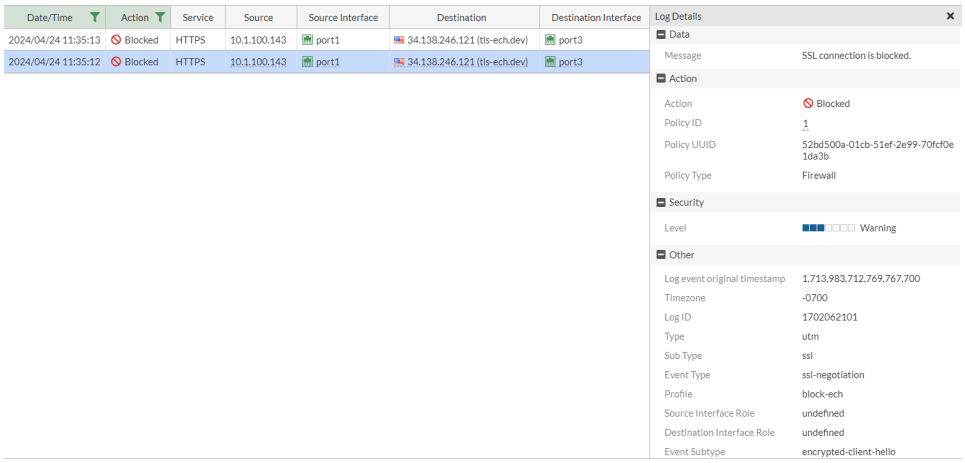
   Because ECH is blocked and the outer SNI matches one of the configured SNIs, the ECH initiated by the browser is blocked. In this case, the browser shows a replacement message:



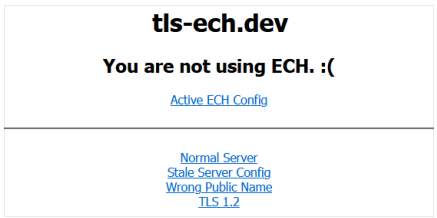
3. An SSL log shows the blocked connection:

```
2: date=2024-04-24 time=11:35:12 eventtime=1713983712769767807 tz="-0700" logid="1702062101"
type="utm" subtype="ssl" eventtype="ssl-negotiation" level="warning" vd="vdom1"
action="blocked" policyid=1 poluuid="52bd500a-01cb-51ef-2e99-70fcf0e1da3b" policytype="policy"
sessionid=120849 service="HTTPS" profile="block-ech" srcip=10.1.100.143 srcport=63253
srccountry="Reserved" dstip=34.138.246.121 dstport=443 dstcountry="United States"
srcintf="port1" srcintfrole="undefined" dstintf="port3" dstintfrole="undefined"
srcuuid="fbd0def6-01ca-51ef-496f-08c90cb6b123" dstuuid="fbd0def6-01ca-51ef-496f-08c90cb6b123"
```

```
proto=6 eventsubtype="encrypted-client-hello" hostname="public.tls-ech.dev" msg="SSL
connection is blocked."
```



4. Try to visit a different website, such as *tls-ech.dev*, that does not match a default SNI to be blocked. The browser will initially try to establish an ECH-enabled TLS connection to *public.tls-ech.dev*, but that will be blocked, forcing the browser to connect to the actual website without ECH. In this case, the browser will load the actual website and not the replacement message:

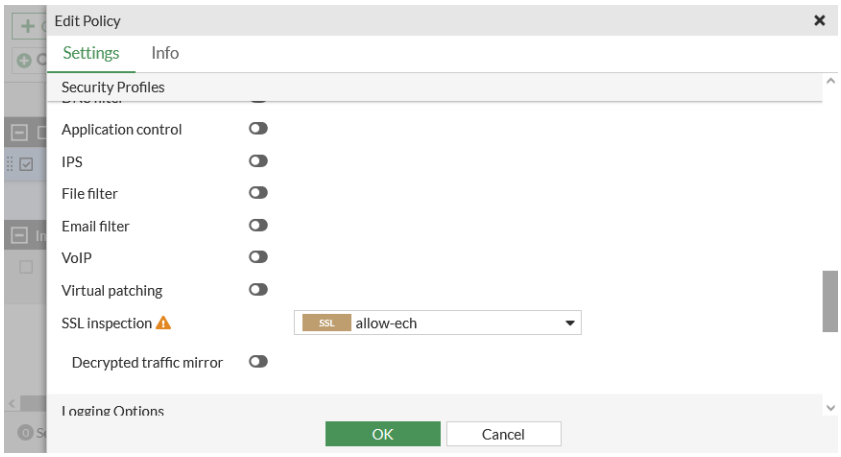


Allowing TLS connections with certificate inspection when ECH is used in the TLS handshake through the FortiGate

In this example, an SSL/SSH inspection profile is configured to allow TLS connections when ECH is used in the TLS handshake.

To configure allowing a TLS connection that uses ECH in the GUI:

1. Go to *Security Profiles* > *SSL/SSH Inspection* and edit an existing profile or click *Create New*.
2. Set *Inspection method* to *SSL Certificate Inspection*.
3. Set *Encrypted Client Hello* to *Allow*.
4. Click *OK*.
5. Go to *Policy & Objects* > *Firewall Policy* and edit an existing policy or click *Create New*.
6. Set *SSL inspection* to the SSL/SSH Inspection profile.



7. Click *OK*.

To configure allowing a TLS connection that uses ECH in the CLI:

1. Configure an SSL/SSH inspection profile to block ECH and set the SNIs to match the outer SNI in the ECH message during the TLS handshake:

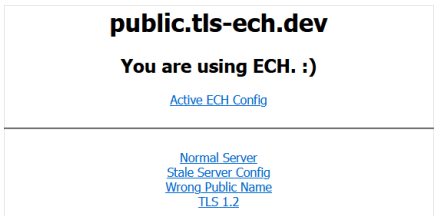
```
config firewall ssl-ssh-profile
    edit "allow-ech"
        config https
            set status certificate-inspection
            set encrypted-client-hello allow
        end
    next
end
```

2. Apply the profile in a firewall policy:

```
config firewall policy
    edit 1
        set ssl-ssh-profile "allow-ech"
    next
end
```

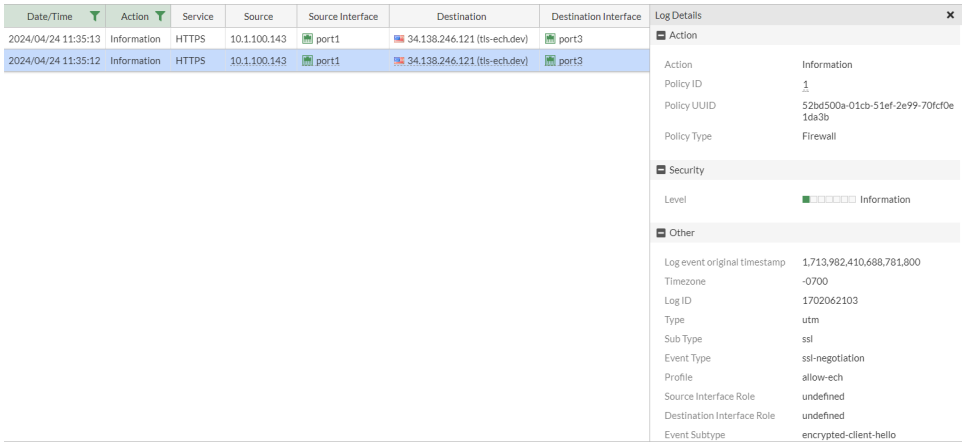
To check the results:

1. In a browser, enable DNS over HTTPS. For example, in Firefox go to *Settings* > *Privacy & Security* and under *DNS over HTTPS* enable *Max Protection*.
2. Visit a website, such as *https://public.tls-ech.dev*.
   The ECH-enabled TLS connection is allowed through the firewall policy and the website opens:



3. An SSL log shows the allowed connection:

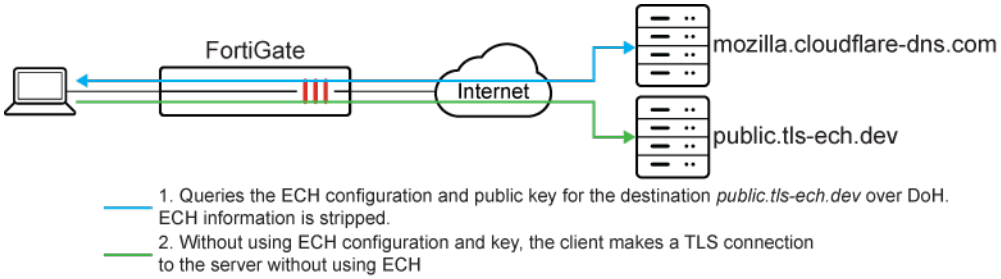
```
2: date=2024-04-24 time=11:13:31 eventtime=1713982410688781760 tz="-0700" logid="1702062103"
type="utm" subtype="ssl" eventtype="ssl-negotiation" level="information" vd="vdom1"
action="info" policyid=1 poluuid="52bd500a-01cb-51ef-2e99-70fcf0e1da3b" policytype="policy"
sessionid=118528 service="HTTPS" profile="allow-ech" srcip=10.1.100.143 srcport=63232
srccountry="Reserved" dstip=34.138.246.121 dstport=443 dstcountry="United States"
srcintf="port1" srcintfrole="undefined" dstintf="port3" dstintfrole="undefined"
srcuuid="fbd0def6-01ca-51ef-496f-08c90cb6b123" dstuuid="fbd0def6-01ca-51ef-496f-08c90cb6b123"
proto=6 eventsubtype="encrypted-client-hello" hostname="public.tls-ech.dev"
```



Stripping ECH information from DoH responses

DNS filters are used to strip ECH information from DNS responses, and force the browser to not use ECH for TLS connections. The browser relies on the ECH information from DNS over HTTPS (DoH) for ECH-enabled TLS connections.

In this example, a client sends a DoH query to a Cloudflare DNS server. The ECH information in the DNS response is stripped.



1. Policy 3 performs deep inspection on DoH traffic between the browser and the DoH server (mozilla.cloudflare-dns.com). A DNS filter profile is applied that strips the ECH information from the DoH response, forcing the browser to use a non-ECH TLS connection.
2. The browser then establishes a TLS connection through policy 1. Although policy 1 has an SSL/SSH inspection profile applied that allows ECH, ECH is not used because the ECH information from the DoH response was stripped by policy 3.

To configure and test stripping ECH information from DoH responses:

1. Configure the DNS filter profile that removes the ECH information:

```
config dnsfilter profile
    edit "strip-ech-enable"
        set strip-ech enable
    next
end
```

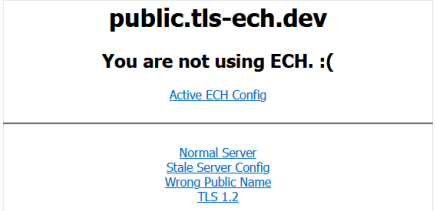
2. Configure a firewall address:

```
config firewall address
    edit "mozilla.cloudflare-dns.com"
        set type fqdn
        set fqdn "mozilla.cloudflare-dns.com."
    next
end
```

3. Configure the policies:

```
config firewall policy
    edit 3
        set srcintf "port1"
        set dstintf "port3"
        set action accept
        set srcaddr "all"
        set dstaddr "mozilla.cloudflare-dns.com"
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set inspection-mode proxy
        set ssl-ssh-profile "deep-inspection"
        set dnsfilter-profile "strip-ech-enable"
        set logtraffic all
        set nat enable
    next
    edit 1
        set srcintf "port1"
        set dstintf "port3"
        set action accept
        set srcaddr "all"
        set dstaddr "all"
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set inspection-mode proxy
        set ssl-ssh-profile "allow-ech"
        set logtraffic all
        set nat enable
    next
end
```

4. In a browser, go to *https://public.tls-ech.dev* to see that ECH is not being used:



5. The debug log will show that the ECH service parameter was removed:

```
# diagnose debug application dnsproxy -1
...
[worker 0] dns_secure_filter_ech()-2166: Found ECH key=5
...
[worker 0] dns_secure_filter_ech()-2203: Removed ECH service parameter
```

6. If the DNS filter profile is changed to disable stripping the ECH information, then the website will show that ECH is being used:

```
config dnsfilter profile
    edit "strip-ech-enable"
        set strip-ech disable
    next
end
```

Configuring certificate probe failure option

The `cert-probe-failure` command is not available for FortiGate models with 2 GB RAM or less, including FortiGate/FortiWiFi 40F and 60F series of devices and their variants, and FortiGate-Rugged 60F (2 GB versions only). See Proxy-related features not supported on FortiGate 2 GB RAM models on page 126.

With an SSL inspection profile configured for either certificate or deep inspection, the FortiGate performs certificate probing where it checks a server certificate before a client-server HTTPS connection is established. Certificate probe failures can occur due to issues like TCP or TLS handshake failures, misrouted traffic, or untrusted root or intermediate CA certificates. If a certificate is invalid, untrusted, or mismatched, then the FortiGate flags a certificate probe failure in the logs.

Certificate probe failure can be allowed or blocked for HTTPS and SSL:

```
config firewall ssl-ssh-profile
    edit <name>
        config https
```

```
            set cert-probe-failure {allow | block}
        end
        config ssl
            set cert-probe-failure {allow | block}
        end
    next
end
```

Option	Description
allow	Bypass the session when unable to retrieve server's certificate for inspection.
block	Block the session when unable to retrieve server's certificate for inspection.

For cases that have increased security requirements or stringent organization security policy, certificate probe failure may need to be configured to block. `cert-probe-failure` is available for custom SSL deep inspection profiles. This option applies to flow mode policies and is available when inspecting all ports is disabled (`set inspect-all disable`).

Hybrid PQC support in proxy mode SSL deep inspection

FortiGate supports TLS 1.3 hybrid Post-Quantum Cryptography (PQC) key exchanges in SSL deep inspection (proxy mode), enabling secure traffic inspection. This ensures compatibility with modern browsers and PQC-enabled servers that use hybrid PQC algorithms, such as X25519MLKEM768.

Now, both pure PQC and hybrid PQC are supported in SSL deep inspection:

- Hybrid PQC algorithms:
  - X25519MLKEM768 (0x11EC)
  - SecP256r1MLKEM768 (0x11EB)
  - SecP384r1MLKEM1024 (0x11ED)
- Pure PQC algorithms:
  - MLKEM512 (0x1302)
  - MLKEM768 (0x1302)
  - MLKEM1024 (0x1302)

FortiGate can perform SSL deep inspection and the client can access PQC algorithm web servers in proxy mode.

These changes also add support for DNS over TLS, HTTPS (1.0, 2.0, 3.0), POP3, IMAPS, and SMTPS with deep inspection to negotiate hybrid+ML-KEM. Hybrid+ML-KEM and ML-KEM are also supported when these protocols run in a virtual-server or explicit-proxy modes.

Although SIP over TLS and the urlfilter TLS connection to FortiGuard use the same TLS implementation as HTTPS (1.0, 2.0, 3.0), POP3, IMAPS, and SMTPS, they do not yet support hybrid+ML-KEM.

Example

This example demonstrates the following scenarios:

- How clients can connect to a web server that uses PQC encryption
- How clients can access through a DNS connection to Cloudflare a web server using hybrid PQC key exchange

First configure the FortiGate for testing, and use the same configuration to test both scenarios.

To configure FortiGate for testing:

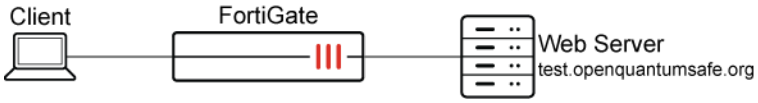
1. On FortiGate, clone a deep-inspection profile and add port 6000-6005 to HTTPS:
   a. Go to *Security Profiles* > *SSL/SSH Inspection*.
   b. Select a deep-inspection profile, and click *Clone*.
   c. Leave *Name* set to *Clone of deep-inspection*.
   d. Under *Protocol Port Mapping*, enable *HTTPS*, and enter *443,6000,6001,6002,6003,6004,6005*.
   e. Click *OK* to save the changes to *Clone of deep-inspection*.
2. Add Port Range 6000–6005 to the HTTPS Service:
   a. Go to *Policy & Objects* > *Service*.
   b. Locate the service named HTTPS and click *Edit*.
   c. In the *Edit Service* window, scroll to the *Protocol Options* section.
   d. Under *Destination Port*, click + to add a new port entry.
   e. Set the second entry to:
      - *Protocol*: TCP
      - *Low*: 6000
      - *High*: 6005
   f. Confirm the configuration and click *OK* to save the service.
3. On FortiGate, configure a policy and select the *Clone of deep-inspection* profile.

```
config firewall policy
   edit 1
       set srcintf "port2"
       set dstintf "port1"
       set action accept
       set srcaddr "all"
       set dstaddr "all"
       set schedule "always"
       set service "ALL"
       set utm-status enable
       set inspection-mode proxy
       set ssl-ssh-profile "Clone of deep-inspection"
       set av-profile "av"
       set logtraffic all
       set nat enable
  next
end
```

4. Test the following scenarios:

- Connect to a web server that uses PQC encryption on page 2647
- Send DNS to a Cloudflare DNS server that uses PQC encryption on page 2647

Connect to a web server that uses PQC encryption



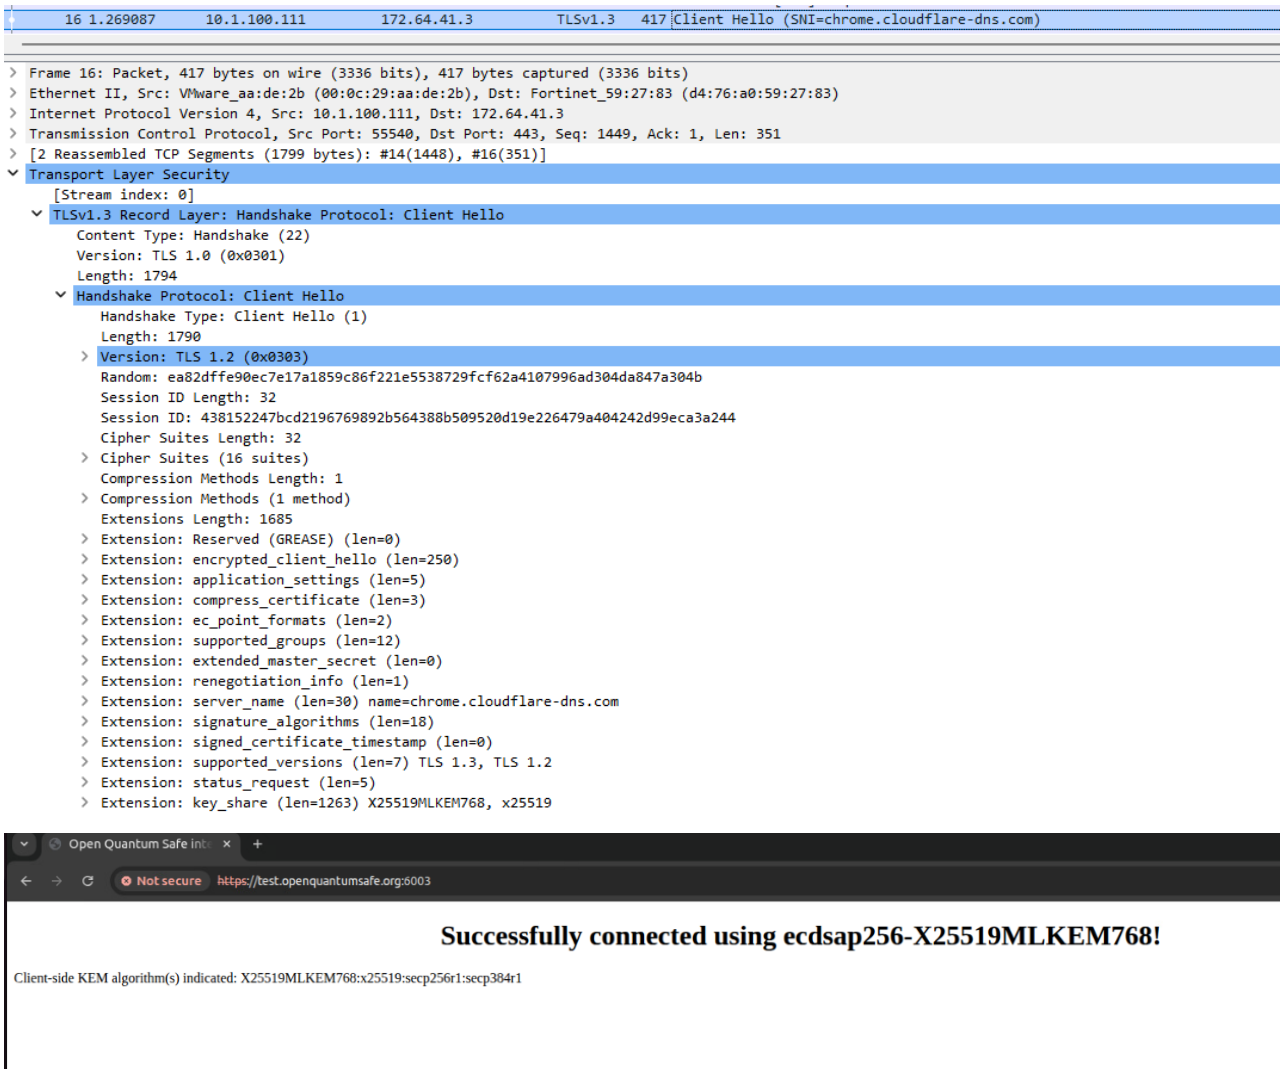
`test.openquantumsafe.org:6000` supports the X25519MLKEM768 key exchange algorithm. Previously, hybrid PQC algorithm was downgraded to non-ML-KEM encryption, and the site would be unreachable. Now, the client can access the web server using hybrid PQC key exchange.

Send DNS to a Cloudflare DNS server that uses PQC encryption

To test the example:

1. In a browser, enable secure DNS connection with Cloudflare (1.1.1.1) to force DNS over TLS.

2. Packet capture shows that the Client Hello sent to the Cloudflare DNS server uses X25519MLKEM768.



Custom signatures

You can create the following custom signatures and apply them to firewall policies:

- Application group
- Application signature
- IPS signature

The following topic provides information about custom signatures:

- Configuring custom signatures on page 2649
- Blocking applications with custom signatures on page 2650
- Filters for application control groups on page 2654
- Application groups in traffic shaping policies on page 2657

Configuring custom signatures

IPS signatures are the basis of signature-based intrusion prevention. Every attack can be reduced to a particular string of commands or a sequence of commands and variables. See Intrusion prevention on page 2402 for more information.

An IPS signature identifies characteristics of a packet that are unique to an attack, such as the protocol type, an option/value pair within the payload, other special aspects of the payload, or specific application options. Custom IPS signatures can be created to block, monitor, or quarantine specific traffic that is not covered by the IPS definitions list. To view the IPS definitions list:

- Go to *Security Profiles* > *IPS Signatures*.
- Go to *Security Profiles* > *Intrusion Prevention*, edit an existing IPS sensor, and click *View IPS Signatures* in the right-hand pane.
- Go to *System* > *FortiGuard*, in the *Subscriptions* > *Licensed* tab, expand *Intrusion Prevention System (IPS)*, and in the *IPS Signatures* row click *Actions* > *View List*.

An application signature identifies characteristics of a packet that is unique to an application. Custom application signatures can be used in application control profiles to block traffic from specific applications that are not covered by the application control signatures list. To view the application control signatures list:

- Go to *Security Profiles* > *Application Signatures* and select the *Signature* view.
- Go to *Security Profiles* > *Application Control*, edit an existing application sensor, and click *View Application Signatures* in the right-hand pane.
- Go to *System* > *FortiGuard*, in the *Subscriptions* > *Licensed* tab, expand *Firmware, VM, and base subscriptions*, and in the *Application Control Signatures* row click *Actions* > *View List*.

Application groups can be created by selecting individual application, or by filtering by application category. The groups can then be used in firewall policies.

For information about the syntax for building IPS and application control signatures, see the Custom IPS and Application Control Signature Syntax Guide.

To make the application signatures settings visible in the GUI:

1. Go to *System* > *Feature Visibility*
2. In the *Security Features* section, enable *Application Control*.
3. Click *Apply*.

To configure custom signatures:

1. Custom application and IPS signatures can be configured:
   - To configure custom application signatures, go to *Security Profiles* > *Application Signatures* and click *Create New* > *Custom Application Signature*. See Blocking applications with custom signatures on page 2650 for an example.
   - To configure custom IPS signatures, go to *Security Profiles* > *IPS Signatures* and click *Create New*.
2. Configure the following settings:

Name	Enter a unique name for the signature.

Comments	Enter a comment (optional).
Signature	Enter the signature.

3. Click *OK*.

To configure application groups:

1. Go to *Security Profiles* > *Application Signatures* and click *Create New* > *Application Group*.
2. Configure the following settings:

Group Name	Enter a unique name for the signature group.
Type	Set the application group type, either application ID or application filter. See Filters for application control groups on page 2654 for information about the available filters.
Members	Select the applications or filter to include in the group.
Comments	Enter a comment (optional).

3. Click *OK*.
   See Application groups in traffic shaping policies on page 2657 for more information.

Blocking applications with custom signatures

Custom signatures can be used in application control profiles to block web traffic from specific applications, such as out of support operating systems.

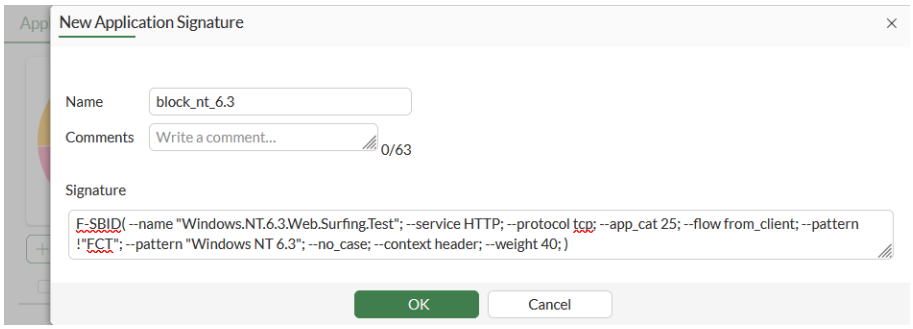
In this example, a custom signature is created to detect PCs running Windows NT 6.3 operating systems, including Windows 8.1. The signature is added to an application control profile and the action is set to block. The profile is then used in a firewall policy so that web traffic matching the signature is blocked. The logs generated by this example can be used to help identify other computers that need to be blocked.

To create the custom application signature:

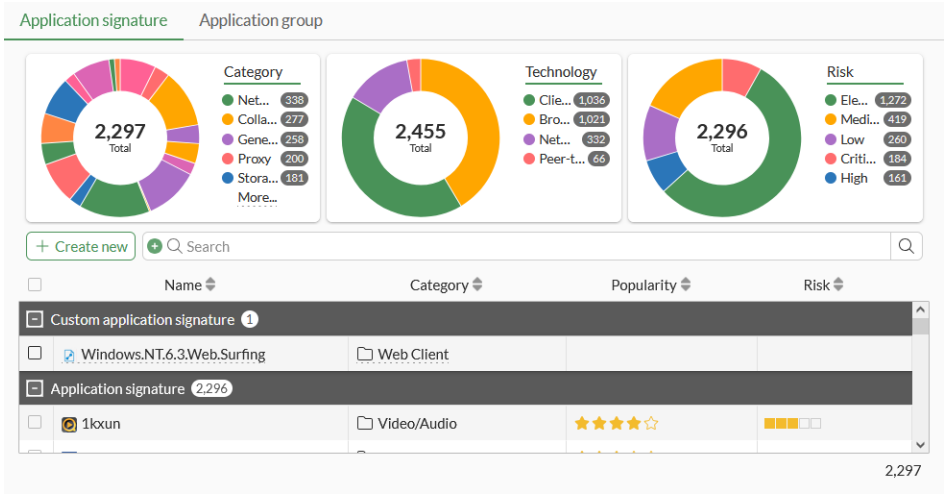
1. Go to *Security Profiles* > *Application Signatures* and click *Create New* > *Custom Application Signature*.
2. Enter a name for the custom signature, such as *block_nt_6.3*.
3. Enter the *Signature*. In this example:

```
F-SBID( --name "Windows.NT.6.3.Web.Surfing.Test"; --service HTTP; --protocol tcp; --app_cat
25; --flow from_client; --pattern !"FCT"; --pattern "Windows NT 6.3"; --no_case; --context
header; --weight 40; )
```

This signature scans HTTP and HTTPS traffic that matches the pattern *Windows NT 6.3* in its header. For blocking older versions of Windows, such as Windows XP, you would use the pattern *Windows NT 5.1*. An attack ID is automatically generated when the signature is created.

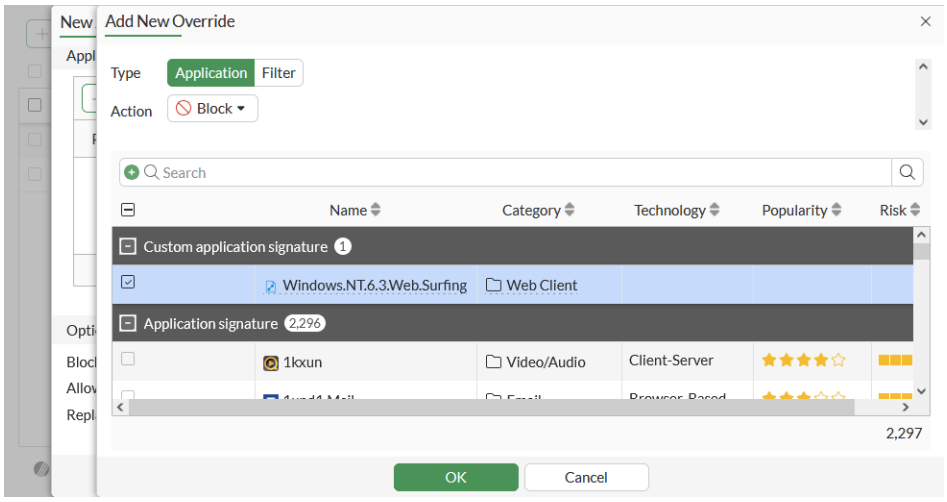


4. Click *OK*.
   The signature is included in the *Custom application signature* section of the signature list.



To use the signature in an application control profile:

1. Go to *Security Profiles* > *Application Control*.
2. Create a new profile, or edit an existing one.
3. In the *Application and Filter Overrides* table, click *Create New*.
4. Set *Type* to *Application* and *Action* to *Block*.
5. Select the custom signature from the list, using the search feature if required.



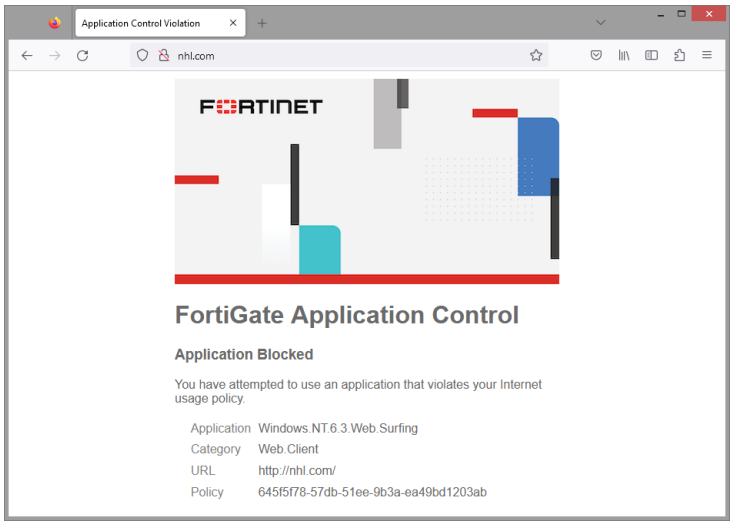
6. Click *OK*.
   The signature is added to the table.
7. Click *OK*.

To add the application control profile to a firewall policy:

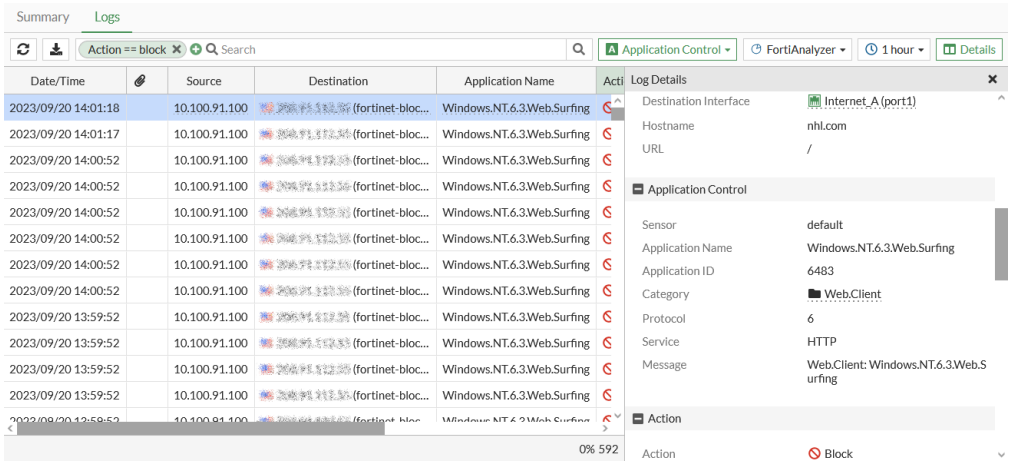
1. Go to *Policy & Objects* > *Firewall Policy*.
2. Edit the policy that currently allows a connection from the internal network to the internet.
3. In the *Security Profiles* section, enable *Application Control* and select the profile.
   If deep inspection is not enabled, then only HTTP traffic will be scanned. To scan HTTPS traffic, set SSL Inspection to a profile that includes deep inspection. See SSL & SSH Inspection on page 2614 for more information.
4. Click *OK*.

Results

When a PC running one of the affected operating systems tries to connect to the internet using a web browser, a replacement message is shown. For information on customizing replacement messages, see Replacement messages on page 3766.



Go to *Log & Report* > *Security Events* to view the web traffic that is logged for the PC that is blocked by the application signature in the *Application Control* card.



The raw logs can also be downloaded:

Filters for application control groups

When defining application groups in NGFW policy or profile mode, the following group filters are available: protocols, risk, vendor, technology, behavior, popularity, and category.

```
config application group
    edit <name>
        set type filter
        set protocols <integer>
        set risk <integer>
        set vendor <id>
        set technology <id>
        set behavior <id>
        set popularity <integer>
        set category <id>
    next
end
```

Command	Description
`protocols <integer>`	Application protocol filter (0 - 47, or all).
`risk <integer>`	Risk or impact of allowing traffic from this application to occur (1 - 5; low (1), elevated (2), medium (3), high (4), and critical (5)).
`vendor <id>`	Application vendor filter (0 - 25, or all).
`technology <id>`	Application technology filter: • all • 0 (network-protocol) • 1 (browser-based) • 2 (client-server) • 4 (peer-to-peer)
`behavior <id>`	Application behavior filter: • all • 2 (botnet) • 3 (evasive) • 5 (excessive bandwidth) • 6 (tunneling) • 9 (cloud)
`popularity <integer>`	Application popularity filter (1 - 5, from least to most popular).
`category <id>`	Application category filter: • 2 (P2P) • 3 (VoIP) • 5 (video/audio) • 6 (proxy) • 7 (remote access)

Command	Description
	• 8 (game) • 12 (general interest) • 15 (network service) • 17 (update) • 21 (email) • 22 (storage backup) • 23 (social media) • 25 (web client) • 26 (industrial) • 28 (collaboration) • 29 (business) • 30 (cloud IT) • 31 (mobile) • 32 (unknown applications) • 36 (generative AI)

Sample configurations

In this example, a single filter (risk level 1) is configured in the application group in NGFW policy mode, so only signatures matching this filter will match the security policy.

To configure the application group:

```
config application group
    edit "risk_1"
        set type filter
        set risk 1
    next
end
```

To configure the security policy:

```
config firewall security-policy
    edit 1
        set srcintf "port2"
        set dstintf "port1"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set status enable
        set schedule "always"
        set enforce-default-app-port disable
        set service "ALL"
        set app-group risk_1
        set logtraffic all
```

```
   next
end
```

In this example, the application group is configured so that only signatures matching both filters, category 5 (video/audio) and technology 1 (browser-based), will match the security policy. The application group can also be configured in a traffic shaping policy.

To configure the application group:

```
config application group
    edit "two"
        set type filter
        set category 5
        set technology 1
    next
 end
```

To configure the security policy:

```
config firewall security-policy
    edit 1
        set srcintf "port2"
        set dstintf "port1"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set status enable
        set schedule "always"
        set enforce-default-app-port disable
        set service "ALL"
        set app-group two
        set logtraffic all
    next
end
```

To configure the traffic shaping policy:

```
config firewall shaping-policy
    edit 1
        set ip-version 4
        set service "ALL"
        set app-group two
        set dstintf port1
        set traffic-shaper "max-100"
        set traffic-shaper-reverse "max-100"
        set srcaddr "all"
        set dstaddr "all"
    next
end
```

Application groups in traffic shaping policies

Application groups can be configured in traffic shaping policies. In this example, there are two traffic shaping policies:

- Policy 1 is for traffic related to cloud applications and has high priority.
- Policy 2 is for other traffic and has low priority.

At least one firewall policy must have application control enabled for the applications to match any policy traffic.

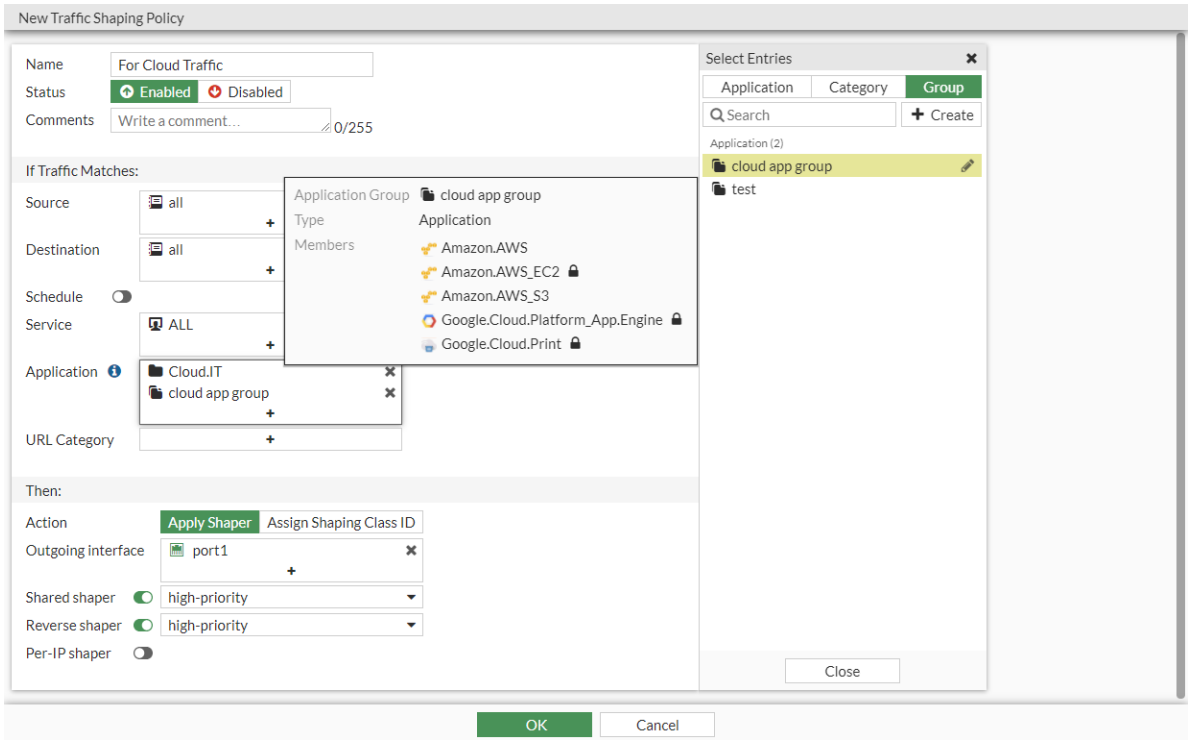
To configure a traffic shaping policy to use an application group in the GUI:

1. Configure an application group for cloud applications:
   a. Go to *Security Profiles* > *Application Signatures*.
   b. Click *Create New* > *Application Group*. The *New Application Group* page opens.
   c. Enter a name for the group, and for *Type*, select *Application*.
   d. Click the + to add the group the members.

   e. Click *OK*.
2. Create the shaping policy for the high priority cloud application traffic:
   a. Go to *Policy & Objects* > *Traffic Shaping*, select the *Traffic Shaping Policy* tab, and click *Create New*.
   b. Enter the following:

Name	For Cloud Traffic
Source	All
Destination	All
Service	All
Application	Add the *Cloud.IT* category and the *cloud app group* application group.
Outgoing interface	port1

Shared shaper	high-priority
Reverse shaper	high-priority

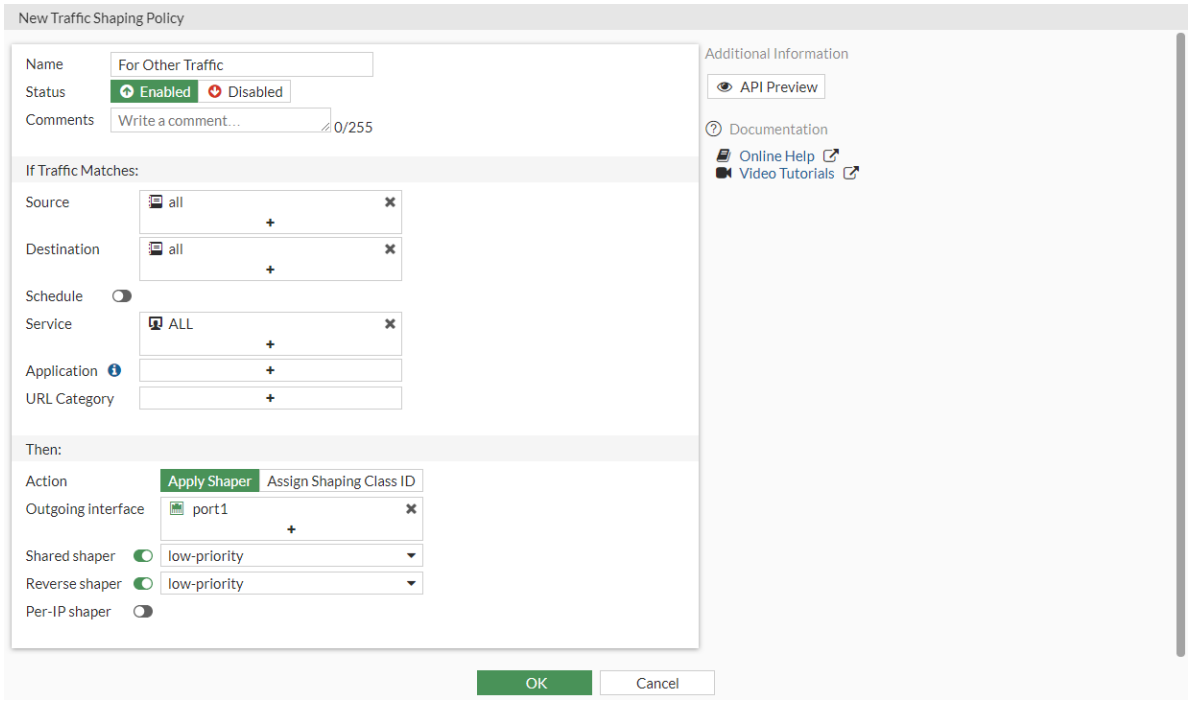


c. Click *OK*.

3. Create the shaping policy for the low priority other traffic:

a. Click *Create New* and enter the following:

Name	For Other Traffic
Source	All
Destination	All
Service	All
Outgoing interface	port1
Shared shaper	low-priority
Reverse shaper	low-priority



b. Click *OK*.

To configure a traffic shaping policy to use an application group in the CLI:

1. Configure an application group for cloud applications:

```
config application group
    edit "cloud app group"
        set application 27210 36740 35944 43296 33048
    next
end
```

2. Create the shaping policies for the high priority cloud application traffic and low priority other traffic:

```
config firewall shaping-policy
    edit 1
        set name "For Cloud Traffic"
```

```
        set service "ALL"
        set app-category 30
        set app-group "cloud app group"
        set dstintf "port1"
        set traffic-shaper "high-priority"
        set traffic-shaper-reverse "high-priority"
        set srcaddr "all"
        set dstaddr "all"
    next
    edit 2
        set name "For Other Traffic"
        set service "ALL"
        set dstintf "port1"
        set traffic-shaper "low-priority"
        set traffic-shaper-reverse "low-priority"
        set srcaddr "all"
        set dstaddr "all"
    next
end
```

Overrides

Web filter configuration can be separated into profile configuration and profile overrides.

You can also override web filter behavior based on the FortiGuard website categorization:

- Use alternate categories (web rating overrides): this method manually assigns a specific website to a different Fortinet category or a locally-created category.
- Use alternate profiles: configured users or IP addresses can use an alternative web filter profile when attempting to access blocked websites.

Some features of this functionality require a subscription to FortiGuard Web Filtering.

The following topics provide information about web overrides:

- Web rating override on page 2660
- Using local and remote categories on page 2669
- Web profile override on page 2671

Web rating override

Web rating overrides allow you to apply a category override to a URL. This overrides the original FortiGuard category for the URL with either a different FortiGuard category, a custom local category, or an external feed remote category.

If a URL is in multiple active categories, the order of precedence is local categories, then remote categories, and then FortiGuard categories.

Web rating override requires a FortiGuard license.

This section includes information about override configurations and examples:

- Configuring the category override rule on page 2661
- Sub-category actions on page 2663
- Category override examples on page 2664

Configuring the category override rule

This topic includes information about configuring following category types:

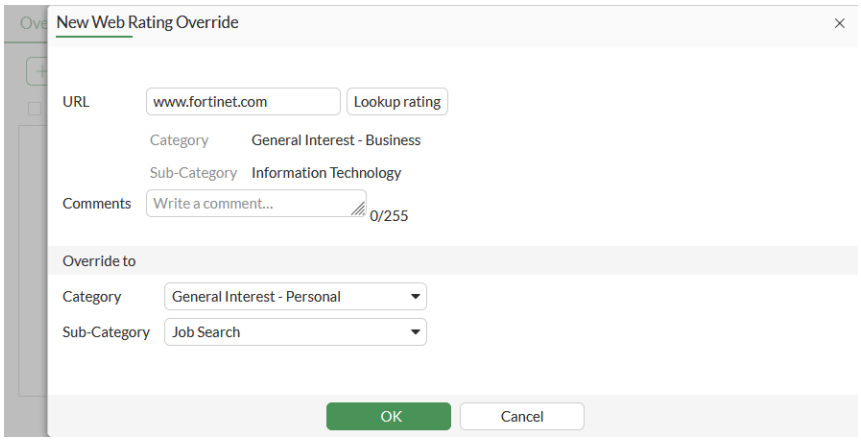
- FortiGuard category override
- Local category override
- Remote category override

Once you have configured the category override rules, ensure that the override category is active in a web filter profile. See Sub-category actions on page 2663 for more information.

To create a FortiGuard category override:

1. Go to *Security Profiles* > *Web Rating Overrides* and click *Create New*.
2. Configure the following settings:

URL	Enter the URL to override.
Lookup rating	Select to view any current *Category* and *Sub-Category* ratings.
Comments	Enter a comment (optional).
Override to	
Category	Select a FortiGuard category, external feed remote category, or a *Custom Category*.
Sub-Category	Select a sub-category to further define the rating. If *Custom Category* was selected for the *Category*, you can select from a list of categories you created.



3. Click *OK*.

See Example 1: Override a FortiGuard category with another FortiGuard category on page 2664 for a sample configuration.

To create a custom local category override:

1. Create a custom category :
   a. Go to *Security Profiles* > *Web Rating Overrides*.
   b. Click *Custom Categories*, then click *Create New*.
   c. Configure the following settings:

Name	Enter a unique name for the category.
Status	Enable/disable the status of the category.

   d. Click *OK*.
2. Create a web rating override:
   a. Go to *Security Profiles* > *Web Rating Overrides* and click *Create New*.
   b. Configure the following settings:

URL	Enter the URL to override.
Lookup rating	Select to view any current *Category* and *Sub-Category* ratings.
Comments	Enter a comment (optional).
Override to	
Category	Select *Custom Category*.
Sub-Category	Select the custom category that was just created.

   c. Click *OK*.

   See Example 3: Override a FortiGuard category with a custom local category on page 2668 for a sample configuration.

To create an external feed remote category override:

1. Go to *Security Fabric > External Connectors* and click *Create New*.
2. In the *External Feeds* section, click *FortiGuard Category*.
3. Enter a name for the external feed. This will also be the name of the remote category.
4. Enter the *URL of external resource* that contains the list of URLs that will be overridden in this remote category.
5. Configure the remaining settings as needed, then click *OK*.

See Example 2: Override a FortiGuard category with a remote category on page 2666for a sample configuration.

Sub-category actions

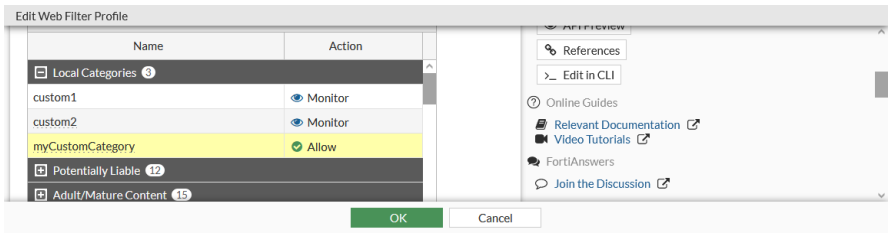
After configuring category override rules, an override category must be active in a web filter profile for it to take effect. Whether a category is active or not depends on the override method and action:

Override method	Active category actions	Inactive category actions
FortiGuard categories	Monitor, Block, Warning, or Authenticate	Allow
Local categories	Allow, Monitor, Block, Warning, or Authenticate	Disable*
Remote categories	Allow, Monitor, Block, Warning, or Authenticate	Disable*

*The *Disable* action is only available for local and remote categories by right clicking on the sub-category.

The *Allow* action in the GUI is different for FortiGuard categories compared to local and remote categories.

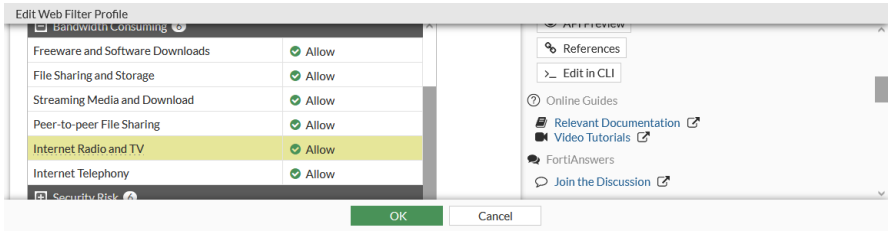
For local and remote categories, the *Allow* action in the GUI corresponds to the monitor action with logging disabled in the CLI:



```
config webfilter profile
    edit <profile>
        config ftgd-wf
            config filters
                edit 142
                    set category 142
                    set action monitor
                    set log disable
                next
            end
```

```
        end
    next
end
```

For FortiGuard categories, the *Allow* action in the GUI corresponds to no entry in the CLI:



The *Internet Radio and TV* sub-category has ID number 75.

```
config webfilter profile
    edit <profile>
        config ftgd-wf
            config filters
            end
        end
    next
end
```

This means that a FortiGuard category with the *Allow* action applied is effectively inactive, as there is no actual action specified in the CLI.

See Category override examples on page 2664 for sample configurations.

Category override examples

This topic includes examples that overrides the original FortiGuard category:

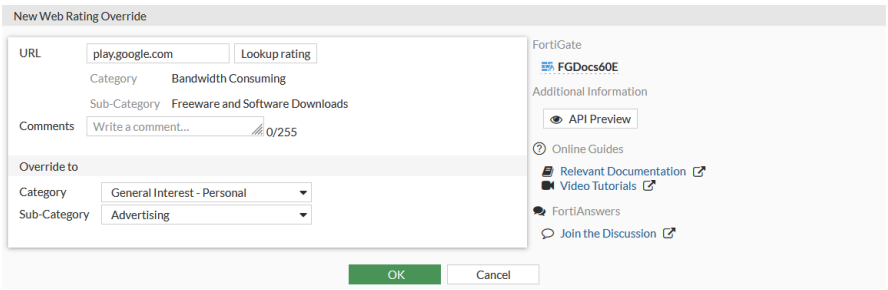
- Example 1: Override a FortiGuard category with another FortiGuard category on page 2664
- Example 2: Override a FortiGuard category with a remote category on page 2666
- Example 3: Override a FortiGuard category with a custom local category on page 2668

Example 1: Override a FortiGuard category with another FortiGuard category

In this example, play.google.com is overridden from its original category, Freeware and Software Download (19), to the Advertising category (17). In the web filter profile, the Advertising category is set to *Block* and the Freeware and Software Download category is set to *Allow*.

To configure a FortiGuard web rating override:

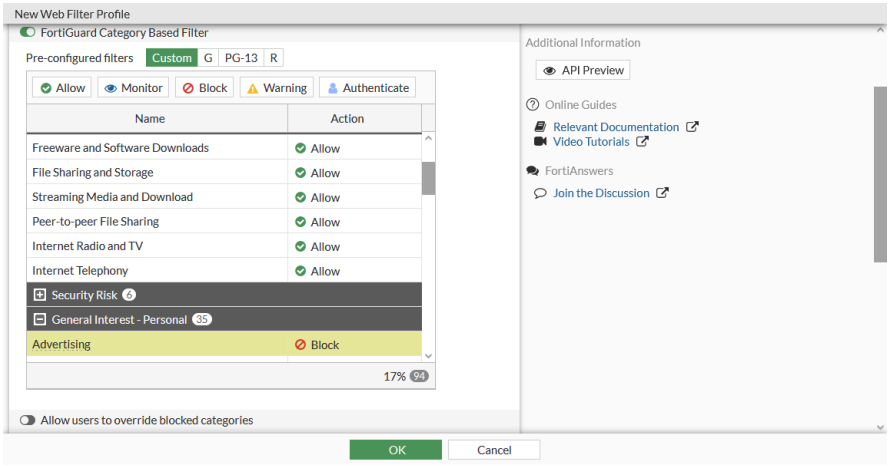
1. Go to *Security Profiles* > *Web Rating Overrides* and click *Create New*.
2. Enter the URL: play.google.com.
3. Optionally, click *Lookup rating* to see what its current rating is.
4. Set the *Category* and *Sub-Category* to an existing category that is different from the original category.



5. Click *OK*.

To apply the category in a web filter profile:

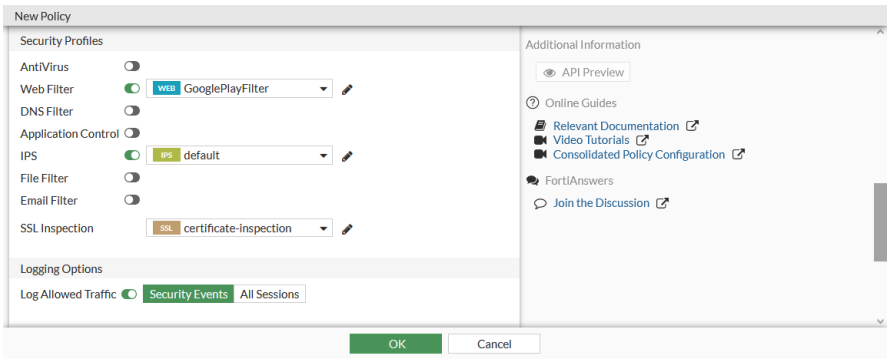
1. Go to *Security Profiles* > *Web Filter* and create or edit a web filter profile. See FortiGuard filter on page 2242 for more information.
2. Enable *FortiGuard category based filter*.
3. Set the action for the *Advertising* category in the *General Interest - Personal* group to *Block*.
4. Set the action for the *Freeware and Software Download* category in the *Bandwidth Consuming* group to *Allow*.



5. Configure the remaining settings required, then click *OK*.

To apply the category in firewall policy:

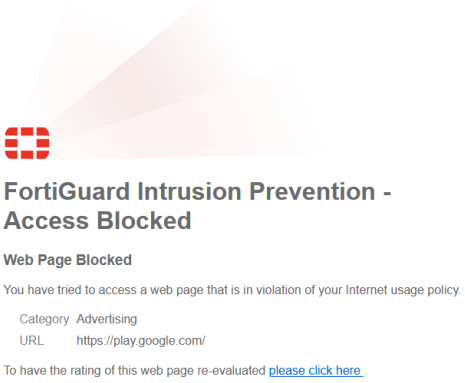
1. Go to *Policy & Objects* > *Firewall Policy* and create or edit a policy.
2. Configure the policy fields as required.
3. Under *Security Profiles*, enable *Web Filter* and select the profile that you just created.
4. Set *SSL Inspection* to *certificate-inspection* or *deep-inspection*.



5. Enable *Log Allowed Traffic*.
6. Click *OK*.

To test the filter:

1. From a Workstation behind the firewall, open a browser and browse to play.google.com. The page will be blocked by the category override.



2. Go to *Log & Report* > *Security Events* and select *Web Filter*.
3. View the log details in the GUI, or download the log file:

```
date=2022-09-21 time=16:43:31 eventtime=1663803811966781540 tz="-0700" logid="0316013056"
type="utm" subtype="webfilter" eventtype="ftgd_blk" level="warning" vd="root" policyid=2
sessionid=891040 srcip=192.168.2.8 srcport=50318 srcintf="port2" srcintfrole="undefined"
dstip=142.251.211.238 dstport=443 dstintf="port1" dstintfrole="undefined" proto=6
service="HTTPS" hostname="play.google.com" profile="FGD-Override-FGD-Flow" action="blocked"
reqtype="direct" url="https://play.google.com/" sentbyte=517 rcvdbyte=0 direction="outgoing"
msg="URL belongs to a denied category in policy" method="domain" cat=17 catdesc="Advertising"
```

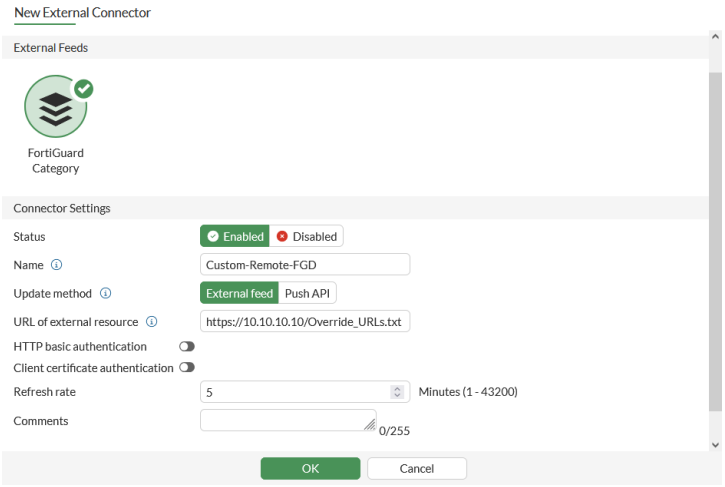
Example 2: Override a FortiGuard category with a remote category

In this example, play.google.com is added to an external URL category list and applied to an external feed. In the web filter profile, the remote category is set to *Allow*, and the original FortiGuard category (Freeware and Software Download) is set to *Block*. Remote categories take precedence over FortiGuard categories, so the override action for the remote category will apply.

Delete the web rating override entry from example 1 for play.google.com before configuring this example.

To configure a FortiGuard external feed for remote category override:

1. Go to *Security Fabric* > *External Connectors* and click *Create New*.
2. In the *External Feeds* section, click *FortiGuard Category*.
3. Enter a name for the external feed, such as *Custom-Remote-FGD*. This will be the name of the remote category.
4. Enter the *URL of external resource* that contains the list of URLs that will be overridden to this remote category. This list will contain one entry for play.google.com.



5. Configure the remaining settings as needed, then click *OK*.

To apply the category in a web filter profile:

1. Go to *Security Profiles* > *Web Filter* and create or edit a web filter profile. See FortiGuard filter on page 2242 for more information.
2. Enable *FortiGuard category based filter*.
3. Set the action for the *Custom-Remote-FGD* category in the *Remote Categories* group to *Allow*.
4. Set the action for the *Freeware and Software Download* category in the *Bandwidth Consuming* group to *Block*.
5. Configure the remaining settings are required, then click *OK*.

To apply the category in firewall policy:

1. Go to *Policy & Objects* > *Firewall Policy* and create or edit a policy.
2. Configure the policy fields as required.
3. Under *Security Profiles*, enable *Web Filter* and select the profile that you just created.
4. Set *SSL Inspection* to *certificate-inspection* or *deep-inspection*.
5. Enable *Log Allowed Traffic*.
6. Click *OK*.

To test the filter:

1. From a Workstation behind the firewall, open a browser and browse to play.google.com. The page will be allowed by the remote category override.

2. No logs are recorded because the *Allow* action is selected.

Example 3: Override a FortiGuard category with a custom local category

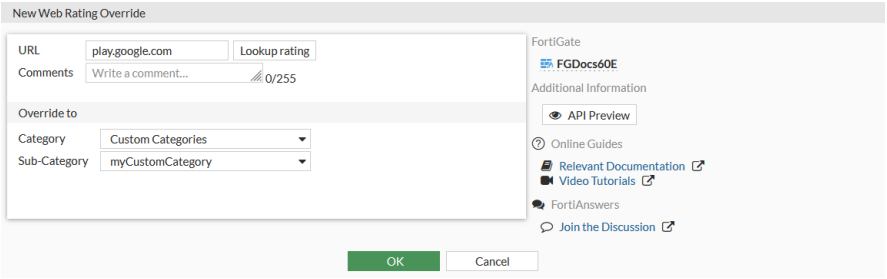
In this example, play.google.com is added to a custom local category. that is set to Monitor in the web filter profile. Local custom categories take precedence over both remote and FortiGuard categories, so the override action for the local category will apply.

To create a custom local category override:

1. Go to *Security Profiles* > *Web Rating Overrides*.
2. Click *Custom Categories*, then click *Create New*.
3. Enter a name for the category, such as *myCustomCategory*, and ensure the *Status* is set to *Enable*.
4. Click *OK*.

To create a web rating override for the custom local category:

1. Go to *Security Profiles* > *Web Rating Overrides* and click *Create New*.
2. Enter the URL to override.
3. For *Category*, select *Custom Categories* and for *Sub-Category* select *myCustomCategory*.



4. Click *OK*.

To apply the category in a web filter profile:

1. Go to *Security Profiles* > *Web Filter* and create or edit a web filter profile. See FortiGuard filter on page 2242 for more information.
2. Enable *FortiGuard category based filter*.
3. Set the action for the *myCustomCategory* category in the *LocalCategories* group to *Monitor*.
4. The other actions can be left as they were at the end of example 2, *Custom-Remote-FGD* set to *Allow* and *Freeware and Software Download* set to *Block*.
5. Configure the remaining settings are required, then click *OK*.

To apply the category in firewall policy:

1. Go to *Policy & Objects* > *Firewall Policy* and create or edit a policy.
2. Configure the policy fields as required.
3. Under *Security Profiles*, enable *Web Filter* and select the profile that you just created.
4. Set *SSL Inspection* to *certificate-inspection* or *deep-inspection*.
5. Enable *Log Allowed Traffic*.

6. Click *OK*.

To test the filter:

1. From a Workstation behind the firewall, open a browser and browse to play.google.com. The page will be allowed by the local category override.
2. Go to *Log & Report* > *Security Events* and select *Web Filter*.
3. View the log details in the GUI, or download the log file:

```
date=2022-09-21 time=17:17:00 eventtime=1663805820486294353 tz="-0700" logid="0317013312"
type="utm" subtype="webfilter" eventtype="ftgd_allow" level="notice" vd="root" policyid=2
sessionid=893147 srcip=192.168.2.8 srcport=50417 srcintf="port2" srcintfrole="undefined"
dstip=142.251.211.238 dstport=443 dstintf="port1" dstintfrole="undefined" proto=6
service="HTTPS" hostname="play.google.com" profile="FGD-Override-FGD-Flow"
action="passthrough" reqtype="direct" url="https://play.google.com/" sentbyte=517 rcvdbyte=0
direction="outgoing" msg="URL belongs to an allowed category in policy" method="domain"
cat=142 catdesc="myCustomCategory"
```

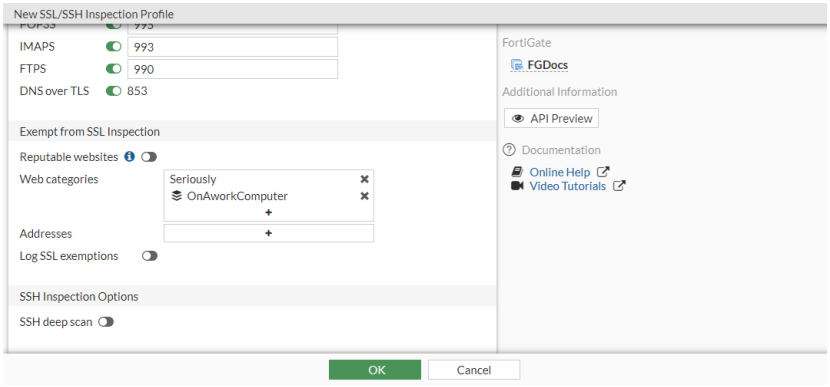
Using local and remote categories

For some functions, local and remote FortiGuard categories must be explicitly selected to apply. In SSL/SSH inspection profiles, custom categories must be explicitly selected to be exempt from SSL inspection. In Proxy addresses, custom categories must be explicitly selected as URL categories for them to apply. In both settings, if a URL is in multiple selected categories, the order of precedence is local categories, then remote categories, and then FortiGuard categories.

SSL/SSH inspection profiles

To use local and remote categories in an SSL/SSH inspection profile to exempt them from SSL inspection in the GUI:

1. Go to *Security Profiles* > *SSL/SSH Inspection*.
2. Create a new profile or edit an existing one.
3. Ensure that *Inspection method* is *Full SSL Inspection*.
4. In the *Exempt from SSL Inspection* section, add the local and remote categories to the *Web categories* list .



5. Configure the remaining settings as required, then click *OK*.

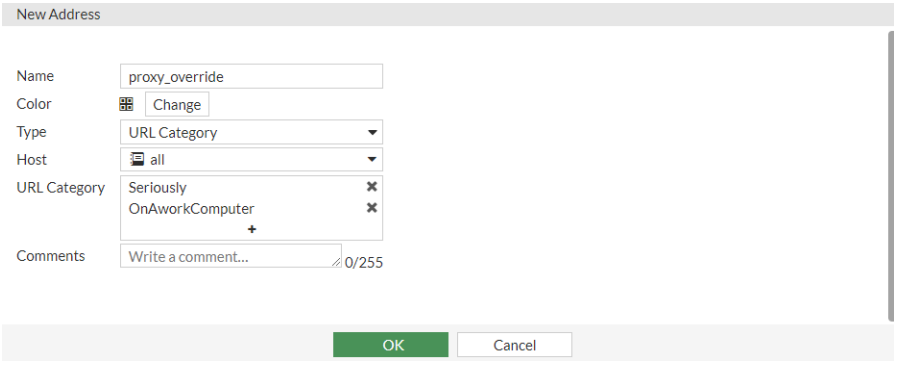
To use local and remote categories in an SSL/SSH inspection profile to exempt them from SSL inspection in the CLI:

```
config vdom
    edit root
        config firewall ssl-ssh-profile
            edit "SSL_Inspection"
                config https
                    set ports 443
                    set status deep-inspection
                end
                ...
                config ssl-exempt
                    edit 1
                        set fortiguard-category 140
                    next
                    edit 2
                        set fortiguard-category 192
                    next
                end
            next
        end
    next
end
```

Proxy addresses

To use local and remote categories in a proxy address in the GUI:

1. Go to *Policy & Objects* > *Addresses* and select *Proxy* > *Address*.
2. Click *Create new* or edit an existing proxy address.
3. Set *Type* to *URL Category*.
4. In the *URL Category*, add the local and remote categories.



5. Configure the remaining settings as required, then click *OK*.

To use local and remote categories in a proxy address in the CLI:

```
config vdom
    edit root
        config firewall proxy-address
            edit "proxy_override"
                set type category
                set host "all"
                set category 140 192
                set color 23
            next
        end
    next
end
```

Web profile override

The following profile override methods are available:

- Administrative override
- Allow users to override blocked categories

Administrative override

Administrators can grant temporary access to sites that are otherwise blocked by a web filter profile. You can grant temporary access to a user, user group, or source IP address. You can set the time limit by selecting a date and time. The default is 15 minutes.

When the administrative web profile override is enabled, a blocked access page or replacement message does not appear, and authentication is not required.

Scope range

You can choose one of the following scope ranges:

- User: authentication for permission to override is based on whether or not the user is using a specific user account.
- User group: authentication for permission to override is based on whether or not the user account supplied as a credential is a member of the specified user group.
- Source IP: authentication for permission to override is based on the IP address of the computer that was used to authenticate. This would be used for computers that have multiple users. For example, if a user logs on to the computer, engages the override by using their credentials, and then logs off, anyone who logs on with an account on that computer would be using the alternate override web filter profile.

When you enter an IP address in the administrative override method, only individual IP addresses are allowed.

Differences between IP and identity-based scope

Using the IP scope does not require using an identity-based policy.

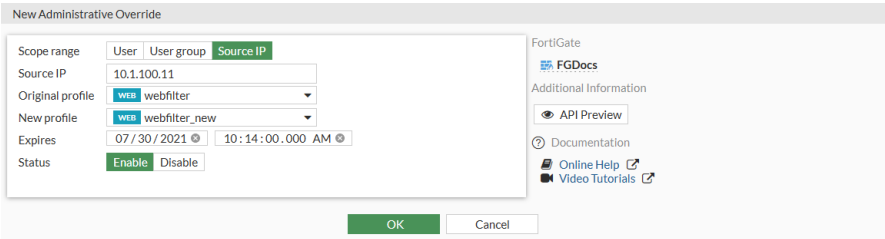
When using the administrative override method and IP scope, you might not see a warning message when you change from using the original web filter profile to using the alternate profile. There is no requirement for credentials from the user so, if allowed, the page will just appear in the browser.

Configuring a web profile administrative override

This example describes how to override the *webfilter* profile with the *webfilter_new* profile.

To configure web profile administrative override using the GUI:

1. Go to *Security Profiles* > *Web Profile Overrides* and click *Create New*.
2. Configure the administrative override:
   a. For *Scope Range*, click *Source IP*.
   b. In the *Source IP* field, enter the IP address for the client computer (*10.1.100.11* in this example).
   c. In the *Original profile* dropdown, select *webfilter*.
   d. In the *New profile* dropdown, select *webfilter_new*.
   In the *Expires* field, the default 15 minutes appears, which is the desired duration for this example.



3. Click *OK*.

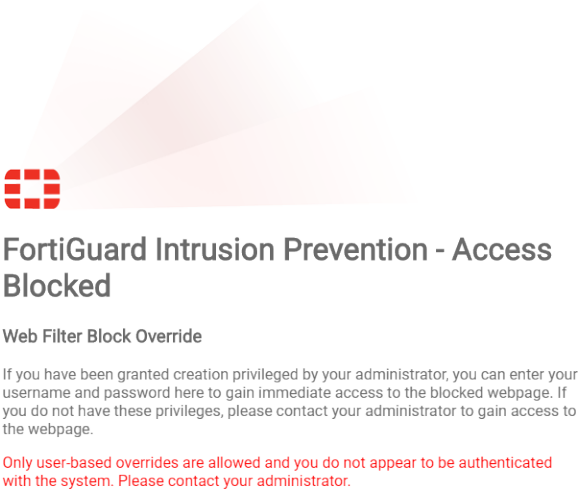
To configure web profile administrative override using the CLI:

```
config webfilter override
    edit 1
        set status enable
        set scope ip
        set old-profile "webfilter"
        set new-profile "webfilter_new"
        set expires 2021/07/30 10:14:00
        set initiator "admin"
        set ip 10.1.100.11
    next
end
```

Allow users to override blocked categories

For both override methods, the scope ranges (for specified users, user groups, or IP addresses) allow sites blocked by web filtering profiles to be overridden for a specified length of time.

But there is a difference between the override methods when the users or user group scope ranges are selected. In both cases, you would need to apply the user or user group as source in the firewall policy. With administrative override, if you do not apply the source in the firewall policy, the traffic will not match the override and will be blocked by the original profile. With the *Allow users to override blocked categories* setting, the traffic will also be blocked, but instead of displaying a blocking page, the following message appears:



When you choose the user group scope, once one user overrides, it will affect the other users in the group when they attempt to override. For example, user1 and user2 both belong to the local_user group. Once user1 successfully overrides, this will generate an override entry for the local_user group instead of one specific user. This means that if user2 logs in from another PC, they can override transparently.

Other features

Besides the scope, there are some other features in *Allow users to override blocked categories*.

Apply to user groups

Individual users can not be selected. You can select one or more of the user groups recognized by the FortiGate. They can be local to the system or from a third party authentication device, such as an AD server through FSSO.

Switch duration

Administrative override sets a specified time frame that is always used for that override. The available options are:

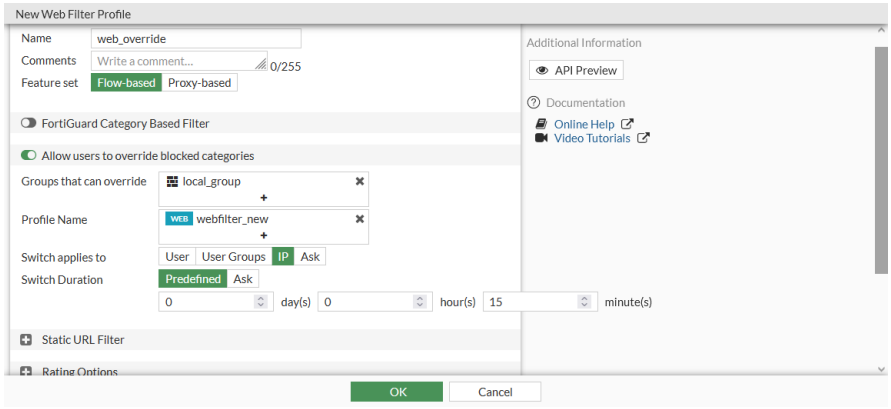
- *Predefined*: the value entered is the set duration (length of time in days, hours, or minutes) that the override will be in effect. If the duration variable is set to 15 minutes, the length of the override will always be 15 minutes. The option will be visible in the override message page, but the setting will be grayed out.
- *Ask*: the user has the option to set the override duration once it is engaged. The user can set the duration in terms of days, hours, or minutes.

Creating a web profile users override

This example describes how to allow users in the *local_group* to override the *webfilter_new* profile.

To allow users to override blocked categories using the GUI:

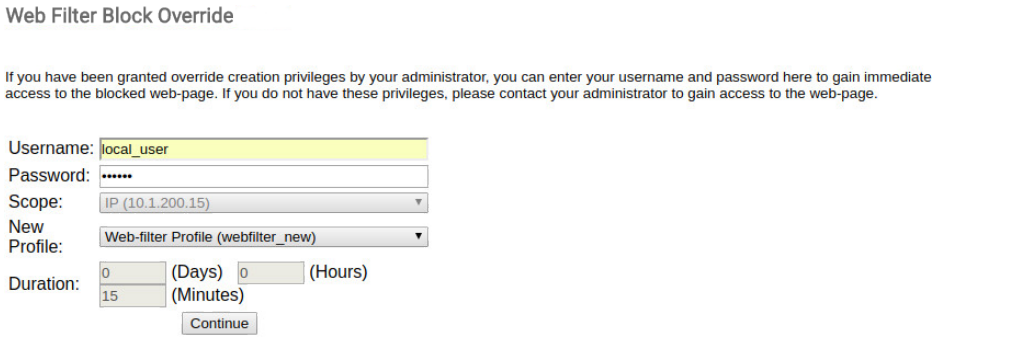
1. Go to *Security Profiles* > *Web Filter* and click *Create New*.
2. Enter a name for the profile.
3. Enable *Allow users to override blocked categories*.
4. Configure the web filter profile:
   a. Click the *Groups that can override* field, and select a group (*local_group* in this example).
   b. Click the *Profile Name* field, and select the *webfilter_new* profile.
   c. For the *Switch applies to* field, click *IP*.
   d. For the *Switch Duration* field, click *Predefined*. The default *15* minutes appears, which is the desired duration for this example.
   e. Configure the rest of the profile as needed.



5. Click *OK*.

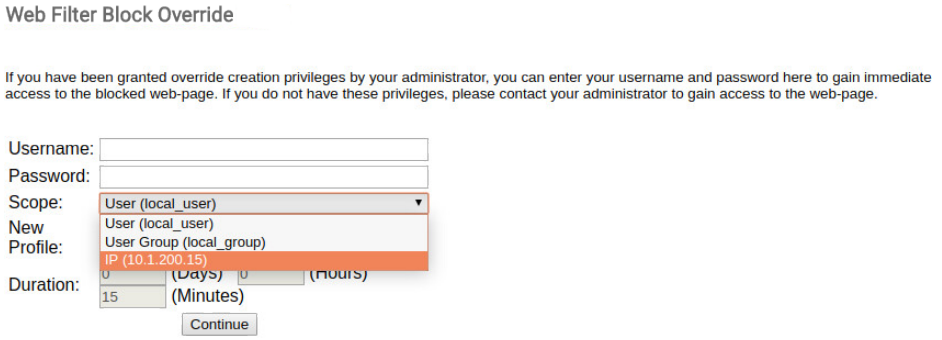
Using the ask feature

This option is only available in *Allow users to override blocked categories* is enabled. It configures the message page to have the user choose which scope they want to use. Normally on the message page, the scope options are grayed out and not editable. In the following example, the *Scope* is predefined with *IP*.



When the ask option is enabled (through the *Switch applies to* field in the GUI), the *Scope* dropdown is editable. Users can choose one of the following:

- User
- User group
- IP



User and *User Group* are only available when there is a user group in the firewall policy. You must specify a user group as a source in the firewall policy so the scope includes *User* and *User Group*; otherwise, only the IP option will be available.

IP ban

The FortiGate IP ban feature is a powerful tool for network security. It allows the system to block traffic originating from specific IP addresses that are deemed potentially harmful by the system administrator.

When an IP address is banned, any active connections originating from the banned IP address are immediately terminated. Any subsequent connection attempts are rejected by the Kernel's packet filter, further fortifying the network's security.

Checks for IP bans are carried out only if there is a corresponding firewall policy with an ACCEPT action. If a match is found, the action is then altered to DENY. In scenarios where there is no matching policy, the connection is refused due to the implicit deny rule that is in effect.

Several methods can be used to ban IP addresses:

- FortiView Source: This method allows you to ban an IP address directly from the *FortiView Sources* monitor. See To ban an IP address for more information.
- IP ban: Administrators can configure an automation stitch with the *IP Ban* action, using a trigger such as a *Compromised Host* or an *Incoming Webhook*. When the automation is triggered, the client PC is quarantined. See Actions on page 4389 and Incoming Webhook Quarantine stitch on page 4362 for more information. The Automation Stitch feature can also be used to configure IP bans from other fabric devices.
- Command line interface (CLI): For those who prefer using command line, IP ban can be added with the CLI. See IP ban using the CLI on page 2676 for more information.
- Security profiles: Most security profiles include a mechanism to ban a source IP address. See IP ban using security profiles on page 2677 for more information.

- DoS policy: A Denial of Service (DoS) policy can be used to block any further traffic from a source IP address that is considered a malicious actor. See DoS policy on page 1836 for more information.

Additionally, administrators can control whether the banned IP list remains intact through a power cycle. See Configuring the persistency for a banned IP list on page 2679 for more information.

IP ban using the CLI

Administrators can use the following command to manage the banned IP address list:

```
# diagnose user banned-ip {list | add | delete | clear | stat}
```

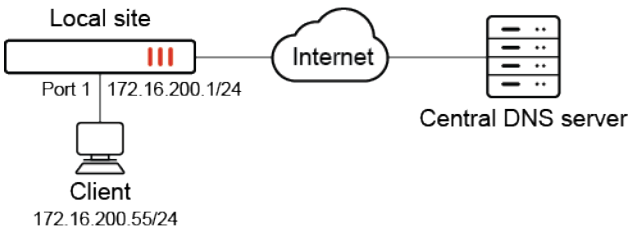
Option	Description
`list`	List banned IPs.
`add`	Add banned IP address.
`delete`	Delete banned IP address.
`clear`	Clear all banned IP addresses.
`stat`	Statistics

To add an IP address to the ban list:

```
# diagnose user banned-ip add <src4 | src6> <src-ipv4 | src-ipv6> <expiry> <admin | dlp | ips | av
| dos | app>
```

Setting the expiry time to `0` results in an indefinite expiry time. If this is combined with the `banned-ip-persistency` (either `permanent-only` or `all`), the ban becomes permanent.

Example



In this example, a client PC is configured with the IP address 172.16.200.55, and an administrator adds the IP address to the IP ban list.

To add an IP address to the ban list:

```
# diagnose user banned-ip add src4 172.16.200.55 2 admin
```

To view the banned IP list:

```
# diagnose user banned-ip list
src-ip-addr       created                  expires                  cause
172.16.200.55       Tue Jan 16 14:46:00 2024 Tue Jan 16 14:56:00 2024 Administrative
```

To verify that the banned IP list is working:

1. From the client with the banned IP address of 172.16.200.55, send a DNS query for a domain that is configured on the Central DNS server.
2. Go to *Log & Report > Forward Traffic*, and search for IP address *172.16.200.55*.
3. View the log details in the GUI, or download the log file.
   In the following log file example, action is deny for source IP 172.16.200.55.

```
date=2024-01-16 time=14:48:43 eventtime=1705445143824107713 tz="+1200" logid="0000000013"
type="traffic" subtype="forward" level="notice" vd="root" srcip=172.16.200.55

```

IP ban using security profiles

Configure one or all of the security profiles to quarantine all traffic originating from the infected host's IP address for a configurable duration. The IP address of the attacker is also incorporated into the list of banned users. The address of the target remains unaffected.

The following types of security profiles can be used to ban IP addresses:

- Antivirus on page 2677
- Application control on page 2678
- DLP on page 2678
- IPS on page 2679

Antivirus

To ban IP addresses using an antivirus profile:

1. Configure an antivirus profile:

```
config antivirus profile
    edit <name>
    config nac-quar
```

```
    set infected quar-src-ip
    set expiry <duration>
 end
```

2. View the banned IP address:

```
# diagnose user banned-ip list
src-ip-addr       created                 expires                 cause
172.16.200.55       Wed Jan 17 13:06:05 2024 Wed Jan 17 13:08:05 2024 AV
```

Application control

Quarantine is available as one of the action types when the application matches this application control profile. See Basic category filters and overrides on page 2359 for more information.

To ban IP addresses using an application control profile:

1. Configure the application control profile:

```
config application list
    edit <name>
        config entries
            edit <id>
                set quarantine attacker
                set quarantine-expiry <duration>
            next
        end
    next
end
```

2. View the banned IP address:

```
# diagnose user banned-ip list
src-ip-addr       created                 expires                 cause     172.16.200.55
   Thu Jan 18 07:17:13 2024 Thu Jan 18 07:22:13 2024 APP
```

DLP

Quarantine is available as one of the action types when the content matches this DLP profile. See Basic DLP settings on page 2530 for more information

To ban IP addresses using a DLP profile:

1. Configure the DLP profile:

```
config dlp profile
    edit <name>
        config rule
```

```
            edit <id>
                set proto <protocols>
                set action quarantine-ip
                set expiry <duration>
            next
        end
    next
end
```

2. View the banned IP address:

```
# diagnose user banned-ip list
src-ip-addr       created                  expires                  cause     172.16.200.55
   Thu Jan 18 07:03:03 2024 Thu Jan 18 07:05:03 2024 DLP
```

IPS

Quarantine is available as one of the action types when the signature matches this IPS profile. A protocol must also be set. See Configuring an IPS sensor on page 2407 for more information.

To ban IP addresses using an IPS profile:

1. Configure the IPS profile:

```
config ips sensor
    edit <name>
        config entries
            edit <id>
                set quarantine attacker
                set quarantine-expiry <duration>
            next
        end
end
```

2. View the banned IP address:

```
# diagnose user banned-ip list
src-ip-addr       created                  expires                  cause
172.16.200.55      Thu Jan 18 06:42:06 2024 Thu Jan 18 06:44:06 2024 IPS
```

Configuring the persistency for a banned IP list

The `banned-ip-persistency` option configures whether the banned IP list persists through a power cycle.

```
config firewall global
    set banned-ip-persistency {disabled | permanent-only | all}
end
```

`banned-ip-persistency {disabled | permanent-only | all}`	Set the persistency of banned IPs across power cycling: • `disabled`: no entries are kept across power cycling (default). • `permanent-only`: only permanent IP bans are kept across power cycling. • `all`: all IP bans are kept across power cycling.

The banned IP list is created from quarantining. For example, when quarantining is enabled for IPS, application control, and DDoS. Permanent quarantining can be added manually using `diagnose user banned-ip add src4`.

The `diagnose user quarantine <parameter>` command has changed to `diagnose user banned-ip <parameter>`.

Example 1: keep all banned IPs across power cycling

When `banned-ip-persistency` is set to `all`, all the banned IPs are saved after a reboot. In this example, an application control security profile with quarantining is already configured. After traffic is generated that triggers the quarantine rule, a quarantine list is generated.

To view the list of banned IPs:

```
# diagnose user banned-ip list
src-ip-addr       created                  expires                  cause
10.1.100.12       Tue Jul  5 18:01:05 2022 Tue Jul  5 18:21:05 2022 APP
```

After a reboot, the banned IP list is the same:

```
# diagnose user banned-ip list
src-ip-addr       created                  expires                  cause
10.1.100.12       Tue Jul  5 18:01:05 2022 Tue Jul  5 18:21:05 2022 APP
```

Example 2: keep only permanent banned IPs across power cycling

When `banned-ip-persistency` is set to `permanent-only`, only banned IPs with an indefinite expiry time are saved after a reboot. The permanent IP ban was already configured for 10.1.100.11 using `diagnose user banned-ip add src4 10.1.100.11 0 ips`.

To view the list of banned IPs:

```
# diagnose user banned-ip list
src-ip-addr       created                  expires                  cause
10.1.100.12       Tue Jul  5 18:01:05 2022 Tue Jul  5 18:21:05 2022 APP
10.1.100.11       Tue Jul  5 18:06:35 2022 indefinite               IPS
```

After a reboot, only 10.1.100.11 remains in the banned IP list:

```
# diagnose user banned-ip list
src-ip-addr       created                  expires                  cause
10.1.100.11       Tue Jul  5 18:06:35 2022 indefinite               IPS
```

Profile groups

Security profiles can be organized into groups. They are useful when there are multiple policies that use the same security profiles, helping save time and preventing missing profiles when configuring policies. When changes need to be made, only the group has to be changed and not the individual policies.

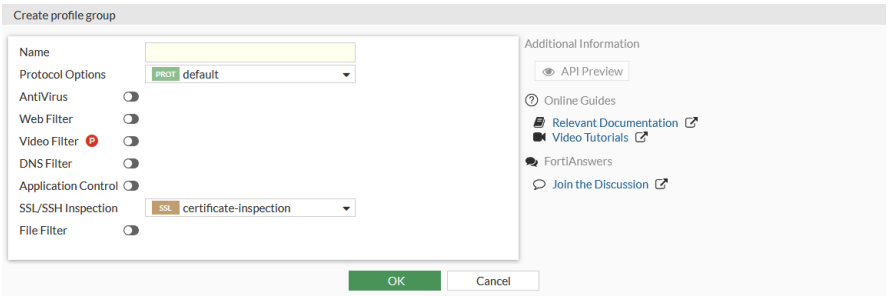
By default, *Security Profiles* > *Profile Groups* is not visible in the GUI. It can only be enabled using the CLI.

To show profile groups in the GUI:

```
config system settings
    set gui-security-profile-group enable
end
```

To configure a profile group in the GUI:

1. Go to *Security Profiles* > *Profile Groups* and click *Create New*.



2. Enter a name for the group.
3. Enable the required profile types and select the profile that will be included in the group.
   A *Protocol Option* must be selected.
4. Click *OK*.

To configure a profile group in the CLI:

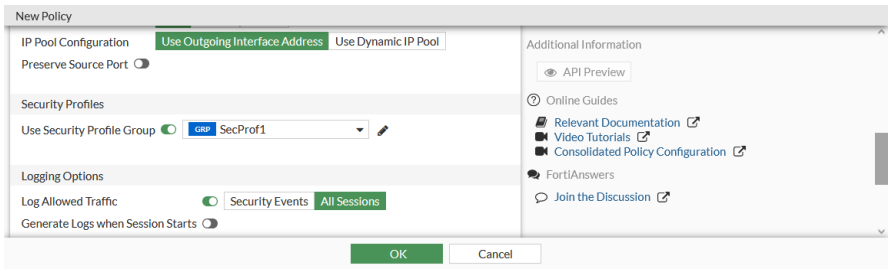
```
config firewall profile-group
    edit <name>
        set application-list <string>
        set av-profile <string>
        set casb-profile <string>
        set cifs-profile <string>
        set diameter-filter-profile <string>
        set dlp-profile <string>
        set dnsfilter-profile <string>
        set emailfilter-profile <string>
        set file-filter-profile <string>
        set icap-profile <string>
        set ips-sensor <string>
        set profile-protocol-options <string>
```

```
        set sctp-filter-profile <string>
        set ssh-filter-profile <string>
        set ssl-ssh-profile <string>
        set videofilter-profile <string>
        set virtual-patch-profile <string>
        set voip-profile <string>
        set waf-profile <string>
        set webfilter-profile <string>
    next
end
```

`application-list <string>`	Name of an existing application list.
`av-profile <string>`	Name of an existing antivirus profile.
`casb-profile <string>`	Name of an existing CASB profile.
`cifs-profile <string>`	Name of an existing CIFS profile.
`diameter-filter-profile <string>`	Name of an existing Diameter filter profile.
`dlp-profile <string>`	Name of an existing DLP profile.
`dnsfilter-profile <string>`	Name of an existing DNS filter profile.
`emailfilter-profile <string>`	Name of an existing email filter profile.
`file-filter-profile <string>`	Name of an existing file-filter profile.
`icap-profile <string>`	Name of an existing ICAP profile.
`ips-sensor <string>`	Name of an existing IPS sensor profile.
`profile-protocol-options <string>`	Name of an existing protocol options profile (default = `default`).
`sctp-filter-profile <string>`	Name of an existing SCTP filter profile.
`ssh-filter-profile <string>`	Name of an existing SSH filter profile.
`ssl-ssh-profile <string>`	Name of an existing SSL SSH profile (default = `certificate-inspection`).
`videofilter-profile <string>`	Name of an existing video filter profile.
`virtual-patch-profile <string>`	Name of an existing virtual-patch profile.
`voip-profile <string>`	Name of an existing VOIP profile.
`waf-profile <string>`	Name of an existing WAF profile.
`webfilter-profile <string>`	Name of an existing web filter profile.

To use the profile group in a policy in the GUI:

1. Go to *Policy & Objects* > *Firewall Policy* and edit an existing policy or create a new one.
2. In the *Security Profiles* section, enable *Use Security Profile Group* and select a group.
   No individual profiles can be selected if using a profile group.



3. Click *OK*.

To use the profile group in a policy in the CLI:

```
config firewall policy
    edit <policyid>
        set name <string>
        set srcintf <interface(s)>
        set dstintf <interface(s)>
        set action {accept | deny | ipsec}
        set srcaddr <address(es)>
        set dstaddr <address(es)>
        set schedule <schedule>
        set service <service(s)>
        set utm-status enable
        set profile-type group
        set profile-group <group>
    next
end
```

IPsec VPN

Virtual Private Network (VPN) technology lets remote users connect to private computer networks to gain access to their resources in a secure way. For example, an employee traveling or working at home can use a VPN to securely access the office network through the internet.

Instead of remotely logging into a private network using an unencrypted and unsecured internet connection, using a VPN ensures that unauthorized parties cannot access the office network and cannot intercept information going between the employee and the office. Another common use of a VPN is to connect the private networks of multiple offices.

IPsec VPN uses the Internet Protocol Security (IPsec) protocol to create encrypted tunnels on the internet. The IPsec protocol operates at the network layer of the OS model and runs on top of the IP protocol, which routes packets. All transmitted data is protected by the IPsec tunnel.

The following sections provide instructions on configuring IPsec VPN connections in FortiOS 8.0.0.

- General IPsec VPN configuration on page 2684
- Site-to-site VPN on page 2780
- Remote access on page 2897
- Aggregate and redundant VPN on page 3050
- ADVPN on page 3099
- Fabric Overlay Orchestrator on page 3136
- Other VPN topics on page 3160
- VPN IPsec troubleshooting on page 3207

General IPsec VPN configuration

The following sections provide instructions on general IPsec VPN configurations:

- Network topologies on page 2685
- Phase 1 configuration on page 2685
- Phase 2 configuration on page 2719
- Post-Quantum readiness on page 2744
- VPN security policies on page 2763
- Blocking unwanted IKE negotiations and ESP packets with a local-in policy on page 2775
- Configurable UDP port for IKE on page 2726
- Renaming IPsec tunnels on page 2777

Network topologies

The topology of your network will determine how remote peers and clients connect to the VPN and how VPN traffic is routed.

Topology	Description
Site-to-Site	Standard one-to-one VPN between two FortiGates. See Site-to-site VPN on page 2780.
Hub and spoke/ADVPN	One central FortiGate (hub) has multiple VPNs to other remote FortiGates (spokes). In ADVPN, shortcuts can be created between spokes for direct communication. See ADVPN on page 3099.
FortiClient dialup	Typically remote FortiClient dialup clients use dynamic IP addresses through NAT devices. The FortiGate acts as a dialup server allowing dialup VPN connections from multiple sources. See FortiClient as dialup client on page 2909.
FortiGate dialup	Similar to site-to-site except one end is a dialup server and the other end is a dialup client. This facilitates scenarios in which the remote dialup end has a dynamic address, or does not have a public IP, possibly because it is behind NAT. See FortiGate as dialup client on page 2898.
Aggregate VPN	Natively support aggregating multiple VPN tunnels to increase performance and provide redundancy over multiple links. See Packet distribution and redundancy for aggregate IPsec tunnels on page 3069.
Redundant VPN	Options for supporting redundant and partially redundant IPsec VPNs, using route-based approaches. See Redundant hub and spoke VPN on page 3092.
L2TP over IPsec	Configure VPN for Microsoft Windows dialup clients using the built in L2TP software. Users do not have to install any Fortinet software. See Native VPN as dialup client - Windows New on page 2957.
GRE over IPsec	Legacy support for routers requiring point-to-point GRE over IPsec for tunneling. See GRE over IPsec on page 2834.

Phase 1 configuration

Phase 1 configuration primarily defines the parameters used in IKE (Internet Key Exchange) negotiation between the ends of the IPsec tunnel. The local end can be an endpoint client or a FortiGate interface that initiates the IKE negotiations. The remote end is the remote gateway that responds and exchanges messages with the initiator. Hence, they are sometimes referred to as the initiator and responder. The purpose of phase 1 is to secure a tunnel with one bi-directional IKE SA (security association) for negotiating IKE phase 2 parameters.

The `auto-negotiate` and `negotiation-timeout` commands control how the IKE negotiation is processed when there is no traffic, and the length of time that the FortiGate waits for negotiations to occur.

IPsec tunnels can be configured in the GUI using the *VPN Wizard*. Go to *VPN* > *VPN Wizard*. The wizard includes several templates (site-to-site, hub and spoke, remote access, and FortiClient Secure Internet Access), but a custom tunnel can be configured with the following settings.

> The IPsec phase 1 interface type cannot be changed after it is configured. This is due to the tunnel ID parameter (`tun_id`), which is used to match routes to IPsec tunnels to forward traffic. If the IPsec phase 1 interface type needs to be changed, a new interface must be configured.

Name		Phase 1 definition name. The maximum length is 15 characters for an interface mode VPN. FortiGate also uses the name for the virtual IPsec interface that it creates automatically.
Network		
	IP Version	Protocol, either IPv4 or IPv6. > FortiClient 7.4.4 does not support IPv6. Use FortiClient 7.4.6 or later.
	Remote Gateway	Category of the remote connection: • *Static IP Address*: the remote peer has a static IP address. • *Dialup User*: one or more FortiClient, FortiGate, or remote dialup clients will connect to the FortiGate. • *Dynamic DNS*: a remote peer that has a domain name and subscribes to a dynamic DNS service will connect to the FortiGate.
	IP Address	The IP address of the remote peer. This option is only available when the *Remote Gateway* is *Static IP Address*.
	Dynamic DNS	The domain name of the remote peer. This option is only available when the *Remote Gateway* is *Dynamic DNS*.
	Interface	The interface through which remote peers or dialup clients connect to the FortiGate. This option is only available in NAT mode.
	Local Gateway	IP address for the local end of the VPN tunnel. When this setting is disabled, 0.0.0.0 is used. • *Primary IP*: defaults to the IP address of the interface chosen as the *Remote Gateway* interface. • *Secondary IP*: secondary address of the interface selected in the *Interface* field. • *Specify*: manually enter an address. Interface mode cannot be configured in a transparent mode VDOM.
	Mode Config	Enable in Dialup VPNs to select the IP stack (IPv4 and/or IPv6), select the method in which client IPs are assigned and configure the client IP address range, subnet mask/prefix length, DNS server, and split tunnel capability to automate remote client addressing.

Transport	By default, IPsec uses encapsulating security payload (ESP) for encrypting data in the VPN session. However, because it uses IP protocol 50 without port numbers, when traversing over a NAT device the packets cannot be demultiplexed. NAT traversal encapsulates the ESP packets inside a UDP packet, thereby adding a unique source port to the packet, allowing the NAT device to map the packet to the correction session. Furthermore, FortiGate also allows ESP and IKE packets to be encapsulated in TCP and encrypted in TLS. See Encapsulate ESP packets within TCP headers on page 2732. Transport mode is configurable only when the *Remote gateway* type is *Static*. In *Static* mode, the Transport is defaulted to UDP. Go to *VPN > VPN Tunnels > Settings* to enable VPN over TCP to allow setting the Transport mode to *Auto*. When Transport mode is in *Auto*, UDP will be attempted first. If the transport threshold has been reached, then connection over TCP will be attempted. When the *Remote gateway* type is *Dialup* and VPN over TCP is allowed, it will behave as if Transport mode is *Auto*.
NAT Traversal	• *Enable*: a NAT device exists between the local FortiGate and the VPN peer or client. Outbound encrypted packets are wrapped inside a UDP IP header that contains a port number. The local FortiGate and the VPN peer or client must have the same NAT traversal setting (both selected or both cleared) to connect reliably. When in doubt, enable NAT traversal. • *Disable*: disable the NAT traversal setting. • *Forced*: the FortiGate will use a port value of zero when constructing the NAT discovery hash for the peer. This causes the peer to think it is behind a NAT device, and it will use UDP encapsulation for IPsec, even if no NAT is present. This approach maintains interoperability with any IPsec implementation that supports the NAT-T RFC.
Keepalive Frequency	Keepalive frequency setting. This option is only available when *NAT Traversal* is set to *Enable* or *Forced*. The NAT device between the VPN peers may remove the session when the VPN connection remains idle for too long. The value represents an interval in seconds where the connection will be maintained with periodic keepalive packets. The keepalive interval must be smaller than the session lifetime value used by the NAT device. The keepalive packet is a 138-byte ISAKMP exchange.
Dead Peer Detection	Reestablishes VPN tunnels on idle connections and cleans up dead IKE peers if required. This feature minimizes the traffic required to check if a VPN peer is available or unavailable (dead). The available options are: • *Disable*: disable dead peer detection (DPD). • *On Idle*: triggers DPD when IPsec is idle. • *On Demand*: Passively sends DPD to reduce load on the firewall. Only triggers DPD when IPsec outbound packets are sent, but no reply is received from the peer. When there is no traffic and the last DPD-ACK

		has been received, IKE will not send DPDs periodically. Notifications are received whenever a tunnel goes up or down, or to keep the tunnel connection open when no traffic is being generated inside the tunnel. For example, in scenarios where a dialup client or dynamic DNS peer connects from an IP address that changes periodically, traffic may be suspended while the IP address changes. When *Dead Peer Detection* is selected, optionally specify a retry count and a retry interval using `dpd-retrycount` and `dpd-retryinterval`. See Dead peer detection on page 2696.
	Forward Error Correction	Enable on both ends of the tunnel to correct errors in data transmission by sending redundant data across the VPN.
	EMS SN verification	Ensures that only licensed FortiClient endpoints can establish an IPsec VPN connection with FortiGate. Both the FortiGate and FortiClient endpoints must be connected to the same FortiClient EMS
Advanced network settings		
	Add route	In a dialup VPN, add a route to a peer destination selector when a dynamic tunnel is negotiated. See Dynamic IPsec route control on page 2697.
	Auto discovery sender	In ADVPN, enable or disable sending of auto-discovery short-cut messages
	Auto discovery receiver	In ADVPN, enable or disable accepting auto-discovery short-cut messages
	Auto discovery forwarder	In ADVPN, enable or disable forwarding auto-discovery short-cut messages
	Exchange interface IP	A Fortinet-specific setting to allow two FortiGates to exchange their overlay tunnel IP. This allows a dialup server to learn the tunnel IP of each client, or in ADVPN, it allow spokes to learn others' tunnel IP during shortcut negotiation.
	Device creation	When enabled, a dynamic interface (network device) is created for each dialup tunnel.
	Aggregate member	When enabled, the tunnel can be used as an aggregate member candidate.
Authentication		
	Method	Either *Pre-shared Key* or *Signature*.
	Pre-shared Key	The pre-shared key that the FortiGate will use to authenticate itself to the remote peer or dialup client during phase 1 negotiations. The same key must be defined at the remote peer or client. See Pre-shared key.
	Certificate Name	When Authentication *Method* is *Signature*, select the server certificate that the FortiGate will use to authenticate itself to the remote peer or dialup client during phase 1 negotiations. See Digital certificates.

IKE	Either *Version 1* or *Version 2*. See Choosing IKE version 1 and 2 on page 2698. Note: When using FortiClient for remote access, IKEv1 is not supported on FortiClient 7.4.4 and later.
Mode	This option is only available when IKEv1 is selected. The two available options are: • *Aggressive*: the phase 1 parameters are exchanged in a single message with unencrypted authentication information. • *Main (ID protection)*: the phase 1 parameters are exchanged in multiple rounds with encrypted authentication information. When the remote VPN peer has a dynamic IP address and is authenticated by a pre-shared key, you must select *Aggressive* mode if there is more than one dialup phase 1 configuration for the interface IP address. When the remote VPN peer has a dynamic IP address and is authenticated by a certificate, you must select *Aggressive* mode if there is more than one phase 1 configuration for the interface IP address and these phase 1 configurations use different proposals.
Accepted Peer ID	Options to authenticate VPN peers or clients depending on the *Remote Gateway* and *Authentication Method* settings.
Any peer ID	Accepts the local ID of any remote VPN peer or client. The FortiGate does not check identifiers (local IDs). *Mode* can be set to *Aggressive* or *Main* in IKEv1. This option can be used with digital certificate authentication, but for higher security, use *Peer certificate*.
Specific peer ID	This option is only applicable when *Aggressive Mode* is enabled in IKEv1. Enter the identifier that is used to authenticate the remote peer. The identifier must match the local ID configured by the remote peer's administrator. For more details, see Customizing IPsec tunnel settings. If the remote peer is a FortiGate, the identifier is specified in the *Local ID* field of the *Phase 1 Proposal* settings. If the remote peer is a FortiClient user, the identifier is specified in the *Local ID* field. In circumstances where multiple remote dialup VPN tunnels exist, each tunnel must have a peer ID set. In IKEv2, use *Network ID*.
Peer ID from dialup group	Authenticate multiple FortiGate or FortiClient dialup clients that use unique identifiers and unique pre-shared keys (or unique pre-shared keys only) through the same VPN tunnel. You must create a dialup user group for authentication purposes. Select the group from the list next to the *Peer ID from dialup group* option. You must set *Mode* to *Aggressive* in IKEv1 when the dialup clients use unique identifiers and unique pre-shared keys. If the dialup clients use unique pre-shared keys only, you can set *Mode* to *Main* if there is only one dialup Phase 1 configuration for this interface IP address.

Peer certificate	Define the CA certificate used to authenticate the remote peer when the authentication mode is *Signature*. If the FortiGate will act as a VPN client, and you are using security certificates for authentication, set the *Local ID* to the distinguished name (DN) of the local server certificate that the FortiGate unit will use for authentication purposes.
Peer certificate group	Select a group from the User Peer Group.

Remote gateway matching	FortiOS supports remote gateway matching in a dial-up IPsec tunnel connection based on the public source IP, geolocation or Security Posture of dial-up clients. When a dial-up client first makes an IPsec connection to the FortiGate VPN gateway, the FortiGate will use the source IP to match the IPsec tunnel based on the IP subnet, address range, or country/region defined for that IPsec tunnel. IPv4 and IPv6 are supported. This feature requires the dynamic (dial-up) tunnel to be defined in IKEv2.
	For geolocation-based matching, see Matching IPsec tunnel gateway based on address parameters.
	
	To configure remote gateway matching:
	
	`config vpn ipsec phase1-interface`
	`edit <name>`
	`set type dynamic`
	`set ike-version 2`
	`set remote-gw-match {any | ipmask | iprange | geography | ztna}`
	`next`
	`end`

Options	Description
`any`	Match any connecting clients.
`ipmask`	Use `src-ip` of the connecting client to match IP subnet of remote VPN gateway. You can then define the IP subnet by setting `remote-gw-subnet`.
`iprange`	Use `src-ip` of the connecting client to match IP range of remote VPN gateway. You can then define the IP address range by setting `remote-gw-start-ip` and `remote-gw-end-ip`.

Options	Description
`geography`	Use `src-ip` of the connecting client to match the specified country/region of the VPN gateway. You can then define the country by setting `remote-gw-country`.
`ztna`	Use `ztna` of the connecting client to match against ZTNA security posture tags. You can then define the tags by setting `remote-gw-ztna-tags`. Alternatively, select the security posture tag(s) directly in the GUI.

Network Overlay

This option is only available when IKEv2 is selected.

In a SD-WAN configuration where a Hub has multiple dialup VPN overlays across different interfaces, enable Network overlay and assign a Network ID to the VPN tunnel to identify the tunnels.

This can also be used to differentiate multiple dial-up VPNs terminating on the same interface and local IP address. The Network ID is used to VPN gateway lookup since it is included in the first packet from the initiator.

Finally, in ADVPN, use the auto-discovery-crossover setting to enable or disable shortcuts to be setup between different network IDs.

Network ID

When *Network Overlay* is enabled, specify the *Network ID*.

The network ID is a Fortinet-proprietary attribute that is used to select the correct phase 1 between IPsec peers, so that multiple IKEv2 tunnels can be established between the same local/remote gateway pairs.

In a dial-up VPN, `network-id` is in the first initiator message of an IKEv2 phase 1 negotiation. The responder (Hub) uses the `network-id` to match a phase 1 configuration with a matching `network-id`. The Hub can then differentiate multiple dial-up phase 1s that are bound to the same underlay interface and IP address. Without a `network-id`, the Hub cannot have multiple phase 1 dialup tunnels on the same interface.

In static phase 1 configurations, `network-id` is used with the pair of gateway IPs to negotiate the correct tunnel with a matching `network-id`. This allows IPsec peers to use the same pair of underlay IPs to establish multiple IPsec tunnels. Without it, only a single tunnel can be established over the same pair of underlay IPs.

XAUTH

This option supports the authentication of dialup clients. It is only available for IKE version 1.

- *Disable*: do not use XAuth.
- *XAuth client*: available only if the *Remote Gateway* is set to *Static IP Address* or *Dynamic DNS*. If the FortiGate is a dialup client, enter the user name and password for the FortiGate to authenticate itself to the remote XAuth server.
- *PAP Server*, *CHAP Server*, *Auto Server*: available only if *Remote Gateway* is set to *Dialup User*. Dialup clients authenticate as members

	of a dialup user group. A user group must be created first for the dialup clients that need access to the network behind the FortiGate. The FortiGate must be configured to forward authentication requests to an external RADIUS or LDAP authentication server. Select the server type based on the encryption method used between the FortiGate, the XAuth client, and the external authentication server. Then select the user group (*Inherit from policy* or *Specify*). See XAuth user authentication on page 2703.

EAP	In IKEv2, use EAP to configure user authentication.
	• IKEv2 IDi payload: Client uses the Identification – Initiator (IDi) payload in the IKE_AUTH exchange to identify itself using unique IDs like IP address, email address, or FQDN.
	• EAP identity request: Request the client to send their identity when authentication is initiated. Use this method when using EAP-MSCHAPv2, EAP-TLS with RADIUS, and LDAP.
	IPsec IKEv2 VPNs support certificate authentication and EAP authentication at the same time from a dialup FortiClient. With the eap-cert-auth setting enabled, FortiGate will validate the X.509 certificate sent from FortiClient when establishing an IKEv2 tunnel. After it is authenticated, FortiGate will continue to perform EAP authentication.
	`config vpn ipsec phase1-interface`
	`edit <tunnel>`
	`set eap enable`
	`set eap-cert-auth {*disable | enable}`
	`set peer <user peer>`
	`next`
	`end`
	See VPN 2FA with EAP and certificate authentication on page 2950.

User Group	When EAP is chosen, you can specify a single user group directly in the VPN phase 1 configurations, or inherit the user groups from the firewall policy.
Phase 1 Proposal	The encryption and authentication algorithms used to generate keys for the IKE SA. There must be a minimum of one combination. The remote peer or client must be configured to use at least one of the proposals that you define.
Encryption	The following symmetric-key encryption algorithms are available: • *DES*: Digital Encryption Standard, a 64-bit block algorithm that uses a 56-bit key. Not Recommended. • *3DES*: triple-DES; plain text is encrypted three times by three keys. Not Recommended. • *AES128*: Advanced Encryption Standard, a 128-bit block algorithm that uses a 128-bit key. • *AES128GCM*: AES in Galois/Counter Mode, a 128-bit block algorithm that uses a 128-bit key. Only available for IKEv2.

		• *AES192*: a 128-bit block algorithm that uses a 192-bit key. • *AES256*: a 128-bit block algorithm that uses a 256-bit key. • *AES256GCM*: AES in Galois/Counter Mode, a 128-bit block algorithm that uses a 256-bit key. Only available for IKEv2. • *CHACHA20POLY1305*: a 128-bit block algorithm that uses a 128-bit key and a symmetric cipher. Only available for IKEv2. See also HMAC settings. • *SM4*: a 128-bit block cipher that uses a 128-bit key and a symmetric cipher. See SM3/SM4 cryptographic algorithms for IKEv1/ IKEv2 NEW on page 2847 for model limitations. *DES* and *3DES* are considered insecure by Fortinet's Security Rating Insights. If a security rating warning appears, disable the use of the Encryption algorithms.
	Authentication	The following message digests that check the message authenticity during an encrypted session are available: • *MD5*: message digest 5. Not Recommended. • *SHA1*: secure hash algorithm 1; a 160-bit message digest. Not Recommended. • *SHA256*: a 256-bit message digest. • *SHA384*: a 384-bit message digest. • *SHA512*: a 512-bit message digest. • *SM3*: a cryptographic hash function that produces a 256 bit digest. See SM3/SM4 cryptographic algorithms for IKEv1/ IKEv2 NEW on page 2847 for model limitations. In IKEv2, encryption algorithms include authentication, but a PRF (pseudo random function) is still required (*PRFSHA1*, *PRFSHA256*, *PRFSHA384*, *PRFSHA512*). See also HMAC settings. MD5 and SHA1 are considered insecure by Fortinet's Security Rating Insights. If a security rating warning appears, disable the use of the Authentication algorithms.
	Diffie-Hellman Groups	Asymmetric key algorithms used for public key cryptography. Select one or more from groups 1, 2, 5, and 14 through 32. At least one of the *Diffie-Hellman Groups* (DH) settings on the remote peer or client must match one the selections on the FortiGate. Failure to match one or more DH groups will result in failed negotiations. DH groups 1, 2, 5, 14, 22-27 are considered insecure by Fortinet's Security Rating Insights. If a security rating warning appears, disable the use of these DH groups. By default, FortiGate uses DH group 20 and 21 when configuring a VPN from the GUI or CLI.
	Post Quantum Cryptography Additional Key Exchanges	Enable quantum-resistant encryption by applying hybrid key exchange per RFC 9370 and RFC 9242. When creating a new PQC Additional KE group: • *Transform Type*: Each Transform type represents an additional round of KE exchange. Choose up to seven rounds or groups

	• *KE Groups*: Choose up to three Key Exchange groups from these Key Exchange Mechanisms (KEMs): *ML KEM (Kyber)*, *BIKE*, *HQC*, and *FRODO*. For more information, see Post-Quantum Cryptography for IPsec key exchange on page 2749.
Key Lifetime	The time (in seconds) that must pass before the IKE encryption key expires. When the key expires, a new key is generated without interrupting service. The keylife can be from 120 to 172 800 seconds.
Local ID	Optional setting. This value must match the peer ID value given for the remote VPN peer's *Peer Options*. • If the FortiGate will act as a VPN client and you are using peer IDs for authentication purposes, enter the identifier that the FortiGate will supply to the VPN server during the phase 1 exchange. • If the FortiGate will act as a VPN client and you are using security certificates for authentication, select the distinguished name (DN) of the local server certificate that the FortiGate will use for authentication purposes.

Additional CLI configurations

The following phase 1 settings can be configured in the CLI:

GRE over IPsec	Packets with a GRE header are encapsulated within IPsec tunnel mode.
	To configure GRE over IPsec:
	`config vpn ipsec {phase1-interface | phase1}`
	`edit ipsec`
	`set interface <name>`
	`set encapsulation gre`
	`set encapsulation-address ike/ipv4/ipv6`
	`set encap-local-gw4 xxx.xxx.xxx.xxx`
	`set encap-remote-gw xxx.xxx.xxx.xxx`
	`next`
	`end`

IPsec tunnel idle timer	Define an idle timer for IPsec tunnels. When no traffic has passed through the tunnel for the configured `idle-timeout` value, the IPsec tunnel will be flushed.
	To configure IPsec tunnel idle timeout:
	`config vpn ipsec phase1-interface`
	`edit p1`
	`set idle-timeout [enable | disable]`
	`set idle-timeoutinterval <integer>` *`IPsec tunnel idle timeout`*

	in minutes (10 - 43200). next end
Monitor tunnel for failover	Monitor a site-to-site tunnel to guarantee operational continuity if the primary tunnel fails. Configure the secondary phase 1 interface to monitor the primary interface. **To configure the monitor:** config vpn ipsec phase1-interface edit <secondary phase1-interface> set monitor <primary phase1-interface> next end
Passive mode	Passive mode turns one side of the tunnel to be a responder only. It does not initiate VPN tunnels either by auto-negotiation, rekey, or traffic initiated behind the FortiGate. **To configure passive mode:** config vpn ipsec phase1-interface edit <example> set rekey {enable | disable} set passive-mode {enable | disable} set passive-tunnel-interface {enable | disable} next end

Show only recommended IKE proposals by default

FortiGate by default only shows recommended configurations for IKE proposals in the CLI. This helps administrators more easily define secured and recommended cryptographic algorithms in the VPN configurations that adheres to security best practices.

The following DH groups are available in the CLI by default:

- 15, 16, 17, 18, 19, 20, 21, 28, 29, 30, 31, 32 (1,2,5,14,27 are hidden)

The following encryption algorithms are available in the CLI by default:

- AES128_CBC
- AES128_GCM
- AES192_CBC
- AES256_CBC
- AES256_GCM
- CHACHA20POLY1305

The following authentication algorithms are available in the CLI by default:

- SHA256
- SHA384
- SHA512

To set your preference for displaying IKE proposals:

```
config system settings
    set ike-proposal-visibility {recommended | all}
end
```

This setting is set to `recommended` by default.

Dead peer detection

By default, dead peer detection (DPD) sends probe messages every five seconds. If you are experiencing high network traffic, you can experiment with increasing the ping interval. However, longer intervals will require more traffic to detect dead peers, which will result in more traffic.

In a dynamic (dialup) connection, the *On Idle* option encourages dialup server configurations to more proactively delete tunnels if the peer is unavailable.

In the GUI, the dead peer detection option can be configured when defining phase 1 options. The following CLI commands support additional options for specifying a retry count and a retry interval.

For example, enter the following to configure DPD on the existing IPsec phase 1 configuration to use 15-second intervals and to wait for three missed attempts before declaring the peer dead and taking action.

To configure DPD:

```
config vpn ipsec phase1-interface
    edit <value>
        set dpd [disable | on-idle | on-demand]
        set dpd-retryinveral 15
        set dpd-retrycount 3
    next
end
```

DPD scalability

On a dialup server, if many VPN connections are idle, the increased DPD exchange could negatively impact the performance/load of the daemon. The `on-demand` option in the CLI triggers DPD when IPsec traffic is sent, but no reply is received from the peer.

When there is no traffic and the last DPD-ACK had been received, IKE will not send DPDs periodically. IKE will only send out DPDs if there are outgoing packets to send, but no inbound packets have since been received.

HMAC settings

The FortiGate uses the HMAC based on the authentication proposal that is chosen in phase 1 or phase 2 of the IPsec configuration. Each proposal consists of the encryption-hash pair (such as `3des-sha256`). The FortiGate matches the most secure proposal to negotiate with the peer.

To view the chosen proposal and the HMAC hash used:

```
# diagnose vpn ike gateway list

vd: root/0
name: MPLS
version: 1
interface: port1 3
addr: 192.168.2.5:500 -> 10.10.10.1:500
tun_id: 10.10.10.1
virtual-interface-addr: 172.31.0.2 -> 172.31.0.1
created: 1015820s ago
IKE SA: created 1/13 established 1/13 time 10/1626/21010 ms
IPsec SA: created 1/24 established 1/24 time 0/11/30 ms

  id/spi: 124 43b087dae99f7733/6a8473e58cd8990a
  direction: responder
  status: established 68693-68693s ago = 10ms
  proposal: 3des-sha256
  key: e0fa6ab8dc509b33-aa2cc549999b1823-c3cb9c337432646e
  lifetime/rekey: 86400/17436
  DPD sent/recv: 000001e1/00000000
```

Dynamic IPsec route control

The `add-route` option adds a route to peer destination selector into the FortiGate routing information base when the dynamic tunnel is negotiated. You can use the distance and priority options to set the distance and priority of this route. If this results in a route with the lowest distance, it is added to the FortiGate forwarding information base.

You can also enable `add-route` in phase 2 configuration that is associated with a dynamic (dialup) phase 1. In phase 2, `add-route` can be enabled, disabled, or set to use the same route as phase 1.

The `add-route` option is enabled by default.

To configure add-route in phase 1:

```
config vpn ipsec phase1
    edit <name>
        set type dynamic
        set add-route {enable | disable}
    next
end
```

To configure add-route in phase 2:

```
config vpn ipsec {phase2 | phase2-interface}
    edit <name>
        set add-route {phase1 | enable | disable}
    next
end
```

Blocking IPsec SA negotiation

IPsec SA negotiation blocking can only be removed if the peer offers a wildcard selector. If a wildcard selector is offered, then the wildcard route will be added to the routing table with the distance/priority value configured in phase 1. If that is the route with the lowest distance, it will be installed into the forwarding information base.

In this scenario, it is important to ensure that the distance value configured for phase 1 is set appropriately.

Choosing IKE version 1 and 2

FortiGate supports IKEv1 and IKEv2, and both are configured similarly. The underlying protocol for IKEv2 defined in RFC 7296 is more streamlined, requiring fewer message exchanges to negotiate the SAs compared to IKEv1. The major difference is IKEv1 uses XAuth (Extended Authentication) for user authentication, and IKEv2 uses EAP (Extensible Authentication Protocol). IKEv2 also supports using TCP as transport enabling IPsec to negotiate over TCP, encapsulate ESP packets within TCP and operate on custom TCP port such as port 443.

IKEv1 is generally well used and well understood, with a more rigid protocol that is simpler to troubleshoot. Whereas IKEv2 offers more flexibility, resulting in more variations when troubleshooting.

However, starting with FortiClient 7.4.4, IKEv1 is no longer supported on the client. Therefore, plan accordingly when choosing your IKE version. Use IKEv2 if you plan on deploying FortiClient 7.4.4 and later for remote access. New tunnel configurations on the FortiGate also default to using IKEv2.

Repeated authentication in IKEv2

This feature provides the option to control whether a device requires its peer to re-authenticate or whether re-key is sufficient. It does not influence the re-authentication or re-key behavior of the device itself, which is controlled by the peer (the default being to re-key). This solution is in response to RFC 4478. As described by the IETF, "the purpose of this is to limit the time that security associations (SAs) can be used by a third party who has gained control of the IPsec peer".

To configure IKE SA re-authentication:

```
config vpn ipsec phase1-interface
    edit p1
        set reauth [enable | disable]
    next
end
```

IKEv2 quick crash detection

There is support for IKEv2 quick crash detection (QCD) as described in RFC 6290.

RFC 6290 describes a method in which an IKE peer can quickly detect that the gateway peer it has and established an IKE session with has rebooted, crashed, or otherwise lost IKE state. When the gateway receives IKE messages or ESP packets with unknown IKE or IPsec SPIs, the IKEv2 protocol allows the gateway to send the peer an unprotected IKE message containing INVALID_IKE_SPI or INVALID_SPI notification payloads.

RFC 6290 introduces the concept of a QCD token, which is generated from the IKE SPIs and a private QCD secret, and exchanged between peers during the protected IKE AUTH exchange.

To configure QCD:

```
config system settings
    set ike-quick-crash-detect [enable | disable]
end
```

IKEv1 quick crash detection

Based on the IKEv2 QCD feature previously described, IKEv1 QCD is implemented using a new IKE vendor ID (Fortinet Quick Crash Detection) so both endpoints must be FortiGates. The QCD token is sent in the phase 1 exchange and must be encrypted, so this is only implemented for IKEv1 in main mode (aggressive mode is not supported as there is no available AUTH message to include the token). Otherwise, the feature works the same as in IKEv2 (RFC 6290).

IKEv1 fragmentation

UDP fragmentation can cause issues in IPsec when either the ISP or perimeter firewall(s) cannot pass or fragment the oversized UDP packets that occur when using a very large public security key (PSK). The result is that IPsec tunnels do not come up. The solution is IKE fragmentation.

For most configurations, enabling IKE fragmentation allows connections to automatically establish when they otherwise might have failed due to intermediate nodes dropping IKE messages containing large certificates, which typically push the packet size over 1500 bytes.

FortiOS will fragment a packet on sending if only all the following are true:

- Phase 1 contains `set fragmentation enable`.
- The packet is larger than the minimum MTU (576 for IPv4, 1280 for IPv6).
- The packet is being re-transmitted.

By default, IKE fragmentation is enabled.

To configure IKEv1 fragmentation:

```
config vpn ipsec phase1-interface
    edit 1
        set fragmentation [enable | disable]
    next
end
```

IKEv2 fragmentation

RFC 7383 requires each fragment to be individually encrypted and authenticated. With IKEv2, a copy of the unencrypted payloads around for each outgoing packet would need to be kept in case the original single packet was never answered and would retry with fragments. With the following implementation, if the IKE payloads are greater than a configured threshold, the IKE packets are preemptively fragmented and encrypted.

To configure IKEv2 fragmentation:

```
config vpn ipsec phase1-interface
    edit ike
        set ike-version 2
        set fragmentation [enable|disable]
        set fragmentation-mtu <500-16000>
    next
end
```

IPsec global IKE embryonic limit

When trying to establish thousands of tunnels simultaneously, a situation can arise where new negotiations starve other SAs from progressing to an established state in IKEv2. The IKE daemon can prioritize established SAs, offload groups 20 and 21 to CP9, and optimize the default embryonic limits for mid- and high-end platforms. The IKE embryonic limit can be configured in the CLI.

```
config system ike
    set embryonic-limit <integer>
end
```

`embryonic-limit <integer>`	Set the maximum number of IPsec tunnels to negotiate simultaneously (50 - 20000, default = 1000).

To configure an IKE embryonic limit of 50:

```
config system ike
    set embryonic-limit 50
end
```

Authentication method

For site-to-site IPsec tunnels between two FortiGates or a FortiGate and another VPN gateway, authentication is typically done using pre-shared keys or certificates. For remote access dialup VPN, users can authenticate using pre-shared keys or certificates and through Extended Authentication (XAuth) in IKEv1 tunnels or EAP in IKEv2 tunnels. Authentication can be any of the following methods supported by the FortiGate:

Authentication Methods	IKE Version	Requirement
• Pre-shared key • PKI (Signature)	IKEv1 and IKEv2	Required to configure one of these authentication methods

Authentication Methods	IKE Version	Requirement
• LDAP	IKEv1 and IKEv2 (requires EAP-TTLS)	Optional user authentication methods. (IPsec IKEv1 uses XAUTH, and IPsec IKEv2 uses EAP for user authentication.)
• Local • RADIUS	IKEv1 and IKEv2	
• SAML	IKEv2	
• Two-factor authentication	IKEv1 and IKEv2	Optional

Pre-shared key and PKI authentication can be paired with any of the other user authentication methods. Two-factor authentication using FortiToken is also supported and can work in combination with Local, LDAP, RADIUS, or SAML authentication. Two-factor authentication with client certificate is also supported.

Pre-shared key

Using a pre-shared key is less secure than using certificates, especially if it is used alone, without requiring peer IDs or extended user authentication like XAuth or EAP. There also needs to be a secure way to distribute the pre-shared key to the peers.

If you use pre-shared key authentication alone, all remote peers and dialup clients must be configured with the same pre-shared key. Optionally, you can configure remote peers and dialup clients with unique pre-shared keys. On the FortiGate, these are configured in user accounts, not in the phase 1 settings.

The pre-shared key must contain at least six printable characters and should be known by network administrators. For optimum protection against currently known attacks, the key must consist of a minimum of 16 randomly chosen alphanumeric characters. The limit is 128 characters.

If you use a pre-shared key as the authentication method, you cannot also use client certificate as another authentication method.

To authenticate the FortiGate using a pre-shared key:

1. Go to *VPN > VPN Tunnels* and create a new tunnel, or edit an existing one.
2. Configure or edit the *Network* section as needed.
3. Configure or edit the *Authentication* settings as follows:

Method	*Pre-shared Key*
Pre-shared Key	<string>
IKE	*Version 1* or *Version 2*
Mode	In IKEv1, select *Aggressive* or *Main* mode.
Accepted Peer ID	Select an *Accept Type* and the corresponding peer. Options vary based on the *Remote Gateway* and *Authentication Method* settings in the *Network* section. *Peer Options* are only available in IKEv1 *Aggressive* mode. For IKEv2, use Network overlay.

Network Overlay	In IKEv2, enable to require peers to configure a *Network ID*. When multiple tunnels are configured on the same interface, *Network ID* is used to match the tunnel.

4. For the *Phase 1 Proposal* section, keep the default settings unless changes are needed to meet your requirements.
5. Optionally, for authentication parameters for a dialup user group, define *XAUTH* parameters.
6. Click *OK*.

Digital certificates

To authenticate the FortiGate using digital certificates, you must have the required certificates installed on the remote peer and on the FortiGate. The signed server certificate on one peer is validated by the presence of the root certificate installed on the other peer. If you use certificates to authenticate the FortiGate, you can also require the remote peers or dialup clients to authenticate using certificates. See Basic site-to-site VPN with digital certificate on page 2790 for a detailed example.

To authenticate the FortiGate using a digital certificate:

1. Go to *VPN > VPN Tunnels* and create a new tunnel, or edit an existing one.
2. Configure or edit the *Network* section as needed.
3. Configure or edit the *Authentication* settings as follows:

Method	*Signature*
Certificate Name	Select the certificate used to identify this FortiGate. If there are no imported certificates, consider first to generate a certificate from a Certificate Authority and import it into the FortiGate. See Import a certificate on page 3830. If that is not possible, consider using the *Fortinet_Factory* certificate.
IKE	*Version 1* or *Version 2*
Mode	In IKEv1, *Aggressive* is recommended.
Accepted Peer ID	For *Accept Type*, select *Peer certificate* and select the peer and the CA certificate used to authenticate the peer. You can define more granular parameters for the peer when you create or edit a PKI user. See Configuring a PKI user on page 3534. If the other end is using the *Fortinet_Factory* certificate, then use the *Fortinet_CA* certificate here.

4. For the *Phase 1 Proposal* section, keep the default settings unless changes are needed to meet your requirements.
5. Optionally, for authentication parameters for a dialup user group, define XAUTH or EAP parameters.
6. Click *OK*.

When using signature as an authentication method in IKEv2, FortiClient supports submitting a certificate to FortiOS IKEv2 for validation, then continuing to the configured EAP method (EAP-MSCHAPv2 or EAP-TTLS) for authentication.

Certificate authentication as an additional step is enabled using the following configuration in FortiOS.

```
config vpn ipsec phase1-interface
    edit <tunnel>
        set authmethod signature
        set peertype peer
        set eap enable
        set eap-cert-auth {*disable | enable}
        set peer <user peer>
    next
end
```

For an example, see VPN 2FA with EAP and certificate authentication on page 2950.

XAuth user authentication

Extended authentication (XAuth) increases security for IKEv1 by requiring remote dialup client users to authenticate in a separate exchange at the end of phase 1. XAuth draws on existing FortiGate user group definitions and uses established authentication mechanisms such as PAP, CHAP, RADIUS, and LDAP to authenticate dialup clients. You can configure a FortiGate to function either as an XAuth server or client. If the server or client is attempting a connection using XAuth and the other end is not using XAuth, the failed connection attempts that are logged will not specify XAuth as the reason.

XAuth server

A FortiGate can act as an XAuth server for dialup clients. When the phase 1 negotiation completes, the FortiGate challenges the user for a user name and password. It then forwards the user's credentials to an external RADIUS or LDAP server for verification.

> If the user records on the RADIUS server have suitably configured Framed-IP-Address fields, you can assign client virtual IP addresses by XAuth instead of from a DHCP address range.

The authentication protocol you use for XAuth depends on the capabilities of the authentication server and the XAuth client:

- Select *CHAP Server* whenever possible for higher challenge-response based security.
- Select *PAP Server* for all implementations of LDAP and some implementations of Microsoft RADIUS that do not support CHAP.
- Select *Auto Server* when the authentication server supports *CHAP Server* but the XAuth client does not. The FortiGate will use PAP to communicate with the XAuth client and CHAP to communicate with the authentication server. You can also use *Auto Server* to allow multiple source interfaces to be defined in an IPsec/IKE policy.

Before you begin, create user accounts and user groups to identify the dialup clients that need to access the network behind the FortiGate dialup server. If password protection will be provided through an external RADIUS or LDAP server, you must configure the FortiGate dialup server to forward authentication requests to the authentication server.

To configure XAuth to authenticate a dialup user group:

1. On the FortiGate dialup server, go to *VPN > IPsec Tunnels* and create a new tunnel, or edit an existing one.
2. Set *Remote gateway* to *Dialup user*.
3. Set *IKE* to *Version 1*.
4. Enable *XAUTH* and select the method to use between the XAuth client, the FortiGate, and the authentication server.
5. For *User Group*:
   a. Select *Inherit from policy* for multiple user groups defined in the IPsec/IKE policy, or
   b. Select *Specify* and, in the dropdown, select the user group that needs to access the private network behind the FortiGate.

   Only one user group may be defined for *Auto Server*.
6. Configure the remaining *Network*, *Authentication*, and *Phase 1 Proposal* options as needed.
7. Click *OK*.
8. Create as many policies as needed, specifying the source user(s) and destination address.

XAuth client

If the FortiGate acts as a dialup client, the remote peer, acting as an XAuth server, might require a username and password. You can configure the FortiGate as an XAuth client with its own username and password, which it provides when challenged.

To configure the FortiGate dialup client as an XAuth client:

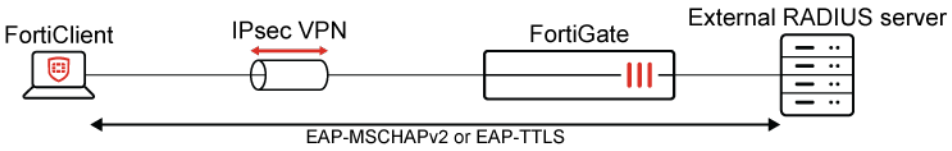
1. On the FortiGate dialup client, go to *VPN > IPsec Tunnels* and create a new tunnel, or edit an existing one.
2. Set *Remote gateway* to either *Static IP address* or *Dynamic DNS*.
3. Set *IKE* to *Version 1*.
4. Enable *XAUTH*, *XAuth client* is selected as the only option.
5. Enter the *Username* and *Password* that will be used to authenticate this FortiGate.
6. Configure the remaining *Network*, *Authentication*, and *Phase 1 Proposal* options as needed.
7. Click *OK*.

EAP user authentication

EAP is a native authentication mechanism of IKEv2 that occurs during the IKE_AUTH exchange. The IKE SA is only completed when EAP authentication completes successfully. EAP allows the VPN gateway to authenticate the initiator using a variety of methods, including EAP-MSCHAPv2, EAP-TLS, and EAP-TTLS.

However, the EAP method must be supported by the client endpoint as well as the external authentication servers. FortiClient IKEv2 only supports initiating EAP-MSCHAPv2 and EAP-TTLS authentication.

EAP-MSCHAPv2 or EAP-TTLS with External RADIUS server



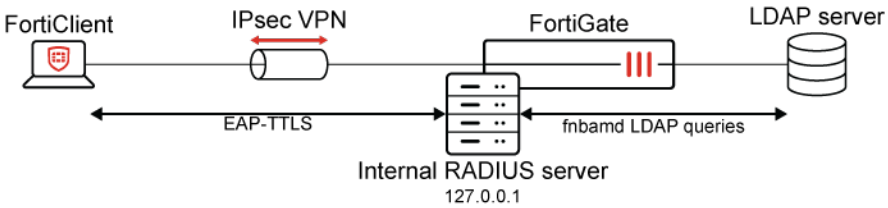
If an external RADIUS server is configured for the VPN, EAP-MSCHAPv2 or EAP-TTLS can be used for end to end communication.

FortiOS does not terminate the EAP-TTLS tunnel on its internal eap_proxy RADIUS server. Instead, it passes the EAP-TTLS connection attempt through to the external RADIUS server. EAP-TTLS with PAP as an inner method must be supported and properly configured on the external RADIUS server, or the authentication attempt will fail.

The EAP method attempted is configured on the client, and the default is EAP-MSCHAPv2. If EAP-TTLS/PAP is in use, the EAP server certificate is configured on the remote RADIUS server. Unlike EAP-TLS, EAP-TTLS does not require the use of client certificates.

Multiple RADIUS servers associated with the same dial-up gateway are not supported.

EAP-TTLS with LDAP server



If EAP-TTLS is used and no external RADIUS server is configured for the VPN (like when LDAP is used), the EAP-TTLS tunnel terminates on the FortiGate's own internal RADIUS server.

Because the firewall can view the user's original plaintext credentials in this case, FortiOS attempts to authenticate them against the set of local users and remote LDAP servers configured for the tunnel.

To support EAP-TTLS on the client side, FortiClient 7.4.3 and later should be used.

FortiGate cannot authenticate Active Directory users against an LDAP server directly using EAP-MSCHAPv2. See IKEv2 dial up VPN with LDAP authentication.

The TLS certificate that FortiOS uses for EAP-TTLS is *Fortinet_Wifi* by default and is signed by a public CA. The certificate is configured in global settings with the `wifi-certificate` command. If the certificate is not trusted by the client, VPN connections will fail with certificate errors showing in debug messages. See EAP-TTLS connection failing with FortiClient and IPsec IKEv2 connection due to certificate error.

Two-factor authentication with FortiToken and FortiAuthenticator

When the user's FortiToken is hosted on a FortiAuthenticator, EAP-MSCHAPv2 must be used for the user to see a token prompt or get a push notification. This can be used to trigger token prompts for on-premises Active

Directory users when the FortiAuthenticator is joined to the Active Directory domain. See Authenticating users using MSCHAP2 PEAP.

When authenticating against a remote RADIUS server that performs 2FA, extending the RADIUS timeout is usually required.

```
config user radius
    edit <server name>
        set timeout 60
    next
end
```

When EAP-TTLS must be used, FortiAuthenticator does not support sending the prompt, but the user may append the token code to their password as a workaround. See Multi-Factor Authentication support for Windows FortiClient with LDAP (EAP-TTLS).

The default IPsec negotiation timeout is 30 seconds. If OTP entry takes longer, the IPsec connection may expire, preventing access even after successful authentication. Consider increasing the IPsec negotiation timeout to allow enough time for users to enter their one-time password (OTP) or accept the token prompt.

```
config vpn ipsec phase1-interface
    edit <tunnel name>
        set negotiate-timeout 60
    next
end
```

If using FortiTokens provisioned on FortiGate, EAP-TTLS authentication requires FortiOS 7.4.9 or later and FortiClient Windows 7.4.4. See Multi-Factor Authentication support for Windows FortiClient with LDAP (EAP-TTLS) and FortiOS 7.4.9 Resolved issue 1031789.

SAML authentication

SAML authentication is not an EAP method. When SAML authentication is in use, FortiClient initiates an HTTPS connection to the FortiGate as the SAML Service Provider (SP) first. After SAML redirect and authentication with the SAML IDP, FortiClient presents the SAML cookie to the FortiGate, which caches a user authentication entry internally.

FortiClient attempts to connect to the IKEv2 dial-up gateway. FortiClient authenticates FortiGate using pre-shared key or signature authentication, then proves ownership of the cached user authentication by authenticating itself against the FortiGate eap_proxy using EAP-MSCHAPv2 or EAP-TTLS.

For this reason, it is still required to enable EAP in the FortiGate phase1-interface configuration, even though SAML is not an EAP method.

When configuring a single-sign-on tunnel on FortiClient, it is recommended leave eap_method in its default value. FortiClient 7.2.4 and later support using SAML authentication with IKEv2. See IPsec VPN SAML-based authentication.

FQDN support for remote gateways

FortiGate supports FQDN when defining an IPsec remote gateway with a dynamically assigned IPv6 address. When FortiGate attempts to connect to the IPv6 device, FQDN will resolve the IPv6 address even when the address changes.

Using FQDN to configure the remote gateway is useful when the remote end has a dynamic IPv6 address assigned by their ISP or DHCPv6 server.

To set the VPN to DDNS and configure FQDN:

```
config vpn ipsec phase1-interface
    edit "ddns6"
        set type ddns
        set interface "agg1"
        set ip-version 6
        set ike-version 2
        set peertype any
        set net-device disable
        set proposal aes128-sha256 aes256-sha256 aes128gcm-prfsha256 aes256gcm-prfsha384
chacha20poly1305-prfsha256
        set dpd on-idle
        set remotegw-ddns "rgwa61.vpnlab.org"
        set psksecret **********
    next
end
```

```
config vpn ipsec phase2-interface
    edit "ddns6"
        set phase1name "ddns6"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm aes256gcm
chacha20poly1305
        set src-addr-type subnet6
        set dst-addr-type subnet6
        set src-subnet6 2003:1:1:1::/64
    next
end
```

FQDN resolves the IPv6 address

```
# diagnose test application dnsproxy 7

vfid=0, name=rgwa61.vpnlab.org, ttl=3600:3547:1747
         2003:33:1:1::22 (ttl=3600)
```

FortiGate uses FQDN to connect to the IPv6 device

```
# diagnose vpn tunnel list name ddns6
list ipsec tunnel by names in vd 0
------------------------------------------------------
```

```
name=ddns6 ver=2 serial=2 2003:33:1:1::1:0->2003:33:1:1::22:0 dst_mtu=1500

Resuming sessions for IPsec tunnel IKE version 2

FortiOS supports session resumptions for IPsec tunnel IKE version 2. This feature enhances the user experience by maintaining the tunnel in an idle state, which allows for uninterrupted usage even after a client resumes from sleep or when connectivity is restored after a disruption. Furthermore, it removes the necessity for re-authentication when reconnecting, making the process more efficient.

```
config vpn ipsec phase1-interface
    edit <phase 1 name>
        set client-resume enable
        set client-resume-interval {integer length of idle time}
    next
end
```

Example

In the following example, the client FortiGate will be configured to enable session resumption after returning from an idle state. The resume interval will be set as 120 seconds and the interface status will be tested when the client resumes within and past this interval.

This example uses a pre-shared key for authentication, although signature authentication can also be used.

To enable session resumption for IPsec tunnel IKE version 2:

1. Configure IPsec VPN for the dialup client FortiGate:
   a. Configure the IPsec phase 1 interface:

```
config vpn ipsec phase1-interface
    edit "toServer"
        set interface "port9"
        set ike-version 2
        set peertype any
        set net-device enable
        set proposal aes128-sha256 aes256-sha256 aes128gcm-prfsha256 aes256gcm-prfsha384
chacha20poly1305-prfsha256
        set dpd on-idle
        set remote-gw 173.1.1.1
        set psksecret ****************
        set dpd-retryinterval 60
    next
end
```

b. Configure the IPsec phase 2 interface:

```
config vpn ipsec phase2-interface
    edit "toServer"
        set phase1name "toServer"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
aes256gcm chacha20poly1305
    next
end
```

c. Configure the firewall policy:

```
config firewall policy
    edit 1
        set srcintf "port2"
        set dstintf "toServer"
        set action accept
        set srcaddr "10.1.100.0"
        set dstaddr "192.168.5.0"
        set schedule "always"
        set service "ALL"
    next
    edit 2
        set srcintf "toServer"
        set dstintf "port2"
        set action accept
        set srcaddr "192.168.5.0"
        set dstaddr "10.1.100.0"
        set schedule "always"
        set service "ALL"
   next
end
```

2. Configure IPsec VPN for the dialup server FortiGate:

a. Configure the IPsec phase 1 interface:

```
config vpn ipsec phase1-interface
    edit "toClient"
        set type dynamic
        set interface "port8"
        set ike-version 2
        set peertype any
        set net-device enable
        set proposal aes128-sha256 aes256-sha256 aes128gcm-prfsha256 aes256gcm-prfsha384
chacha20poly1305-prfsha256
        set dpd on-idle
        set client-resume enable
        set client-resume-interval 120
        set psksecret ****************
        set dpd-retryinterval 60
    next
end
```

b. Configure the IPsec phase 2 interface:

```
config vpn ipsec phase2-interface
    edit "toClient"
        set phase1name "toClient"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
aes256gcm chacha20poly1305
    next
end
```

c. Configure the firewall policy:

```
config firewall policy
    edit 1
        set srcintf "port2"
        set dstintf "toClient"
        set action accept
        set srcaddr "192.168.5.0"
        set dstaddr "all"
        set schedule "always"
        set service "ALL"
    next
    edit 2
        set srcintf "toClient"
        set dstintf "port2"
        set action accept
        set srcaddr "all"
        set dstaddr "192.168.5.0"
        set schedule "always"
        set service "ALL"
    next
end
```

3. Check the IPsec phase 1 and phase 2 interface status and the client resume messages:

a. In the following scenario, the client becomes idle or has connectivity issues but resumes within the set 120 second interval:

```
# diagnose debug application ike -1
ike V=root:0:toClient_0: starting client-resume sleep period 120 sec (1)
ike V=root:0: comes 11.101.1.1:500->173.1.1.1:500,ifindex=16,vrf=0,len=632....
ike V=root:0: IKEv2 exchange=SA_INIT id=dfa40e0473d89550/0000000000000000 len=632
ike V=root:0:toClient_0: client has resumed (1)
ike 0:toClient_0:10: out
6749C602DDF25B141E24AC649641D2242E2025000000000200000050000000343F9A56C6D16E93E2F5D7BC7F66
DC7CBDB3E44EA75F0A87A3238DCC08EE0BF478817EC93DF72EB2B3E027D695FACECF4E
ike V=root:0:toClient_0:11:toClient:30: sending SNMP tunnel UP trap
ike V=root:0:toClient_0: tunnel up event
```

b. In the following scenario, the client becomes idle or has connectivity issues but the set 120 second interval expires before it resumes. Therefore, the tunnel is not maintained:

```
# diagnose debug application ike -1
ike V=root:0:toClient_0:9: sent IKE msg (RETRANSMIT_INFORMATIONAL): 173.1.1.1:500-
```

```
>11.101.1.1:500, len=80, vrf=0, id=e50861aebc1e5b1a/6457ea1e8512148c, oif=16
ike V=root:0:toClient_0: link is idle 16 173.1.1.1->11.101.1.1:0 dpd=1 seqno=2 rr=0
ike V=root:0:toClient_0:9: send IKEv2 DPD probe, seqno 2
ike V=root:0:toClient_0:9: e50861aebc1e5b1a/6457ea1e8512148c retransmission timeout
ike V=root:0:toClient_0: starting client-resume sleep period 120 sec (1)
ike V=root:0:toClient_0: client-resume sleep period has expired (1)
ike V=root:0:toClient_0: going to be deleted
ike V=root:0:toClient_0: flushing
ike V=root:0:toClient_0: deleting IPsec SA with SPI 30c477cd
ike V=root:0:toClient_0:toClient: deleted IPsec SA with SPI 30c477cd, SA count: 0
ike V=toClient_0:0:toClient_0:23: del route 0.0.0.0/0.0.0.0 tunnel 11.101.1.1 oif
toClient_0(45) metric 15 priority 1
ike V=root:0:toClient_0: sending SNMP tunnel DOWN trap for toClient
ike V=root:0:toClient_0: last dialup SA expired while client sleeping
ike V=root:0:toClient_0: flushed
```

Fragmenting IP packets before IPsec encapsulation

The `ip-fragmentation` command controls packet fragmentation before IPsec encapsulation, which can benefit packet loss in some environments.

For example, when a packet is encapsulated and exceeds the MTU size but it is NP-offloaded, the NPU cannot generate an ICMP unreachable, need to frag message. This message can only be generated when NPU offloading is disabled. This can lead to packet loss because the sender cannot be notified and the IP fragments cannot be transmitted.

By enabling pre-encapsulation, the TCP packet is fragmented before it is encapsulated, so all fragments are encapsulated and transmitted as ESP packets.

The following options are available for the `ip-fragmentation` variable.

Option	Description
`pre-encapsulation`	Fragment before IPsec encapsulation.
`post-encapsulation`	Fragment after IPsec encapsulation (RFC compliant) (default value).

To configure packet fragmentation using the CLI:

```
config vpn ipsec phase1-interface
    edit "demo"
        set interface "port1"
        set authmethod signature
        set peertype any
        set net-device enable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set ip-fragmentation pre-encapsulation
        set remote-gw 172.16.200.4
        set certificate "Fortinet_Factory"
```

```
    next
end
```

In 7.6.1 and later, FortiGate does not reduce the MSS size. It only uses the ICMP_FRAG_NEEDED message to notify the sender of the MTU size so that the sender can adjust the TCP MSS and packet size. In earlier versions, when TCP traffic goes through an IPsec tunnel, FortiGate would reduce the TCP MSS size if the packet was larger than the tunnel's MTU. FortiGate would then use the ICMP_FRAG_NEEDED message to notify the sender of the MTU size so that the sender can adjust the TCP MSS and packet size.

Cross-validation for IPsec VPN

FortiOS supports a cross-validation mechanism for IPsec VPN, aimed at bolstering security and user authentication by mitigating the risk of unauthorized access and identity spoofing. This mechanism functions by cross-checking whether the username provided by the client matches the identity field specified in the peer certificate. The identity field, which could be an Othername, RFC 822 Name, or CN, serves as a unique identifier for the client.

```
config vpn ipsec phase1-interface
    edit <name>
        set cert-peer-username-validation {none | othername | rfc822name | cn}
        set cert-peer-username-strip {enable | disable}
    next
end
```

Validation can be enabled for IPsec VPN when the peer sends certificates for authentication and XAUTH, EAP, SAML, or `azure-ad-autoconnect` is used. Name matching is not case sensitive.

To configure cross-validation for IPsec VPN:

1. Configure IPsec VPN phase1:

```
config vpn ipsec phase1-interface
    edit "toclient"
        set type dynamic
        set interface "port8"
        set authmethod signature
        set peertype any
        set net-device disable
        set proposal aes128-sha256 aes256-sha256
        set dpd on-idle
        set dhgrp 5
        set xauthtype auto
        set authusrgrp "vpnad01- ldap-group"
        set cert-peer-username-validation othername
        set cert-peer-username-strip enable
        set certificate "FTG-D"
```

```
    next
end
```

2. Configure IPsec VPN phase2:

```
config vpn ipsec phase2-interface
    edit "toclient"
        set phase1name "toclient"
        set proposal aes128-sha256 aes256-sha256
        set dhcp-ipsec enable
    next
end
```

3. In FortiClient, input a username that corresponds with the identity in the certificate, such as *tester2*.
4. Verify that the cross-validation succeeded and the tunnel is established:

```
# diagnose vpn ike gateway list

vd: root/0
name: toclient_0
version: 1
interface: port8 16
addr: 173.1.1.1:4500 -> 173.1.1.2:64917
tun_id: 173.1.1.2/::10.0.0.12
remote_location: 0.0.0.0
network-id: 0
transport: UDP
created: 17s ago
xauth-user: tester2
2FA: no
peer-id: DC=com, DC=vpnfosqa, CN=Users, CN=tester2
peer-id-auth: yes
FortiClient UID: 43B7079E9D244365A91CB0F139EA470F

```

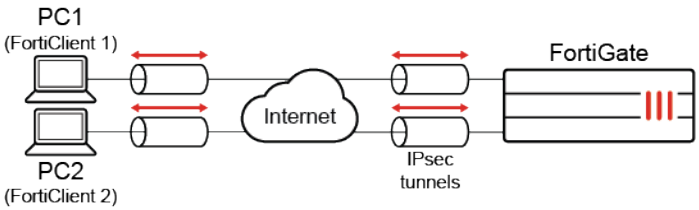
IPsec VPN IP address assignments

When a user disconnects from a VPN tunnel, it is not always desirable for the released IP address to be used immediately. In IPsec VPN, IP addresses can held for the specified delay interval before being released back into the pool for assignment. The first-available address assignment method is still used.

Example



In this example, two PCs connect to the VPN. The IP address reuse delay interval is used to prevent a released address from being reused for at least four minutes. After the interval elapses, the IP address becomes available to clients again. Dual stack address assignment (both IPv4 and IPv6) is used.

To configure IPsec VPN with an IP address reuse delay interval:

1. Configure the IPsec phase1 interface, setting the IP address reuse delay interval to 240 seconds:

```
config vpn ipsec phase1-interface
    edit "FCT"
        set type dynamic
        set interface "port27"
        set mode aggressive
        set peertype any
        set net-device disable
        set mode-cfg enable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set wizard-type dialup-forticlient
        set xauthtype auto
        set authusrgrp "local-group"
        set ipv4-start-ip 10.20.1.1
        set ipv4-end-ip 10.20.1.100
        set dns-mode auto
        set ipv4-split-include "FCT_split"
        set ipv6-start-ip 2001::1
        set ipv6-end-ip 2001::2
        set ip-delay-interval 240
        set save-password enable
        set psksecret **********
    next
end
```

2. Configure the IPsec phase2 interface:

```
config vpn ipsec phase2-interface
    edit "FCT"
        set phase1name "FCT"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm aes256gcm
chacha20poly1305
    next
    edit "FCT6"
        set phase1name "FCT"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm aes256gcm
```

```
chacha20poly1305
        set src-addr-type subnet6
        set dst-addr-type subnet6
    next
end
```

To test the results:

1. Connect to the VPN with FortiClient 1 on PC1 then check the assigned IP address:

```
# diagnose vpn ike gateway list

vd: root/0
name: FCT_0
version: 1
interface: port27 17
addr: 173.1.1.1:4500 -> 173.1.1.2:60417

  key: 356637ee6e9a9cb5-fade432c09efb8aa-54be307fc1eeeab5-6e4b9ef19f98d5fa
  lifetime/rekey: 86400/86115
  DPD sent/recv: 00000000/00000394
```

2. Disconnect FortiClient 1 and connect with FortiClient 2. The IP address assigned to FortiClient 1 is not released to the pool, and a different IP address is assigned to FortiClient 2:

```
# diagnose vpn ike gateway list

vd: root/0
name: FCT_0
version: 1
interface: port27 17
addr: 173.1.1.1:4500 -> 173.1.1.2:64916
tun_id: 173.1.1.2
remote_location: 0.0.0.0
virtual-interface-addr: 169.254.1.1 -> 169.254.1.1
created: 6s ago
```

```
xauth-user: usera
2FA: no
FortiClient UID: EAF90E297393456AB546A041066C0720
assigned IPv4 address: 10.20.1.2/255.255.255.255
assigned IPv6 address: 2001::2/128
nat: peer
IKE SA: created 1/1  established 1/1  time 110/110/110 ms
IPsec SA: created 2/2  established 2/2  time 0/5/10 ms

  id/spi: 3 b25141d5a915e67e/b32decdb8cf98318
  direction: responder
  status: established 6-6s ago = 110ms
  proposal: aes256-sha256
  key: 374ab753f3207ea0-83496b5cb24b5a8d-c51da1fd505cf3a4-727884839897808a
  lifetime/rekey: 86400/86123
  DPD sent/recv: 00000000/00000453
```

3. Wait for 240 seconds, then disconnect and reconnect FortiClient 2. The IP address previously assigned to FortiClient 1 has been released back to the pool, and is assigned to FortiClient 2:

```
# diagnose vpn ike gateway list

vd: root/0
name: FCT_0
version: 1
interface: port27 17
addr: 173.1.1.1:4500 -> 173.1.1.2:64916
tun_id: 173.1.1.2
remote_location: 0.0.0.0
virtual-interface-addr: 169.254.1.1 -> 169.254.1.1
created: 20s ago
xauth-user: usera
2FA: no
FortiClient UID: EAF90E297393456AB546A041066C0720
assigned IPv4 address: 10.20.1.1/255.255.255.255
assigned IPv6 address: 2001::1/128
nat: peer
IKE SA: created 1/1  established 1/1  time 100/100/100 ms
IPsec SA: created 2/2  established 2/2  time 0/0/0 ms

  id/spi: 4 fb1fbad0c12f5476/aa06a2de76964f63
  direction: responder
  status: established 20-20s ago = 100ms
  proposal: aes256-sha256
  key: af43f1bb876dc79c-16448592fe608dc3-f251746d71b2c35d-c848e8c03bf738e9
  lifetime/rekey: 86400/86109
  DPD sent/recv: 00000000/000000a9
```

Instead of waiting for 240 seconds, you can instead use the `diagnose vpn ike gateway flush` command to release the previously used IP addresses back into the pool.

Phase 2 configuration

After phase 1 negotiations end successfully, phase 2 begins. In Phase 2, the VPN peer or client and the FortiGate exchange keys again to establish a secure communication channel. The phase 2 proposal parameters select the encryption and authentication algorithms needed to generate keys for protecting the implementation details of security associations (SAs). The keys are generated automatically using a Diffie-Hellman algorithm. Post-Quantum cryptographic algorithms can also be used in additional Key Exchange just like in phase 1.

The basic phase 2 settings associate IPsec phase 2 parameters with the phase 1 configuration that specifies the remote end point of the VPN tunnel. In most cases, you need to configure only basic Phase 2 settings.

Some settings can be configured in the CLI. The following options can be configured when you create a custom VPN tunnel by clicking *Create New* in the *Phase 2 selectors* table.

Command	Description
Name	Phase 2 definition name.
Encapsulation	Define whether you encapsulate the entire IP packet or leave the original IP headers intact. • *Tunnel Mode*: The original IP header and payload are encrypted and encapsulated in ESP with a new IP header. Used for site-to-site and remote access VPNs where the gateway is the endpoint for the outer IP header. • *Transport Mode*: Only the payload is encrypted and encapsulated in ESP. The original header is used for the outer IP header. Used for VPNs between two hosts. For NAT traversal and IKEv2 over TCP, the ESP packet is further encapsulated in UDP or TCP.
IP version	*Tunnel Mode* only. Choose the IP version for the packet
Named address	*Tunnel Mode* only. Instead of defining the local and remote selector address directly in Phase 2 settings, select address objects instead.
Local Address	*Tunnel Mode* only. A value of `0.0.0.0/0` means all IP addresses behind the local VPN peer. Add a specific address or range to allow traffic from and to only this local address. See Quick mode selectors on page 2722.
Remote Address	*Tunnel Mode* only. Enter the destination IP address that corresponds to the recipients or network behind the remote VPN peer. A value of `0.0.0.0/0` means all IP addresses behind the remote VPN peer. See Quick mode selectors on page 2722.
Advanced	Select the encryption and authentication algorithms that will be proposed to the remote VPN peer. To establish a VPN connection, at least one of the proposals specified must match the configuration on the remote peer.
Encryption	The following symmetric-key encryption algorithms are available: • *NULL*: do not use an encryption algorithm. **Not recommended**.

Command	Description
	• *DES*: Digital Encryption Standard, a 64-bit block algorithm that uses a 56-bit key. **Not recommended**. • *3DES*: triple-DES; plain text is encrypted three times by three keys. **Not recommended**. • *AES128*: Advanced Encryption Standard, a 128-bit block algorithm that uses a 128-bit key. • *AES128GCM*: AES in Galois/Counter Mode, a 128-bit block algorithm that uses a 128-bit key. Only available for IKEv2. • *AES192*: a 128-bit block algorithm that uses a 192-bit key. • *AES256*: a 128-bit block algorithm that uses a 256-bit key. • *AES256GCM*: AES in Galois/Counter Mode, a 128-bit block algorithm that uses a 256-bit key. Only available for IKEv2. • *CHACHA20POLY1305*: a 128-bit block algorithm that uses a 128-bit key and a symmetric cipher. Only available for IKEv2. See ChaCha20 and Poly1305 AEAD cipher on page 2724, AES-GCM for IKEv2 phase 1 on page 2724, and HMAC settings.
Authentication	The following message digests that check the message authenticity during an encrypted session are available: • *NULL*: do not use a message digest. **Not recommended**. • *MD5*: message digest 5. **Not recommended**. • *SHA1*: secure hash algorithm 1; a 160-bit message digest. **Not recommended**. • *SHA256*: a 256-bit message digest. • *SHA384*: a 384-bit message digest. • *SHA512*: a 512-bit message digest. See also HMAC settings.
L2TP	Enable or disable L2TP over IPsec. Typically used by native VPN clients such as Windows VPN client. See Native VPN as dialup client - Windows New on page 2957.
Replay Detection	Replay attacks occur when an unauthorized party intercepts a series of IPsec packets and replays them back into the tunnel. Replay detection allows the FortiGate to check all IPsec packets to see if they have been received before. If any encrypted packets arrive out of order, the FortiGate discards them. Note that 64-bit extended sequence numbers (as described in RFC 4303, RFC 4304 as an addition to IKEv1, and RFC 5996 for IKEv2) are supported for IPsec when replay detection is enabled.
Perfect Forward Secrecy (PFS)	Perfect forward secrecy (PFS) improves security by forcing a new Diffie-Hellman exchange whenever keylife expires.
Diffie-Hellman Group	Asymmetric key algorithms used for public key cryptography.

Command	Description
	Select one or more from groups 1, 2, 5, and 14 through 32. At least one of the *Diffie-Hellman Groups* (DH) settings on the remote peer or client must match one the selections on the FortiGate. Failure to match one or more DH groups will result in failed negotiations. Fortinet recommends choosing DH groups in the range 15-21 and 28-32 for security best practices.
Post Quantum Cryptography Additional Key Exchanges	Enable quantum-resistant encryption by applying hybrid key exchange per RFC 9370 and RFC 9242. When creating a new PQC Additional KE group: • *Transform Type*: Each Transform type represents an additional round of KE exchange. Choose up to seven rounds or groups • *KE Groups*: Choose up to three Key Exchange groups from these Key Exchange Mechanisms (KEMs): *ML KEM (Kyber)*, *BIKE*, *HQC*, and *FRODO*. For more information, see Post-Quantum Cryptography for IPsec key exchange on page 2749.
Local Port	*Tunnel Mode* only. Enter the port number that the local VPN peer uses to transport traffic related to the specified service (protocol number). The range is from 0 to 65535. To specify all ports, select *All*, or enter `0`.
Remote Port	*Tunnel Mode* only. Enter the port number that the remote VPN peer uses to transport traffic related to the specified service (protocol number). To specify all ports, select *All*, or enter `0`.
Protocol	*Tunnel Mode* only. Enter the IP protocol number of the service. To specify all services, select *All*, or enter `0`.
Auto-negotiate	Select this option for the tunnel to be automatically renegotiated when the it expires. See Auto-negotiate on page 2723. This option is only available when the *Remote Gateway* mode in phase 1 is not a dialup user.
Autokey Keep Alive	Select this option for the tunnel to remain active when no data is being processed.
Key Lifetime	Select the method for determining when the phase 2 key expires: • *Seconds* • *Kilobytes* • *Both* Enter a corresponding value for *Seconds* and/or *Kilobytes* in the text boxes. If *Both* is selected, the key expires when either the time has passed or the number of kilobytes have been processed.

Quick mode selectors

Quick mode selectors determine which IP addresses can perform IKE negotiations to establish a tunnel. By only allowing authorized IP addresses access to the VPN tunnel, the network is more secure.

The default settings are as broad as possible: any IP address or configured address object using any protocol on any port.

> ⚠ While the dropdown menus for specifying an address also show address groups, the use of address groups may not be supported on a remote endpoint device that is not a FortiGate.

When configuring a quick mode selector for *Local Address* and *Remote Address*, valid options include IPv4 and IPv6 single addresses, subnets, or ranges.

There are some configurations that require specific selectors:

- The VPN peer is a third-party device that uses specific phase2 selectors.
- The FortiGate connects as a dialup client to another FortiGate, in which case (usually) you must specify a local IP address, IP address range, or subnet. However, this is not required if you are using dynamic routing and `mode-cfg`.

With FortiOS VPNs, your network has multiple layers of security, with quick mode selectors being an important line of defense:

- Routes guide traffic from one IP address to another.
- Phase 1 and phase 2 connection settings ensure there is a valid remote end point for the VPN tunnel that agrees on the encryption and parameters.
- Quick mode selectors allow IKE negotiations only for allowed peers.
- Security policies control which IP addresses can connect to the VPN.
- Security policies also control what protocols are allowed over the VPN along with any bandwidth limiting.

If you are editing an existing phase 2 configuration, the local address and remote address fields are unavailable if the tunnel has been configured to use firewall addresses as selectors. This option exists only in the CLI.

Using the add-route option

Consider using the `add-route` option to add a route to a peer destination selector in phase 2 to automatically match the settings in phase 1.

To configure add-route:

```
config vpn ipsec {phase2 | phase2-interface}
    edit <name>
        set add-route {phase1 | enable | disable}
    next
end
```

Auto-negotiate

By default, the phase 2 security association (SA) is not negotiated until a peer attempts to send data. The triggering packet and some subsequent packets are dropped until the SA is established. Applications normally resend this data, so there is no loss, but there might be a noticeable delay in response to the user.

If the tunnel goes down, the auto-negotiate feature (when enabled) attempts to re-establish the tunnel. Auto-negotiate initiates the phase 2 SA negotiation automatically, repeating every five seconds until the SA is established.

Automatically establishing the SA can be important for a dialup peer. It ensures that the VPN tunnel is available for peers at the server end to initiate traffic to the dialup peer. Otherwise, the VPN tunnel does not exist until the dialup peer initiates traffic.

To configure auto-negotiate:

```
config vpn ipsec phase2
    edit <phase2_name>
        set auto-negotiate enable
    next
end
```

Installing dynamic selectors via auto-negotiate

The IPsec SA connect message generated is used to install dynamic selectors. These selectors can be installed via the auto-negotiate mechanism. When phase 2 has `auto-negotiate` enabled, and phase 1 has `mesh-selector-type` set to `subnet`, a new dynamic selector will be installed for each combination of source and destination subnets. Each dynamic selector will inherit the auto-negotiate option from the template selector and begin SA negotiation. Phase 2 selector sources from dialup clients will all establish SAs without traffic being initiated from the client subnets to the hub.

DHCP

The `dhcp-ipsec` option lets the FortiGate assign IP addresses to FortiClient dialup clients through a DHCP server or relay in IKEv1. This option is only available if the remote gateway in the phase 1 configuration is set to dialup user and `mode-cfg` is disabled.

With `dhcp-ipsec`, the FortiGate dialup server acts as a proxy for FortiClient dialup clients that have VIP addresses on the subnet of the private network behind the FortiGate. In this case, the FortiGate dialup server acts as a proxy on the local private network for the FortiClient dialup client. A host on the network behind the dialup server issues an ARP request, corresponding to the device MAC address of the FortiClient host (when a remote server sends an ARP to the local FortiClient dialup client). The FortiGate then answers the ARP request on behalf of the FortiClient host, and then forwards the associated traffic to the FortiClient host through the tunnel.

Acting as a proxy prevents the VIP address assigned to the FortiClient dialup client from causing possible ARP broadcast problems—the normal and VIP addresses can confuse some network switches when two addresses have the same MAC address.

Bypassing the FortiGate and using DHCP is not recommended. Using `mode-cfg` or IPAM is preferred.

ChaCha20 and Poly1305 AEAD cipher

In IKEv2 to support RFC 7634, the ChaCha20 and Poly1305 crypto algorithms can be used together as a combined mode AEAD cipher (like AES-GCM) in the `crypto_ftnt` cipher in `cipher_chacha20poly1305.c`:

```
config vpn ipsec phase2-interface
    edit <name>
        set phase1name <name>
        set proposal chacha20poly1305
    next
end
```

AES-GCM for IKEv2 phase 1

In IKEv2 to support RFC 5282, the AEAD algorithm AES-GCM supports 128- and 256-bit variants:

```
config vpn ipsec phase2-interface
    edit <name>
        set phase1name <name>
        set proposal [aes128gcm | aes256gcm]
    next
end
```

Tunneling protocol and encapsulation

Fortinet's IPsec VPN offers the following options for tunneling and encapsulation:

- Native ESP
- UDP encapsulation
- TCP encapsulation with Fortinet proprietary extension
- TCP encapsulation using RFC 8229
- TCP encapsulation using RFC 8229 with TLS 1.3

When ESP is used without encapsulation, it connects directly over IP Protocol 50. When ESP is encapsulated within UDP, it uses UDP/500 and UDP/4500 for NAT traversal, which are the options for dialup IPsec VPN. Furthermore the port can be modified on a per-VDOM basis.

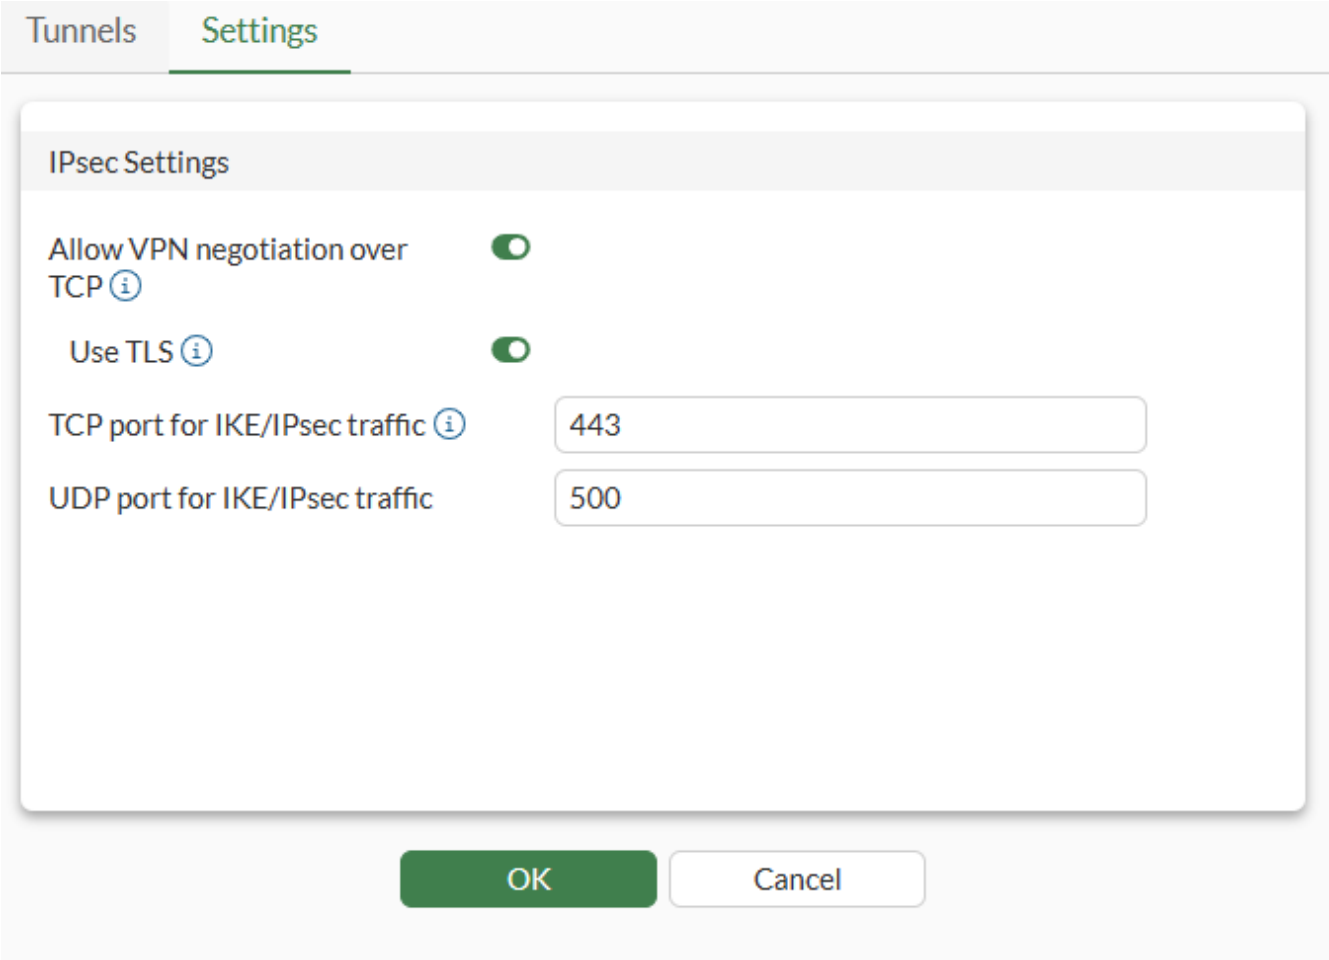
FortiGate can also operate in an Auto-transport mode where UDP will be attempted first before failing over to TCP or TCP with TLS. By default, TCP encapsulation and Auto-transport is disabled per VDOM. However, once enabled, tunnels can be changed to use Auto-transport mode.

This allows IPsec to encapsulate ESP packets within TCP and operate on TCP port 443 (default), enabling ESP packets to traverse carrier networks where direct IPsec traffic is blocked or impeded by carrier-grade NAT.

This feature requires using IKE version 2. For remote access over dialup tunnels, it also requires FortiClient 7.4.1 or later.

Tunnel and encapsulation settings

In the GUI, go to *VPN* > *VPN Tunnels* and select the *Settings* tab:



In the CLI:

```
config system settings
    set ike-tcp-service {enable | disable}
    set ike-tls-service {enable | disable}
end
```

Both settings are per-vdom settings to control whether IKE over TCP and TLS is used in VPN tunnels. These settings are disabled by default.

When `ike-tcp-service` is enabled, dialup VPNs configured in the VDOM will behave as the *Auto* transport option - transport over UDP will be preferred, but when the IKE connection cannot be made over UDP, communication will be attempted in TCP or TLS. For site-to-site VPNs, you must set the transport option to *Auto* to use TCP or TLS.

When disabled (default), dialup VPNs will not attempt to connect over TCP.

Upgrading from 7.6 and lower:

1. If a dynamic-type dialup VPN with auto or TCP transport mode exists, the `ike-tcp-service` setting is enabled for the VDOM.
2. If a static VPN with TCP transport mode exists, the `ike-tcp-service` setting is enabled for the VDOM.
3. If a static VPN with auto transport mode exists, that VPN will be changed to use transport UDP.

For more information:

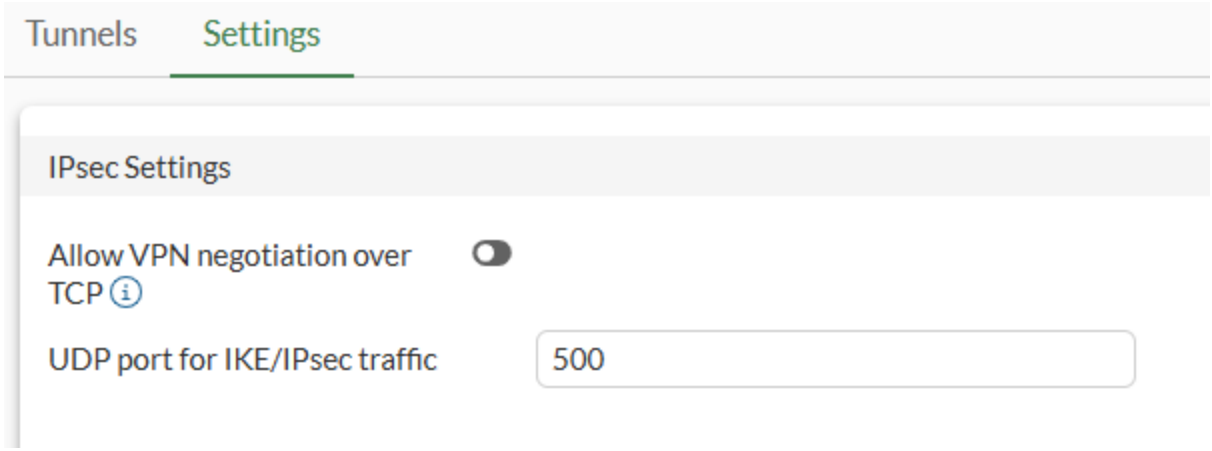
- Configurable UDP port for IKE on page 2726
- Encapsulate ESP packets within TCP headers on page 2732
- GUI warnings for IKE-TCP port conflicts on page 2735
- TLS 1.3 based VPN over TCP on page 2739

Configurable UDP port for IKE

Some ISPs block UDP port 500 or UDP port 4500, preventing an IPsec VPN from being negotiated and established. To accommodate this, the IKE port can be changed.

To set the IKE port in the GUI:

1. Go to *VPN* > *VPN Tunnels* and select the *Settings* tab.
2. Edit the *UDP port for IKE/IPsec traffic* field.



3. Click *OK*.

To set the IKE port in the CLI:

```
config system settings
    set ike-port <integer>
end
```

Command	Description
`ike-port <integer>`	UDP port for IKE/IPsec traffic (1024 - 65535, default = 500, special = 500 and 443).

Example 1: site-to-site VPN without NAT

In this example, the IKE port is set to 6000 on the two site-to-site VPN gateways. There is no NAT between the VPN gateways, but the ISP has blocked UDP port 500. A site-to-site VPN is established using the defined IKE port.

To set the IKE port:

```
config system settings
    set ike-port 6000
end
```

To configure and check the site-to-site VPN:

1. Configure the phase1 and phase2 interfaces:

```
config vpn ipsec phase1-interface
    edit "s2s"
        set interface "port27"
        set ike-version 2
        set peertype any
        set net-device disable
        set proposal aes128-sha256 aes256-sha256 aes128gcm-prfsha256 aes256gcm-prfsha384
chacha20poly1305-prfsha256
        set wizard-type static-fortigate
        set remote-gw 11.101.1.1
        set psksecret **********
    next
end
```

```
config vpn ipsec phase2-interface
    edit "s2s"
        set phase1name "s2s"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm aes256gcm
chacha20poly1305
        set src-addr-type name
        set dst-addr-type name
        set src-name "s2s_local"
        set dst-name "s2s_remote"
    next
end
```

2. Check the IKE gateway list and confirm that the specified port is used:

```
# diagnose vpn ike gateway list

vd: root/0
name: s2s
version: 2
interface: port27 17
addr: 173.1.1.1:6000 -> 11.101.1.1:6000
```

```
tun_id: 11.101.1.1
remote_location: 0.0.0.0
created: 194s ago
PPK: no
IKE SA: created 1/2  established 1/2  time 0/4500/9000 ms
IPsec SA: created 1/2  established 1/2  time 0/4500/9000 ms
...
```

3. Check the VPN tunnel list:

```
# diagnose vpn tunnel list
list all ipsec tunnel in vd 0
------------------------------------------------------
name=s2s ver=2 serial=1 173.1.1.1:6000->11.101.1.1:6000 tun_id=11.101.1.1 dst_mtu=1500 dpd-
link=on remote_location=0.0.0.0 weight=1
bound_if=17 lgwy=static/1 tun=tunnel/15 mode=auto/1 encap=none/520 options[0208]=npu frag-rfc
run_state=0 accept_traffic=1 overlay_id=0
...
```

Example 2: dialup VPN with NAT

In this example, the IKE port is set to 5000 on the VPN gateway and the dialup peer. The dialup peer is behind NAT, so NAT traversal (NAT-T) is used. The ISP blocks both UDP port 500 and UDP port 4500. The VPN connection is initiated on UDP port 5000 from the dialup VPN client and remains on port 5000 since NAT-T floating to 4500 is only required when the IKE port is 500.

To set the IKE port:

```
config system settings
    set ike-port 5000
end
```

To configure and check the dialup VPN with NAT:

1. Configure the phase1 and phase2 interfaces:

```
config vpn ipsec phase1-interface
    edit "server"
        set type dynamic
        set interface "port27"
        set ike-version 2
        set peertype any
        set net-device disable
        set proposal aes128-sha256 aes256-sha256 aes128gcm-prfsha256 aes256gcm-prfsha384
chacha20poly1305-prfsha256
        set dpd on-idle
        set wizard-type static-fortigate
        set psksecret **********
        set dpd-retryinterval 60
```

```
    next
end
```

```
config vpn ipsec phase2-interface
    edit "server"
        set phase1name "server"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm aes256gcm
chacha20poly1305
        set src-addr-type name
        set dst-addr-type name
        set src-name "server_local"
        set dst-name "server_remote"
    next
end
```

2. Check the IKE gateway list and confirm that the specified port is used:

```
# diagnose vpn ike gateway list

vd: root/0
name: server_0
version: 2
interface: port27 17
addr: 173.1.1.1:5000 -> 173.1.1.2:65416
tun_id: 173.1.1.2
remote_location: 0.0.0.0
created: 90s ago
nat: peer
PPK: no
IKE SA: created 1/1  established 1/1  time 0/0/0 ms
IPsec SA: created 1/1  established 1/1  time 0/0/0 ms
...
```

3. Check the VPN tunnel list:

```
# diagnose vpn tunnel list
list all ipsec tunnel in vd 0
------------------------------------------------------
name=server_0 ver=2 serial=a 173.1.1.1:5000->173.1.1.2:65416 tun_id=173.1.1.2 dst_mtu=1500
dpd-link=on remote_location=0.0.0.0 weight=1
bound_if=17 lgwy=static/1 tun=tunnel/15 mode=dial_inst/3 encap=none/904 options[0388]=npu
rgwy-chg rport-chg frag-rfc  run_state=0 accept_traffic=1 overlay_id=0
...
```

Example 3: UDP port 443 for dialup IPsec VPN

This example demonstrates a simple VPN configuration utilizing IKEv2 over UDP/443 between a Dialup VPN Gateway (FGTD) and a VPN Client (FGTA) where both ends utilize UDP/443 for IKEv2 negotiations.

To configure the hub FortiGate, FGTD:

1. Configure the IKE port:

```
config system settings
    set ike-port 443
end
```

2. Configure an IPSec VPN tunnel:

```
config vpn ipsec phase1-interface
    edit "tofgta"
        set type dynamic
        set interface "port13"
        set ike-version 2
        set peertype any
        set net-device disable
        set proposal aes128-sha256 aes256-sha256 aes128gcm-prfsha256 aes256gcm-prfsha384
chacha20poly1305-prfsha256
        set dhgrp 20 21
        set transport auto
        set psksecret <password>
    next
end
```

```
config vpn ipsec phase2-interface
    edit "tofgta"
        set phase1name "tofgta"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm aes256gcm
chacha20poly1305
        set dhgrp 20 21
    next
end
```

3. Configure a firewall policy:

```
config firewall policy
    edit 1
        set srcintf "any"
        set dstintf "any"
        set action accept
        set srcaddr "all"
        set dstaddr "all"
        set srcaddr6 "all"
        set dstaddr6 "all"
        set schedule "always"
        set service "ALL"
    next
end
```

To configure the spoke FortiGate, FGTA:

1. Configure the IKE port:

```
config system settings
    set ike-port 443
end
```

2. Configure an IPSec VPN tunnel:

```
config vpn ipsec phase1-interface
    edit "tofgtd"
        set interface "port9"
        set ike-version 2
        set peertype any
        set net-device disable
        set proposal aes128-sha256 aes256-sha256 aes128gcm-prfsha256 aes256gcm-prfsha384
chacha20poly1305-prfsha256
        set dhgrp 20 21
        set transport auto
        set remote-gw 173.1.1.1
        set psksecret <password>
    next
end
```

```
config vpn ipsec phase2-interface
    edit "tofgtd"
        set phase1name "tofgtd"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm aes256gcm
chacha20poly1305
        set dhgrp 20 21
    next
end
```

3. Configure a firewall policy:

```
config firewall policy
    edit 1
        set srcintf "any"
        set dstintf "any"
        set action accept
        set srcaddr "all"
        set dstaddr "all"
        set srcaddr6 "all"
        set dstaddr6 "all"
        set schedule "always"
        set service "ALL"
    next
end
```

To verify the IPsec VPN tunnel status:

Note that `addr` shows the UDP custom port value and `transport` shows `UDP`.

```
# diagnose vpn ike gateway list
vd: root/0

Encapsulate ESP packets within TCP headers

FortiOS supports encapsulation of IKE and ESP packets within Transmission Control Protocol (TCP) headers, in accordance with RFC 8229. This allows IKE & ESP packets to be assigned a TCP port number that enables them to traverse over carrier networks where direct IPsec traffic is blocked or impeded by carrier-grade NAT. This standards-based TCP encapsulation method is also supported across multiple vendors, ensuring that you can maintain a secure and efficient network, while also having the flexibility to choose the hardware that aligns best with your requirements.

This feature only works with IKE version 2, and it does not support ADVPN or NPU offloading.

You can choose between a standards-based (RFC 8229) or Fortinet-proprietary method to encapsulate IKE and ESP traffic within TCP headers. This table compares the encapsulation methods. Using the standards-based method is recommended.

Encapsulation method	Dialup IPsec VPN using FortiClient	IPsec VPN between FortiGate to FortiGate	IPsec VPN between FortiGate and 3rd party device	Support TLS 1.3
RFC 8229 compliant (`fortinet-esp` disabled)	Supported. For example, see Dialup IPsec VPN using custom TCP port on page 3023.	Supported.	Supported.	Yes. See TLS 1.3 based VPN over TCP on page 2739.
Fortinet propriety (`fortinet-esp` enabled)	Not supported	Supported. See VPN over TCP with Fortinet proprietary encapsulation on page 2828.	Not supported	No

To configure TCP encapsulation for IPsec VPN:

1. Go to *VPN > VPN Tunnels* and select the *Settings* tab.
2. Enable *Allow VPN negotiation over TCP*.
3. Optionally, enable *TCP*.
4. Optionally, change the *TCP port*.
5. Click *OK*.

To configure TCP encapsulation for IPsec VPN in the CLI:

```
config system settings
    set ike-tcp-service {enable | disable}
    set ike-tls-service {enable | disable}
    set ike-tcp-port <port>
end
```

Command	Description
`ike-tcp-service {enable | disable}`	Enable/disable the use of TCP transport for IKE and ESP. Disabled by default. This is a per-VDOM setting
`ike-tls-service {enable | disable}`	When ike-tcp-service is enabled, enable/disable the use of TLS 1.3
`ike-tcp-port <port>`	Set the TCP port for IKE/IPsec traffic (1 - 65535, default = 443). By default, IKE listens on port 4500 when ike-tcp-port is configured as 4500. If ike-tcp-port is configured on any other port, the IKE daemon listens on port 4500 and port 11443 while traffic enters on the ike-tcp-port and redirects to port 11443

```
config vpn ipsec phase1-interface
    edit <name>
        set ike-version 2
        set transport {auto | udp}
        set fortinet-esp {enable | disable}
    next
end
```

Command	Description
`transport {auto | udp}`	This setting is only available in a site-to-site VPN configuration (type is either static or ddns). Set the IKE transport protocol: • `auto`: use UDP transport for IKE and ESP, with automatic fallback to TCP transport if UDP attempt fails for timeout threshold. • `udp`: use UDP transport for IKE and ESP only.
`fortinet-esp {enable | disable}`	The Fortinet propriety feature is designed to offload IPsec VPN traffic to Fortinet's NP (Network Processor) ASICs to improve performance. This command enables or disables encapsulation of ESP (Encapsulating Security Payload) packets within non-standard TCP headers. • `disable`: Encapsulates ESP packets using standard TCP headers. This is the default option. • `enable`: Encapsulates ESP packets using non-standard TCP headers. This feature is not supported in the following scenarios: • When FortiGate is configured as Dialup IPsec VPN server for remote access when using FortiClient as dialup client. • In multi-vendor environments that use TCP encapsulation for ESP packets. Make sure that this setting is disabled for these two scenarios to ensure uninterrupted ESP packet flow encapsulated within standard TCP headers.

When using TCP port 443 for IKE/IPsec traffic, GUI access can be affected for interfaces that are bound to an IPsec tunnel when the GUI admin port is also using port 443. To ensure continued functionality, change either the IKE/IPsec port or the administrative access port. See GUI warnings for IKE-TCP port conflicts on page 2735.

To change the administrative access port:

```
config system global
    set admin-sport <port>
end
```

`admin-sport <port>`	Set the administrative access port for HTTPS (1 - 65535, default = 443).

For port conflicts with ZTNA and Agentless VPN, ZTNA and Agentless VPN will take precedence. To avoid any port conflicts with other services, review the FortiOS Ports guide for other incoming ports used on the FortiGate.

GUI warnings for IKE-TCP port conflicts

TCP port 443 is used by default when TCP over VPN is enabled to encapsulate ESP packets within TCP headers.

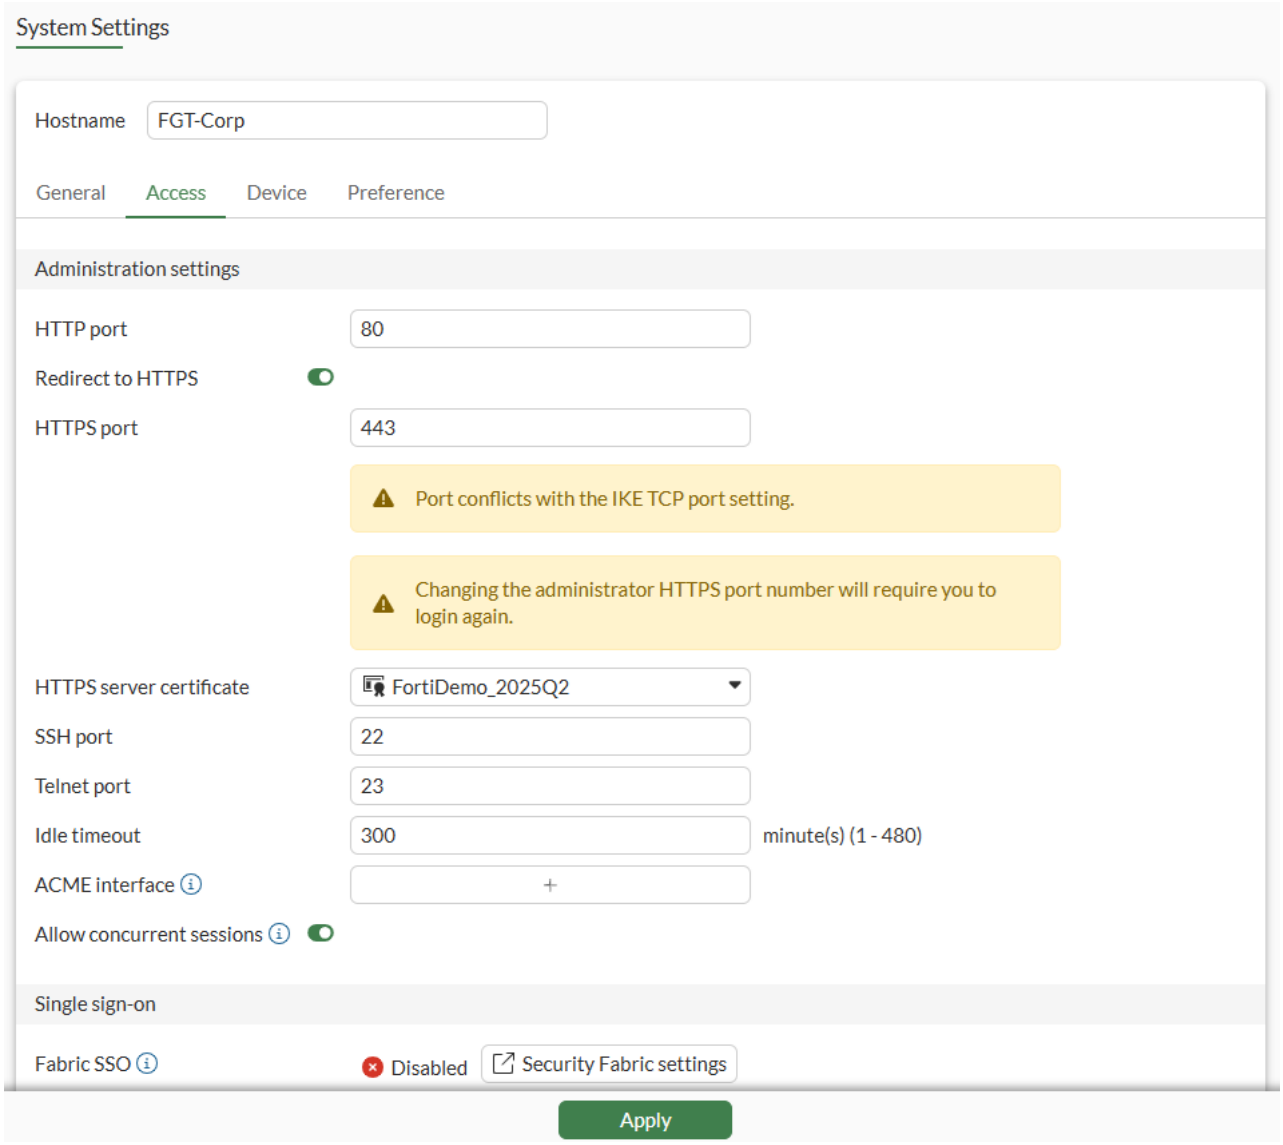
If administrators assign port 443 for HTTPS administrative access on an interface that is also bound to an IPsec tunnel, FortiOS will display a warning indicating that HTTPS access on that port will no longer be available. This is because port 443 is also used for IKE over TCP, and in such cases, IKE takes precedence over HTTPS, resulting in the loss of GUI access on that interface.

The default IKE-TCP value of port 443 is only applicable to new FortiGate configurations with FortiOS 7.6.1 and above. If FortiOS is upgraded to 7.6.1 and above, the `ike-tcp-port` value from before the upgrade is retained.

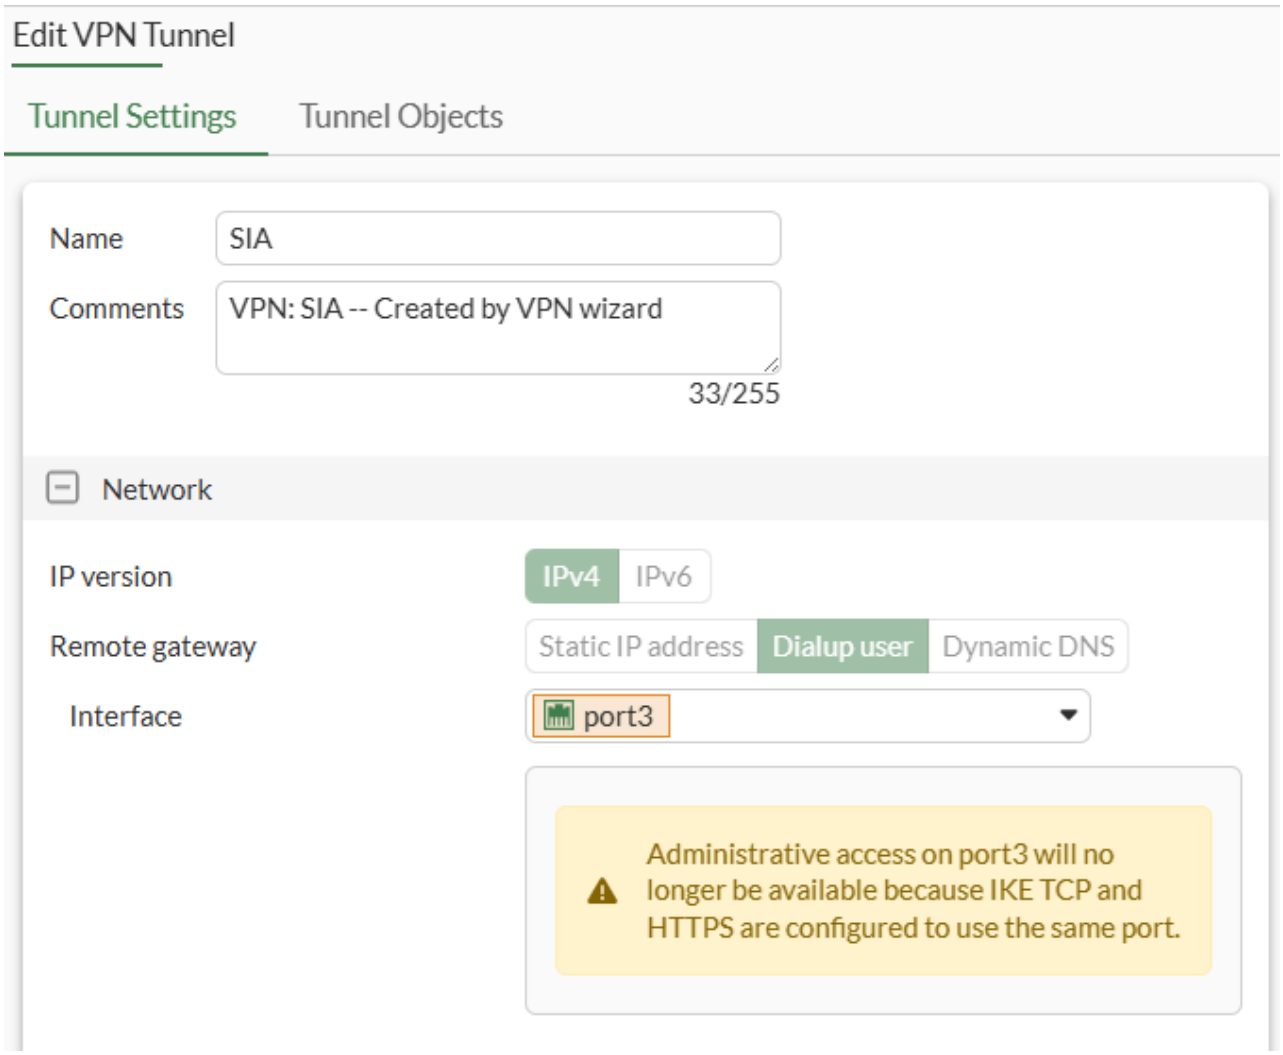
Furthermore, by default IKE listens on port 4500 when `ike-tcp-port` is configured as 4500. If `ike-tcp-port` is configured on any other port, the IKE daemon listens on port 4500 and port 11443 while traffic enters on the `ike-tcp-port` and redirects to port 11443. Therefore, when the `ike-tcp-port` is set to 443 by default, do not use port 443, 11443, or 4500 for HTTPS GUI access.

Warnings that may appear include the following:

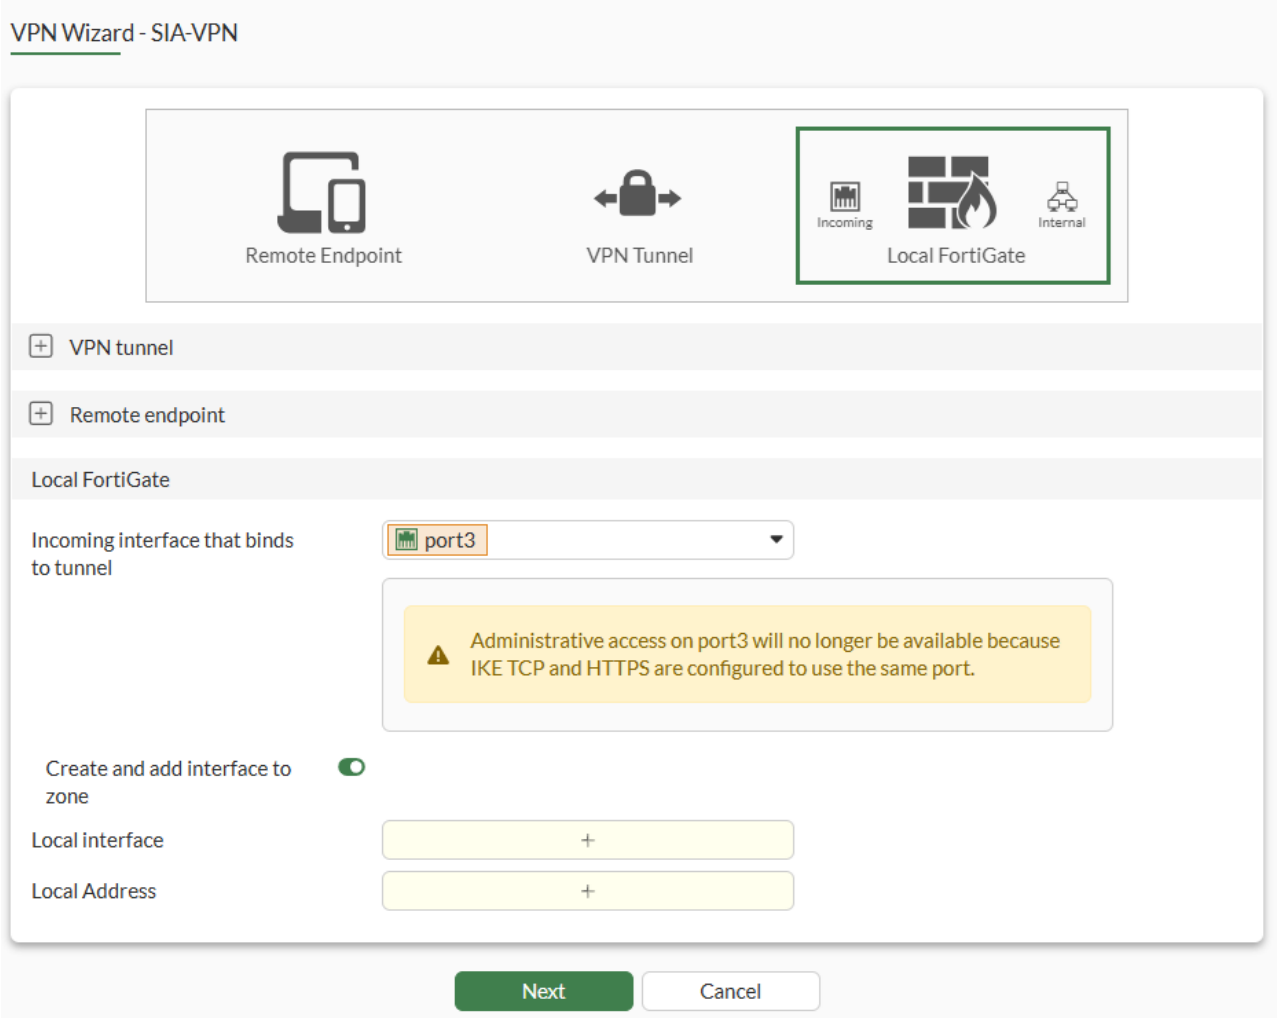
- In *System* > *Settings* > *Access*, a warning is displayed for the *Administrator Settings* > *HTTPS port* field when the entered HTTPS port conflicts with the IKE-TCP port. This happens even if *Allow VPN negotiation over TCP* is disabled.



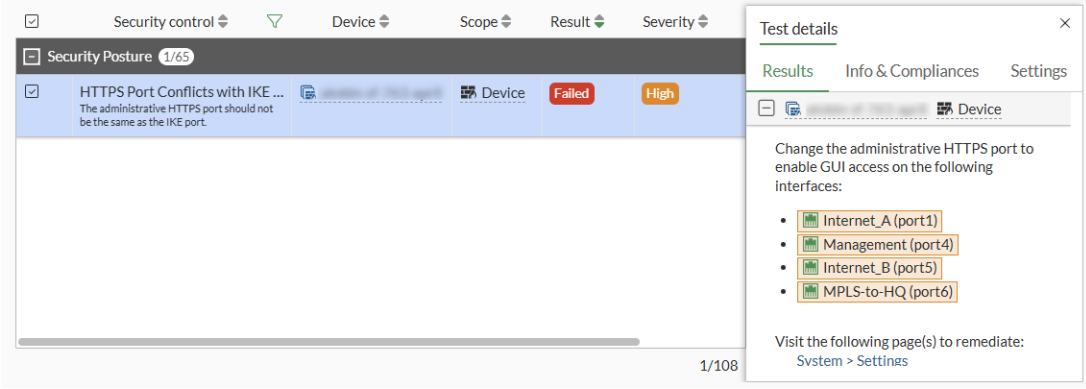
- In *VPN* > *VPN Tunnels*, a warning is displayed for the *Network* > *Interface* field when the HTTPS port conflicts with IKE-TCP port and the selected port has HTTPS allow access.



- In *VPN > VPN Wizard*, a warning is displayed in the *Local FortiGate* configuration page where *Incoming interface that binds to tunnel* field has a port conflicts with IKE-TCP port and the selected port has HTTPS allow access.



- In *Security Fabric > Security Rating*, a *Security Posture* failure is flagged for the *HTTPS Port Conflict with IKE Port* check, indicating a configuration issue. Likewise, a *Security Ratings Insights* recommendation is listed. This occurs when the HTTPS port conflicts with the IKE port when a tunnel is configured and TCP over VPN is enabled.



TLS 1.3 based VPN over TCP

IKE based VPN tunnels can be configured to be ESP, UDP or TCP based. When TCP is used as the transport protocol, IKE and ESP packets are encapsulated in TCP in the port that you specified.

In this enhancement, TLS 1.3 is added as an option for VPN over TCP. The TLS option can be selected when *Allow VPN negotiation over TCP* is enabled in the *VPN > VPN Tunnels > Settings* page. With TLS enabled, IKE and ESP traffic are transported over TLS.

This option is supported for Site-to-Site and Dial-up VPN between FortiGates. FortiClient endpoints do not currently support TLS based VPN over TCP.

For information about configurations and usage, see Tunnel and encapsulation settings on page 2725.

Example

An IKEv2 over TLS 1.3 VPN tunnel is formed between a VPN Client (FGTA) and a dialup VPN Gateway (FGTD).

To configure the hub FortiGate, FGTD, in the GUI:

1. Go to *VPN > VPN Tunnels* and select the *Settings* tab.
2. Enable *Allow VPN negotiation over TCP*.
3. Enable *Use TLS*.
4. Click *OK*.
5. Go to *VPN > VPN Tunnels*, select the *Tunnels* tab, and click *Create new > Custom IPsec tunnel*.
6. Configure the following settings:

Field	Value
Name	tofgta
Remote gateway	Dialup user
Interface	port13
Authentication Method	Signature
Certificate name	Select your certificate
IKE	Version 2 (default)

7. In the *Phase 2 selectors* table, click *Create New* and configure the following:

Field	Value
Name	tofgta
Encryption – authentication	Remove all SHA1 based entries

8. Click *OK* to save the phase 2 selector.
9. Click *OK* to save the tunnel.
10. Create firewall policies to allow traffic from *tofgta* to a protected network, and to allow traffic from a protected network to *tofgta*.

To configure the hub FortiGate, FGTD, in the CLI:

```
config system settings
    set ike-tcp-service enable
    set ike-tls-service enable
end
```

```
config vpn ipsec phase1-interface
    edit "tofgta"
        set type dynamic
        set interface "port13"
        set ike-version 2
        set authmethod signature
        set peertype any
        set net-device disable
        set proposal aes128-sha256 aes256-sha256 aes128gcm-prfsha256 aes256gcm-prfsha384
chacha20poly1305-prfsha256
        set dhgrp 20 21
        set certificate "test1"
    next
end
```

```
config vpn ipsec phase2-interface
    edit "tofgta"
        set phase1name "tofgta"
        set proposal aes128-sha256 aes256-sha256 aes128gcm aes256gcm chacha20poly1305
        set dhgrp 20 21
    next
end
```

```
config firewall policy
    edit 1
        set srcintf "port2"
        set dstintf "tofgta"
        set action accept
        set srcaddr "192.168.5.0"
        set dstaddr "10.1.100.0"
        set schedule "always"
        set service "ALL"
    next
    edit 2
        set srcintf "tofgta"
        set dstintf "port2"
        set action accept
        set srcaddr "10.1.100.0"
        set dstaddr "192.168.5.0"
```

```
        set schedule "always"
        set service "ALL"
    next
end
```

To configure the dialup client FortiGate, FGTA, on the GUI:

1. Go to *VPN* > *VPN Tunnels* and select the *Settings* tab.
2. Enable *Allow VPN negotiation over TCP*.
3. Enable *Use TLS*.
4. Click *OK*.
5. Go to *VPN* > *VPN Tunnels*, select the *Tunnels* tab, and click *Create new* > *Custom IPsec tunnel*.
6. Configure the following settings:

Field	Value
Name	tofgtd
Remote gateway	Static IP address
IP address	173.1.1.1
Interface	port9
Transport	Auto
Authentication Method	Signature
Certificate name	Select your certificate
IKE	Version 2 (default)

7. In the *Phase 2 selectors* table, click *Create New* and configure the following:

Field	Value
Name	tofgtd
Encryption – authentication	Remove all SHA1 based entries

8. Click *OK* to save the phase 2 selector.
9. Click *OK* to save the tunnel.
10. Create firewall policies to allow traffic from *tofgtd* to a protected network, and to allow traffic from a protected network to *tofgtd*.

To configure the dialup client FortiGate, FGTA, on the CLI:

```
config system settings
    set ike-tcp-service enable
    set ike-tls-service enable
end
```

```
config vpn ipsec phase1-interface
    edit "tofgtd"
        set interface "port9"
        set ike-version 2
        set authmethod signature
        set peertype any
        set net-device disable
        set proposal aes128-sha256 aes256-sha256 aes128gcm-prfsha256 aes256gcm-prfsha384
chacha20poly1305-prfsha256
        set dhgrp 20 21
        set transport auto
        set remote-gw 173.1.1.1
        set certificate "test3"
    next
end
```

```
config vpn ipsec phase2-interface
    edit "tofgtd"
        set phase1name "tofgtd"
        set proposal aes128-sha256 aes256-sha256 aes128gcm aes256gcm chacha20poly1305
        set dhgrp 20 21
    next
end
```

```
config firewall policy
    edit 1
        set srcintf "port2"
        set dstintf "tofgtd"
        set action accept
        set srcaddr "10.1.100.0"
        set dstaddr "192.168.5.0"
        set schedule "always"
        set service "ALL"
    next
    edit 2
        set srcintf "tofgtd"
        set dstintf "port2"
        set action accept
        set srcaddr "192.168.5.0"
        set dstaddr "10.1.100.0"
        set schedule "always"
        set service "ALL"
    next
end
```

Verification

When the tunnel is established, run the following debugs on FGTA to verify:

```
# diagnose vpn ike gateway list
```

```
vd: root/0
name: tofgtd
version: 2
interface: port9 15

Post-Quantum readiness

- IPsec key retrieval with a QKD system on page 2744
- Post-Quantum Cryptography for IPsec key exchange on page 2749
- Applying hybrid QKD and PQC in IPsec key establishment on page 2757

IPsec key retrieval with a QKD system

FortiGates support IPsec key retrieval with a quantum key distribution (QKD) system using the ETSI standardized API. A QKD server, which is also referred to as Key Management Entity (KME) or Key Management Server (KMS) is responsible for delivering quantum-generated cryptographic keys for FortiGate to use in IKE SAs.

This eliminates the Key Exchange and negotiation process by delivering keys directly for use for the IPSec SA (Security Association). This has the advantage of being quantum-safe, no longer depending on the DH key exchange, higher entropy and more resilience in case IKE negotiations is compromised. This also enhances efficiency in IPsec key management.

```
config vpn qkd
    edit <name>
        set server <string>
        set port <integer>
        set id <string>
        set peer <string>
        set certificate <certificate_name>
```

```
    next
end
```

`server <string>`	Enter the IPv4, IPv6, or DNS address of the key management entity (KME).
`port <integer>`	Enter the port to connect to on the KME, 1 - 65535.
`id <string>`	Enter the quantum key distribution ID assigned by the KME.
`peer <string>`	Enter the peer or peer group to authenticate with the quantum key device's certificate.
`certificate <certificate_name>`	Enter the name of up to four certificates to offer to the KME.

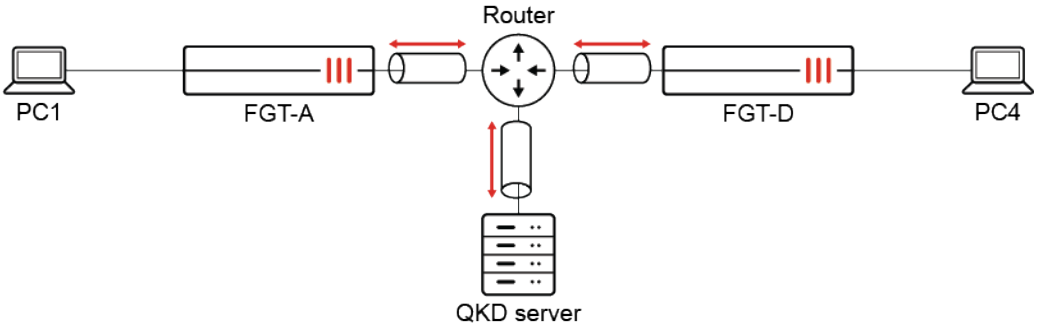
```
config ipsec phase1-interface
    edit <name>
        set qkd {disable | allow | require}
        set qkd-profile <profile>
    next
end
```

`qkd {disable | allow | require}`	• `disable`: Do not use QKD server. • `allow`: Allowed but does not require the use of QKD server. • `require`: Requires the use of QKD server.
`qkd-profile <profile>`	Name of the profile created from `config vpn qkd`.

When QKD is enabled, PFS (Perfect Forward Secrecy) is disabled, and DH Group cannot be configured in Phase 2.

Example

In this example, a quantum key distribution (QKD) system is deployed to perform central IPsec key management. The FortiGates installed as security gateways will terminate large amount of IPsec tunnels.



To configure IPsec key retrieval with a QKD system:

1. Configure FGT-A:
   a. Configure the QKD profile:

```
config vpn qkd
    edit "qkd_1"
        set server "172.16.200.83"
        set port 8989
        set id "FGT-A"
        set peer "qkd"
        set certificate "FGT_qkd1"
    next
end
```

   b. Configure the IPsec phase 1 interface settings:

```
config vpn ipsec phase1-interface
    edit "site1"
        set interface "wan1"
        set peertype any
        set net-device disable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set qkd allow
        set qkd-profile "qkd_1"
        set remote-gw 173.1.1.1
        set psksecret **********
    next
end
```

   c. Configure the IPsec phase 2 interface settings:

```
config vpn ipsec phase2-interface
    edit "site1"
        set phase1name "site1"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
aes256gcm chacha20poly1305
    next
end
```

2. Configure FGT-D:
   a. Configure the QKD profile:

```
config vpn qkd
    edit "qkd_1"
        set server "172.16.200.83"
        set port 8989
        set id "FGT-D"
        set peer "qkd"
        set certificate "FGT_qkd3"
    next
end
```

b. Configure the IPsec phase 1 interface settings:

```
config vpn ipsec phase1-interface
    edit "site2"
        set interface "port25"
        set peertype any
        set net-device disable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set qkd require
        set qkd-profile "qkd_1"
        set remote-gw 11.101.1.1
        set psksecret **********
    next
end
```

c. Configure the IPsec phase 2 interface settings:

```
config vpn ipsec phase2-interface
    edit "site2"
        set phase1name "site2"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
aes256gcm chacha20poly1305
    next
end
```

To verify the configuration:

1. Generate traffic between PC1 and PC4.
2. Run diagnostics on FGT-A:
   a. Verify the IPsec phase 1 interface status:

```
# diagnose vpn ike gateway list

vd: root/0
name: site1
version: 1
interface: wan1 17
addr: 11.101.1.1:500 -> 173.1.1.1:500
tun_id: 172.16.200.4/::172.16.200.4
remote_location: 0.0.0.0
network-id: 0
transport: UDP
created: 3s ago
peer-id: 173.1.1.1
peer-id-auth: no
IKE SA: created 1/1  established 1/1  time 0/0/0 ms
IPsec SA: created 1/1  established 1/1  time 30/30/30 ms

  id/spi: 21 ad7d995677250c7e/053f958ea7be66c8
  direction: initiator
  status: established 3-3s ago = 0ms
  proposal: aes128-sha256
```

```
  key: 5b198e1a431c20fb-c08135cf0c007704
  QKD: yes
  lifetime/rekey: 86400/86096
  DPD sent/recv: 00000000/00000000
  peer-id: 173.1.1.1
```

b. Verify the IPsec phase 2 tunnel status:

```
# diagnose vpn tunnel list
list all ipsec tunnel in vd 0
------------------------------------------------------
name=site1 ver=1 serial=2 11.101.1.1:0->173.1.1.1:0 tun_id=172.16.200.4 tun_
id6=::172.16.200.4 dst_mtu=1500 dpd-link=on weight=1
bound_if=17 lgwy=static/1 tun=intf mode=auto/1 encap=none/552 options[0228]=npu frag-rfc
run_state=0 role=primary accept_traffic=1 overlay_id=0

proxyid_num=1 child_num=0 refcnt=4 ilast=12 olast=11 ad=/0
stat: rxp=1 txp=2 rxb=84 txb=168
dpd: mode=on-demand on=1 idle=20000ms retry=3 count=0 seqno=0
natt: mode=none draft=0 interval=0 remote_port=0
fec: egress=0 ingress=0
proxyid=site1 proto=0 sa=1 ref=3 serial=2
  src: 0:0.0.0.0-255.255.255.255:0
  dst: 0:0.0.0.0-255.255.255.255:0
  SA:  ref=6 options=10226 type=00 soft=0 mtu=1438 expire=42883/0B replaywin=2048
       seqno=3 esn=0 replaywin_lastseq=00000002 qat=0 rekey=0 hash_search_len=1
  life: type=01 bytes=0/0 timeout=42897/43200
  dec: spi=b2af532f esp=aes key=16 c1d5d17e6bdecd5b145f672a5054cde1
       ah=sha1 key=20 084f1c0fee48994f59a125606f9c757838dc2421
  enc: spi=3d14392a esp=aes key=16 66277c8cf2bdbd2d12a9d829dde356ad
       ah=sha1 key=20 fdbaa42cca5c3a9bffb1cf0fc74ff29a643a2b9f
  dec:pkts/bytes=1/84, enc:pkts/bytes=2/304
  npu_flag=03 npu_rgwy=173.1.1.1 npu_lgwy=11.101.1.1 npu_selid=4 dec_npuid=2 enc_npuid=2
```

The IPsec tunnel is up and traffic passes through.

c. Verify the IKE debug messages:

```
# diagnose debug application ike -1
...
ike V=root:0:site1:site1: IPsec SA connect 17 11.101.1.1->173.1.1.1:0
ike V=root:0:site1:site1: using existing connection
ike V=root:0:site1:site1: config found
ike V=root:0:site1:site1: IPsec SA connect 17 11.101.1.1->173.1.1.1:500 negotiating
ike 0:site1:20:site1:22: QKD initiator request
ike 0:site1:20:site1:22: QKD initiator key-id '4e0592fe-9568-11ee-97b8-5fb93000b0c2'
...
ike V=root:0:site1:20:site1:22: add IPsec SA: SPIs=b2af532d/3d143928
ike 0:site1:20:site1:22: IPsec SA dec spi b2af532d key 16:958EE561ABD2B6F0F4C6E042202F451E

```

Post-Quantum Cryptography for IPsec key exchange

IPsec key exchange supports Post-Quantum Cryptography (PQC) to enhance security with algorithms that protect against quantum computer attacks. This update ensures future-proof encryption and addresses vulnerabilities in traditional methods, aligning with upcoming security standards.

PQC in IPsec applies Hybrid Key Exchange per RFC 9370, which extends IKEv2 to perform multiple key exchanges in a single IKE SA establishment. It uses the IKE_INTERMEDIATE exchange from RFC 9242 to carry extra Key Exchanges (KEs) during initial SA setup. And it uses IKE_FOLLOWUP_KE for additional key exchanges when rekeying the IKE SA or creating additional child SAs in IKEv2 Phase 2.

In addition to the classic DH key exchange, one or more post quantum Key Exchange Mechanisms (KEMs), such as ML KEM (Kyber), BIKE, HQC and FRODO are supported. When configuring Phase1 VPN settings, choose up to three KE groups in each round of additional key exchanges. Choose up to seven rounds of additional key exchanges (for example, ADDKE1, ADDKE2, and so on).

While FortiOS allows users to specify various KE groups and mechanisms, only the following KE groups are standardized by NIST and are FIPS 203 compliant:

- ML-KEM-512
- ML-KEM-768
- ML-KEM-1024

FIPS 203, also known as the Module-Lattice-Based Key-Encapsulation Mechanism (ML-KEM) Standard, is a set of guidelines established by the National Institute of Standards and Technology (NIST). These guidelines specify the use of lattice-based cryptographic algorithms for key encapsulation mechanisms, which are crucial for secure communication in various applications.

The three parameter sets offer different levels of security and performance:

ML-KEM-512	Provides a balance between security and efficiency, suitable for environments where moderate security is sufficient.
ML-KEM-768	Offers a higher level of security compared to ML-KEM-512, making it suitable for more sensitive applications.
ML-KEM-1024	Delivers the highest level of security among the three, ideal for highly sensitive data and critical applications.

See FIPS203 and Module-Lattice-Based Key-Encapsulation Mechanism Standard for more information.

CLI configuration

The following commands can be used to enable and configure PQC:

```
config vpn ipsec phase1-interface
    edit <name>
        set addke1 <option1>, <option2>, <option3>
        set addke2 <option1>, <option2>, <option3>
        set addke3 <option1>, <option2>, <option3>
        set addke4 <option1>, <option2>, <option3>
        set addke5 <option1>, <option2>, <option3>
        set addke6 <option1>, <option2>, <option3>
        set addke7 <option1>, <option2>, <option3>
        set childless-ike enable
    next
end
config vpn ipsec phase2-interface
    edit <name>
        set addke1 <option1>, <option2>, <option3>
```

```
        set addke2 <option1>, <option2>, <option3>
        set addke3 <option1>, <option2>, <option3>
        set addke4 <option1>, <option2>, <option3>
        set addke5 <option1>, <option2>, <option3>
        set addke6 <option1>, <option2>, <option3>
        set addke7 <option1>, <option2>, <option3>
    next
end
```

Example

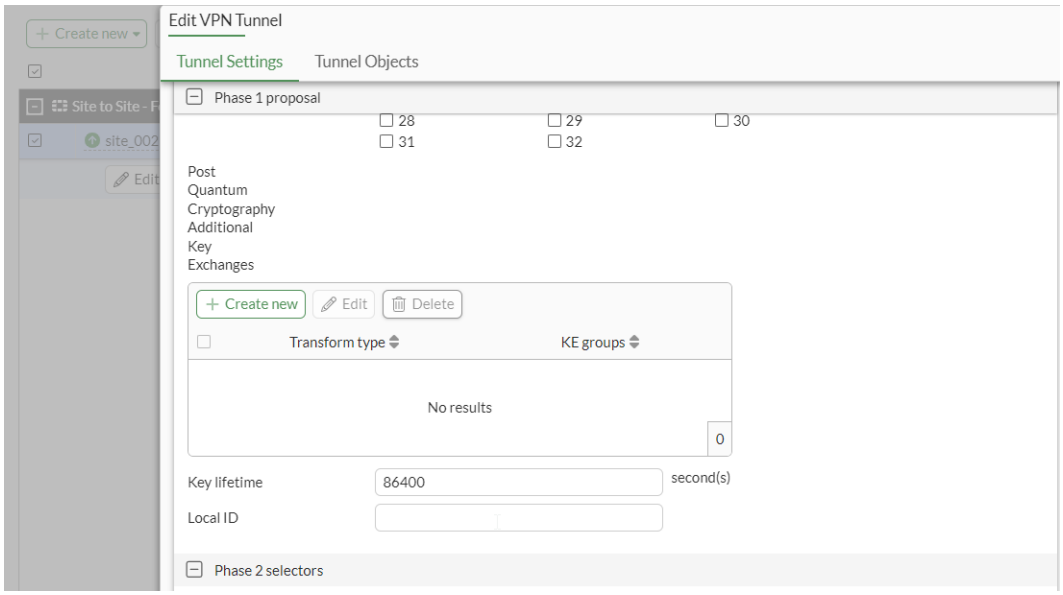
A financial institution uses IPsec VPN to move sensitive customer data, such as account numbers, social insurance numbers, and credit card information. The current encryption used is based on traditional algorithms, which could be vulnerable to attacks from quantum computers in the future. By implementing Post-Quantum Cryptography, the financial institution can ensure that their data remains secure even as technology advances, protecting themselves and their customers from potential breaches due to advancements in computing power. This ensures compliance with regulatory requirements and maintains customer trust.

To enable PQC in the GUI:

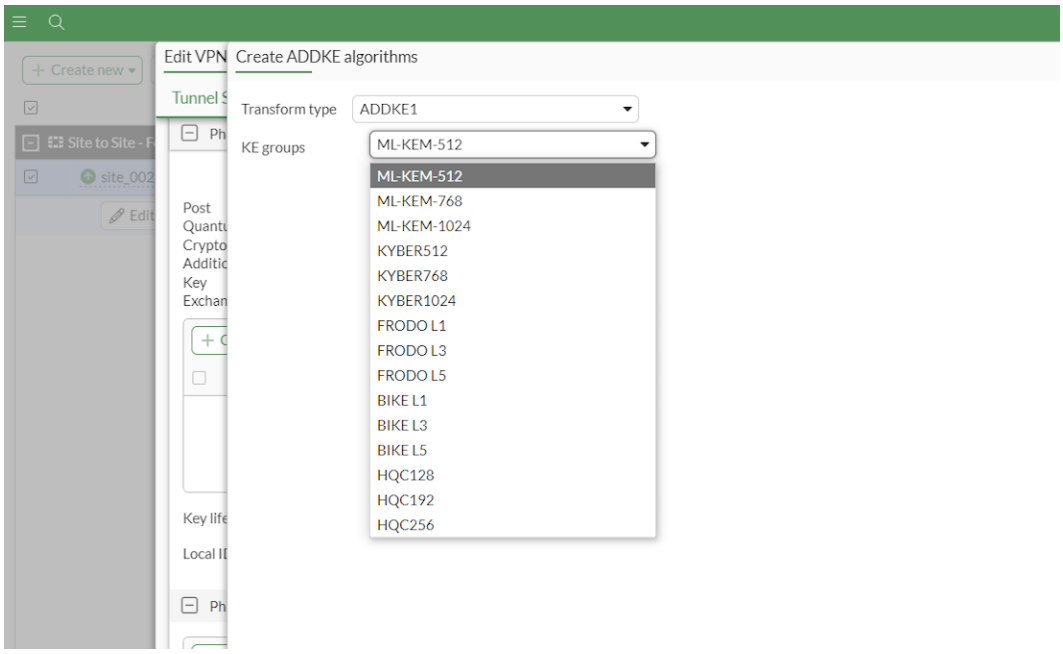
> This is a site-to-site VPN setup. Only the new configuration is being demonstrated in the GUI for this example. For more information, see Basic site-to-site VPN with pre-shared key on page 2780.

1. Go to *VPN* > *VPN Tunnels*.

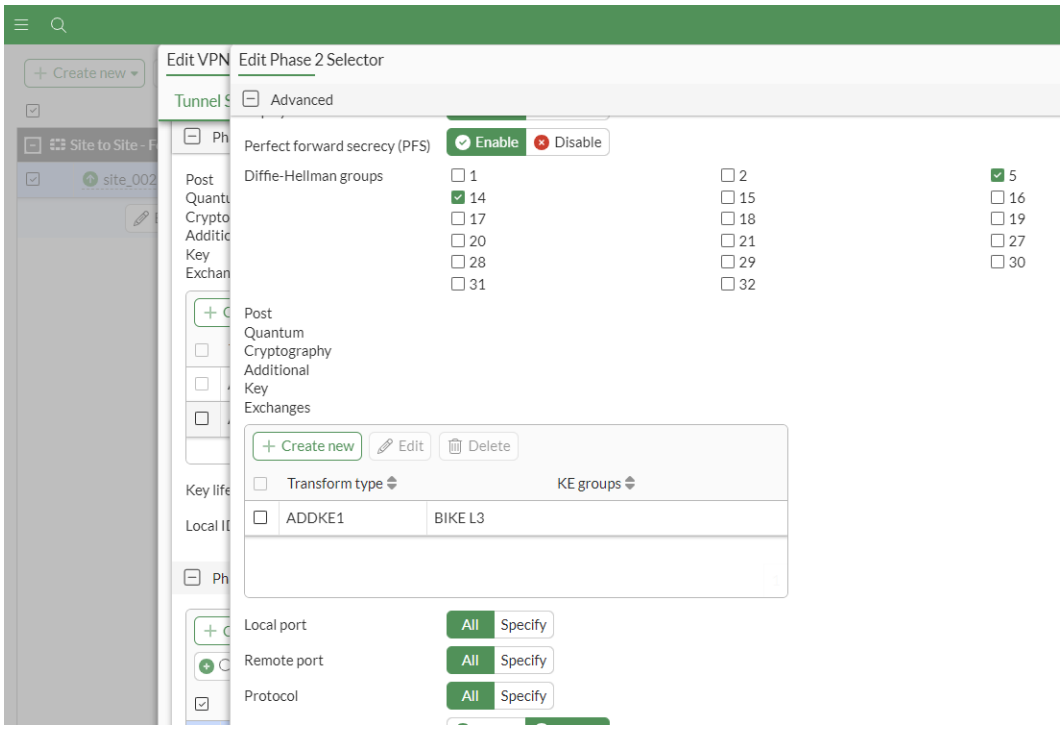
2. Double-click the VPN Tunnel to open it for editing.
3. Scroll down to *Post Quantum Cryptography Additional Key Exchanges*, and click *Create new*.



4. Set *Transform type*. Each transform type represents an additional round of KE exchange in addition to the DH group Key Exchange. A total of seven transform types can be created.
5. For each *Transform type*, select up to three *KE groups*, and click *OK*.



6. In *Phase 2 selectors*, click *Create new* and repeat the steps above.



7. Click *OK* to save the tunnel.

To enable PQC key exchange for an IPsec tunnel in the CLI:

1. Configure FGT-C:

```
config vpn ipsec phase1-interface
    edit "site_002"
        set interface "port1"
        set ike-version 2
        set peertype any
        set net-device disable
        set proposal aes128-sha256 aes256-sha256 aes128gcm-prfsha256 aes256gcm-prfsha384
chacha20poly1305-prfsha256
        set addke1 35 36 37
        set addke2 1083
        set childless-ike enable
        set transport auto
        set remote-gw 172.16.200.9
        set psksecret XXXXXX
    next
end
config vpn ipsec phase2-interface
    edit "site_002"
        set phase1name "site_002"
        set addke1 1090
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm aes256gcm
chacha20poly1305
```

```
   next
end
```

2. Configure FGT-D:

```
config vpn ipsec phase1-interface
    edit "site_001"
        set interface "port1"
        set ike-version 2
        set peertype any
        set net-device disable
        set proposal aes128-sha256 aes256-sha256 aes128gcm-prfsha256 aes256gcm-prfsha384
chacha20poly1305-prfsha256
        set addke1 35 36 37
        set addke2 1083
        set childless-ike enable
        set transport auto
        set remote-gw 172.16.200.8
        set psksecret XXXXXX
    next
end
config vpn ipsec phase2-interface
    edit "site_001"
        set phase1name "site_001"
        set addke1 1090
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm aes256gcm
chacha20poly1305
    next
end
```

3. Verify the IPsec VPN tunnel state on FGT-D:

```
#diagnose vpn ike gateway list

vd: root/0
name: site_001PPPPPP1
version: 2
interface: port1 9
addr: 172.16.200.9:500 -> 172.16.200.8:500
tun_id: 172.16.200.8/::172.16.200.8
remote_location: 0.0.0.0
network-id: 0
transport: UDP
created: 88s ago
peer-id: 172.16.200.8
peer-id-auth: no
pending-queue: 0
PPK: no
IKE SA: created 1/1  established 1/1  time 0/0/0 ms
IPsec SA: created 1/1  established 1/1  time 0/0/0 ms

  id/spi: 111 7316ebc639a46c4b/4be2fd15d7304333
```

```
  direction: responder
  status: established 88-88s ago = 0ms
  proposal: aes128-sha256

Applying hybrid QKD and PQC in IPsec key establishment

Independently, Quantum Key Distribution (IPsec key retrieval with a QKD system) and Post-Quantum Cryptography (Post-Quantum Cryptography for IPsec key exchange) can be used to secure the IPsec tunnel against future quantum threats. Together, FortiGate also supports the hybrid approach of applying QKD and PQC and Diffie-Heiman Exchange (DHE) together.

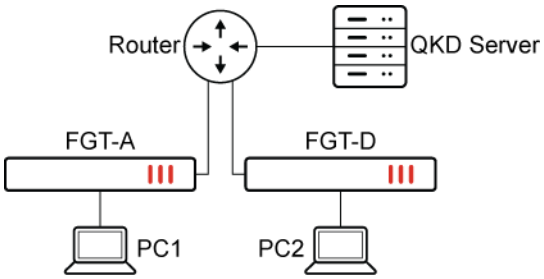
This allows you to mix keys from QKD, PQC, and traditional Diffie-Hellman (DH) key exchange in establishing the IKE SA and IPsec SA, ensuring robust security and defense-in-depth. By combining different types of keys, users can achieve maximum resilience against potential threats.

This feature can be used in environments handling highly sensitive data, necessitating the highest level of security. For example, a financial institution might use this feature in its network infrastructure to secure communications between different system components. This ensures that even if one key exchange method is compromised, the other methods will still provide secure communication.

```
config ipsec phase1-interface
    edit <name>
        set qkd {disable | allow | require}
        set qkd-profile <profile>
        set qkd-hybrid {disable | allow | require}
    next
end
```

`qkd-hybrid {disable | allow | require}`	• `disable`: Do not use QKD hybrid keys. • `allow`: Allowed but do not require the use of QKD hybrid keys. • `require`: Require the use of QKD hybrid keys.

Example



To configure IPsec key establishment with a QKD and PQC keys together by CLI:

1. Configure FGT-A
   a. Configure the QKD profile:

```
config vpn qkd
    edit "qkd_1"
        set server "10.1.100.9"
        set port 8989
        set id "123456"
        set peer "qkdtest"
    next
end
```

   b. Configure the IPsec phase1 interface:

```
config vpn ipsec phase1-interface
    edit "test_qkd"
        set interface "port9"
        set peertype any
        set net-device disable
        set proposal aes128-sha256 aes256-sha256 aes128gcm-prfsha256 aes256gcm-prfsha384
chacha20poly1305-prfsha256
        set dhgrp 21
        set addke1 1080
        set qkd require
        set qkd-hybrid require
        set qkd-profile "qkdtest"
        set remote-gw 173.1.1.1
        set psksecret **********
    next
end
```

   c. Configure the IPsec phase2 interface :

```
config vpn ipsec phase2-interface
    edit "test_qkd"
        set phase1name "test_qkd"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
aes256gcm chacha20poly1305
```

```
        set dhgrp 20 21
        set addke1 35
    next
end
```

2. Configure FGT-D
   a. Configure the QKD profile:

```
config vpn qkd
    edit "qkdtest"
        set server "10.1.100.9"
        set port 8989
        set id "123456"
        set peer "qkdtest"
    next
end
```

   b. Configure the IPsec phase1 interface:

```
config vpn ipsec phase1-interface
    edit "test_qkd"
        set interface "test_qkd"
        set peertype any
        set net-device disable
        set proposal aes128-sha256 aes256-sha256 aes128gcm-prfsha256 aes256gcm-prfsha384
chacha20poly1305-prfsha256
        set dhgrp 21
        set addke1 1080
        set qkd require
        set qkd-hybrid require
        set qkd-profile "qkdtest"
        set remote-gw 11.101.1.1
        set psksecret **********
    next
end
```

   c. Configure the IPsec phase2 interface :

```
config vpn ipsec phase2-interface
    edit "test_qkd"
        set phase1name "test_qkd"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
aes256gcm chacha20poly1305
        set dhgrp 20 21
        set addke1 35
    next
end
```

To verify the configuration on FGT-A:

1. Generate traffic between PC1 and PC4.
2. Verify the IPsec phase1 interface status:

```
# diagnose vpn ike gateway list
vd: root/0
name: test_qkd

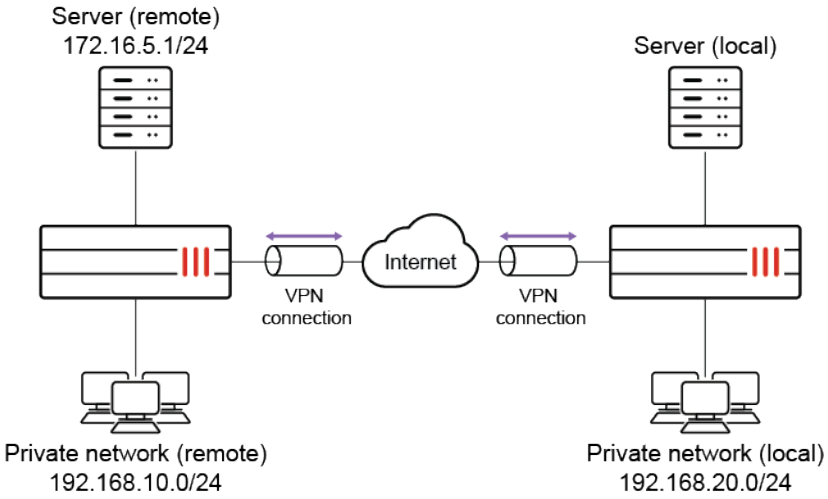
ike.qkd.server.curl.initiator.error.request.send.value: 7
ike.qkd.server.curl.inflight: now 0  max 2  total 48
ike.qkd.server.curl.ssl.verify.count: 3952
ike.qkd.server.curl.ssl.verify.last.ticks: 4295231030
ike.qkd.server.curl.ssl.verify.last.ago: 13
ike.qkd.server.curl.ssl.verify.last.local: 2025-04-01 06:45:33 +1200
ike.qkd.server.curl.ssl.verify.last.utc: 2025-03-31 18:45:33
```

VPN security policies

This section explains how to specify the source and destination IP addresses of traffic transmitted through an IPsec VPN, and how to define appropriate security policies.

Topology



Defining policy addresses

In a gateway-to-gateway, hub-and-spoke, dynamic DNS, redundant tunnel, or transparent configuration, you need to define a policy address for the private IP address of the network behind the remote VPN peer (for example, `192.168.10.0/255.255.255.0` or `192.168.10.0/24`).

In a peer-to-peer configuration, you need to define a policy address for the private IP address of a server or host behind the remote VPN peer (for example, `172.16.5.1/255.255.255.255`, `172.16.5.1/32`, or `172.16.5.1`).

For a FortiGate dialup server in a dialup-client or internet-browsing configuration, the source IP should reflect the IP addresses of the dialup clients:

Defining security policies

Policy-based and route-based VPNs require different security policies.

- A policy-based VPN requires an IPsec policy. You specify the interface to the private network, the interface to the remote peer and the VPN tunnel. A single policy can enable traffic inbound, outbound, or in both directions.
- A route-based VPN requires an accept policy for each direction. For the source and destination interfaces, you specify the interface to the private network and the virtual IPsec interface (phase 1 configuration) of the VPN. The IPsec interface is the destination interface for the outbound policy and the source interface for the inbound policy. One security policy must be configured for each direction of each VPN interface.

If the policy that grants the VPN connection is limited to certain services, DHCP must be included, otherwise the client will not be able to retrieve a lease from the FortiGate's (IPsec) DHCP server because the DHCP request (coming out of the tunnel) will be blocked.

Policy-based VPN

An IPsec policy enables the transmission and reception of encrypted packets, specifies the permitted direction of VPN traffic, and selects the VPN tunnel. In most cases, a single policy is needed to control both inbound and outbound IP traffic through a VPN tunnel. For a detailed example, see Policy-based IPsec tunnel on page 2840. Be aware of the following before creating an IPsec policy.

Allow traffic to be initiated from the remote site

Policies specify which IP addresses can initiate a tunnel. By default, traffic from the local private network initiates the tunnel. When the *Allow traffic to be initiated from the remote site* option is selected, traffic from a dialup client, or a computer on a remote network, initiates the tunnel. Both can be enabled at the same time for bi-directional initiation of the tunnel.

Outbound and inbound NAT

When a FortiGate operates in NAT mode, you can enable inbound or outbound NAT. Outbound NAT may be performed on outbound encrypted packets or IP packets in order to change their source address before they are sent through the tunnel. Inbound NAT is performed to intercept and decrypt emerging IP packets from the tunnel.

By default, these options are not selected in security policies and can only be set through the CLI.

Defining multiple IPsec policies for the same tunnel

You must define at least one IPsec policy for each VPN tunnel. If the same remote server or client requires access to more than one network behind a local FortiGate, the FortiGate must be configured with an IPsec policy for each network. Multiple policies may be required to configure redundant connections to a remote destination or control access to different services at different times.

To ensure a secure connection, the FortiGate must evaluate policies with *Action* set to *IPsec* before *ACCEPT* and *DENY*. Because the FortiGate unit reads policies starting at the top of the list, you must move all IPsec policies to the top of the list, and be sure to reorder your multiple IPsec policies that apply to the tunnel so that specific constraints can be evaluated before general constraints. If you create two equivalent IPsec policies for two different tunnels, the system will select the correct policy based on the specified source and destination addresses.

Adding multiple IPsec policies for the same VPN tunnel can cause conflicts if the policies specify similar source and destination addresses, but have different settings for the same service. When policies overlap in this manner, the system may apply the wrong IPsec policy or the tunnel may fail.

Route-based VPN

When you define a route-based VPN, you create a virtual IPsec interface on the physical interface that connects to the remote peer. You create ordinary accept policies to enable traffic between the IPsec interface and the interface that connects to the private network. This makes configuration simpler than for policy-based VPNs.

To configure policies for a route-based VPN:

1. Go to *Policy & Objects* > *Firewall Policy*.
2. Click *Create New* and define an *ACCEPT* policy to permit communication between the local private network and the private network behind the remote peer and enter these settings in particular:

Name	Enter a name for the security policy.
Incoming Interface	Select the interface that connects to the private network behind this FortiGate.
Outgoing Interface	Select the IPsec interface you configured.
Source	Select the address name you defined for the private network behind this FortiGate.
Destination	Select the address name you defined for the private network behind the remote peer.
Action	Select *ACCEPT*.
NAT	Disable *NAT*.

3. Click *OK*.
   To permit the remote client to initiate communication, you need to define a security policy for communication in that direction.
4. Click *Create New* and enter these settings in particular:

Name	Enter a name for the security policy.
Incoming Interface	Select the IPsec interface you configured.
Outgoing Interface	Select the interface that connects to the private network behind this FortiGate.
Source	Select the address name you defined for the private network behind the remote peer.
Destination	Select the address name you defined for the private network behind this FortiGate.
Action	Select *ACCEPT*.
NAT	Disable *NAT*.

5. Click *OK*.

Encryption algorithms

This topic provides a brief introduction to IPsec phase 1 and phase 2 encryption algorithms and includes the following sections:

- IKEv2 phase 1 encryption algorithm
- IKEv2 phase 2 encryption algorithm
- IKEv1 phase 1 encryption algorithm
- IKEv1 phase 2 encryption algorithm
- HMAC settings

FortiGate by default only shows recommended configurations for IKE proposals in the CLI.

To set your preference for displaying IKE proposals:

```
config system settings
    set ike-proposal-visibility {recommended | all}
end
```

This setting is set to recommended by default. See Show only recommended IKE proposals by default on page 2695.

IKEv2 phase 1 encryption algorithm

The default encryption algorithm is:

`aes128-sha256 aes256-sha256 aes128gcm-prfsha256 aes256gcm-prfsha384 chacha20poly1305-prfsha256`

While MD5 and SHA1 may be configurable, they are not recommended.

DES is a symmetric-key algorithm, which means the same key is used for encrypting and decrypting data. FortiOS supports the following; however, they are not recommended:

- des-md5
- des-sha1
- des-sha256
- des-sha384
- des-sha512

3DES applies the DES algorithm three times to each data. FortiOS supports the following; however, they are not recommended.

- 3des-md5
- 3des-sha1
- 3des-sha256
- 3des-sha384
- 3des-sha512

AES is a symmetric-key algorithm with different key lengths (128, 192, and 256 bits). FortiOS supports:

- aes128-md5*
- aes128-sha1*

- aes128-sha256
- aes128-sha384
- aes128-sha512
- aes128gcm-prfsha1
- aes128gcm-prfsha256
- aes128gcm-prfsha384
- aes128gcm-prfsha512
- aes192-md5*
- aes192-sha1*
- aes192-sha256
- aes192-sha384
- aes192-sha512
- aes256-md5*
- aes256-sha1*
- aes256-sha256
- aes256-sha384
- aes256-sha512
- aes256gcm-prfsha1
- aes256gcm-prfsha256
- aes256gcm-prfsha384
- aes256gcm-prfsha512

*Not recommended

The ARIA algorithm is based on AES with different key lengths (128, 192, and 256 bits). FortiOS supports:

- aria128-md5*
- aria128-sha1*
- aria128-sha256
- aria128-sha384
- aria128-sha512
- aria192-md5*
- aria192-sha1*
- aria192-sha256
- aria192-sha384
- aria192-sha512
- aria256-md5*
- aria256-sha1*
- aria256-sha256
- aria256-sha384
- aria256-sha512

*Not recommended

With the chacha20poly1305 encryption algorithm, FortiOS supports:

- chacha20poly1305-prfsha1
- chacha20poly1305-prfsha256
- chacha20poly1305-prfsha384
- chacha20poly1305-prfsha512

SEED is a symmetric-key algorithm. FortiOS supports:

- seed128-md5*
- seed128-sha1*
- seed128-sha256
- seed128-sha384
- seed128-sha512

*Not recommended

Suite-B is a set of AES encryption with ICV in GCM mode. IPsec traffic can be offloaded on NP6XLite and NP7 platforms. They cannot be offloaded on other NP6 processors and below. CP9 supports Suite-B offloading, otherwise packets are encrypted and decrypted by software. FortiOS supports:

- suite-b-gcm-128
- suite-b-gcm-256

See Network processors (NP7, NP7Lite, NP6, NP6XLite, and NP6Lite) and Content processors (CP10, CP9, CP9XLite, CP9Lite) in the Hardware Acceleration guide for more information.

ShangMi SM4 is a 128-bit block cipher that uses a 128-bit key and a symmetric cipher. SM3 is a cryptographic hash function that produces a 256 bit digest. See SM3/SM4 cryptographic algorithms for IKEv1/ IKEv2 NEW on page 2847 for model limitations. FortiOS supports:

- SM4-SM3

SM4-SM3 does not support hardware acceleration and offloading. It is only available to physical or FortiGate-VMs using x86_64 processors.

IKEv2 phase 2 encryption algorithm

The default encryption algorithm is:

```
aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm aes256gcm chacha20poly1305
```

With null encryption, IPsec traffic can offload NPU/CP. FortiOS supports the following, however, they are not recommended:

- null-md5
- null-sha1
- null-sha256
- null-sha384
- null-sha512

With the DES encryption algorithm, IPsec traffic can offload NPU/CP. FortiOS supports the following, however, they are not recommended:

- des-null
- des-md5
- des-sha1
- des-sha256
- des-sha384
- des-sha512

With the 3DES encryption algorithm, IPsec traffic can offload NPU/CP. FortiOS supports the following, however, they are not recommended:

- 3des-null
- 3des-md5
- 3des-sha1
- 3des-sha256
- 3des-sha384
- 3des-sha512

With the AES encryption algorithm, IPsec traffic can offload NPU/CP. FortiOS supports:

- aes128-null*
- aes128-md5*
- aes128-sha1*
- aes128-sha256
- aes128-sha384
- aes128-sha512
- aes192-null*
- aes192-md5*
- aes192-sha1*
- aes192-sha256
- aes192-sha384
- aes192-sha512
- aes256-null*
- aes256-md5*
- aes256-sha1*
- aes256-sha256
- aes256-sha384
- aes256-sha512

*Not recommended

NP7 and NP6XLite can offload the AESGCM encryption algorithm for IPsec traffic. CP9 supports AESGCM offloading. FortiOS supports:

- aes128gcm
- aes256gcm

With the chacha20poly1305 encryption algorithm, IPsec traffic **cannot** offload NPU/CP. FortiOS supports:

- chacha20poly1305

With the ARIA encryption algorithm, IPsec traffic **cannot** offload NPU/CP. FortiOS supports:

- aria128-null*
- aria128-md5*
- aria128-sha1*
- aria128-sha256
- aria128-sha384
- aria128-sha512
- aria192-null*
- aria192-md5*
- aria192-sha1*
- aria192-sha256
- aria192-sha384
- aria192-sha512
- aria256-null*
- aria256-md5*
- aria256-sha1*
- aria256-sha256
- aria256-sha384
- aria256-sha512

*Not recommended

With the SEED encryption algorithm, IPsec traffic **cannot** offload NPU/CP. FortiOS supports:

- seed-null*
- seed-md5*
- seed-sha1*
- seed-sha256
- seed-sha384
- seed-sha512

*Not recommended

ShangMi SM4 is a 128-bit block cipher that uses a 128-bit key and a symmetric cipher. SM3 is a cryptographic hash function that produces a 256 bit digest. See SM3/SM4 cryptographic algorithms for IKEv1/ IKEv2 NEW on page 2847 for model limitations. FortiOS supports:

- SM4-SM3

SM4-SM3 does not support hardware acceleration and offloading. It is only available to physical or FortiGate-VMs using x86_64 processors.

Post-Quantum Cryptography (PQC) algorithm for IKEv2

The following PQC key exchange mechanisms and cryptographic algorithms are supported:

ml-kem-512	ML-KEM-512. Module-Lattice-Based Key-Encapsulation Mechanism.
ml-kem-768	ML-KEM-768.
ml-kem-1024	ML-KEM-1024.
frodo-l1	FRODO L1. Frodo-KEM Level 1
frodo-l3	FRODO L3.
frodo-l5	FRODO L5.
bike-l1	BIKE L1. Bit Flipping Key Encapsulation Level 1
bike-l3	BIKE L3.
bike-l5	BIKE L5.

IKEv1 phase 1 encryption algorithm

The default encryption algorithm is:

```
aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
```

While MD5 and SHA1 may be configurable, they are not recommended.

DES is a symmetric-key algorithm, which means the same key is used for encrypting and decrypting data. FortiOS supports the following, however, they are not recommended:

- des-md5
- des-sha1
- des-sha256
- des-sha384
- des-sha512

3DES applies the DES algorithm three times to each data. FortiOS supports the following, however, they are not recommended:

- 3des-md5
- 3des-sha1
- 3des-sha256
- 3des-sha384
- 3des-sha512

AES is a symmetric-key algorithm with different key lengths (128, 192, and 256 bits). FortiOS supports:

- aes128-md5*
- aes128-sha1*
- aes128-sha256
- aes128-sha384
- aes128-sha512
- aes192-md5*
- aes192-sha1

- aes192-sha256
- aes192-sha384
- aes192-sha512
- aes256-md5*
- aes256-sha1*
- aes256-sha256
- aes256-sha384
- aes256-sha512

*Not recommended

The ARIA algorithm is based on AES with different key lengths (128, 192, and 256 bits). FortiOS supports the following from the CLI only:

- aria128-md5*
- aria128-sha1*
- aria128-sha256
- aria128-sha384
- aria128-sha512
- aria192-md5*
- aria192-sha1*
- aria192-sha256
- aria192-sha384
- aria192-sha512
- aria256-md5*
- aria256-sha1*
- aria256-sha256
- aria256-sha384
- aria256-sha512

*Not recommended

SEED is a symmetric-key algorithm. FortiOS supports:

- seed128-md5*
- seed128-sha1*
- seed128-sha256
- seed128-sha384
- seed128-sha512

*Not recommended

Suite-B is a set of AES encryption with ICV in GCM mode. IPsec traffic can be offloaded on NP6XLite and NP7 platforms. They cannot be offloaded on other NP6 processors and below. CP9 supports Suite-B offloading, otherwise packets are encrypted and decrypted by software. FortiOS supports:

- suite-b-gcm-128
- suite-b-gcm-256

See Network processors (NP7, NP7Lite, NP6, NP6XLite, and NP6Lite) and Content processors (CP10, CP9, CP9XLite, CP9Lite) in the Hardware Acceleration guide for more information.

IKEv1 phase 2 encryption algorithm

The default encryption algorithm is:

```
aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm aes256gcm chacha20poly1305
```

With null encryption, IPsec traffic can offload NPU/CP. FortiOS supports the following, however, they are not recommended:

- null-md5
- null-sha1
- null-sha256
- null-sha384
- null-sha512

With the DES encryption algorithm, IPsec traffic can offload NPU/CP. FortiOS supports the following, however, they are not recommended:

- des-null
- des-md5
- des-sha1
- des-sha256
- des-sha384
- des-sha512

With the 3DES encryption algorithm, IPsec traffic can offload NPU/CP. FortiOS supports the following, however, they are not recommended:

- 3des-null
- 3des-md5
- 3des-sha1
- 3des-sha256
- 3des-sha384
- 3des-sha512

With the AES encryption algorithm, IPsec traffic can offload NPU/CP. FortiOS supports:

- aes128-null*
- aes128-md5*
- aes128-sha1*
- aes128-sha256
- aes128-sha384
- aes128-sha512
- aes192-null*
- aes192-md5*
- aes192-sha1*
- aes192-sha256
- aes192-sha384
- aes192-sha512
- aes256-null*

- aes256-md5*
- aes256-sha1*
- aes256-sha256
- aes256-sha384
- aes256-sha512

*Not recommended

With the AESGCM encryption algorithm, IPsec traffic **cannot** offload NPU/CP. FortiOS supports:

- aes128gcm
- aes256gcm

With the chacha20poly1305 encryption algorithm, IPsec traffic **cannot** offload NPU/CP. FortiOS supports:

- chacha20poly1305

With the ARIA encryption algorithm, IPsec traffic **cannot** offload NPU/CP. FortiOS supports:

- aria128-null*
- aria128-md5*
- aria128-sha1*
- aria128-sha256
- aria128-sha384
- aria128-sha512
- aria192-null*
- aria192-md5*
- aria192-sha1*
- aria192-sha256
- aria192-sha384
- aria192-sha512
- aria256-null*
- aria256-md5*
- aria256-sha1*
- aria256-sha256
- aria256-sha384
- aria256-sha512

*Not recommended

With the SEED encryption algorithm, IPsec traffic **cannot** offload NPU/CP. FortiOS supports:

- seed-null*
- seed-md5*
- seed-sha1*
- seed-sha256
- seed-sha384
- seed-sha512

*Not recommended

HMAC settings

The FortiGate uses the HMAC based on the authentication proposal that is chosen in phase 1 or phase 2 of the IPsec configuration. Each proposal consists of the encryption-hash pair (such as 3des-sha256). The FortiGate matches the most secure proposal to negotiate with the peer.

To view the chosen proposal and the HMAC hash used:

```
# diagnose vpn ike gateway list

vd: root/0
name: MPLS
version: 1
interface: port1 3
addr: 192.168.2.5:500 -> 10.10.10.1:500
tun_id: 10.10.10.1
virtual-interface-addr: 172.31.0.2 -> 172.31.0.1
created: 1015820s ago
IKE SA: created 1/13 established 1/13 time 10/1626/21010 ms
IPsec SA: created 1/24 established 1/24 time 0/11/30 ms

  id/spi: 124 43b087dae99f7733/6a8473e58cd8990a
  direction: responder
  status: established 68693-68693s ago = 10ms
  proposal: 3des-sha256
  key: e0fa6ab8dc509b33-aa2cc549999b1823-c3cb9c337432646e

  DPD sent/recv: 000001e1/00000000
```

Blocking unwanted IKE negotiations and ESP packets with a local-in policy

It is not unusual to receive IPsec connection attempts or malicious IKE packets from all over the internet. Malicious parties use these probes to try to establish an IPsec tunnel in order to gain access to your private network. A good way to prevent this is to use local-in policies to deny such traffic.

Sometimes there are malicious attempts using crafted invalid ESP packets. These invalid attempts are automatically blocked by the FOS IPsec local-in handler when it checks the SPI value against the SAs of existing tunnels. The IPsec local-in handler processes the packet instead of the firewall's local-in handler. So when these attempts are blocked, you will notice an `unknown SPI` message in your VPN logs instead of being silently blocked by your local-in policy. These log messages are rate limited.

Sample log and alert email

```
Message meets Alert condition
```

```
date=2020-08-11 time=09:28:40 devname=toSite1 devid=FGT60Fxxxxxxxxxx logid="0101037131"
type="event" subtype="vpn" level="error" vd="root" eventtime=1597163320747963100 tz="-0700"
logdesc="IPsec ESP" msg="IPsec ESP" action="error" remip=131.62.25.102 locip=192.157.116.88
remport=40601 locport=500 outintf="wan1" cookies="N/A" user="N/A" group="N/A" xauthuser="N/A"
xauthgroup="N/A" assignip=N/A vpntunnel="N/A" status="esp_error" error_num="Received ESP packet
with unknown SPI." spi="f6c9e2x1" seq="02000400"
```

The ESP packet handling process has the detection of unknown ESP packets enabled by default. You can disable the detection of unknown ESP packets using the `detect-unknown-esp` command.

To configure unknown ESP packet detection:

```
config system settings
    set detect-unknown-esp {enable | disable}
end
```

Note that invalid SPIs may not always indicate malicious activity. For example, the SPI may not match during rekey, or when one unit flushes its tunnel SAs. Administrators should collect as much information as possible before making a conclusion.

To block undesirable IPsec connection attempts and IKE packets using a local-in policy:

1. Configure an address group that excludes legitimate IPs:

```
config firewall addrgrp
    edit "All_exceptions"
        set member "all"
        set exclude enable
        set exclude-member "remote-vpn"
    next
end
```

2. Create a local-in policy that blocks IKE traffic from the address group:

```
config firewall local-in-policy
    edit 1
        set intf "wan1"
        set srcaddr "All_exceptions"
        set dstaddr "all"
        set service "IKE"
        set schedule "always"
    next
end
```

The default action is deny.

3. Verify the traffic blocked by the local-in policy:

```
# diagnose debug flow filter dport 500
# diagnose debug flow trace start 10
# diagnose debug enable
```

```
id=20085 trace_id=290 func=print_pkt_detail line=5588 msg="vd-root:0 received a packet
(proto=17, 10.10.10.13:500->10.10.10.1:500) from wan1. "
id=20085 trace_id=290 func=init_ip_session_common line=5760 msg="allocate a new session-
003442e7"
id=20085 trace_id=290 func=vf_ip_route_input_common line=2598 msg="find a route: flag=84000000
gw-10.10.10.1 via root"
id=20085 trace_id=290 func=fw_local_in_handler line=430 msg="iprope_in_check() check failed on
policy 1, drop"
```

Renaming IPsec tunnels

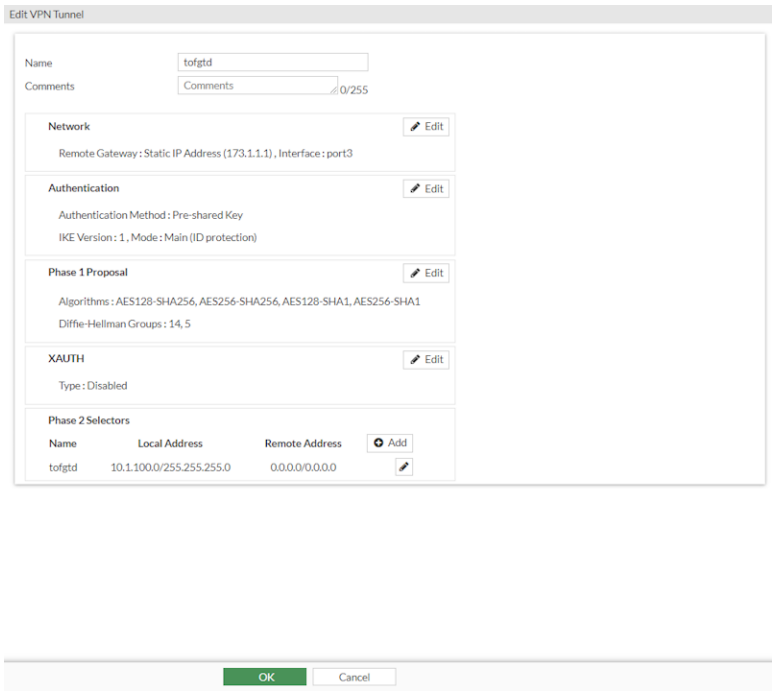
IPsec tunnels can be renamed. When you rename an IPsec tunnel, all references to the tunnel, such as routing and policies, are automatically updated to reflect the new name.

```
config vpn ipsec phase1-interface
    rename <string> to <string>
end
```

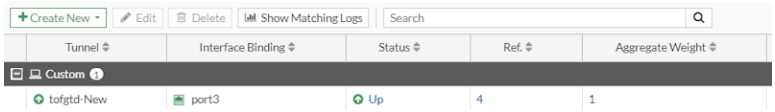
In this example, the IPsec tunnel named *tofgtd* is renamed to *tofgtd-New*, and all associated references are updated.

To rename an IPsec tunnel in the GUI:

1. Go to *VPN* > *IPsec Tunnels* and double-click an IPsec tunnel to open it for editing.
   In this example, the IPsec tunnel name is *tofgtd*.



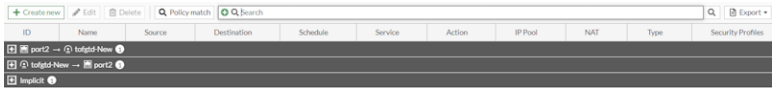
2. In the *Name* box, type a new name, and click *OK*. The IPsec tunnel is renamed, and all associated references are updated.
   In this example, the IPsec tunnel is renamed to *tofgtd-New*.



3. Check the associated references:
   In this example, all associated references show the new IPsec tunnel name of *tofgtd-New*.
   - Go to *Network* > *Interfaces* to see that the interface references the new IPsec tunnel name.

   - Go to *Network* > *Static Routes* to see that the static route references the new IPsec tunnel name.

   - Go to *Policy & Objects* > *Firewall Policy* to see that the policy references the new IPsec tunnel name



To rename an IPsec tunnel in the CLI:

1. Rename the IPsec tunnel.
   In this example, the IPsec tunnel named *tofgtd* is renamed to *tofgtd-New*:

```
config vpn ipsec phase1-interface
    rename tofgtd to tofgtd-New
end
```

2. Show the configuration to confirm that the IPsec tunnel was renamed.
   In this example, the IPsec tunnel was renamed to *tofgtd-New*:

```
show
config vpn ipsec phase1-interface
    edit "tofgtd-New"
        set interface "port3"
        set peertype any
        set net-device disable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set dpd disable
        set remote-gw 173.1.1.1
```

```
        ...
    next
end
```

3. Check the associated references.
   In this example, all associated references show the new IPsec tunnel name of *tofgtd-New*.
   - Confirm that the interfaces reference the new IPsec tunnel name:

```
config router static
show
config router static
    edit 3
        set dst 192.168.5.0 255.255.255.0
        set device "tofgtd-New"
    next
end
```

   - Confirm that the static route references the new IPsec tunnel name:

```
config system interface
show
    edit "tofgtd-New"
    ....
end
```

   - Confirm that the policies references the new IPsec tunnel name:

```
config firewall policy
show
config firewall policy
    edit 1
        set uuid 802c6c2e-8368-51ee-bf40-6c3c32da1024
        set srcintf "port2"
        set dstintf "tofgtd-New"
        set action accept
        ...

    next
end
```

Site-to-site VPN

A site-to-site VPN connection lets branch offices use the Internet to access the main office's intranet. A site-to-site VPN allows offices in multiple, fixed locations to establish secure connections with each other over a public network such as the Internet.

The following sections provide instructions for configuring site-to-site VPNs:

- FortiGate-to-FortiGate on page 2780
- FortiGate-to-third-party on page 2858

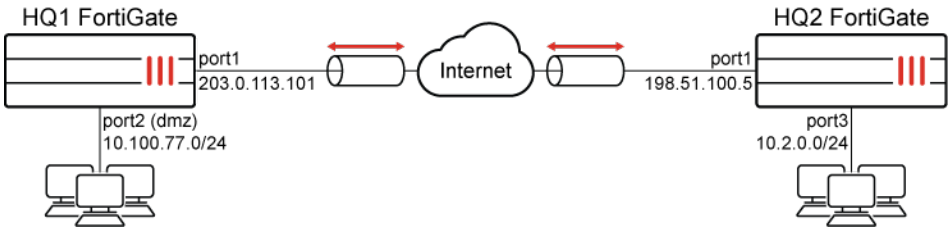
FortiGate-to-FortiGate

This section contains the following topics about FortiGate-to-FortiGate VPN configurations:

- Basic site-to-site VPN with pre-shared key on page 2780
- Basic site-to-site VPN with digital certificate on page 2790
- Site-to-site VPN with overlapping subnets on page 2802
- Tunneled Internet browsing on page 2814
- Geography-based tunneled internet browsing New on page 2823
- VPN over TCP with Fortinet proprietary encapsulation on page 2828
- GRE over IPsec on page 2834
- Policy-based IPsec tunnel on page 2840
- SM3/SM4 cryptographic algorithms for IKEv1/ IKEv2 NEW on page 2847
- Securely exchange serial numbers between FortiGates connected with IPsec VPN on page 2853

Basic site-to-site VPN with pre-shared key

This example shows how to configure a basic site-to-site IPsec tunnel between two FortiGates. This IKEv2 tunnel will use a pre-shared key to authenticate. Only traffic from the local subnets are permitted through the tunnel.



Individual options may vary. However, in order for the tunnel to come up, options configured on one FortiGate should be identical to the other.

For more information on IPsec settings, see Phase 1 configuration on page 2685 and Phase 2 configuration on page 2719.

For optimal security, it is advised to use digital certificates for authentication rather than pre-shared keys. See Basic site-to-site VPN with digital certificate on page 2790.

To configure an IPsec VPN using the VPN Wizard in the GUI:

1. Configure the HQ1 FortiGate.
   a. Go to *VPN > VPN Wizard* and configure the following settings for VPN Setup:
      i. Enter a VPN name in the *Tunnel name* field. In this example, *HQ2B2*.
      ii. From the *Select a template* options, select *Site to Site*.
      iii. Click *Begin*.
   b. Configure the VPN tunnel:
      i. For *Authentication Method*, select *Pre-shared Key*.
      ii. In the *Pre-shared Key* field, enter your key.
      iii. For *IKE*, select *Version 2*.
      iv. For *Transport*, if the option is grayed out and set to *UDP*, this means that *Allow VPN negotiation over TCP* has not been enabled. If the *Transport* can be selected, select *Auto*. Leave the *Use Fortinet encapsulation* option toggled off.

      When *Auto* is selected, UDP transport will be attempted first. If this fails, VPN negotiations over TCP will be attempted.

      v. For *NAT traversal*, select *Enable*.
      vi. For *Keepalive frequency*, enter *10*.
      vii. Click *Next*.
   c. Configure the *Remote Site*:
      i. For *Remote site device type*, select *FortiGate*.
      ii. For *Remote site device*, select *Accessible and static*.
      iii. For the *IP address*, enter *198.51.100.5*.
      iv. For *Remote site subnets that can access VPN*, enter 10.2.0.0/24.
      v. Click *Next*.
   d. Configure the *Local Site*:
      i. For *Outgoing interface that binds to tunnel*, select the WAN interface. In this example, *port1*. Disable the *Create and add interface to zone* toggle, if you do not want a zone created.
      ii. For *Local Interface*, select an interface from the *Select Entries* slide-out panel. In this example, *port2*.
      iii. The *Local subnets that can access VPN* field should automatically fill with the IP address related to the selected local interface (*10.100.77.0/24*).
      iv. Leave the *Allow remote site's internet traffic through this device* toggle disabled.
      v. Click *Next*.
   e. Review the configuration and click *Submit*.
2. Configure the HQ2 FortiGate

a. Go to *VPN > VPN Wizard* and configure the following settings for VPN Setup:
  i. Enter a VPN name in the *Tunnel name* field. In this example, *B2toHQ*.
  ii. From the *Select a template* options, select *Site to Site*.
  iii. Click *Begin*.
b. Configure the *VPN tunnel*:
  i. For *Authentication Method*, select *Pre-shared Key*.
  ii. In the *Pre-shared Key* field, enter your key.
  iii. For *IKE*, select *Version 2*.
  iv. If *Transport* can be selected, select *Auto*. Leave the *Use Fortinet encapsulation* option toggled off.
  v. For *NAT traversal*, select *Enable*.
  vi. For *Keepalive frequency*, enter *10*.
  vii. Click *Next*.
c. Configure the *Remote Site*:
  i. For *Remote site device type*, select *FortiGate*.
  ii. For *Remote site device*, select *Accessible and static*.
  iii. For the *IP address*, enter *203.0.113.101*.
  iv. For *Remote site subnets that can access VPN*, enter *10.100.77.0/24*.
  v. Click *Next*.
d. Configure the *Local Site*:
  i. For *Outgoing interface that binds to tunnel*, select the WAN interface. In this example, *port1*. Leave the *Create and add interface to zone* toggle enabled.
  ii. For *Local Interface*, select an interface from the *Select Entries* slide-out panel. In this example, *port3*.
  iii. The *Local subnets that can access VPN* field should automatically fill with the IP address related to the selected local interface (*10.2.0.0/24*).
  iv. Leave the *Allow remote site's internet traffic through this device* toggle disabled.
  v. Click *Next*.

Verify the VPN tunnel configurations created in the VPN Wizard

Verify the VPN tunnel configurations for HQ1 and HQ2 created in the *VPN Wizard* using the CLI.

Verify the HQ1 configuration

```
config firewall address
    edit "HQ2B2_local_subnet_0"
        set allow-routing enable
        set subnet 10.100.77.0 255.255.255.0
    next
    edit "HQ2B2_remote_subnet_0"
        set allow-routing enable
        set subnet 10.2.0.0 255.255.255.0
    next
end
```

```
config firewall addrgrp
    edit "HQ2B2_local"
        set allow-routing enable
        set member "HQ2B2_local_subnet_0"
        set comment "VPN: HQ2B2 -- Created by VPN wizard"
    next
    edit "HQ2B2_remote"
        set allow-routing enable
        set member "HQ2B2_remote_subnet_0"
        set comment "VPN: HQ2B2 -- Created by VPN wizard"
    next
end
```

```
config vpn ipsec phase1-interface
    edit "HQ2B2"
        set interface "port1"
        set ike-version 2
        set peertype any
        set net-device disable
        set proposal aes128-sha256 aes256-sha256 aes128gcm-prfsha256 aes256gcm-prfsha384

end
```

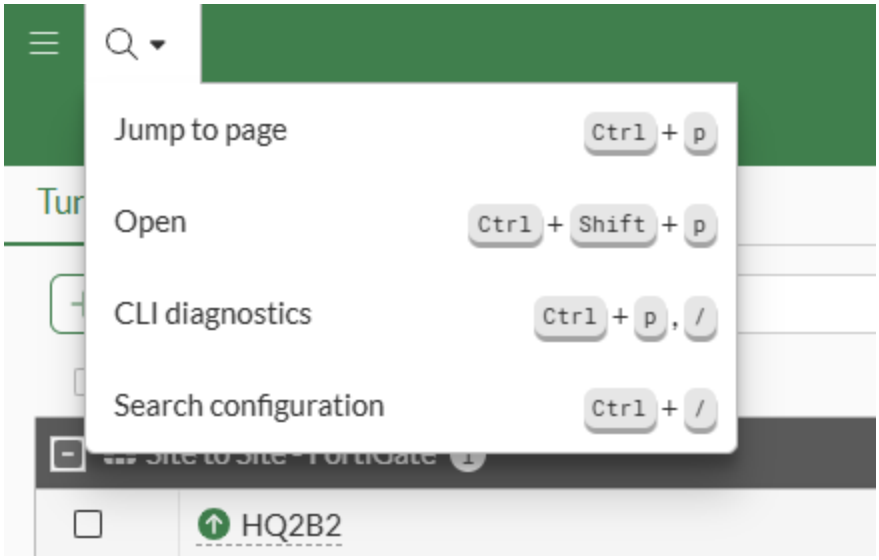
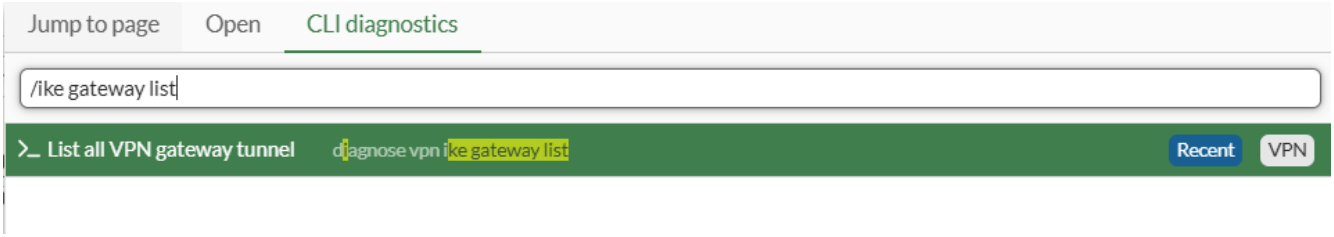
Testing the tunnel

To verify that a tunnel is established, goo to *Dashboard* > *Network Monitor* > *VPN*, or use the `diagnose vpn ike gateway list name <tunnel>` CLI command.

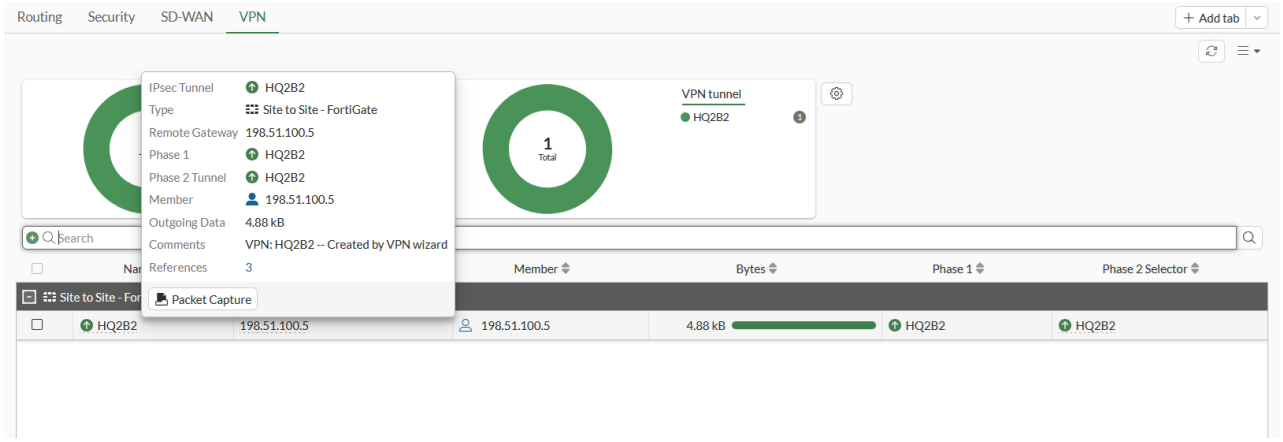
You can also use the command palette for CLI diagnostics. Open the command palette from the Find icon at the top of the page and then search for the command to run:





To verify the HQ1 tunnel in the GUI:

1. Go to *Dashboard* > *Network Monitor* and select the *VPN* tab.
2. Look for the newly created tunnel, in this example, *HQ2B2*, and hover the cursor over the tunnel name and observe additional details.



To verify the HQ1 tunnel in the CLI:

```
# diagnose vpn ike gateway list name HQ2B2
vd: root/0
name: HQ2B2
version: 2
interface: port1 3
addr: 203.0.113.101:500 -> 198.51.100.5:500
tun_id: 198.51.100.5/::198.51.100.5

HQ1 acted as the responder, and established the tunnel with remote peer *198.51.100.5* over UDP/500.

To verify the HQ2 tunnel in the GUI:

1. Go to *Dashboard > Network Monitor > VPN*.
2. Look for the newly created tunnel, in this example, *B2toHQ*, and hover the cursor over the tunnel name and observe additional details.

Verify the HQ2 tunnel

1. Go to *Dashboard > Network Monitor > VPN*.
2. Look for the newly created tunnel, in this example, *B2toHQ*, and hover the cursor over the tunnel name and observe additional details.

To verify the HQ2 tunnel in the CLI:

```
# diagnose vpn ike gateway list name B2toHQ
vd: root/0
name: B2toHQ
version: 2
interface: port1 3
addr: 198.51.100.5:500 -> 203.0.113.101:500

```

HQ2 acted as the initiator, and established the tunnel with remote peer *203.0.113.101* over UDP/500.

Verifying traffic flow

Send traffic from *PC1 10.100.77.101* to the *10.2.0.0/24* network and verify traffic goes through.

To verify traffic on PC1 (10.100.77.101):

```
root@dmz-public-server:~# ping 10.2.0.7
PING 10.2.0.7 (10.2.0.7) 56(84) bytes of data.
64 bytes from 10.2.0.7: icmp_seq=1 ttl=62 time=9.84 ms
64 bytes from 10.2.0.7: icmp_seq=2 ttl=62 time=0.808 ms
```

To verify traffic on HQ1:

In the CLI, run `diagnose sniffer packet any 'host 10.2.0.7' 4 0 l` and observe the output:

```
HQ1 # diagnose sniffer packet any 'host 10.2.0.7' 4 0 l
Using Original Sniffing Mode
interfaces=[any]
filters=[host 10.2.0.7]
2024-11-05 12:06:05.509027 port2 in 10.100.77.101 -> 10.2.0.7: icmp: echo request
2024-11-05 12:06:05.509074 HQ2B2 out 10.100.77.101 -> 10.2.0.7: icmp: echo request
2024-11-05 12:06:05.518607 HQ2B2 in 10.2.0.7 -> 10.100.77.101: icmp: echo reply
2024-11-05 12:06:05.518632 port2 out 10.2.0.7 -> 10.100.77.101: icmp: echo reply
```

The ICMP request is received on port2 and routed to the HQ2B2 tunnel. The ICMP reply is received on the HQ2B2 tunnel and routed back out port2.

To verify traffic on HQ2:

In the CLI, run `diagnose sniffer packet any 'host 10.100.77.101' 4 0 l` and observe the output:

```
HQ2 # diagnose sniffer packet any 'host 10.100.77.101' 4 0 l
Using Original Sniffing Mode
interfaces=[any]
filters=[host 10.100.77.101]
2024-11-05 12:06:05.509711 B2toHQ in 10.100.77.101 -> 10.2.0.7: icmp: echo request
2024-11-05 12:06:05.509791 port3 out 10.100.77.101 -> 10.2.0.7: icmp: echo request
2024-11-05 12:06:05.518809 port3 in 10.2.0.7 -> 10.100.77.101: icmp: echo reply
2024-11-05 12:06:05.518899 B2toHQ out 10.2.0.7 -> 10.100.77.101: icmp: echo reply
```

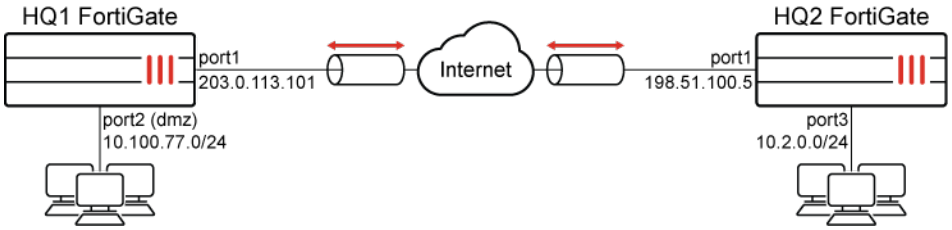
The ICMP request is received on the B2toHQ tunnel and routed to port3. The ICMP reply is received on port3 and routed back out the B2toHQ tunnel.

Basic site-to-site VPN with digital certificate

This is a sample configuration of IPsec VPN authenticating a remote FortiGate peer with a certificate. The certificate on one peer is validated by the presence of the CA certificate that is installed on the other peer.

The VPN Wizard is used to configure a site-to-site VPN tunnel.

It is assumed that the certificates have been configured and imported to the FortiGates. For information about configuring certificates using third party tools, such as XCA, see Creating certificates with XCA on page 3850. For information about importing a certificate, see Import a certificate on page 3830.



Individual settings can vary, but in order for the tunnel to come up, the configuration must be the same on both FortiGates.

For more information on IPsec settings, see Phase 1 configuration on page 2685 and Phase 2 configuration on page 2719.

To configure an IPsec VPN using the VPN Wizard on the HQ1 FortiGate:

1. Go to *VPN > VPN Wizard*.
2. Enter a name for the VPN in the *Tunnel name* field. In this example, *HQ2B2*.
3. Set *Select a template* to *Site to Site*.
4. Click *Begin*.
5. Configure the *VPN tunnel* settings:

Field	Value
Authentication method	*Signature*
Certificate name	Select a certificate.
Peer certificate CA	Select a peer CA certificate.
IKE	*Version 2*
Transport	If the option is grayed out and set to *UDP*, this means that *Allow VPN negotiation over TCP* has not been enabled. If the *Transport* can be selected, select *Auto*. Leave *Use Fortinet encapsulation* toggled off.
NAT traversal	*Enable* Set *Keepalive frequency* to *10*.

6. Click *Next*.
7. Configure the *Remote site* settings:

Field	Value
Remote site device type	*FortiGate*
Remote site device	*Accessible and static* Set *IP/FQDN* to *198.51.100.5*.
Route this device's internet traffic through the remote site.	Disabled
Remote site subnets that can access VPN	*10.2.0.0/24*

8. Click *Next*.
9. Configure the *Local site* settings:

Field	Value
Outgoing interface that binds to tunnel	*port1* (the WAN interface in this example) Disable *Create and add interface to zone* if you do not need a zone to be created.
Local interface	*port2* (in this example)
Local subnets that can access VPN	This field automatically uses the IP address related to the selected local interface. In this example, 10.100.77.0/24
Allow remote site's internet traffic through this device	Disabled

10. Click *Next*.
11. Review the configuration and, if everything is correct, click *Submit*.

To configure an IPsec VPN using the VPN Wizard on the HQ2 FortiGate:

1. Go to *VPN > VPN Wizard*.
2. Enter a name for the VPN in the *Tunnel name* field. In this example, *B2toHQ*.
3. Set *Select a template* to *Site to Site*.
4. Click *Begin*.
5. Configure the *VPN tunnel* settings:

Field	Value
Authentication method	*Signature*
Certificate name	Select a certificate.
Peer certificate CA	Select a peer CA certificate.

Field	Value
IKE	*Version 2*
Transport	If the option is grayed out and set to *UDP*, this means that *Allow VPN negotiation over TCP* has not been enabled. If the *Transport* can be selected, select *Auto*. Leave *Use Fortinet encapsulation* toggled off.
NAT traversal	*Enable* Set *Keepalive frequency* to *10*.

6. Click *Next*.
7. Configure the *Remote site* settings:

Field	Value
Remote site device type	*FortiGate*
Remote site device	*Accessible and static* Set *IP/FQDN* to *203.0.113.101*.
Route this device's internet traffic through the remote site.	Disabled
Remote site subnets that can access VPN	*10.100.77.0/24*

8. Click *Next*.
9. Configure the *Local site* settings:

Field	Value
Outgoing interface that binds to tunnel	*port1* (the WAN interface in this example) Enable *Create and add interface to zone*.
Local interface	*port3* (in this example)
Local subnets that can access VPN	This field automatically uses the IP address related to the selected local interface. In this example, 10.2.0.0/24
Allow remote site's internet traffic through this device	Disabled

10. Click *Next*.
11. Review the configuration and, if everything is correct, click *Submit*.

To configure HQ1 for IPsec VPN authenticating a remote FortiGate peer with a digital certificate using the CLI:

1. Configure the WAN interface and default route.
   The WAN interface is the interface connected to the ISP. The IPsec tunnel is established over the WAN interface.

```
config system interface
    edit "port1"
        set vdom "root"
        set ip 203.0.113.101 255.255.255.0
    next
end
config router static
    edit 1
        set gateway 203.0.113.102
        set device "port1"
    next
end
```

2. Configure address objects for internal protected networks.

```
config firewall address
    edit "10.2.0.0"
        set subnet 10.2.0.0 255.255.255.0
    next
    edit "10.100.77.0"
        set subnet 10.100.77.0 255.255.255.0
    next
end
```

3. Configure the internal (protected subnet) interface.

   The internal interface connects to the corporate internal network. Traffic from this interface routes out the IPsec VPN tunnel.

```
config system interface
    edit "port2"
        set vdom "root"
        set ip 10.100.77.0 255.255.255.0
    next
end
```

4. Configure the import certificate and its CA certificate information.

   The certificate and its CA certificate must be imported on the remote peer FortiGate and on the primary FortiGate before configuring IPsec VPN tunnels. If the built-in *Fortinet_Factory* certificate and the *Fortinet_CA* CA certificate are used for authentication, you can skip this step.

```
config vpn certificate local
    edit "test1"
        ...
        set range global
    next
end
config vpn certificate ca
    edit "CA_Cert_1"
        ...
        set range global
    next
end
```

5. Configure the peer user.

   The peer user is used in the IPsec VPN tunnel peer setting to authenticate the remote peer FortiGate.

   - If not using the built-in *Fortinet_Factory* certificate and *Fortinet_CA* CA certificate, use the certificate the you imported (CA_Cert_1):

     ```
     config user peer
         edit "peer1"
             set ca "CA_Cert_1"
         next
     end
     ```

   - If the built-in *Fortinet_Factory* certificate and *Fortinet_CA* CA certificate are used for authentication, the peer user must be configured based on *Fortinet_CA*:

     ```
     config user peer
         edit "peer1"
             set ca "Fortinet_CA"
         next
     end
     ```

6. Configure the IPsec phase1-interface.

   ```
   config vpn ipsec phase1-interface
       edit "HQ2B2"
           set interface "port1"
           set ike-version 2
           set authmethod signature
           set net-device enable
           set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
           set dhgrp 20 21
           set remote-gw 198.51.100.5
           set certificate "test1"
           set peer "peer1"
       next
   end
   ```

7. Configure the IPsec phase2-interface.

   ```
   config vpn ipsec phase2-interface
       edit "HQ2B2"
           set phase1name "HQ2B2 "
           set proposal aes128-sha256 aes256-sha256 aes128gcm aes256gcm chacha20poly1305
           set dhgrp 20 21
           set auto-negotiate enable
           set src-addr-type name
           set dst-addr-type name
           set src-name "10.100.77.0"
           set dst-name "10.2.0.0"
       next
   end
   ```

8. Configure the static routes.

Two static routes are added to reach the remote protected subnet. The blackhole route is important to ensure that IPsec traffic does not match the default route when the IPsec tunnel is down.

```
config router static
    edit 2
        set dst 10.20.0.0 255.255.255.0
        set device "HQ2B2"
    next
    edit 3
        set dst 10.20.0.0 255.255.255.0
        set blackhole enable
        set distance 254
    next
end
```

9. Configure two firewall policies to allow bidirectional IPsec traffic flow over the IPsec VPN tunnel.

```
config firewall policy
    edit 1
        set name "inbound"
        set srcintf "HQ2B2"
        set dstintf "port2"
        set srcaddr "10.2.0.0"
        set dstaddr "10.100.77.0"
        set action accept
        set schedule "always"
        set service "ALL"
    next
    edit 2
        set name "outbound"
        set srcintf "port2"
        set dstintf "HQ2B2"
        set srcaddr "10.100.77.0"
        set dstaddr "10.2.0.0"
        set action accept
        set schedule "always"
        set service "ALL"
    next
end
```

To configure HQ2 for IPsec VPN authenticating a remote FortiGate peer with a digital certificate using the CLI:

1. Configure the WAN interface and default route.

```
config system interface
    edit "port1"
        set vdom "root"
        set ip 198.51.100.5 255.255.255.0
    next
end
config router static
```

```
    edit 1
        set gateway 198.51.100.2
        set device "port1"
    next
end
```

2. Configure address objects for internal protected networks.

```
config firewall address
    edit "10.2.0.0"
        set subnet 10.2.0.0 255.255.255.0
    next
end
config firewall address
    edit "10.100.77.0"
        set subnet 10.100.77.0 255.255.255.0
    next
end
```

3. Configure the internal (protected subnet) interface.

```
config system interface
    edit "port3"
        set vdom "root"
        set ip 10.2.0.0 255.255.255.0
    next
end
```

4. Configure the import certificate and its CA certificate information.

```
config vpn certificate local
    edit "test2"
        ...
        set range global
    next
end
config vpn certificate ca
    edit "CA_Cert_1"
        ...
        set range global
    next
end
```

5. Configure the peer user.
   - If not using the built-in *Fortinet_Factory* certificate and *Fortinet_CA* CA certificate, use the certificate the you imported (CA_Cert_1):

```
config user peer
    edit "peer2"
        set ca "CA_Cert_1"
    next
end
```

- If the built-in *Fortinet_Factory* certificate and *Fortinet_CA* CA certificate are used for authentication, the peer user must be configured based on *Fortinet_CA*:

```
config user peer
    edit "peer2"
        set ca "Fortinet_CA"
    next
end
```

6. Configure the IPsec phase1-interface.

```
config vpn ipsec phase1-interface
    edit "HQ2B2"
        set interface "port1"
        set ike-version 2
        set authmethod signature
        set net-device enable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set dhgrp 20 21
        set remote-gw 198.51.100.5
        set certificate "test1"
        set peer "peer1"
    next
end
```

7. Configure the IPsec phase2-interface.

```
config vpn ipsec phase2-interface
    edit "B2toHQ"
        set phase1name "B2toHQ"
        set proposal aes128-sha256 aes256-sha256 aes128gcm aes256gcm chacha20poly1305
        set dhgrp 20 21
        set auto-negotiate enable
        set src-addr-type name
        set dst-addr-type name
        set src-name "10.2.0.0"
        set dst-name "10.100.77.0"
    next
end
```

8. Configure the static routes.

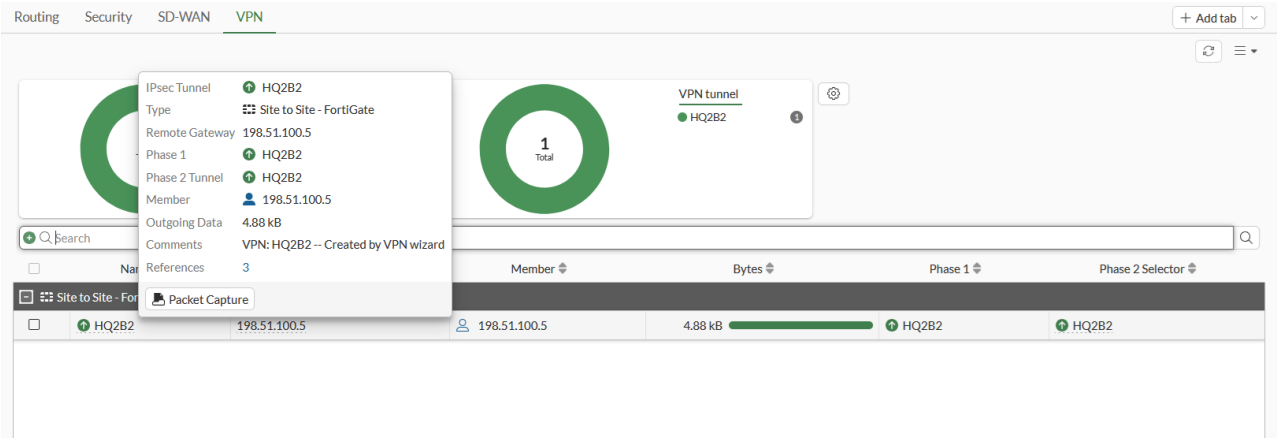
```
config router static
    edit 2
        set dst 10.100.77.0 255.255.255.0
        set device "B2toHQ"
    next
    edit 3
        set dst 10.100.77.0 255.255.255.0
        set blackhole enable
        set distance 254
    next
end
```

9. Configure two firewall policies to allow bidirectional IPsec traffic flow over the IPsec VPN tunnel.

```
config firewall policy
    edit 1
        set name "inbound"
        set srcintf "B2toHQ"
        set dstintf "port3"
        set srcaddr "10.100.77.0"
        set dstaddr "10.2.0.0"
        set action accept
        set schedule "always"
        set service "ALL"
    next
    edit 2
        set name "outbound"
        set srcintf "port3"
        set dstintf "B2toHQ"
        set srcaddr "10.2.0.0"
        set dstaddr "10.100.77.0"
        set action accept
        set schedule "always"
        set service "ALL"
    next
end
```

To verify the tunnel status in the GUI:

1. On FortiGate HQ1, go to *Dashboard* > *Network Monitor* > *VPN*.
2. Find the new tunnel, *HQ2B2* in this example, and check that both *Phase 1* and *Phase 2 Tunnel* are up.



3. Verify the tunnel status on HQ2 in the same way.

To verify the tunnel status in the CLI:

1. On FortiGate HQ1, run the following command:

```
# diagnose vpn ike gateway list name HQ2B2
vd: root/0
```

```
name: HQ2B2
version: 2
interface: port1 3
addr: 203.0.113.101:500 -> 198.51.100.5:500
tun_id: 198.51.100.5/::198.51.100.5
remote_location: 0.0.0.0
network-id: 0
transport: UDP
created: 852804s ago
peer-id: 198.51.100.5
peer-id-auth: no
pending-queue: 0
PPK: no
IKE SA: created 1/11  established 1/11  time 0/820/9010 ms
IPsec SA: created 1/21  established 1/21  time 0/433/9010 ms

id/spi: 8895 45e69522bd784183/69be2940ae314677
direction: responder
status: established 77898-77898s ago = 0ms
proposal: aes128-sha256
child: yes
SK_ei: 07446ef38bd406fa-18e45bec886a2bd3

DPD sent/recv: 00000000/00000000
peer-id: 198.51.100.5
```

Note that HQ1 acted as the *responder*, and established the tunnel with remote peer 198.51.100.5 over UDP/500.

2. On FortiGate HQ2, run the following command:

```
# diagnose vpn ike gateway list name B2toHQ
vd: root/0
name: B2toHQ
version: 2
interface: port1 3
addr: 198.51.100.5:500 -> 203.0.113.101:500
tun_id: 203.0.113.101/::203.0.113.101
remote_location: 0.0.0.0
network-id: 0
transport: UDP
created: 853181s ago
peer-id: 203.0.113.101
peer-id-auth: no
pending-queue: 0
PPK: no
IKE SA: created 1/11  established 1/11  time 0/5/10 ms
IPsec SA: created 1/21  established 1/21  time 0/0/10 ms
```

```
id/spi: 5788 45e69522bd784183/69be2940ae314677
direction: initiator
status: established 78281-78281s ago = 10ms
proposal: aes128-sha256
child: yes

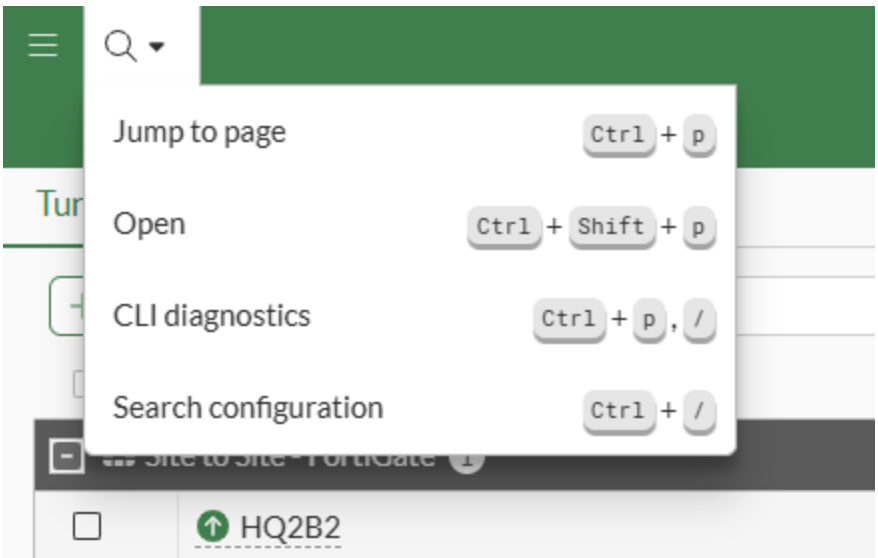
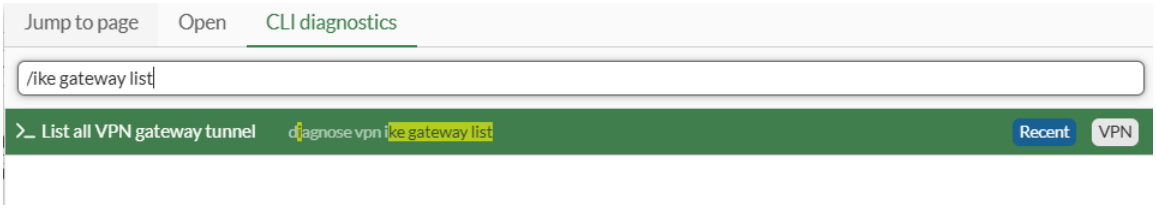
SK_ai: 61eeb720d062c70b-e606340beab6f9d5-3a4da2966373ab15-e5766540cf6c7dd1
SK_ar: bbdd888b98dbda7b-669da7a726ce2148-3f08940f802f580c-52b6ef93f48672aa
message-id sent/recv: 1792/0
QKD: no
lifetime/rekey: 86400/7818
DPD sent/recv: 00001ed7/00001ed7
peer-id: 203.0.113.101
```

Note that HQ2 acted as the *initiator*, and established the tunnel with remote peer 203.0.113.101 over UDP/500.

You can also use the command palette for CLI diagnostics. Open the command palette from the Find icon at the top of the page and then search for the command to run:





To verify traffic through the IPsec tunnel:

1. On a PC connected behind the port2 interface of HQ1, initiate ICMP traffic to the 10.2.0.0/24 network and verify that traffic goes through:

```
root@dmz-public-server:~# ping 10.2.0.7
PING 10.2.0.7 (10.2.0.7) 56(84) bytes of data.
64 bytes from 10.2.0.7: icmp_seq=1 ttl=62 time=9.84 ms
64 bytes from 10.2.0.7: icmp_seq=2 ttl=62 time=0.808 ms
```

2. Verify the traffic on HQ1:

```
# diagnose sniffer packet any 'host 10.2.0.7' 4 0 l
Using Original Sniffing Mode
interfaces=[any]
filters=[host 10.2.0.7]
2024-11-05 12:06:05.509027 port2 in 10.100.77.101 -> 10.2.0.7: icmp: echo request
2024-11-05 12:06:05.509074 HQ2B2 out 10.100.77.101 -> 10.2.0.7: icmp: echo request
2024-11-05 12:06:05.518607 HQ2B2 in 10.2.0.7 -> 10.100.77.101: icmp: echo reply
2024-11-05 12:06:05.518632 port2 out 10.2.0.7 -> 10.100.77.101: icmp: echo reply
```

   The ICMP request packets are received on port2 and routed to the HQ2B2 tunnel. ICMP reply packets are received on the HQ2B2 tunnel and routed back out port2.

3. Verify the traffic on HQ12:

```
# diagnose sniffer packet any 'host 10.100.77.101' 4 0 l
Using Original Sniffing Mode
interfaces=[any]
filters=[host 10.100.77.101]
2024-11-05 12:06:05.509711 B2toHQ in 10.100.77.101 -> 10.2.0.7: icmp: echo request
2024-11-05 12:06:05.509791 port3 out 10.100.77.101 -> 10.2.0.7: icmp: echo request
2024-11-05 12:06:05.518809 port3 in 10.2.0.7 -> 10.100.77.101: icmp: echo reply
2024-11-05 12:06:05.518899 B2toHQ out 10.2.0.7 -> 10.100.77.101: icmp: echo reply
```

   The ICMP request is received on the B2toHQ tunnel and routed to port3. The ICMP reply is received on port3 and routed back out the B2toHQ.

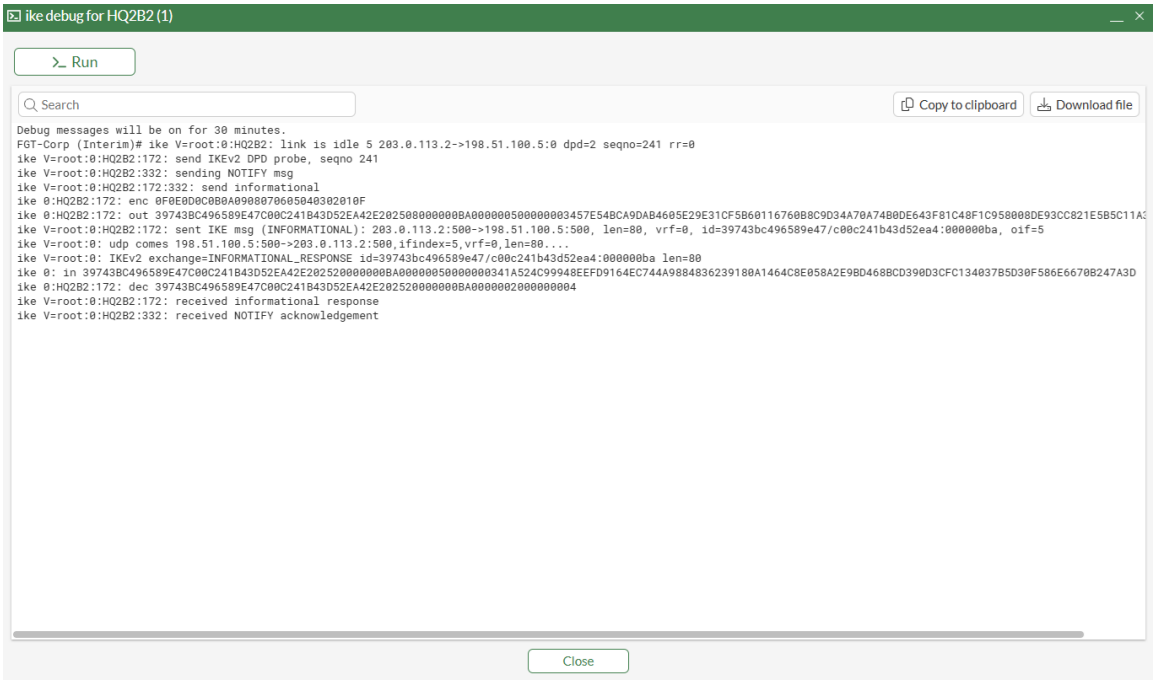
4. Optionally, run real time IKE debug using appropriate filters for troubleshooting if the IPsec tunnel does not come up:

```
# diagnose debug application ike -1
```

   If the remote FortiGate certificate cannot be validated, the following error is shown in the debug output:

```
ike 0: to_HQ2:15314: certificate validation failed
```

You can also quickly access the *CLI diagnostic* console to run the above command directly from the *VPN > VPN Tunnels > Tunnel* page. Select the Tunnel, click *More > CLI diagnostics*, and click the *Run* button to start collecting real-time debugs.



Site-to-site VPN with overlapping subnets

Overlapping subnets in IPsec occur when two or more networks involved in a VPN tunnel use the same or overlapping IP address ranges. This creates a conflict, as IPsec relies on unique network subnets to route traffic securely between them. Overlapping subnets often occur when two networks with the same IP ranges need to communicate, such as in mergers or acquisitions.

This example shows the configuration steps required to set up an IPsec VPN that enables communication between two overlapping networks located behind separate FortiGates using a route-based tunnel. Both source NAT (SNAT) and destination NAT (DNAT) are used to resolve IP conflicts.

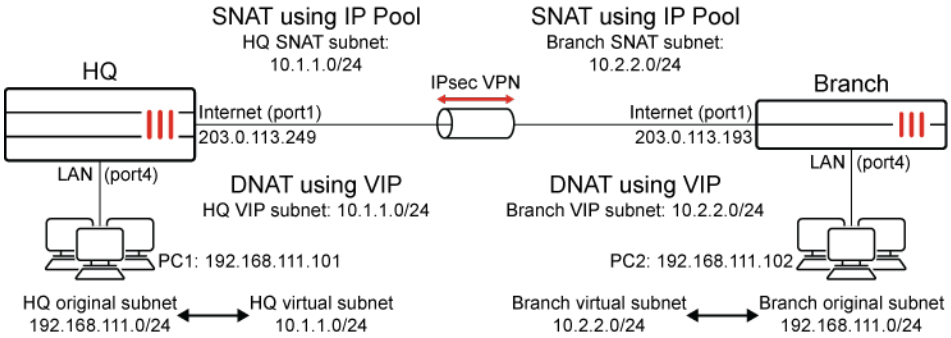
Both the HQ and Branch FortiGates use the same overlapping internal subnet, 192.168.111.0/24. To establish communication between these networks over the IPsec tunnel, address translation is required to distinguish between the identical subnets. Without SNAT and DNAT, routing traffic between these overlapping networks would lead to conflicts, as networking devices cannot differentiate between identical IP addresses.

To resolve this issue, a unique and non-overlapping subnet is used on both FortiGates for address translation during transit.

- On the HQ FortiGate, the IP addresses of the HQ original subnet are logically one-to-one mapped to IP address in the HQ virtual subnet of 10.1.1.0/24.
- On the Branch FortiGate, the IP addresses of the Branch original subnet are logically one-to-one mapped to IP address in the Branch virtual subnet of 10.2.2.0/24.

The virtual subnets must be the same size as the overlapping subnet to cover the entire IP address range in the subnet and avoid network issues. The virtual subnets are used for SNAT using IP Pools and DNAT using virtual

IP (VIP) configurations, ensuring that traffic originating from the overlapped subnets is translated according to the respective virtual subnets for communication.



After the configuration is complete, users that are in the HQ original subnet (192.168.111.0/24) are required to use the Branch virtual subnet (10.2.2.0/24) to communicate with users that are behind the Branch. Users that are in the Branch original subnet (192.168.111.0/24) are required to use the HQ virtual subnet (10.1.1.0/24) to communicate with users that are behind the HQ.

Source	Destination	Used subnet
HQ	Branch	Branch virtual subnet (10.2.2.0/24)
Branch	HQ	HQ virtual subnet (10.1.1.0/24)

This ensures seamless communication across the IPsec tunnel while resolving the challenges posed by overlapping subnets.

HQ FortiGate configuration

To configure IPsec VPN:

1. Go to *VPN* > *VPN Tunnels* and click on *Create New* > *Custom IPsec tunnel*.
2. Set the *Name*, such as *HQtoBranchVPN*.
3. Configure the *Network* settings:

Field	Value
IP version	*IPv4*
Remote gateway	*Static IP address*
IP address	*203.0.113.193*
Interface	*Internet (port1)*
Transport	If the option is grayed out and set to *UDP*, this means that *Allow VPN negotiation over TCP* has not been enabled. If the *Transport* can be selected, select *Auto*.

4. Leave the remaining *Network* settings as their default values.
5. Configure the *Authentication* settings:

Field	Value
Method	*Pre-shared Key*
Pre-shared key	Enter a suitable key. The same pre-shared key must be configured on the Branch FortiGate. For better security, use a digital certificate.
IKE	Version 2

6. Leave the remaining *Authentication* settings as their default values.
7. Leave the *Phase 1 proposal* settings as their default values.
8. Configure the *Phase 2 selectors* settings:
   a. In the table, click *Create New*.
   b. Configure the new phase 2 selector:

Field	Value
Name	*HQtoBranchVPN*
Local address	*Subnet Address* *10.1.1.0/24*
Remote address	*Subnet Address* *10.2.2.0/24*
Auto-negotiate	(Optional) *Enable*

Only traffic matching the subnets specified in the *Local address* and *Remote address* fields in the Phase 2 configuration can pass through the IPsec tunnel.

- Outgoing traffic exiting through the IPsec tunnel is first matched against a firewall policy, then Source NAT (if configured) is applied, and finally, is checked against the traffic selectors in the IPsec tunnel settings.
- Incoming traffic on IPsec tunnel is first evaluated against the traffic selectors, then matched to a firewall policy, and finally, DNAT (if configured) is applied.

   c. Leave the remaining settings as their default values and click *OK*.
9. Click *OK*.

To configure static routes:

1. Go to *Network* > *Static Routes* and click *Create New*.
2. Configure the static route for the Branch virtual subnet:

Field	Value
Destination	*Subnet* *10.2.2.0/24*
Interface	*HQtoBranchVPN* (the IPsec tunnel interface)

Field	Value
Administrative Distance	*10*
Status	*Enabled*

3. Click *OK*.
4. Create a second static route with the same *Destination* that uses the blackhole interface.
   This is a best practice for route-based IPsec VPN tunnels because it ensures that traffic for the remote FortiGate's subnet is not sent using the default route in the event that the IPsec tunnel goes down and is instead sent to the blackhole.

Field	Value
Destination	*Subnet* *10.2.2.0/24*
Interface	*Blackhole*
Administrative Distance	*254*
Status	*Enable*

To configure the address objects:

1. Go to *Policy & Objects* > *Addresses* and select *Address*.
2. Click *Create new* and configure an address object for HQ original subnet:

Field	Value
Name	*HQ original subnet*
Interface	*Any*
Type	*Subnet*
IP/Netmask	*192.168.111.0/24*
Routing configuration	Disable

3. Click *OK*.
4. Click *Create new* again and configure an address object for Branch virtual subnet:

Field	Value
Name	*Branch virtual subnet*
Interface	*Any*
Type	*Subnet*
IP/Netmask	*10.2.2.0/24*
Routing configuration	Disable

5. Click *OK*

To configure the IP pool for SNAT:

1. Go to *Policy & Objects* > *IP Pools* and click *Create new*.
2. Configure the dynamic IP pool:

Field	Value
Name	*HQ SNAT subnet*
Type	*Fixed Port Range*
External IP Range	*10.1.1.1-10.1.1.254*
Internal IP Range	*192.168.111.1-192.168.111.254*

3. Leave the remaining settings as their default values and click *OK*.

To configure the VIP for DNAT:

1. Go to *Policy & Objects* > *Virtual IPs* > *Virtual IP* and click *Create new*.
2. Configure the virtual IP:

Field	Value
Name	*HQ VIP subnet*
Type	*Static NAT*
External IP address/range	*10.1.1.1-10.1.1.254*
Map to IPv4 address/range	*192.168.111.1*

3. Click *OK*.

To configure the firewall policies:

1. Go to *Policy & Objects* > *Firewall Policy* and click *Create New*.
2. Configure the policy to allow traffic to flow from the HQ original subnet to the Branch virtual subnet and to perform SNAT:

Field	Value
Name	*HQ to Branch*
Incoming interface	*LAN (port4)*
Outgoing interface	*HQtoBranchVPN*
Source	*HQ original subnet*
Destination	*Branch virtual subnet*
Service	*ALL*
NAT	Enable
IP pool configuration	*Use Dynamic IP Pool*

Field	Value
	HQ SNAT subnet IP

3. Configure the remaining settings as needed, then click *OK*.
4. Click *Create New* again and configure the policy to allow traffic to flow from the Branch virtual subnet to the HQ original subnet and to perform DNAT:

Field	Value
Name	*Branch to HQ*
Incoming interface	*HQtoBranchVPN*
Outgoing interface	*LAN (port4)*
Source	*Branch virtual subnet*
Destination	*HQ VIP subnet* (the virtual IP/server to perform DNAT)
Service	*ALL*
NAT	Disable

5. Configure the remaining settings as needed, then click *OK*.

Branch FortiGate configuration

To configure IPsec VPN:

1. Go to *VPN* > *VPN Tunnels* and click on *Create New* > *Custom IPsec tunnel*.
2. Set the *Name*, such as *BranchtoHQVPN*.
3. Configure the *Network* settings:

Field	Value
IP version	*IPv4*
Remote gateway	*Static IP address*
IP address	*203.0.113.249*
Interface	*Internet (port1)*
Transport	If the option is grayed out and set to *UDP*, this means that *Allow VPN negotiation over TCP* has not been enabled. If the *Transport* can be selected, select *Auto*.

4. Leave the remaining *Network* settings as their default values.
5. Configure the *Authentication* settings:

Field	Value
Method	*Pre-shared Key*
Pre-shared key	Enter a suitable key.

Field	Value
	The same pre-shared key must be configured on the HQ FortiGate. For better security, use a digital certificate.
IKE	Version 2

6. Leave the remaining *Authentication* settings as their default values.
7. Leave the *Phase 1 proposal* settings as their default values.
8. Configure the *Phase 2 selectors* settings:
   a. In the table, click *Create New*.
   b. Configure the new phase 2 selector:

Field	Value
Name	*BranchtoHQVPN*
Local address	*Subnet Address* *10.2.2.0/24*
Remote address	*Subnet Address* *10.1.1.0/24*
Auto-negotiate	(Optional) *Enable*

Only traffic matching the subnets specified in the *Local address* and *Remote address* fields in the Phase 2 configuration can pass through the IPsec tunnel.

- Outgoing traffic exiting through the IPsec tunnel is first matched against a firewall policy, then Source NAT (if configured) is applied, and finally, is checked against the traffic selectors in the IPsec tunnel settings.
- Incoming traffic on IPsec tunnel is first evaluated against the traffic selectors, then matched to a firewall policy, and finally, DNAT (if configured) is applied.

   c. Leave the remaining settings as their default values and click *OK*.
9. Click *OK*.

To configure static routes:

1. Go to *Network* > *Static Routes* and click *Create New*.
2. Configure the static route for the Branch virtual subnet:

Field	Value
Destination	*Subnet* *10.1.1.0/24*
Interface	*BranchtoHQVPN* (the IPsec tunnel interface)
Administrative Distance	*10*
Status	*Enabled*

3. Click *OK*.
4. Create a second static route with the same *Destination* that uses the blackhole interface.
   This is a best practice for route-based IPsec VPN tunnels because it ensures that traffic for the remote FortiGate's subnet is not sent using the default route in the event that the IPsec tunnel goes down and is instead sent to the blackhole.

Field	Value
Destination	*Subnet* *10.1.1.0/24*
Interface	*Blackhole*
Administrative Distance	*254*
Status	*Enable*

To configure the address objects:

1. Go to *Policy & Objects* > *Addresses* > *Address*.
2. Click *Create new* and configure an address object for HQ original subnet:

Field	Value
Name	*Branch original subnet*
Interface	*Any*
Type	*Subnet*
IP/Netmask	*192.168.111.0/24*
Routing configuration	Disable

3. Click *OK*.
4. Click *Create new* again and configure an address object for Branch virtual subnet:

Field	Value
Name	*HQ virtual subnet*
Interface	*Any*
Type	*Subnet*
IP/Netmask	*10.1.1.0/24*
Routing configuration	Disable

5. Click *OK*

To configure the IP pool for SNAT:

1. Go to *Policy & Objects* > *IP Pools* and click *Create new*.
2. Configure the dynamic IP pool:

Field	Value
Name	*Branch SNAT subnet*
Type	*Fixed Port Range*
External IP Range	*10.2.2.1-10.2.2.254*
Internal IP Range	*192.168.111.1-192.168.111.254*

3. Leave the remaining settings as their default values and click *OK*.

To configure the VIP for DNAT:

1. Go to *Policy & Objects* > *Virtual IPs* > *Virtual IP* and click *Create New*.
2. Configure the virtual IP:

Field	Value
Name	*Branch VIP subnet*
Type	*Static NAT*
External IP address/range	*10.2.2.1-10.2.2.254*
Map to IPv4 address/range	*192.168.111.1*

3. Click *OK*.

To configure the firewall policies:

1. Go to *Policy & Objects* > *Firewall Policy* and click *Create New*.
2. Configure the policy to allow traffic to flow from the HQ original subnet to the Branch virtual subnet and to perform SNAT:

Field	Value
Name	*Branch to HQ*
Incoming interface	*LAN (port4)*
Outgoing interface	*BranchtoHQVPN*
Source	*Branch original subnet*
Destination	*HQ virtual subnet*
Service	*ALL*
NAT	Enable
IP pool configuration	*Use Dynamic IP Pool* *Branch SNAT subnet IP*

3. Configure the remaining settings as needed, then click *OK*.
4. Click *Create New* again and configure the policy to allow traffic to flow from the Branch virtual subnet to the HQ original subnet and to perform DNAT:

Field	Value
Name	*HQ to Branch*
Incoming interface	*BranchtoHQVPN*
Outgoing interface	*LAN (port4)*
Source	*HQ virtual subnet*
Destination	*Branch VIP subnet* (the virtual IP/server to perform DNAT)
Service	*ALL*
NAT	Disable

5. Configure the remaining settings as needed, then click *OK*.

Verification

To verify the status of IPsec tunnel in the GUI:

1. On either FortiGate, go to *Dashboard* > *Network Monitor* > *VPN*.
2. The tunnels should be up on both FortiGates. If you did not enable *Auto-negotiate* in the IPsec VPN settings, you may have to select the tunnel and click *Bring Up*.

To verify the status of IPsec tunnel in the CLI:

1. Verify the status of Phase 1:

```
Branch # diagnose vpn ike gateway list name BranchtoHQVPN
vd: root/0
name: BranchtoHQVPN
version: 2
interface: port1 3
addr: 203.0.113.193:4500 -> 203.0.113.249:4500
tun_id: 203.0.113.249/::203.0.113.249
remote_location: 0.0.0.0
network-id: 0
transport: UDP
created: 58s ago
peer-id: 203.0.113.249
peer-id-auth: no
nat: me peer
pending-queue: 0
PPK: no
IKE SA: created 1/1  established 1/1  time 10/10/10 ms
IPsec SA: created 1/1  established 1/1  time 10/10/10 ms

  id/spi: 5 8d6f155741b90831/54940957144cdd82
  direction: initiator
  ...
  peer-id: 203.0.113.249
```

2. Verify the status of Phase 2:

```
Branch # diagnose vpn tunnel list name BranchtoHQVPN
list ipsec tunnel by names in vd 0
------------------------------------------------------
name=BranchtoHQVPN ver=2 serial=1 203.0.113.193:4500->203.0.113.249:4500 nexthop=203.0.113.1

npuid=0
```

Note that the protected subnet in the IPsec tunnel are the virtual subnets for Branch and HQ, respectively.

To verify the traffic flow from PC1 to PC2:

1. From a PC in the HQ network (PC1, 192.168.111.101), ping a PC in the Branch network (PC2, 192.168.111.102) using the virtual IP of PC2, 10.2.2.102.

   The ping should be successful.

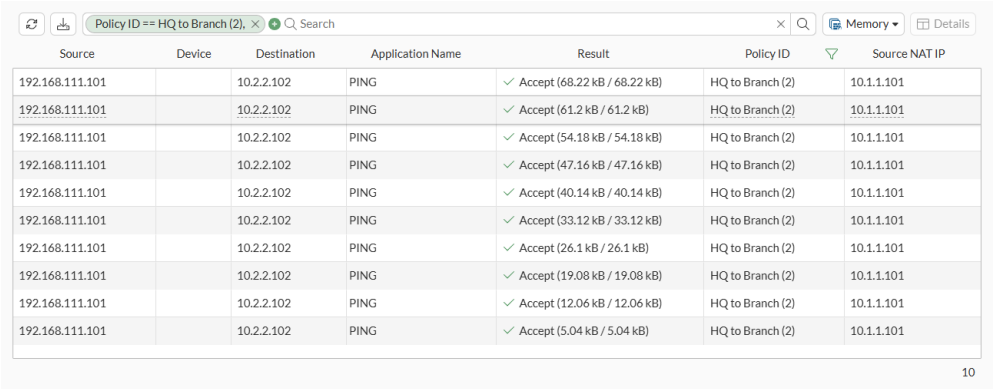
```
C:\>ping 10.2.2.102

Pinging 10.2.2.102 with 32 bytes of data:
Reply from 10.2.2.102: bytes=32 times=10ms TTL=126
Reply from 10.2.2.102: bytes=32 times=3ms TTL=126
Reply from 10.2.2.102: bytes=32 times=3ms TTL=126
Reply from 10.2.2.102: bytes=32 times=3ms TTL=126

Ping statistics for 10.2.2.102:
    Packets: Sent = 4, Received = 4, Lost = 0 (0% loss),
Approximate round trip times in milli-seconds:
    Minimum = 3ms, Maximum = 10ms, Average = 4ms
```

To verify the traffic flow from PC1 to PC2 in the GUI:

1. On either FortiGate, go to *Log & Report* > *Forward Traffic*.
2. Filter the content using the search bar and add the required columns to see the logs.



Source	Device	Destination	Application Name	Result	Policy ID	Source NAT IP
192.168.111.101		10.2.2.102	PING	Accept (68.22 kB / 68.22 kB)	HQ to Branch (2)	10.1.1.101
192.168.111.101		10.2.2.102	PING	Accept (61.2 kB / 61.2 kB)	HQ to Branch (2)	10.1.1.101
192.168.111.101		10.2.2.102	PING	Accept (54.18 kB / 54.18 kB)	HQ to Branch (2)	10.1.1.101
192.168.111.101		10.2.2.102	PING	Accept (47.16 kB / 47.16 kB)	HQ to Branch (2)	10.1.1.101
192.168.111.101		10.2.2.102	PING	Accept (40.14 kB / 40.14 kB)	HQ to Branch (2)	10.1.1.101
192.168.111.101		10.2.2.102	PING	Accept (33.12 kB / 33.12 kB)	HQ to Branch (2)	10.1.1.101
192.168.111.101		10.2.2.102	PING	Accept (26.1 kB / 26.1 kB)	HQ to Branch (2)	10.1.1.101
192.168.111.101		10.2.2.102	PING	Accept (19.08 kB / 19.08 kB)	HQ to Branch (2)	10.1.1.101
192.168.111.101		10.2.2.102	PING	Accept (12.06 kB / 12.06 kB)	HQ to Branch (2)	10.1.1.101
192.168.111.101		10.2.2.102	PING	Accept (5.04 kB / 5.04 kB)	HQ to Branch (2)	10.1.1.101

10

To make sure that the logs are collected and shown under *Forward Traffic*, set *Log Allowed Traffic* to *All Sessions* in the corresponding firewall policy configured under *Policy & Objects* > *Firewall Policy*.

To verify the traffic flow from PC1 to PC2 in the CLI:

1. Verify the SNAT operation for traffic flowing from PC1 to PC2 on HQ:
   a. Using sniffer trace:

```
HQ # diagnose sniffer packet any 'icmp' 4 10
Using Original Sniffing Mode
interfaces=[any]
filters=[icmp]
6.141932 port4 in 192.168.111.101 -> 10.2.2.102: icmp: echo request
6.144532 HQtoBranchVPN out 10.1.1.101 -> 10.2.2.102: icmp: echo request
6.149731 HQtoBranchVPN in 10.2.2.102 -> 10.1.1.101: icmp: echo reply
6.149770 port4 out 10.2.2.102 -> 192.168.111.101: icmp: echo reply
```

   b. Using session table:

```
HQ # diagnose sys session filter proto 1
HQ # diagnose sys session list
session info: proto=1 proto_state=00 duration=1 expire=58 timeout=0 refresh_dir=both
flags=00000000 socktype=0 sockport=0 av_idx=0 use=3
origin-shaper=

no_ofld_reason:  npu-flag-off
total session: 1
```

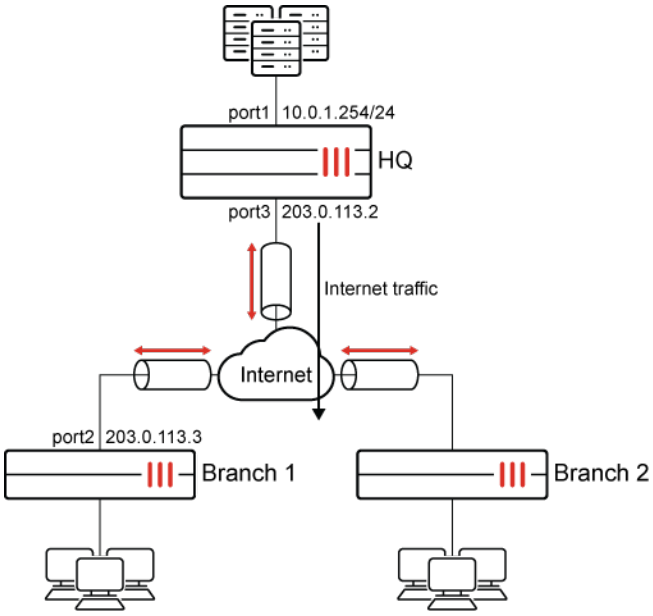
For more information on running sniffer trace, see Performing a sniffer trace or packet capture on page 4825.
For more information about using session table, see Using a session table on page 4838.

Tunneled Internet browsing

This is a sample configuration of tunneled internet browsing using a dialup VPN. To centralize network management and control, all branch office traffic is tunneled to HQ, including Internet browsing.



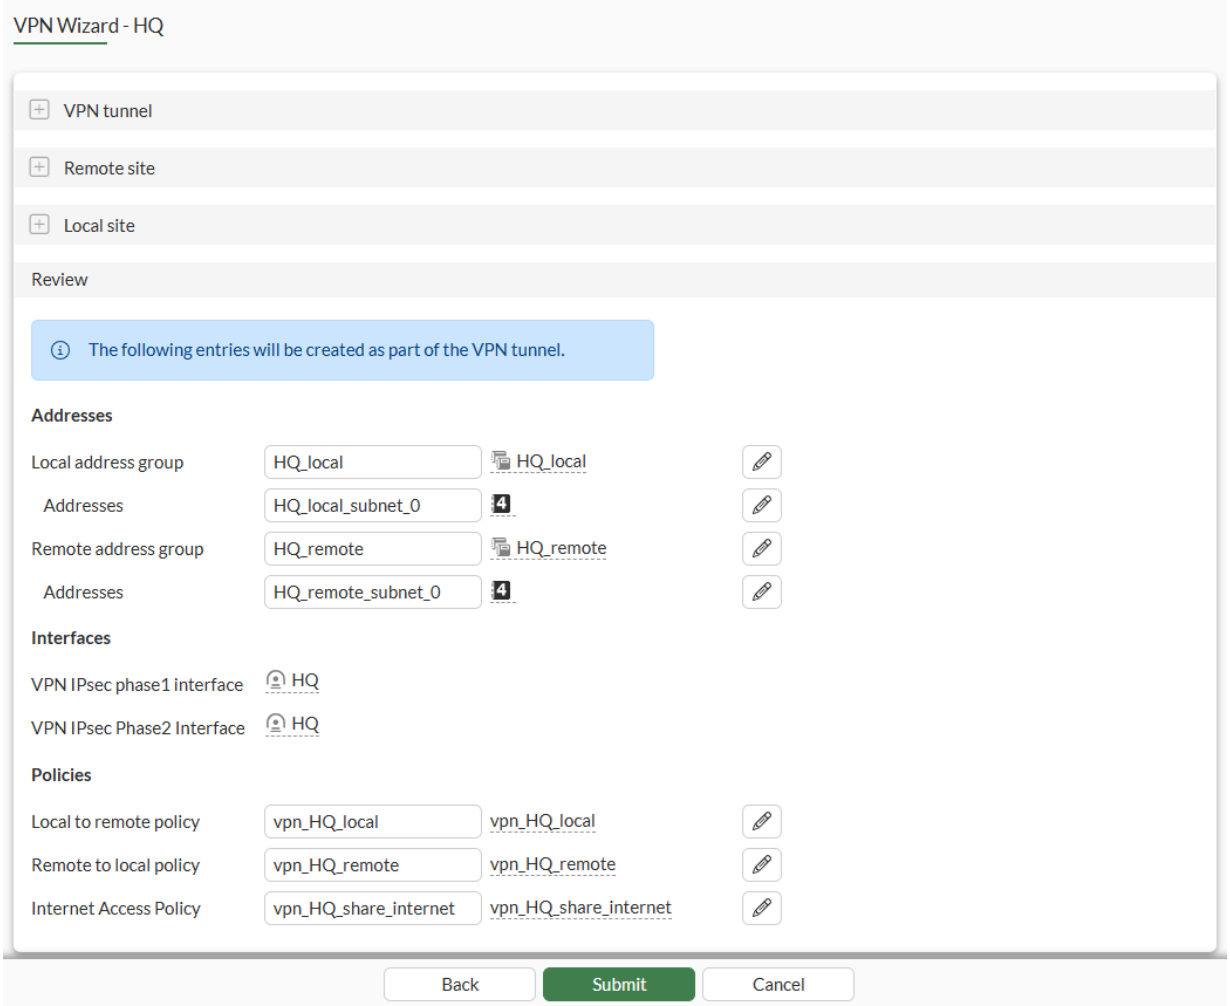
To configure a dialup VPN to tunnel Internet browsing using the GUI:

1. Configure the dialup VPN server FortiGate at HQ:
   a. Go to *VPN > VPN Wizard* and configure the following settings for *VPN Setup*:
      i. Enter a VPN name, in this example, *HQ*.
      ii. For *Template Type*, select *Site to Site*.
      iii. Click *Begin*.
   b. Configure the VPN tunnel:
      i. For *Authentication Method*, select *Pre-shared Key*.
      ii. In the *Pre-shared Key* field, enter your key.
      iii. For *IKE*, select *Version 2*.
      iv. Keep *Transport* set to *UDP*. If TCP is required, enable *Allow VPN negotiation over TCP* in *VPN > VPN Tunnels > Settings* before using the VPN wizard.
      v. Click *Next*.
   c. Configure the *Remote Site*:
      i. For *Remote site device type*, select *FortiGate*.
      ii. For *Remote site device*, select *Behind NAT or dynamic*.
      iii. For *Remote site subnets that can access VPN*, depending on whether you need to allow each branch individually, entire their subnets. Use 0.0.0.0/0 if you need to allow any subnets.
      iv. Click *Next*.
   d. Configure the *Local Site*:
      i. For *Outgoing interface that binds to tunnel*, select *port3*.
      ii. Disable *Create and add interface to zone*.
      iii. For *Local Interface*, select *port1*.
      iv. The *Local subnets that can access VPN* field should automatically fill with the local subnet on port1.
      v. Enable *Allow remote site's internet traffic through this device*.

vi. Set *Shared WAN* to *port3*. This is the interface that will provide internet access. If this is an interface other than the interface used for your VPN tunnel, specify it here.

vii. Click *Next*.

e. Review the configuration and click *Submit*.



This effectively creates a VPN dialup gateway on the HQ, which allows tunneled traffic to access the internet through the internet access policy *vpn_HQ_share_Internet*.

2. Configure the dialup VPN client FortiGate on Branch 1:

a. Go to *VPN* > *VPN Wizard* and configure the following settings for *VPN Setup*:

i. Enter a VPN name, in this example, *Branch1*.

ii. For *Template Type*, select *Site to Site*.

iii. Click *Begin*.

b. Configure the VPN tunnel:

i. For *Authentication Method*, select *Pre-shared Key*.

ii. In the *Pre-shared Key* field, enter *sample* as the key.

iii. For *IKE*, select *Version 2*.

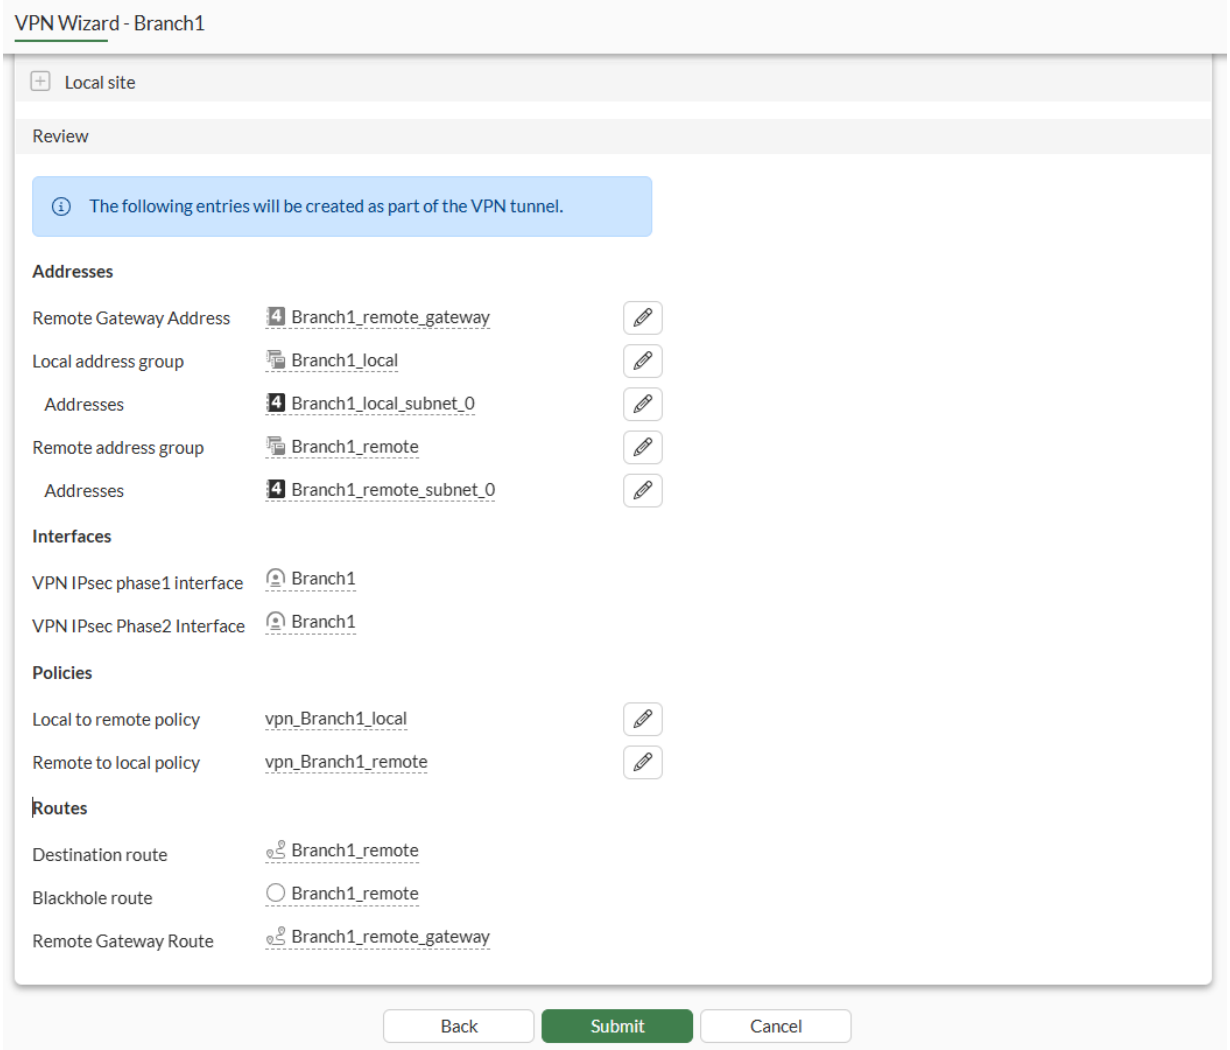
iv. Keep *Transport* set to *UDP*. If TCP is required, enable *Allow VPN negotiation over TCP* in *VPN* > *VPN Tunnels* > *Settings* before using the VPN wizard.

v. Click *Next*.

c. Configure the *Remote Site*:
   i. For *Remote site device type*, select *FortiGate*.
   ii. For *Remote site device*, select *Accessible and static*.
   iii. Set *IP* to *203.0.113.2*.
   iv. Enable *Route this device's internet traffic through the remote site*.
   v. Click *Next*.

d. Configure the *Local Site*:
   i. For *Outgoing interface that binds to tunnel*, select *port2*.
   ii. Disable *Create and add interface to zone*.
   iii. For *Local Interface*, select *port3*.
   iv. The *Local subnets that can access VPN* field should automatically fill with the local subnet on port1.
   v. For *Local Gateway*, specify the next hop of the outgoing interface.
   vi. Click *Next*.

e. Review the configuration and click *Submit*.



3. Configure the dialup VPN client FortiGate similarly on other branches.

To configure a dialup VPN to tunnel Internet browsing using the CLI:

1. Configure the WAN interface and static route on the FortiGate at HQ:

```
config system interface
    edit "port1"
        set ip 10.0.1.254 255.255.255.0
        set alias "Clients_LAN"
    next
    edit "port3"
        set ip 203.0.113.2 255.255.255.0
        set alias "WAN"
        set role wan
    next
end
config router static
    edit 1
        set gateway 203.0.113.254
        set device "port3"
    next
end
```

2. Configure IPsec phase1-interface and phase2-interface configuration at HQ:

```
config vpn ipsec phase1-interface
    edit "HQ"
        set type dynamic
        set interface "port3"
        set ike-version 2
        set peertype any
        set net-device disable
        set proposal aes128-sha256 aes256-sha256 aes128gcm-prfsha256 aes256gcm-prfsha384
chacha20poly1305-prfsha256
        set dhgrp 20 21
        set psksecret <secret>
    next
end
config vpn ipsec phase2-interface
    edit "HQ"
        set phase1name "HQ"
        set proposal aes128-sha256 aes256-sha256 aes128gcm aes256gcm chacha20poly1305
        set dhgrp 20 21
        set src-addr-type name
        set dst-addr-type name
        set src-name "all"
        set dst-name "HQ_remote"
    next
end
```

3. Configure the firewall policies at HQ:

```
config firewall policy
    edit 19
```

```
        set name "vpn_HQ_local"
        set srcintf "port1"
        set dstintf "HQ"
        set action accept
        set srcaddr "HQ_local"
        set dstaddr "HQ_remote"
        set schedule "always"
        set service "ALL"
    next
    edit 20
        set name "vpn_HQ_remote"
        set srcintf "HQ"
        set dstintf "port1"
        set action accept
        set srcaddr "HQ_remote"
        set dstaddr "HQ_local"
        set schedule "always"
        set service "ALL"
    next
    edit 21
        set name "vpn_HQ_share_internet"
        set srcintf "HQ"
        set dstintf "port3"
        set action accept
        set srcaddr "HQ_remote"
        set dstaddr "all"
        set schedule "always"
        set service "ALL"
        set nat enable
    next
end
```

4. Configure the WAN interface and static route on Branch 1:

```
config system interface
    edit "port2"
        set ip 203.0.113.3 255.255.255.0
    next
    edit "port3"
        set ip 172.16.7.8 255.255.255.0
    next
end
config router static
    edit 1
        set gateway 203.0.113.254
        set device "wan1"
    next
end
```

5. Configure the address objects on Branch 1:

```
config firewall address
    edit "Branch1_local_subnet_0"
        set allow-routing enable
        set subnet 172.16.7.0 255.255.255.0
    next
    edit "Branch1_remote_subnet_0"
        set allow-routing enable
        set subnet 0.0.0.0 0.0.0.0
    next
end
config firewall addrgrp
    edit "Branch1_local"
        set allow-routing enable
        set member "Branch1_local_subnet_0"
    next
    edit "Branch1_remote"
        set allow-routing enable
        set member "Branch1_remote_subnet_0"
    next
end
```

6. Configure IPsec phase1-interface and phase2-interface configuration on Branch 1:

```
config vpn ipsec phase1-interface
    edit "Branch1"
        set interface "port2"
        set ike-version 2
        set peertype any
        set net-device disable
        set proposal aes128-sha256 aes256-sha256 aes128gcm-prfsha256 aes256gcm-prfsha384
chacha20poly1305-prfsha256
        set dhgrp 20 21
        set wizard-type static-fortigate
        set transport udp
        set remote-gw 203.0.113.2
        set psksecret <secret>
    next
end
config vpn ipsec phase2-interface
    edit "Branch1"
        set phase1name "Branch1"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm aes256gcm
chacha20poly1305
        set dhgrp 20 21
        set src-addr-type name
        set dst-addr-type name
        set src-name "Branch1_local"
        set dst-name "Branch1_remote"
    next
end
```

7. Configure the firewall policies on Branch 1:

```
config firewall policy
    edit 5
        set name "vpn_Branch1_local"
        set srcintf "port3"
        set dstintf "Branch1"
        set action accept
        set srcaddr "Branch1_local"
        set dstaddr "Branch1_remote"
        set schedule "always"
        set service "ALL"
    next
    edit 6
        set name "vpn_Branch1_remote"
        set srcintf "Branch1"
        set dstintf "port3"
        set action accept
        set srcaddr "Branch1_remote"
        set dstaddr "Branch1_local"
        set schedule "always"
        set service "ALL"
    next
end
```

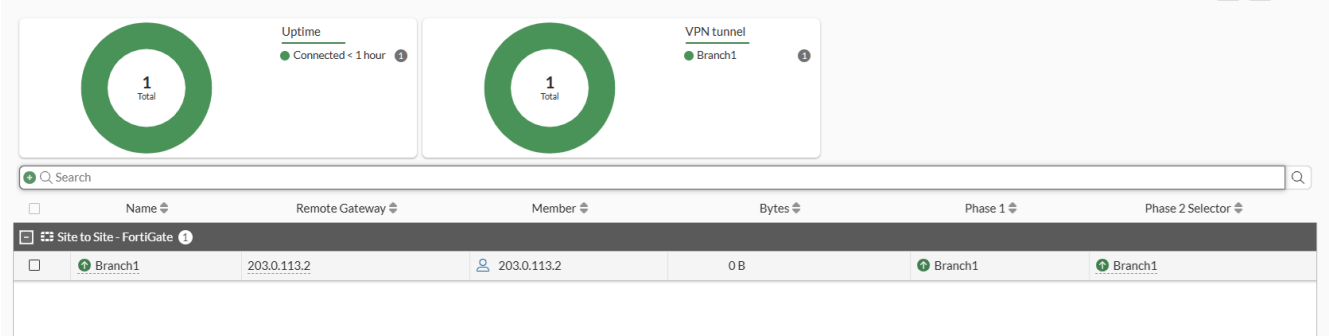
8. Configure the static routes to route traffic to the tunnel and the gateway on Branch 1:

```
config router static
    edit 4
        set distance 1
        set device "Branch1"
        set dstaddr "Branch1_remote"
    next
    edit 5
        set distance 254
        set blackhole enable
        set dstaddr "Branch1_remote"
        set vrf 0
    next
    edit 6
        set gateway 203.0.113.254
        set distance 1
        set device "port2"
        set dstaddr "Branch1_remote_gateway"
    next
end
```

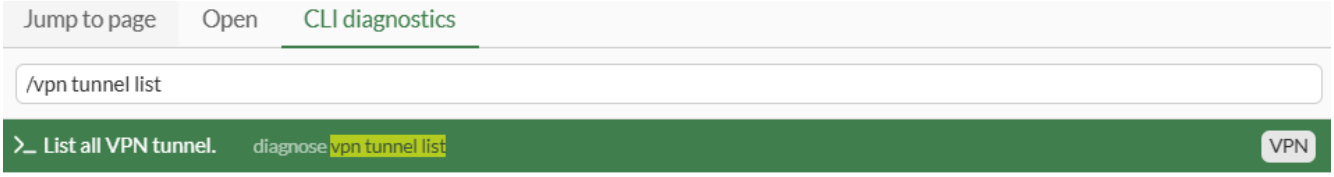
Verifying the tunnel connectivity

After the branch's tunnel has been created, it should come up automatically.

On the branch, go to the VPN monitor to see the tunnel status.



Optionally, view the VPN tunnel list on a branch with the `diagnose vpn tunnel list` command, or using the command palette (ctrl-p) > CLI diagnostics:



```
# diagnose vpn tunnel list
list all ipsec tunnel in vd 0
------------------------------------------------------
name=Branch1 ver=2 serial=2 203.0.113.3:0->203.0.113.2:0 nexthop=203.0.113.254 tun_id=203.0.113.2

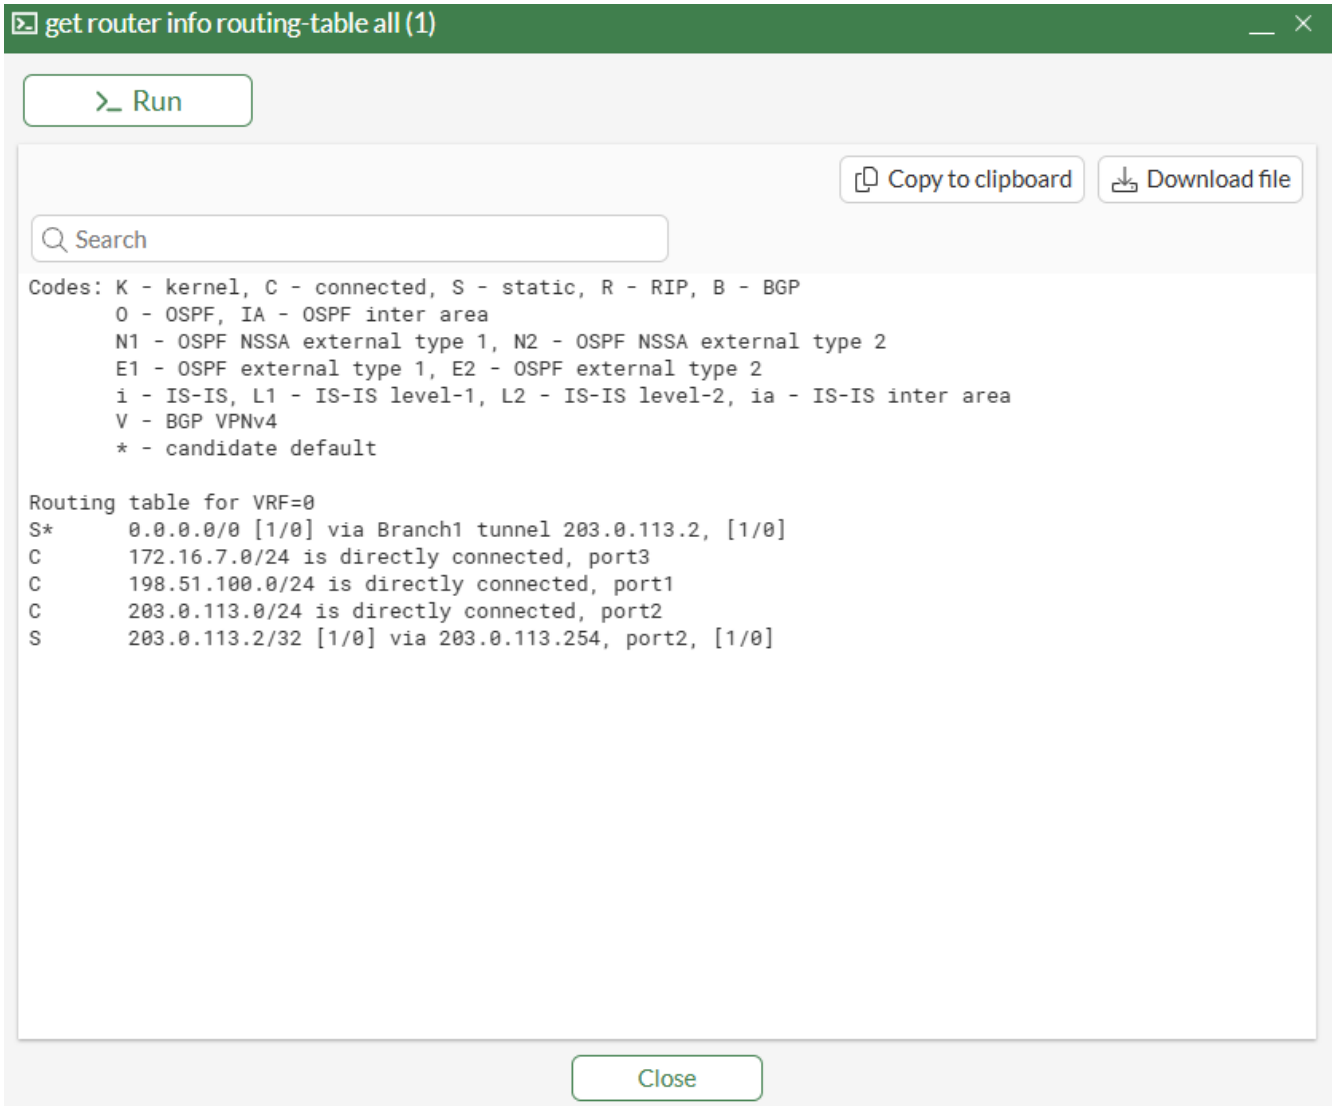
```

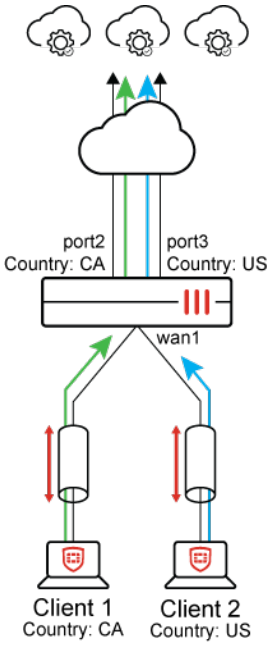
Optionally, view static routing table on a branch with the `get router info routing-table all` command, or from the command palette:

```
# get router info routing-table all
Routing table for VRF=0
S*      0.0.0.0/0 [5/0] is directly connected, branch1
S*      22.1.1.1/32 [1/0] via 15.1.1.1, wan1
```



Geography-based tunneled internet browsing NEW

A FortiGate VPN gateway can be configured to route egress traffic to the Internet through a specific interface (port2 or port3) based on the originating geolocation of the ingress client traffic (Canada or US). This can be achieved using FortiClient Secure Internet Access (SIA) configuration together with a policy route to route traffic to the proper egress interface.



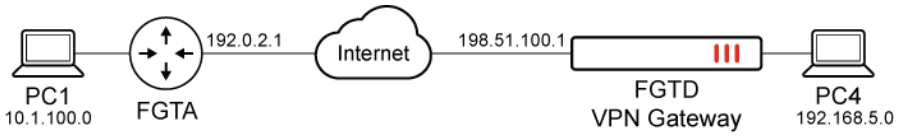
Previously, using the supported configuration of Matching IPsec tunnel gateway based on address parameters, IPsec clients with public source IP addresses originating from a specific geolocation (country/region) were matched by specifying the source geography within the IPsec tunnel configuration itself, namely, in the Phase 1 configuration. This meant that for every geolocation to be matched, a new IPsec tunnel, consisting of Phase 1 and Phase 2 settings, needed to be configured.

FortiOS has added support for specifying source geography addresses in firewall policies and policy routes on a FortiGate configured for dial-up IPsec remote access. With this enhancement, a single IPsec tunnel can be used while matching client source IP addresses based on geolocation can be achieved by configuring source geography addresses in the firewall policies and policy routes.

Example

In this example, the client PC1 behind FGTA with NAT enabled is located in Canada. FGTD is configured as the VPN Gateway with:

- Firewall source address (geo-CA) configured with CA country
- VPN IPsec tunnel
- Firewall policy with geo-CA selected as the source address



This example shows how a firewall policy and policy route involving a dialup IPsec tunnel can both be matched based on the source IP geolocation of incoming dialup clients. FortiOS internally keeps track of the original geolocation of incoming dialup traffic and integrates with firewall policies and with policy routing.

To configure FGTD:

1. On FGTD, configure a firewall address with a geolocation country/region:

```
config firewall address
    edit "geo-CA"
        set uuid 3c2d2398-9d91-51f0-4c8d-58f43ee65c8a
        set type geography
        set country "CA"
    next
end
```

2. Configure an IPsec VPN tunnel:

```
config vpn ipsec phase1-interface
    edit "Dialup"
        set type dynamic
        set interface "wan1"
        set ike-version 2
        set peertype any
        set net-device disable
        set proposal aes128-sha256 aes256-sha256 aes128gcm-prfsha256 aes256gcm-prfsha384
chacha20poly1305-prfsha256
        set dhgrp 20 21
        set wizard-type dialup-fortigate
        set transport auto
        set psksecret ENC *
    next
end
config vpn ipsec phase2-interface
    edit "Dialup"
        set phase1name "Dialup"
        set proposal aes128-sha256 aes256-sha256 aes128gcm aes256gcm chacha20poly1305
        set dhgrp 20 21
    next
end
```

3. Configure a firewall policy and select `geo-CA` as the source address:

```
config firewall policy
    edit 1
        set name "vpn_Dialup_local"
        set uuid 9378cc0e-9d8e-51f0-4e0d-a90274db10fb
        set srcintf "port1"
        set dstintf "Dialup"
        set action accept
        set srcaddr "Dialup_local"
        set dstaddr "Dialup_remote"
        set schedule "always"
        set service "ALL"
        set comments "VPN: Dialup -- Created by VPN wizard"
    next
    edit 2
        set name "vpn_Dialup_remote"
        set uuid 937abc9e-9d8e-51f0-c288-04ad4bb6f72f
```

```
        set srcintf "Dialup"
        set dstintf "port1"
        set action accept
        set srcaddr "geo-CA"
        set dstaddr "192.168.5.0"
        set schedule "always"
        set service "ALL"
        set comments "VPN: Dialup -- Created by VPN wizard"
    next
end
```

4. Configure a policy route to ensure client traffic from Canada is routed out of port2:

```
config router policy
    edit 1
        set input-device "Dialup"
        set srcaddr "geo-CA"
        set dstaddr "all"
        set gateway 198.51.100.2
        set output-device "port2"
    next
end
```

5. Verify using the VPN IKE gateway list and the VPN tunnel list:
   - VPN IKE gateway list:

```
# diagnose vpn ike gateway list

vd: root/0
name: Dialup_0

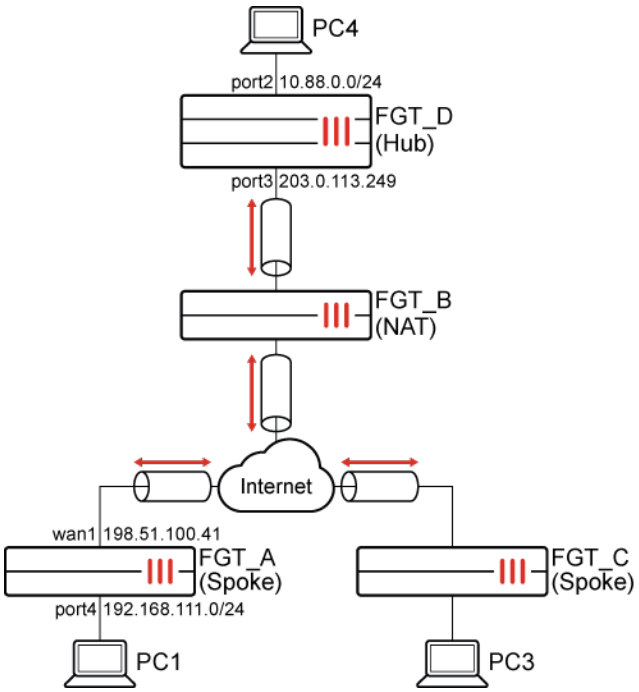
VPN over TCP with Fortinet proprietary encapsulation

In this example, IPsec VPN crosses over a carrier network which blocks UDP and ESP packets. NAT is also applied between the Spokes and the Hub. Therefore, using Fortinet's proprietary encapsulation, IPsec VPN traffic is encapsulated in TCP on port 1443 to be transported over the carrier.



To configure the IKE TCP port settings in the GUI:

1. On each FortiGate, go to *VPN* > *VPN Tunnels* > *Settings*.
2. Enable *Allow VPN negotiations over TCP* and change the *TCP port* to *1443*.
3. Click *Apply*.

To configure the IKE TCP port settings in the CLI:

```
config system settings
    set ike-tcp-service enable
    set ike-tcp-port 1443
end
```

To disable anti-replay in the global settings on the FGT_B (NAT) FortiGate:

```
config system global
    set anti-replay disable
    set hostname "FGT-B"
end
```

See Verify the ESP packets sniffed on the NAT device for more details.

To configure the FGT_D (hub) FortiGate in the GUI:

1. Go to *VPN* > *VPN Wizard*.
2. Set *Tunnel name* to *Hub*.
3. Set *Select a template* to *Site to Site*.
4. Click *Begin*.
5. Configure the *VPN tunnel* settings:

Field	Value
Authentication method	*Pre-shared key* For better security, use *Signature*.
Pre-shared key	Enter an appropriate key
IKE	*Version 2*
Transport	*Auto*
Use Fortinet encapsulation	*Enable*

6. Click *Next*.
7. Configure the *Remote site* settings:

Field	Value
Remote site device type	*FortiGate*
Remote site device	*Behind NAT or dynamic*
Remote site subnets that can access VPN	*0.0.0.0/0* For better security, enter the remote subnets individually.

8. Click *Next*.
9. Configure the *Local site* settings:

Field	Value
Outgoing interface that binds to tunnel	*WAN (port3)*
Create and add interface to zone	Disable
Local interface	*DMZ (port2)*
Local subnets that can access VPN	*10.88.0.0/24*

10. Click *Next*.
11. Review the configuration and, if everything is correct, click *Submit*.

To configure the FGT_A (spoke) FortiGate in the GUI:

1. Go to *VPN > VPN Wizard*.
2. Set *Tunnel name* to *Spoke*.
3. Set *Select a template* to *Site to Site*.
4. Click *Begin*.
5. Configure the *VPN tunnel* settings:

Field	Value
Authentication method	*Pre-shared key* For better security, use *Signature*.
Pre-shared key	Enter an appropriate key
IKE	*Version 2*
Transport	*Auto*
Use Fortinet encapsulation	*Enable*

6. Click *Next*.
7. Configure the *Remote site* settings:

Field	Value
Remote site device type	*FortiGate*
Remote site device	*Accessible and static*
IP/FQDN	*203.0.113.249*
Route this device's internet traffic through the remote site	*Disable*
Remote site subnets that can access VPN	*0.0.0.0/0* For better security, enter the remote subnets individually.

8. Click *Next*.
9. Configure the *Local site* settings:

Field	Value
Outgoing interface that binds to tunnel	*wan1*
Create and add interface to zone	Disable
Local interface	*port4*
Local subnets that can access VPN	*192.168.111.0/24*

10. Click *Next*.

11. Review the configuration and, if everything is correct, click *Submit*.

Configure the FGT_C (spoke) FortiGate similar to FGT_A.

To configure the FGT_D (hub) FortiGate in the CLI:

1. Configure the IPsec phase 1 settings:

```
config vpn ipsec phase1-interface
    edit "Hub"
        set type dynamic
        set interface "port3"
        set ike-version 2
        set peertype any
        set net-device disable
        set proposal aes128-sha256 aes256-sha256 aes128gcm-prfsha256 aes256gcm-prfsha384
chacha20poly1305-prfsha256
        set dhgrp 20 21
        set fortinet-esp enable
        set psksecret **********
    next
end
```

2. Configure the IPsec phase 2 settings:

```
config vpn ipsec phase2-interface
    edit "Hub"
        set proposal aes128-sha256 aes256-sha256 aes128gcm aes256gcm chacha20poly1305
        set dhgrp 20 21
    next
end
```

To configure the FGT_A (spoke) FortiGate in the CLI:

1. Configure the IPsec phase 1 settings:

```
config vpn ipsec phase1-interface
    edit "spoke"
        set interface "wan1"
        set ike-version 2
        set peertype any
        set net-device disable
        set proposal aes128-sha256 aes256-sha256 aes128gcm-prfsha256 aes256gcm-prfsha384
chacha20poly1305-prfsha256
        set dhgrp 20 21
        set transport auto
        set fortinet-esp enable
        set remote-gw 203.0.113.249
        set psksecret **********
    next
end
```

2. Configure the IPsec phase 2 settings:

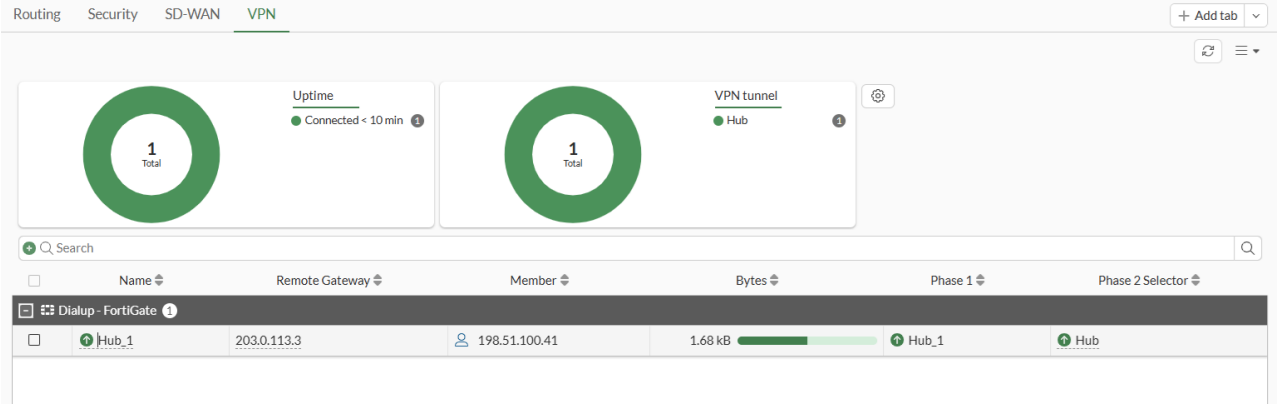
```
config vpn ipsec phase2-interface
    edit "spoke"
        set phase1name "spoke"
        set proposal aes128-sha256 aes256-sha256 aes128gcm aes256gcm chacha20poly1305
        set dhgrp 20 21
    next
end
```

IKE and ESP will be encapsulated into TCP, and ESP packets encapsulated into a non-standard TCP header.

Configure the FGT_C (spoke) FortiGate similar to FGT_A.

To verify the tunnel:

1. On the Hub, go to *Dashboard* > *Network Monitor* > *VPN*.



The tunnel shows the remote member's IP address (198.51.100.41), and the NAT'd IP (203.0.113.3) as the Remote Gateway.

2. Verify the IPsec VPN tunnel state from the CLI or from the Command palette (CTRL+P) > CLI diagnostics:

```
# diagnose vpn ike gateway list

vd: root/0
name: Hub_1
version: 2
interface: port3 5
addr: 203.0.113.249:1443 -> 203.0.113.3:7782

```

3. Use the following command to see the tunnel information:

```
# diagnose vpn tunnel list

list all ipsec tunnel in vd 0
------------------------------------------------------
name=Hub ver=2 serial=e 203.0.113.249:0->0.0.0.0:0 nexthop= tun_id=10.0.0.6 tun_id6=::10.0.0.6

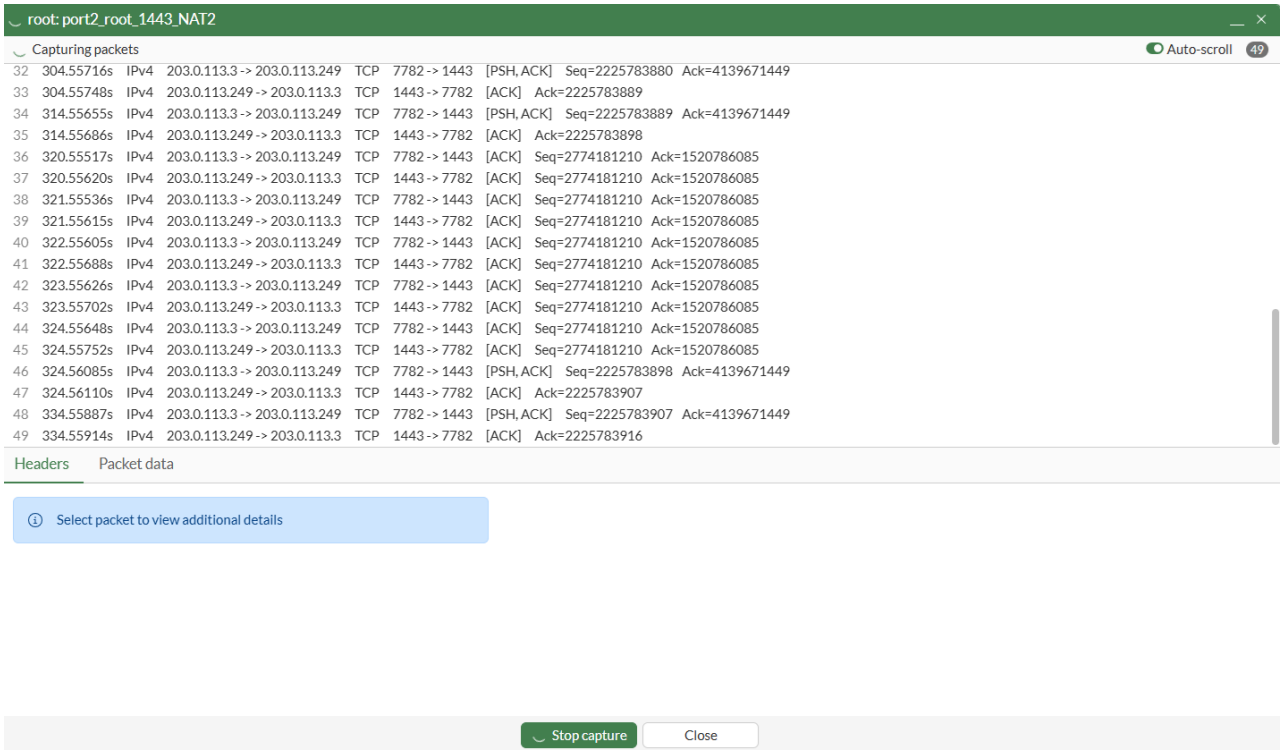
     ah=sha256 key=32 3f8af0b8c4352a1d169651abed35190921929c81eacc68c09c0986ec30ec04f4
enc: spi=ec013982 esp=aes key=16 e91b4810924fcf2d1b031abfd47d4b7f
     ah=sha256 key=32 5dca604e0171ec94ed2c997040a97fabf9eecf7dd91ad604e2e8e3d479316863
dec:pkts/bytes=10/840, enc:pkts/bytes=10/840
npu_flag=00 npu_rgwy=0.0.0.0:0 npu_lgwy=0.0.0.0:0 npu_selid=0
dec_npuid=0 enc_npuid=0 dec_engid=-1 enc_engid=-1 dec_saidx=-1 enc_saidx=-1
```

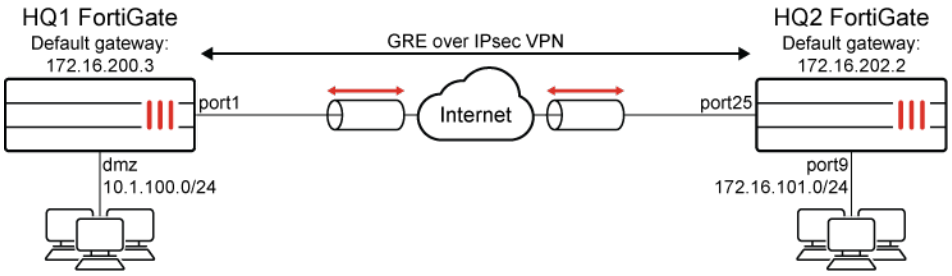
4. Verify the ESP packets sniffed on the NAT device:



In the packet capture, when data traffic passes through the tunnel, ESP packets are encapsulated into TCP ACK packets with the same sequence number. This is why anti-replay must be disabled on the NAT FortiGate.

GRE over IPsec

This is an example of GRE over an IPsec tunnel using a static route over GRE tunnel and `tunnel-mode` in the `phase2-interface` settings.



To configure GRE over an IPsec tunnel:

1. Enable subnet overlapping at both HQ1 and HQ2.

```
config system settings
    set allow-subnet-overlap enable
end
```

2. Configure the WAN interface and static route.
   a. HQ1.

```
config system interface
    edit "port1"
        set ip 172.16.200.1 255.255.255.0
    next
    edit "dmz"
        set ip 10.1.100.1 255.255.255.0
    next
end
config router static
    edit 1
        set gateway 172.16.200.3
        set device "port1"
    next
end
```

   b. HQ2.

```
config system interface
    edit "port25"
        set ip 172.16.202.1 255.255.255.0
    next
    edit "port9"
        set ip 172.16.101.1 255.255.255.0
    next
end
config router static
    edit 1
        set gateway 172.16.202.2
        set device "port25"
    next
end
```

3. Configure IPsec phase1-interface and phase2-interface.

a. HQ1.

```
config vpn ipsec phase1-interface
    edit "greipsec"
        set interface "port1"
        set peertype any
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set remote-gw 172.16.202.1
        set psksecret sample
        next
end
config vpn ipsec phase2-interface
    edit "greipsec"
        set phase1name "greipsec"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
aes256gcm chacha20poly1305
        set protocol 47
    next
end
```

b. HQ2.

```
config vpn ipsec phase1-interface
    edit "greipsec"
        set interface "port25"
        set peertype any
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set remote-gw 172.16.200.1
        set psksecret sample
        next
end
config vpn ipsec phase2-interface
    edit "greipsec"
        set phase1name "greipsec"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
aes256gcm chacha20poly1305
        set protocol 47
    next
end
```

4. Configure IPsec tunnel interface IP address.

a. HQ1.

```
config system interface
    edit "greipsec"
        set ip 10.10.10.1 255.255.255.255
        set remote-ip 10.10.10.2 255.255.255.255
    next
end
```

b. HQ2.

```
config system interface
    edit "greipsec"
        set ip 10.10.10.2 255.255.255.255
        set remote-ip 10.10.10.1 255.255.255.255
    next
end
```

5. Configure the GRE tunnel.
   a. HQ1.

```
config system gre-tunnel
    edit "gre_to_HQ2"
        set interface "greipsec"
        set remote-gw 10.10.10.2
        set local-gw 10.10.10.1
    next
end
```

   b. HQ2.

```
config system gre-tunnel
    edit "gre_to_HQ1"
        set interface "greipsec"
        set remote-gw 10.10.10.1
        set local-gw 10.10.10.2
    next
end
```

6. Configure the firewall policy.
   a. HQ1.

```
config firewall policy
    edit 1
        set srcintf "dmz"
        set dstintf "gre_to_HQ2"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
    next
    edit 2
        set srcintf "gre_to_HQ2"
        set dstintf "dmz"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
    next
    edit 3
        set srcintf "greipsec"
```

```
        set dstintf "greipsec"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
    next
end
```

b. HQ2.

```
config firewall policy
    edit 1
        set srcintf "port9"
        set dstintf "gre_to_HQ1"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
    next
    edit 2
        set srcintf "gre_to_HQ1"
        set dstintf "port9"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
    next
    edit 3
        set srcintf "greipsec"
        set dstintf "greipsec"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
    next
end
```

7. Configure the static route.

a. HQ1.

```
config router static
    edit 2
        set dst 172.16.101.0 255.255.255.0
        set device "gre_to_HQ2"
    next
end
```

b. HQ2.

```
config router static
    edit 2
        set dst 10.1.100.0 255.255.255.0
        set device "gre_to_HQ1"
    next
end
```

To view the VPN tunnel list on HQ1:

```
diagnose vpn tunnel list
list all ipsec tunnel in vd 0
----

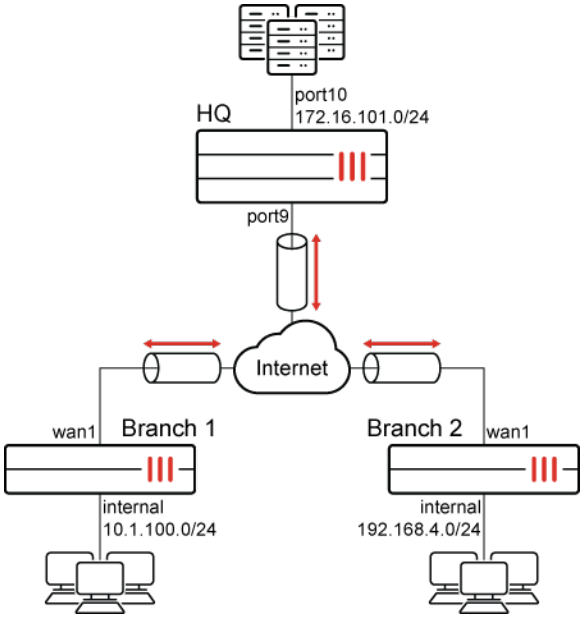
To view the static routing table on HQ1:

```
get router info routing-table static
Routing table for VRF=0
S*      0.0.0.0/0 [10/0] via 172.16.200.3, port1
S       172.16.101.0/24 [10/0] is directly connected, gre_to_HQ2
```

Policy-based IPsec tunnel

This is an example of policy-based IPsec tunnel using site-to-site VPN between branch and HQ. HQ is the IPsec concentrator.

Sample topology



Sample configuration

To configure a policy-based IPsec tunnel using the GUI:

- Configure the IPsec VPN at HQ.
- Configure the IPsec concentrator at HQ.
- Configure the firewall policy at HQ.
- Configure IPsec VPN at branch 1.
- Configure the firewall policy at branch 1.
- Configure IPsec VPN at branch 2.
- Configure the firewall policy at branch 2.

To configure the IPsec VPN at HQ:

1. Go to *VPN* > *IPsec Wizard* to set up branch 1.
   a. Enter a VPN *Name*. In this example, *to_branch1*.
   b. For *Template Type*, click *Custom*. Click *Next*.
   c. Uncheck *Enable IPsec Interface Mode*.
   d. For *Remote Gateway*, select *Static IP Address*.
   e. Enter IP address, in this example, *15.1.1.2*.
   f. For *Interface*, select *port9*.

g. In the *Authentication* section, for *Method*, select *Pre-shared Key* and enter the *Pre-shared Key*.
h. Click *OK*.

2. Go to *VPN > IPsec Wizard* to set up branch 2.
a. Enter a VPN *Name*. In this example, *to_branch2*.
b. For *Template Type*, click *Custom*. Click *Next*.
c. Uncheck *Enable IPsec Interface Mode*.
d. For *Remote Gateway*, select *Static IP Address*.
e. Enter IP address, in this example, *13.1.1.2*.
f. For *Interface*, select *port9*.
g. In the *Authentication* section, for *Method*, select *Pre-shared Key* and enter the *Pre-shared Key*.
h. Click *OK*.

To configure the IPsec concentrator at HQ:

1. Go to *VPN > IPsec Concentrator* and click *Create New*.
2. Enter a name. In this example, *branch*.
3. Add the *Membersto_branch1* and *to_branch2*.
4. Click *OK*.

To configure the firewall policy at HQ:

1. Go to *Policy & Objects > Firewall Policy* and click *Create New*.
2. Enter a policy *Name*.
3. For *Incoming Interface*, select *port10*.
4. For *Outgoing Interface*, select *port9*.
5. Select the *Source*, *Destination*, *Schedule*, *Service*, and set *Action* to *IPsec*.
6. Select the *VPN Tunnel*, in this example, *Branch1/Branch2*.
7. In this example, enable *Allow traffic to be initiated from the remote site*.
8. Click *OK*.

To configure IPsec VPN at branch 1:

1. Go to *VPN > IPsec Wizard* to set up branch 1.
2. Enter a VPN name. In this example, *to_HQ*.
3. For *Template Type*, click *Custom*. Click *Next*.
4. Uncheck *Enable IPsec Interface Mode*.
5. For *Remote Gateway*, select *Static IP Address*.
6. Enter IP address, in this example, *22.1.1.1*.
7. For *Interface*, select *wan1*.
8. In the *Authentication* section, for *Method*, select *Pre-shared Key* and enter the *Pre-shared Key*.
9. Click *OK*.

To configure the firewall policy at branch 1:

1. Go to *Policy & Objects > Firewall Policy* and click *Create New*.
2. Enter a policy *Name*.
3. Choose the *Incoming Interface*, in this example, *internal*.
4. Choose the *Outgoing Interface*, in this example, *wan1*.
5. Select the *Source*, *Destination*, *Schedule*, *Service*, and set *Action* to *IPsec*.
6. Select the *VPN Tunnel*, in this example, *Branch1/Branch2*.
7. In this example, enable *Allow traffic to be initiated from the remote site*.
8. Click *OK*.

To configure IPsec VPN at branch 2:

1. Go to *VPN > IPsec Wizard* to set up branch 1.
2. Enter a VPN name. In this example, *to_HQ*.
3. For *Template Type*, click *Custom*. Click *Next*.
4. Uncheck *Enable IPsec Interface Mode*.
5. For *Remote Gateway*, select *Static IP Address*.
6. Enter IP address, in this example, *22.1.1.1*.
7. For *Interface*, select *wan1*.
8. In the *Authentication* section, for *Method*, select *Pre-shared Key* and enter the *Pre-shared Key*.
9. Click *OK*.

To configure the firewall policy at branch 2:

1. Go to *Policy & Objects > Firewall Policy* and click *Create New*.
2. Enter a policy *Name*.
3. Choose the *Incoming Interface*, in this example, *internal*.
4. Choose the *Outgoing Interface*, in this example, *wan1*.
5. Select the *Source*, *Destination*, *Schedule*, *Service*, and set *Action* to *IPsec*.
6. Select the *VPN Tunnel*, in this example, *to_HQ*.
7. In this example, enable *Allow traffic to be initiated from the remote site*.
8. Click *OK*.

To configure a policy-based IPsec tunnel using the CLI:

1. Configure the HQ WAN interface and static route.

```
config system interface
    edit "port9"
        set alias "WAN"
        set ip 22.1.1.1 255.255.255.0
    next
    edit "port10"
        set alias "Internal"
        set ip 172.16.101.1 255.255.255.0
```

```
    next
end
config router static
    edit 1
        set gateway 22.1.1.2
        set device "port9"
    next
end
```

2. Configure the HQ IPsec phase1 and phase2.

```
config vpn ipsec phase1
    edit "to_branch1"
        set interface "port9"
        set peertype any
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set remote-gw 15.1.1.2
        set psksecret sample
        next
    edit "to_branch2"
        set interface "port9"
        set peertype any
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set remote-gw 13.1.1.2
        set psksecret sample
        next
end
config vpn ipsec phase2
    edit "to_branch1"
        set phase1name "to_branch1"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm aes256gcm
chacha20poly1305
    next
    edit "to_branch2"
        set phase1name "to_branch2"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm aes256gcm
chacha20poly1305
    next
end
```

3. Configure the firewall policy at HQ.

```
config firewall policy
    edit 1
        set srcintf "port10"
        set dstintf "port9"
        set srcaddr "all"
        set dstaddr "10.1.100.0"
        set action ipsec
        set schedule "always"
        set service "ALL"
        set inbound enable
```

```
        set vpntunnel "to_branch1"
    next
    edit 2
        set srcintf "port10"
        set dstintf "port9"
        set srcaddr "all"
        set dstaddr "192.168.4.0"
        set action ipsec
        set schedule "always"
        set service "ALL"
        set inbound enable
        set vpntunnel "to_branch2"
    next
end
```

4. Configure the IPsec concentrator at HQ.

```
config vpn ipsec concentrator
    edit 1
        set name "branch"
        set member "to_branch1" "to_branch2"
    next
end
```

5. Configure the branch WAN interface and static route.
   a. For branch 1.

```
config system interface
    edit "wan1"
        set alias "primary_WAN"
        set ip 15.1.1.2 255.255.255.0
    next
    edit "internal"
        set ip 10.1.100.1 255.255.255.0
    next
end
config router static
    edit 1
        set gateway 15.1.1.1
        set device "wan1"
    next
end
```

   b. For branch 2.

```
config system interface
    edit "wan1"
        set alias "primary_WAN"
        set ip 13.1.1.2 255.255.255.0
    next
    edit "internal"
        set ip 192.168.4.1 255.255.255.0
```

```
    next
end
config router static
    edit 1
        set gateway 13.1.1.1
        set device "wan1"
    next
end
```

6. Configure the branch IPsec phase1 and phase2.
   a. For branch 1.

```
config vpn ipsec phase1
    edit "to_HQ"
        set interface "wan1"
        set peertype any
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set remote-gw 22.1.1.1
        set psksecret sample
        next
end
config vpn ipsec phase2
    edit "to_HQ"
        set phase1name "to_HQ"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
aes256gcm chacha20poly1305
    next
end
```

   b. For branch 2.

```
config vpn ipsec phase1
    edit "to_HQ"
        set interface "wan1"
        set peertype any
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set remote-gw 22.1.1.1
        set psksecret sample
        next
end
config vpn ipsec phase2
    edit "to_HQ"
        set phase1name "to_HQ"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
aes256gcm chacha20poly1305
    next
end
```

7. Configure the branch firewall policy.

a. For branch 1.

```
config firewall policy
    edit 1
        set srcintf "internal"
        set dstintf "wan1"
        set srcaddr "10.1.100.0"
        set dstaddr "all"
        set action ipsec
        set schedule "always"
        set service "ALL"
        set inbound enable
        set vpntunnel "to_HQ"
    next
end
```

b. For branch 2.

```
config firewall policy
    edit 1
        set srcintf "internal"
        set dstintf "wan1"
        set srcaddr "192.168.4.0"
        set dstaddr "all"
        set action ipsec
        set schedule "always"
        set service "ALL"
        set inbound enable
        set vpntunnel "to_HQ"
    next
end
```

To view the IPsec VPN tunnel list at HQ:

```
# diagnose vpn tunnel list
```

```
list all ipsec tunnel in vd 0

SM3/SM4 cryptographic algorithms for IKEv1/ IKEv2 NEW

The ShangMi SM4 encryption algorithm and SM3 hash algorithm are supported proposals for IKEv1 and IKEv2 site-to-site VPN configurations. The SM4-SM3 pair can be selected for Phase1 IKE proposal and Phase2 ESP tunnel proposal.

These encryption algorithms are often used in regulatory requirements in China. They are incorporated into ISO/IEC standards and recognized by IETF in the Internet-Draft for Using ShangMi in the Internet Key Exchange Protocol Version 2 (IKEv2).

For IKEv2:

FortiGate supports the following transform types and names for IKEv2:

Transform Type	Type	Name
1	Encryption Algorithm Transform	ENCR_SM4_CBC

Transform Type	Type	Name
2	Pseudorandom Function Transform	PRF_HMAC_SM3
3	Integrity Algorithm Transform	AUTH_HMAC_SM3

In IKEv2, when SM4-SM3 proposal is chosen:

- HMAC-SM3 is used as the PRF and integrity algorithm.
- SM4-CBC is used for IKE encryption.
- 128-bit IV length defined by SM4-CBC block size.
- For IPsec:
  - SM4-CBC is used for payload encryption. IV length: 128 bits.
  - HMAC-SM3 is used for ESP integrity. ICV uses the full 256-bit hash output without truncation.

For IKEv1:

Similarly, IKEv1 uses the following transform identifiers:

- OAKLEY_ATTR_ENC_ALG_SM4
- OAKLEY_ATTR_HASH_ALG_SM3
- IPSECDOI_ESP_SM4_CBC
- IPSECDOI_ATTR_AUTH_HMAC_SM3_256

Supported FortiGate models:

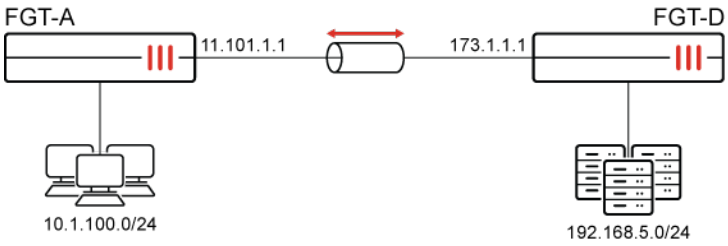
- 200G series
- 400F
- 600F
- 900G
- All high-end F-series from 1000F and above
- 7000F
- FG-VM64

Limitations

- Any tunnels using SM4-SM3 proposal do not support hardware acceleration.
- It is only available to physical or FortiGate-VMs using x86_64 processors.
- FGT using 3.2 Linux kernel are not supported

Example

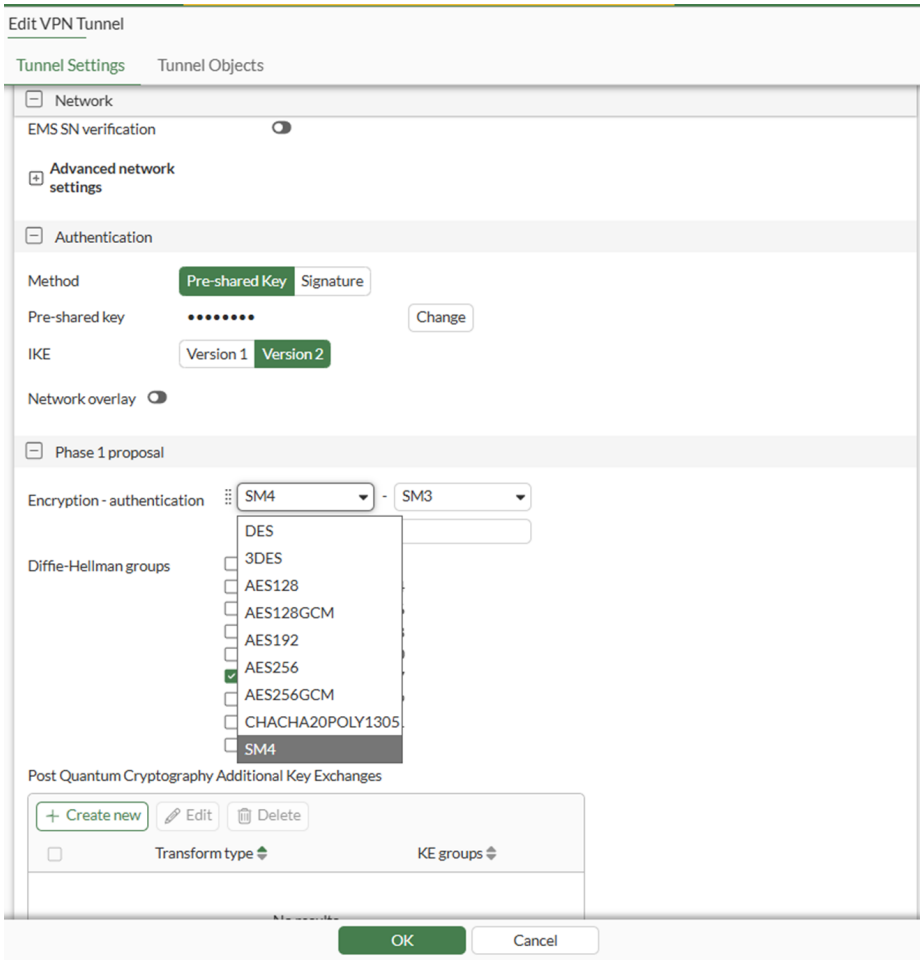
SM4-SM3 is used in the IKE proposal in IKEv2 to meet regulatory requirement for a site-to-site VPN.



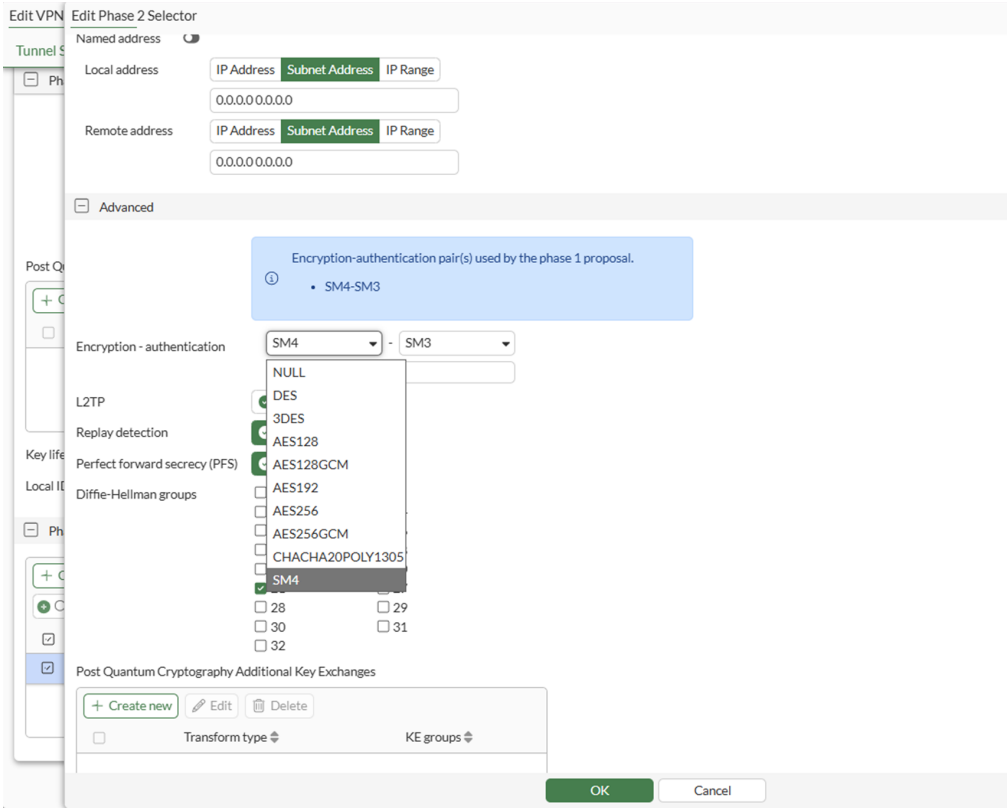
To configure in the GUI:

Exact steps are not provided in detail. See CLI configuration for exact configurations.

1. On FGT-A, go to *VPN > VPN Tunnels* and create a new tunnel.
2. Set *Remote gateway* to *Static IP address*, and configure the *Network* and *Authentication* settings as needed.
3. For Phase 1 proposal:
   a. Remove all default proposals.
   b. Select *SM4* for the *Encryption* algorithm. SM3 will be selected automatically for the *authentication* algorithm.



4. For Phase 2, create a new selector:
   a. Under *Advanced*, remove all default proposals.
   b. Select *SM4* for the *Encryption* algorithm. SM3 will be selected automatically for the *authentication* algorithm.
   c. Click *OK*.



5. Click *OK*.
6. Similarly configure SM4-SM3 proposals in the VPN configurations on your remote FortiGate FGT-D.

To configure in the CLI:

```
config system settings
    set ike-proposal-visibility all
end
```

```
config vpn ipsec phase1-interface
    edit "HUB"
        set type dynamic
        set interface "port13"
        set ike-version 2
        set peertype any
        set net-device disable
        set proposal sm4-sm3
        set dhgrp 20 21
        set psksecret <password>
```

```
   next
end
```

```
config vpn ipsec phase2-interface
    edit "HUB"
        set phase1name "HUB"
        set proposal sm4-sm3
        set dhgrp 20 21
    next
end
```

```
config firewall policy
    edit 1
        set srcintf "any"
        set dstintf "any"
        set action accept
        set srcaddr "all"
        set dstaddr "all"
        set srcaddr6 "all"
        set dstaddr6 "all"
        set schedule "always"
        set service "ALL"
    next
end
```

This policy is for example purposes only. Do not configure an any-to-any allow policy in production.

Verification

Use the following CLI commands to view the real-time debugs when establishing the VPN tunnel. Note the proposals that were offered and matched in the three transform types (ENCRYPTION, INTEGRITY, PRF) for IKE (P1) and for ESP (P2).

```
# diagnose debug application ike -1
# diagnose debug enable

ike V=root:0:toHUB:376: incoming proposal:
ike V=root:0:toHUB:376: proposal id = 1:
ike V=root:0:toHUB:376:   protocol = IKEv2:

ike V=root:0:toHUB:376:         type=ENCR, val=SM4_CBC (key_len = 128)
ike V=root:0:toHUB:376:         type=INTEGR, val=AUTH_HMAC_SM3
```

```
ike V=root:0:toHUB:376:         type=PRF, val=PRF_HMAC_SM3
ike V=root:0:toHUB:376:         type=DH_GROUP, val=ECP384.
...
ike V=root:0:toHUB:376:toHUB:495: incoming child SA proposal:
ike V=root:0:toHUB:376:toHUB:495: proposal id = 1:
ike V=root:0:toHUB:376:toHUB:495:   protocol = ESP:
ike V=root:0:toHUB:376:toHUB:495:      encapsulation = TUNNEL
ike V=root:0:toHUB:376:toHUB:495:         type=ENCR, val=SM4_CBC (key_len = 128)
ike V=root:0:toHUB:376:toHUB:495:         type=INTEGR, val=SM3
ike V=root:0:toHUB:376:toHUB:495:         type=ESN, val=NO
ike V=root:0:toHUB:376:toHUB:495:         PFS is disabled
ike V=root:0:toHUB:376:toHUB:495: matched proposal id 1
ike V=root:0:toHUB:376:toHUB:495: proposal id = 1:
ike V=root:0:toHUB:376:toHUB:495:   protocol = ESP:
ike V=root:0:toHUB:376:toHUB:495:      encapsulation = TUNNEL
ike V=root:0:toHUB:376:toHUB:495:         type=ENCR, val=SM4_CBC (key_len = 128)
ike V=root:0:toHUB:376:toHUB:495:         type=INTEGR, val=SM3
ike V=root:0:toHUB:376:toHUB:495:         type=ESN, val=NO
ike V=root:0:toHUB:376:toHUB:495:         PFS is disabled
...
ike V=root:0:toHUB:376:toHUB:495: sending SNMP tunnel UP trap
ike V=root:0:toHUB: static tunnel up event 0.0.0.0 (dev=53)
ike V=root:0:toHUB: static tunnel up event :: (dev=53)
```

Use the following CLI commands to verify the tunnel is established with the SM4-SM3 proposal:

```
# diagnose vpn ike gateway list name <tunnel>

vd: root/0
name: toHUB
version: 2
interface: port9 15
addr: 11.101.1.1:500 -> 173.1.1.1:500

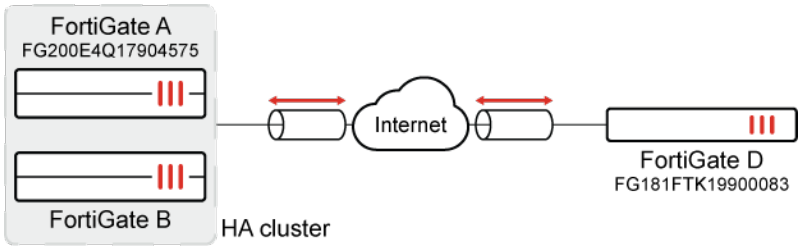
Securely exchange serial numbers between FortiGates connected with IPsec VPN

Serial numbers can be securely exchanged between FortiGates connected with IPsec VPN. This feature is supported in IKEv2, IKEv1 main mode, and IKEv1 aggressive mode. The exchange is only performed with participating FortiGates that have enabled the `exchange-fgt-device-id` setting under `config vpn ipsec phase1-interface`.

Example

In this example, FortiGates A and B are in an HA cluster, so the serial numbers will not exchange after failover. The cluster is connected to FortiGate D through IPsec VPN.



To securely exchange serial numbers between the FortiGates:

1. Configure the IPsec settings on FortiGate A.
   a. Configure the phase 1 interface settings:

```
config vpn ipsec phase1-interface
    edit "to_FGTD"
        set interface "port1"
        set peertype any
        set net-device disable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set exchange-fgt-device-id enable
        set remote-gw 172.16.200.4
        set psksecret **********
    next
end
```

   b. Configure the phase 2 interface settings:

```
config vpn ipsec phase2-interface
    edit "to_FGTD"
        set phase1name "to_FGTD"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
aes256gcm chacha20poly1305
        set src-addr-type name
        set dst-addr-type name
        set src-name "to_FGTD_local"
        set dst-name "to_FGTD_remote"
    next
end
```

2. Configure the IPsec settings on FortiGate D.
   a. Configure the phase 1 interface settings:

```
config vpn ipsec phase1-interface
    edit "to_FGTA"
        set interface "port2"
        set peertype any
```

```
        set net-device disable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set exchange-fgt-device-id enable
        set remote-gw 172.16.200.1
        set psksecret **********
    next
end
```

b. Configure the phase 2 interface settings:

```
config vpn ipsec phase2-interface
    edit "to_FGTA"
        set phase1name "to_FGTA"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
aes256gcm chacha20poly1305
        set src-addr-type name
        set dst-addr-type name
        set src-name "to_FGTA_local"
        set dst-name "to_FGTA_remote"
    next
end
```

3. Verify the peer serial numbers.

a. On FortiGate A:

```
# diagnose vpn ike gateway list

vd: root/0
name: to_FGTD
version: 1
interface: port1 19
addr: 172.16.200.1:500 -> 172.16.200.4:500
tun_id: 172.16.200.4/::172.16.200.4
remote_location: 0.0.0.0
network-id: 0
created: 783s ago
peer-id: 172.16.200.4
peer-id-auth: no
peer-SN: FG181FTK19900083

```

To retrieve the peer serial number in FortiManager:

1. Add and authorize FortiGate A (see Adding online devices using Discover mode for more details).
2. Go to *Device Manager* > *Device & Groups* and select the FortiGate A.
3. Add the *IPsec VPN* widget (see Customizing the dashboard for more details).
4. Open the developer tools in your browser and select the *Network* tab.
5. Refresh the *IPsec VPN* widget.

6. In the *Network* tab, there should be a JSON POST request that FortiManager will proxy request to the FortiGate for the IPsec API. The response should contain the peer serial number.

FortiGate-to-third-party

This section contains the following topics about FortiGate-to-third-party VPN configurations:

- IKEv2 IPsec site-to-site VPN to an AWS VPN gateway on page 2858
- IPsec VPN to Azure with virtual network gateway on page 2865
- IPsec VPN to an Azure with virtual WAN on page 2873
- IPSec VPN between a FortiGate and a Cisco ASA with multiple subnets on page 2877
- Cisco GRE-over-IPsec VPN on page 2878
- Cloud SDN Orchestration VPN wizard for AWS NEW on page 2884

IKEv2 IPsec site-to-site VPN to an AWS VPN gateway

This is a sample configuration of an IPsec site-to-site VPN connection between an on-premise FortiGate and an AWS virtual private cloud (VPC).

AWS uses unique identifiers to manipulate a VPN connection's configuration. Each VPN connection is assigned an identifier and is associated with two other identifiers: the customer gateway ID for the FortiGate and virtual private gateway ID.

This example includes the following IDs:

- VPN connection ID: vpn-07e988ccc1d46f749
- Customer gateway ID: cgw-0440c1aebed2f418a
- Virtual private gateway ID

This example assumes that you have configured VPC-related settings in the AWS management portal.

This example includes creating and configuring two tunnels. You must configure both tunnels on your FortiGate.

To configure IKEv2 IPsec site-to-site VPN to an AWS VPN gateway:

1. Configure the first VPN tunnel:
   a. Configure Internet Key Exchange (IKE).
   b. Configure IPsec.
   c. Configure the tunnel interface.
   d. Configure border gateway protocol (BGP).
   e. Configure firewall policies.
2. Configure the second VPN tunnel:
   a. Configure Internet Key Exchange (IKE).
   b. Configure IPsec.
   c. Configure the tunnel interface.
   d. Configure BGP.
   e. Configure firewall policies.

To configure IKE for the first VPN tunnel:

A policy is established for the supported ISAKMP encryption, authentication, Diffie-Hellman (DH), lifetime, and key parameters. These sample configurations fulfill the minimum requirements for AES128, SHA1, and DH Group 2. Category VPN connections in the GovCloud AWS region have a minimum requirement of AES128, SHA2, and DH Group 14. To take advantage of AES256, SHA256, or other DH groups such as 14-18, 22, 23, and 24, you must modify these sample configuration files. Higher parameters are only available for VPNs of category "VPN", not for "VPN-Classic".

Your FortiGate's external interface's address must be static. Your FortiGate may reside behind a device performing NAT. To ensure NAT traversal can function, you must adjust your firewall rules to unblock UDP port 4500. If not behind NAT, it is recommended to disable NAT traversal.

Begin configuration in the root VDOM. The interface name must be shorter than 15 characters. It is best if the name is shorter than 12 characters. IPsec dead peer detection (DPD) causes periodic messages to be sent to ensure a security association remains operational.

```
config vpn ipsec phase1-interface
    edit vpn-07e988ccc1d46f749-0
        set interface "wan1"
        set dpd enable
        set local-gw 35.170.66.108
        set dhgrp 2
        set proposal aes128-sha1
        set keylife 28800
        set remote-gw 3.214.239.164
        set psksecret iCelks0UOob8z4SYMRM6zlx.rU2C3jth
        set dpd-retryinterval 10
    next
end
```

To configure IPsec for the first VPN tunnel:

The IPsec transform set defines the encryption, authentication, and IPsec mode parameters.

```
config vpn ipsec phase2-interface
    edit "vpn-07e988ccc1d46f749-0"
        set phase1name "vpn-07e988ccc1d46f749-0"
        set proposal aes128-sha1
        set dhgrp 2
        set pfs enable
        set keylifeseconds 3600
    next
end
```

To configure the tunnel interface for the first VPN tunnel:

You must configure a tunnel interface as the logical interface associated with the tunnel. All traffic routed to the tunnel interface must be encrypted and transmitted to the VPC. Similarly, traffic from the VPC will be logically received on this interface.

You must configure the interface's address with your FortiGate's address. If the address changes, you must recreate the FortiGate and VPN connection with Amazon VPC.

The `tcp-mss` option causes the router to reduce the TCP packets' maximum segment size to prevent packet fragmentation.

```
config system interface
    edit "vpn-07e988ccc1d46f749-0"
        set vdom "root"
        set ip 169.254.45.90 255.255.255.255
        set allowaccess ping
        set type tunnel
        set tcp-mss 1379
        set remote-ip 169.254.45.89
        set mtu 1427
        set interface "wan1"
    next
end
```

To configure BGP for the first VPN tunnel:

BGP is used within the tunnel to exchange prefixes between the virtual private gateway and your FortiGate. The virtual private gateway announces the prefix according to your VPC.

The local BGP autonomous system number (ASN) (65000) is configured as part of your FortiGate. If you must change the ASN, you must recreate the FortiGate and VPN connection with AWS.

Your FortiGate may announce a default route (0.0.0.0/0) to AWS. This is done using a prefix list and route map in FortiOS.

```
config router bgp
    set as 65000
    config neighbor
        edit 169.254.45.89
            set remote-as 64512
        next
    end
end
config router bgp
    config neighbor
        edit 169.254.45.89
            set capability-default-originate enable
        next
    end
end
config router prefix-list
    edit "default_route"
        config rule
            edit 1
                set prefix 0.0.0.0 0.0.0.0
            next
        end
    next
end
config router route-map
    edit "routemap1"
```

```
        config rule
            edit 1
                set match-ip-address "default_route"
            next
        end
    next
end
```

To advertise additional prefixes to the Amazon VPC, add these prefixes to the network statement and identify the prefix you want to advertise. Ensure that the prefix is present in the routing table of the device with a valid next-hop. If you want to advertise 192.168.0.0/16 to Amazon, you would do the following:

```
config router bgp
    config network
        edit 1
            set prefix 192.168.0.0 255.255.0.0
        next
    end
end
```

To configure firewall policies for the first VPN tunnel:

Create a firewall policy permitting traffic from your local subnet to the VPC subnet, and vice-versa.

This example policy permits all traffic from the local subnet to the VPC. First, view all existing policies using the `show firewall policy` command. Then, create a new firewall policy starting with the next available policy ID. In this example, running `show firewall policy` displayed policies 1, 2, 3, and 4, so you would proceed to create policy 5.

```
config firewall policy
    edit 5
        set srcintf "vpn-07e988ccc1d46f749-0"
        set dstintf internal
        set srcaddr all
        set dstaddr all
        set action accept
        set schedule always
        set service ANY
    next
end
config firewall policy
    edit 5
        set srcintf internal
        set dstintf "vpn-07e988ccc1d46f749-0"
        set srcaddr all
        set dstaddr all
        set action accept
        set schedule always
        set service ANY
    next
end
```

To configure IKE for the second VPN tunnel:

A policy is established for the supported ISAKMP encryption, authentication, DH, lifetime, and key parameters. These sample configurations fulfill the minimum requirements for AES128, SHA1, and DH Group 2. Category VPN connections in the GovCloud AWS region have a minimum requirement of AES128, SHA2, and DH Group 14. To take advantage of AES256, SHA256, or other DH groups such as 14-18, 22, 23, and 24, you must modify these sample configuration files. Higher parameters are only available for VPNs of category "VPN", not for "VPN-Classic".

Your FortiGate's external interface's address must be static. Your FortiGate may reside behind a device performing NAT. To ensure NAT traversal can function, you must adjust your firewall rules to unblock UDP port 4500. If not behind NAT, it is recommended to disable NAT traversal.

Begin configuration in the root VDOM. The interface name must be shorter than 15 characters. It is best if the name is shorter than 12 characters. IPsec DPD causes periodic messages to be sent to ensure a security association remains operational.

```
config vpn ipsec phase1-interface
    edit vpn-07e988ccc1d46f749-1
        set interface "wan1"
        set dpd enable
        set local-gw 35.170.66.108
        set dhgrp 2
        set proposal aes128-sha1
        set keylife 28800
        set remote-gw 100.25.187.58
        set psksecret IjFzyDneUtDdAT4RNmQ85apUG3y4Akre
        set dpd-retryinterval 10
    next
end
```

To configure IPsec for the second VPN tunnel:

The IPsec transform set defines the encryption, authentication, and IPsec mode parameters.

```
config vpn ipsec phase2-interface
    edit "vpn-07e988ccc1d46f749-1"
        set phase1name "vpn-07e988ccc1d46f749-1"
        set proposal aes128-sha1
        set dhgrp 2
        set pfs enable
        set keylifeseconds 3600
    next
end
```

To configure the tunnel interface for the second VPN tunnel:

You must configure a tunnel interface as the logical interface associated with the tunnel. All traffic routed to the tunnel interface must be encrypted and transmitted to the VPC. Similarly, traffic from the VPC will be logically received on this interface.

You must configure the interface's address with your FortiGate's address. If the address changes, you must recreate the FortiGate and VPN connection with Amazon VPC.

The `tcp-mss` option causes the router to reduce the TCP packets' maximum segment size to prevent packet fragmentation.

```
config system interface
    edit "vpn-07e988ccc1d46f749-1"
        set vdom "root"
        set ip 169.254.44.162 255.255.255.255
        set allowaccess ping
        set type tunnel
        set tcp-mss 1379
        set remote-ip 169.254.44.161
        set mtu 1427
        set interface "wan1"
    next
end
```

To configure BGP for the second VPN tunnel:

BGP is used within the tunnel to exchange prefixes between the virtual private gateway and your FortiGate. The virtual private gateway announces the prefix according to your VPC.

The local BGP ASN (65000) is configured as part of your FortiGate. If you must change the ASN, you must recreate the FortiGate and VPN connection with AWS.

Your FortiGate may announce a default route (0.0.0.0/0) to AWS. This is done using a prefix list and route map in FortiOS.

```
config router bgp
    set as 65000
    config neighbor
        edit 169.254.44.161
            set remote-as 64512
        next
    end
end
config router bgp
    config neighbor
        edit 169.254.44.161
            set capability-default-originate enable
        next
    end
end
config router prefix-list
    edit "default_route"
        config rule
            edit 1
                set prefix 0.0.0.0 0.0.0.0
            next
        end
    next
end
config router route-map
    edit "routemap1"
```

```
        config rule
            edit 1
                set match-ip-address "default_route"
            next
        end
    next
end
```

To advertise additional prefixes to the Amazon VPC, add these prefixes to the network statement and identify the prefix you want to advertise. Ensure that the prefix is present in the routing table of the device with a valid next-hop. If you want to advertise 192.168.0.0/16 to Amazon, you would do the following:

```
config router bgp
    config network
        edit 1
            set prefix 192.168.0.0 255.255.0.0
        next
    end
end
```

To configure firewall policies for the second VPN tunnel:

Create a firewall policy permitting traffic from your local subnet to the VPC subnet, and vice-versa.

This example policy permits all traffic from the local subnet to the VPC. First, view all existing policies using the `show firewall policy` command. Then, create a new firewall policy starting with the next available policy ID. In this example, running `show firewall policy` displayed policies 1, 2, 3, 4, and 5, so you would proceed to create policy 6.

```
config firewall policy
    edit 6
        set srcintf "vpn-07e988ccc1d46f749-1"
        set dstintf internal
        set srcaddr all
        set dstaddr all
        set action accept
        set schedule always
        set service ANY
    next
end
config firewall policy
    edit 6
        set srcintf internal
        set dstintf "vpn-07e988ccc1d46f749-1"
        set srcaddr all
        set dstaddr all
        set action accept
        set schedule always
        set service ANY
    next
end
```

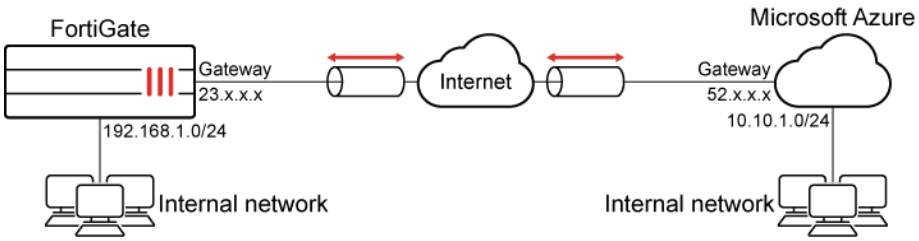
IPsec VPN to Azure with virtual network gateway

This example shows how to configure a site-to-site IPsec VPN tunnel to Microsoft Azure. It shows how to configure a tunnel between each site, avoiding overlapping subnets, so that a secure tunnel can be established.

Prerequisites

- A FortiGate with an Internet-facing IP address
- A valid Microsoft Azure account

Sample topology



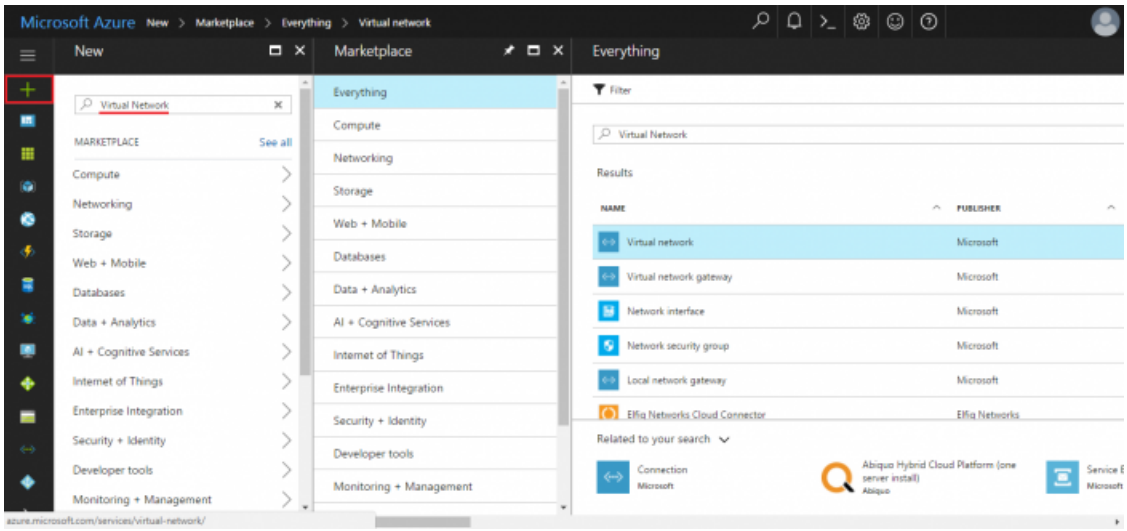
Sample configuration

This sample configuration shows how to:

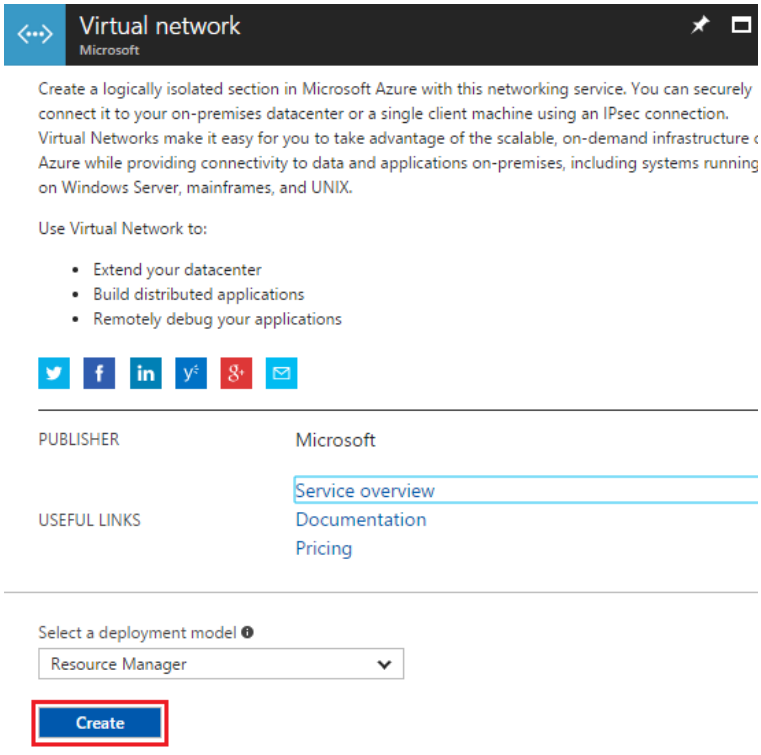
1. Configure an Azure virtual network
2. Specify the Azure DNS server
3. Configure the Azure virtual network gateway
4. Configure the Azure local network gateway
5. Configure the FortiGate tunnel
6. Create the Azure firewall object
7. Create the FortiGate firewall policies
8. Create the FortiGate static route
9. Create the Azure site-to-site VPN connection
10. Check the results

To configure an Azure virtual network:

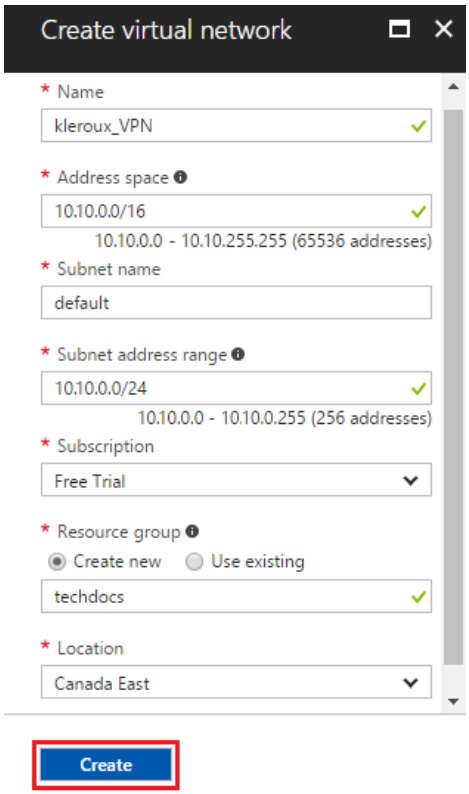
1. Log in to Azure and click *New*.
2. In *Search the Marketplace*, type *Virtual network*.
3. Click *Virtual network* to open the *Virtual network* pane.



4. At the bottom of the *Virtual network* pane, click the *Select a deployment model* dropdown list and select *Resource Manager*.
5. Click *Create*.

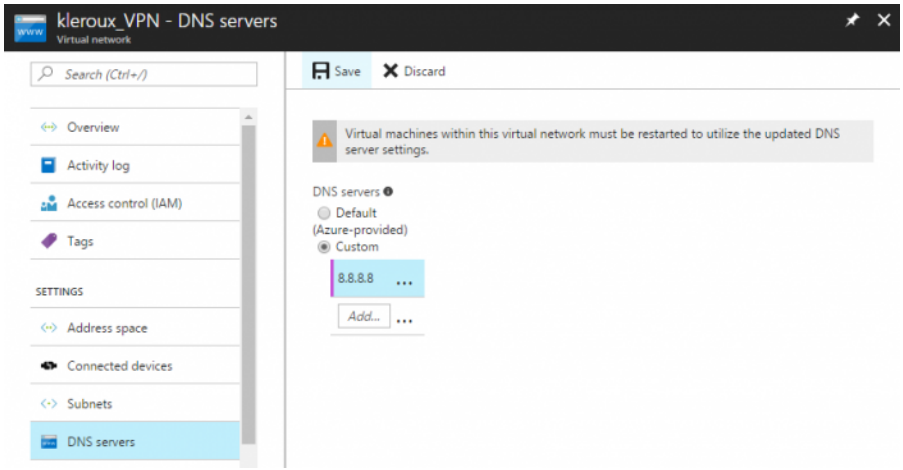


6. On the *Create virtual network* pane, enter you virtual network settings, and click *Create*.



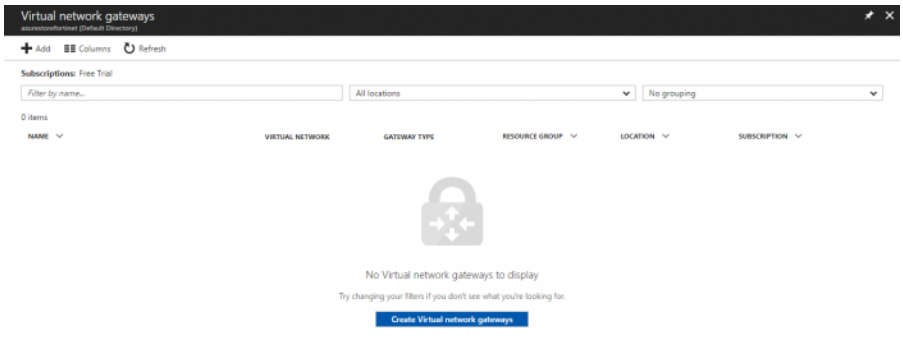
To specify the Azure DNS server:

1. Open the virtual network you just created.
2. Click *DNS servers* to open the *DNS servers* pane.
3. Enter the IP address of the DNS server and click *Save*.

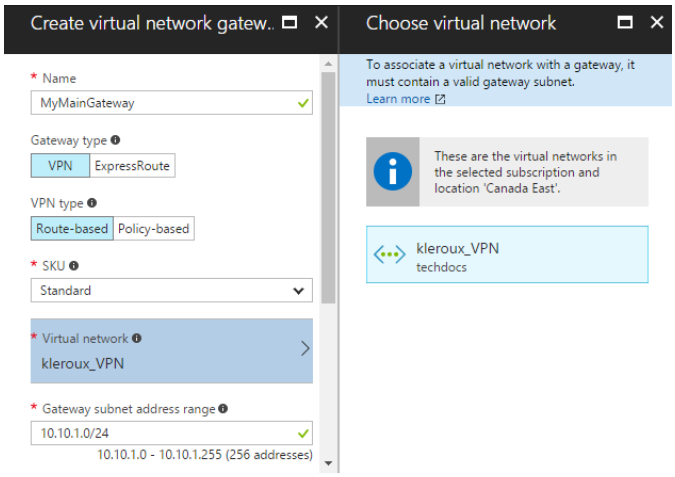


To configure the Azure virtual network gateway:

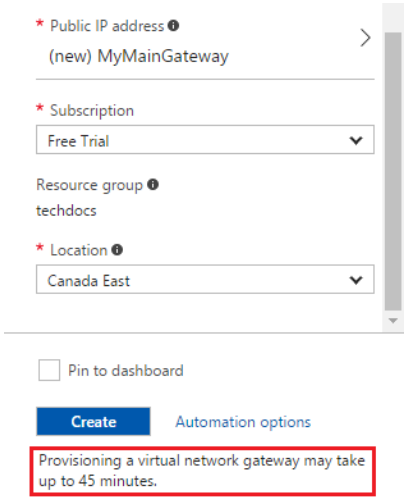
1. In the portal dashboard, go to *New*.
2. Search for *Virtual Network Gateway* and click it to open the *Virtual network gateway* pane.



3. Click *Create Virtual network gateways* and enter the settings for your virtual network gateway.

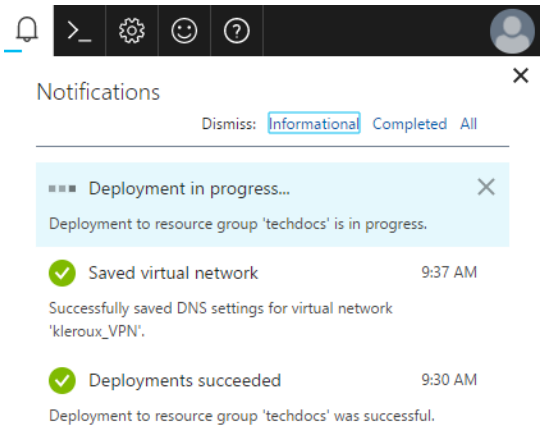


4. If needed, create a Public IP address.



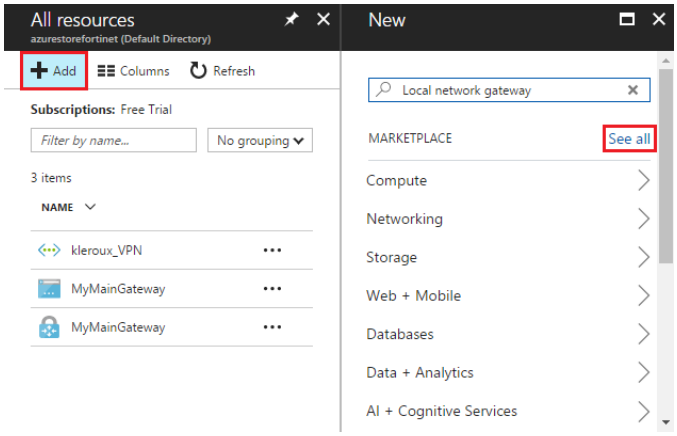
5. Click *Create*.

   Creating the virtual network gateway might take some time. When the provisioning is done, you'll receive a notification.

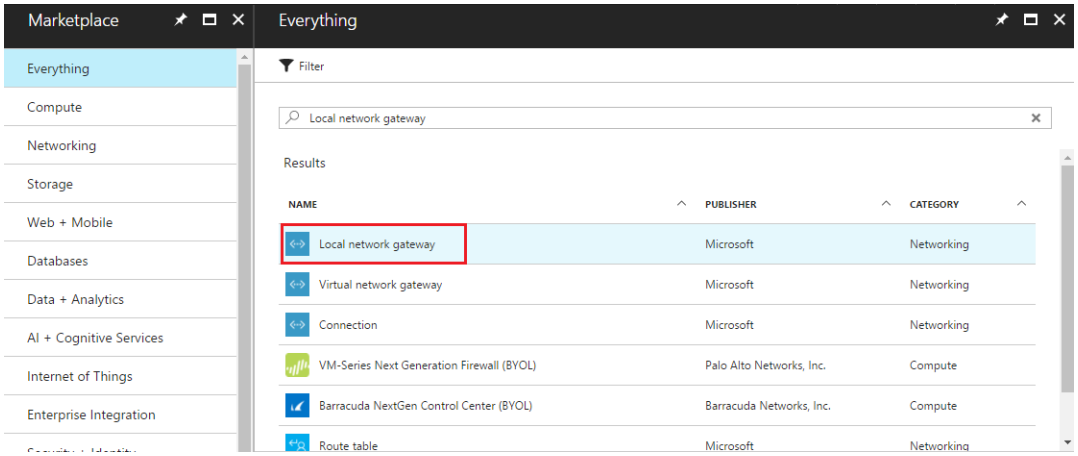


To configure the Azure local network gateway:

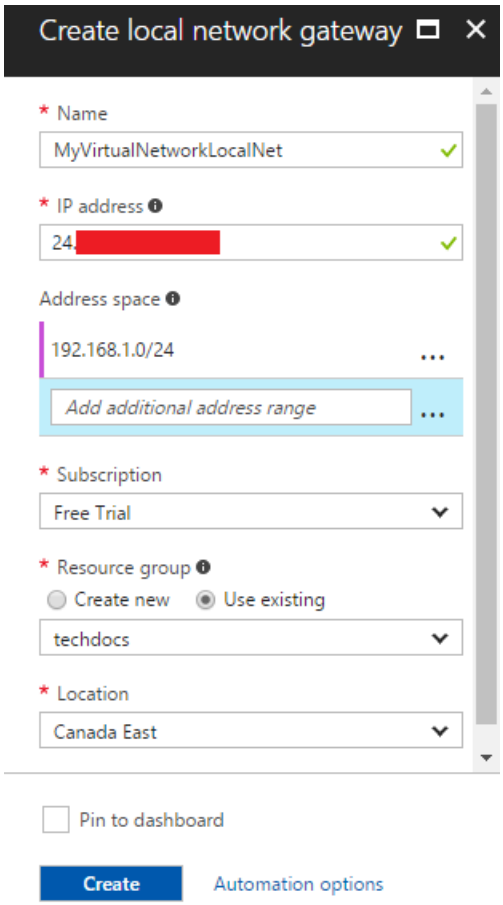
1. In the portal dashboard, click *All resources*.
2. Click *Add* and then click *See all*.



3. In the *Everything* pane, search for *Local network gateway* and then click *Create local network gateway*.



4. For the *IP address*, enter the local network gateway IP address, that is, the FortiGate's external IP address.



5. Set the remaining values for your local network gateway and click *Create*.

To configure the FortiGate tunnel:

1. In the FortiGate, go to *VPN > IP Wizard*.
2. Enter a *Name* for the tunnel, click *Custom*, and then click *Next*.
3. Configure the *Network* settings.
   a. For *Remote Gateway*, select *Static IP Address* and enter the IP address provided by Azure.
   b. For *Interface*, select *wan1*.
   c. For *NAT Traversal*, select *Disable*,
   d. For *Dead Peer Detection*, select *On Idle*.
   e. In the Authentication section, select
4. Configure the *Authentication* settings.
   a. For *Method*, select *Pre-shared Key* and enter the *Pre-shared Key*.
   b. For *IKE*, select *2*.
5. Configure the *Phase 1 Proposal* settings.
   a. Set the Encryption and Authentication combination to the three supported encryption algorithm combinations accepted by Azure.
      - AES256 and SHA1
      - 3DES and SHA1

    - AES256 and SHA256
  b. For *Diffie-Hellman Groups*, select *2*.
  c. Set *Key Lifetime (seconds)* to *28800*.
6. In *Phase 2 Selectors*, expand the *Advanced* section to configure the *Phase 2 Proposal* settings.
  a. Set the Encryption and Authentication combinations:
    - AES256 and SHA1
    - 3DES and SHA1
    - AES256 and SHA256
  b. Uncheck *Enable Perfect Forward Secrecy (PFS)*.
  c. Set *Key Lifetime (seconds)* to *27000*.
7. Click *OK*.

To create the Azure firewall object:

1. In the FortiGate, go to *Policy & Objects > Addresses*.
2. Create a firewall object for the Azure VPN tunnel.

To create the FortiGate firewall policies:

1. In the FortiGate, go to *Policy & Objects > Firewall Policy*.
2. Create a policy for the site-to-site connection that allows outgoing traffic.
  a. Set the *Source* address and *Destination* address using the firewall objects you just created.
  b. Disable *NAT*.
3. Create another policy that allows incoming traffic.
  a. For this policy, reverse the *Source* address and *Destination* address.
4. We recommend limiting the TCP maximum segment size (MSS) being sent and received so as to avoid packet drops and fragmentation.

  To do this, use the following CLI commands on both policies.

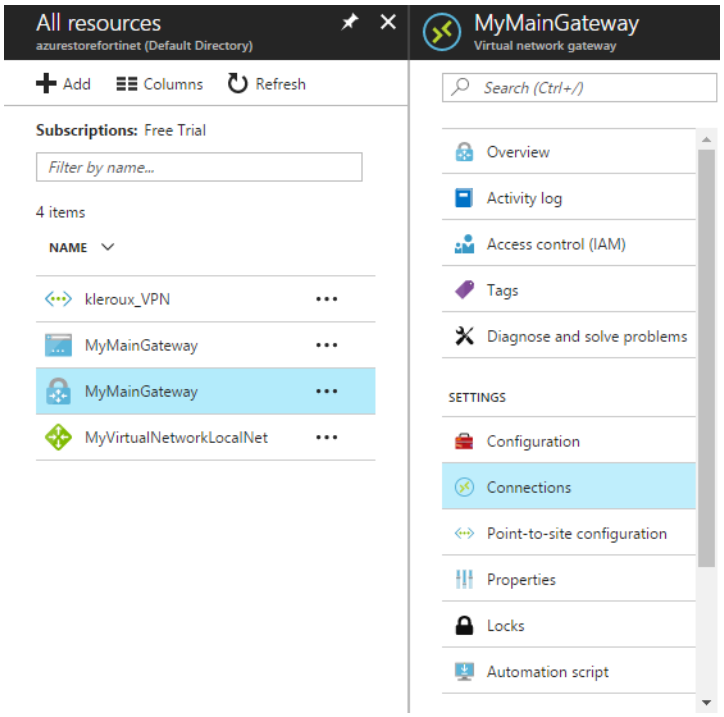
```
config firewall policy
   edit <policy-id>
      set tcp-mss-sender 1350
      set tcp-mss-receiver 1350
   next
end
```

To create the FortiGate static route:

1. In the FortiGate, go to *Network > Static Routes*.
2. Create an IPv4 Static Route that forces outgoing traffic going to Azure to go through the route-based tunnel.
3. Set the *Administrative Distance* to a value lower than the existing default route value.

To create the Azure site-to-site VPN connection:

1. In the Azure portal, locate and select your virtual network gateway.
2. In the *Settings* pane, click *Connections* and then click *Add*.



3. Enter the settings for your connection. Ensure the *Shared Key (PSK)* matches the *Pre-shared Key* for the FortiGate tunnel.

To check the results:

1. In the FortiGate, go to *Monitor* > *IPsec Monitor* and check that the tunnel is up. If the tunnel is down, right-click the tunnel and select *Bring Up*.
2. In the FortiGate, go to *Log & Report* > *System Events*.
   a. Select an event card to view more information and verify the connection.

3. In the Azure portal dashboard, click *All resources* and locate your virtual network gateway.
   a. In your virtual network gateway pane, click *Connections* to see the status of each connection.

   b. Click a connection to open the *Essentials* pane to view more information about that connection.
      - If the connection is successful, the *Status* shows *Connected*.
      - See the *ingress* and *egress* bytes to confirm traffic flowing through the tunnel.

IPsec VPN to an Azure with virtual WAN

This is a sample configuration of an IPsec site-to-site VPN connection between an on-premise FortiGate and an Azure virtual network (VNet). This example uses Azure virtual WAN (vWAN) to establish the VPN connection.

- Azure must use IPsec v2 for this configuration.
- Azure uses overlapped subnet IP addresses for the IPsec interfaces.

To configure IKEv2 IPsec site-to-site VPN to an Azure VPN gateway:

1. In the Azure management portal, configure vWAN-related settings as described in Tutorial: Create a Site-to-Site connection using Azure Virtual WAN.
   If a custom BGP IP address is configured on Azure's vWAN, such as 169.254.21.6 and 169.254.21.7, you must configure the FortiGate `remote-IP` to the corresponding *Custom BGP IP Address* value. If a custom BGP IP address is not configured, FortiGate `remote-IPs` should point to the *Default BGP IP Address* value.
2. Download the VPN configuration. The following shows an example VPN configuration:

```
[ {"configurationVersion":{"LastUpdatedTime":"2019-07-16T22:16:28.0409002Z","Version":"be5c5787-
     b903-43b1-a237-49eae1b373e4"},"vpnSiteConfiguration":
     {"Name":"toaws","IPAddress":"3.220.252.93","BgpSetting":
     {"Asn":7225,"BgpPeeringAddress":"169.254.24.25","PeerWeight":32768},"LinkName":"toaws"},"v
     pnSiteConnections":[{"hubConfiguration":{"AddressSpace":"10.1.0.0/16","Region":"West
     US","ConnectedSubnets":["10.2.0.0/16"]},"gatewayConfiguration":{"IpAddresses":
     {"Instance0":"52.180.90.47","Instance1":"52.180.89.94"},"BgpSetting":
     {"Asn":65515,"BgpPeeringAddresses":
     {"Instance0":"10.1.0.7","Instance1":"10.1.0.6"},"PeerWeight":0}},"connectionConfiguration":
     {"IsBgpEnabled":true,"PSK":"Fortinet123#","IPsecParameters":
     {"SADataSizeInKilobytes":102400000,"SALifeTimeInSeconds":3600}}}]} ]
```

3. Configure the following on the FortiGate. Note for `set proposal`, you can select from several proposals.

```
config vpn ipsec phase1-interface
    edit "toazure1"
        set interface "port1"
        set ike-version 2
        set keylife 28800
        set peertype any
        set proposal aes256-sha1
        set dhgrp 2
        set remote-gw 52.180.90.47
        set psksecret **********
    next
    edit "toazure2"
        set interface "port1"
        set ike-version 2
        set keylife 28800
        set peertype any
        set proposal aes256-sha1
        set dhgrp 2
        set remote-gw 52.180.89.94
        set psksecret **********
    next
end
config vpn ipsec phase2-interface
    edit "toazure1"
        set phase1name "toazure1"
        set proposal aes256-sha1
        set dhgrp 2
        set keylifeseconds 3600
    next
    edit "toazure2"
        set phase1name "toazure2"
        set proposal aes256-sha1
        set dhgrp 2
        set keylifeseconds 3600
    next
end
config system settings
    set allow-subnet-overlap enable
end
config system interface
    edit "toazure1"
```

```
        set vdom "root"
        set ip 169.254.24.25 255.255.255.255
        set type tunnel
        set remote-ip 10.1.0.7 255.255.255.255
        set snmp-index 4
        set interface "port1"
    next
    edit "toazure2"
        set vdom "root"
        set ip 169.254.24.25 255.255.255.255
        set type tunnel
        set remote-ip 10.1.0.6 255.255.255.255
        set snmp-index 5
        set interface "port1"
    next
end
config router bgp
    set as 7225
    set router-id 169.254.24.25
    config neighbor
        edit "10.1.0.7"
            set remote-as 65515
        next
        edit "10.1.0.6"
            set remote-as 65515
        next
    end
    config network
        edit 1
            set prefix 172.30.101.0 255.255.255.0
        next
    end
    config redistribute "connected"
        set status enable
    end
    config redistribute "rip"
    end
    config redistribute "ospf"
    end
    config redistribute "static"
    end
    config redistribute "isis"
    end
    config redistribute6 "connected"
    end
    config redistribute6 "rip"
    end
    config redistribute6 "ospf"
    end
    config redistribute6 "static"
    end
```

```
    config redistribute6 "isis"
    end
end
```

4. Run `diagnose vpn tunnel list`. If the configuration was successful, the output should resemble the following:

```
name=toazure1 ver=2 serial=3 172.30.1.83:4500->52.180.90.47:4500 tun_id=52.180.90.47

```

IPSec VPN between a FortiGate and a Cisco ASA with multiple subnets

When a Cisco ASA unit has multiple subnets configured, multiple phase 2 tunnels must be created on the FortiGate to allocate to each subnet (rather than having multiple subnets on one phase 2 tunnel).

The FortiGate uses the same SPI value to bring up the phase 2 negotiation for all of the subnets, while the Cisco ASA expects different SPI values for each of its configured subnets. Using multiple phase 2 tunnels on the FortiGate creates different SPI values for each subnet.

To configure multiple phase 2 interfaces in route-based mode:

```
config vpn ipsec phase2-interface
    edit "First subnet"
        set phase1name "VPN to Cisco"
        set src-subnet 192.168.227.253 255.255.255.255
        set dst-subnet 10.142.0.0 255.255.254.0
    next
    edit "Second subnet"
        set phase1name "VPN to Cisco"
        set src-subnet 192.168.227.253 255.255.255.255
        set dst-subnet 10.143.0.0 255.255.254.0
    next
end
```

To configure multiple phase 2 interfaces in policy-based mode:

```
config vpn ipsec phase2
    edit "First subnet"
        set phase1name "VPN to Cisco"
        set src-subnet 192.168.227.253 255.255.255.255
        set dst-subnet 10.142.0.0 255.255.254.0
    next
    edit "Second subnet"
```

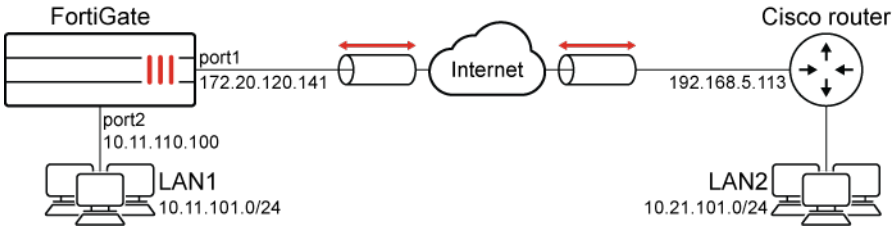
```
        set phase1name "VPN to Cisco"
        set src-subnet 192.168.227.253 255.255.255.255
        set dst-subnet 10.143.0.0 255.255.254.0
    next
end
```

Cisco GRE-over-IPsec VPN

This is a sample configuration of a FortiGate VPN that is compatible with Cisco-style VPNs that use GRE in an IPsec tunnel. Cisco products with VPN support often use the GRE protocol tunnel over IPsec encryption. Cisco VPNs can use either transport mode or tunnel mode IPsec.

Topology

In this example, LAN1 users are provided with access to LAN2.



Configuring the FortiGate

There are five steps to configure GRE-over-IPsec with a FortiGate and Cisco router:

1. Enable overlapping subnets.
2. Configure a route-based IPsec VPN on the external interface.
3. Configure a GRE tunnel on the virtual IPsec interface.
4. Configure security policies.
5. Configure the static route.

Enabling overlapping subnets

Overlapping subnets are required because the IPsec and GRE tunnels will use the same addresses. By default, each FortiGate network interface must be on a separate network. This configuration assigns an IPsec tunnel endpoint and the external interface to the same network.

To enable overlapping subnets:

```
config system settings
    set allow-subnet-overlap enable
end
```

Configuring a route-based IPsec VPN

A route-based VPN that use encryption and authentication algorithms compatible with the Cisco router is required. Pre-shared key authentication is used in this configuration.

To configure route-based IPsec in the GUI:

1. Go to *VPN* > *IPsec Wizard* and select the *Custom* template.
2. Enter the tunnel name (*tocisco*) and click *Next*.
3. Enter the following:

Remote Gateway	Static IP Address
IP Address	Cisco router public interface (192.168.5.113)
Interface	FortiGate public interface (172.20.120.141)
Authentication Method	Pre-shared Key
Pre-shared Key	Entry must match the pre-shared key on the Cisco router
Mode	Main (ID Protection)
Phase 1 Proposal	3DES-SHA1, AES128-SHA1 (at least one proposal must match the settings on the Cisco router)
Local Address	GRE local tunnel endpoint IP address (172.20.120.141)
Remote Address	GRE remote tunnel endpoint IP address (192.168.5.113)
Phase 2 Proposal	3DES-MD5 (at least one proposal must match the settings on the Cisco router)
Local Port	0
Remote Port	0
Protocol	47

4. Click *OK*.
5. If the Cisco router is configured to use transport mode IPsec, configure transport mode on the FortiGate:

```
config vpn phase2-interface
    edit tocisco_p2
        set encapsulation transport-mode
    next
end
```

To configure route-based IPsec in the CLI:

```
config vpn ipsec phase1-interface
    edit tocisco
        set interface port1
        set proposal 3des-sha1 aes128-sha1
        set remote-gw 192.168.5.113
```

```
        set psksecret xxxxxxxxxxxxxxx
    next
end
```

```
config vpn ipsec phase2-interface
    edit tocisco_p2
        set phase1name tocisco
        set proposal 3des-md5
        set encapsulation [tunnel-mode | transport-mode]
        set protocol 47
        set src-addr-type ip
        set dst-start-ip 192.168.5.113
        set src-start-ip 172.20.120.141
    next
end
```

To add the IPsec tunnel end addresses:

```
config system interface
    edit tocisco
        set ip 172.20.120.141 255.255.255.255
        set remote-ip 192.168.5.113
    next
end
```

Configuring the GRE tunnel

The local gateway and remote gateway addresses must match the local and remote gateways of the IPsec tunnel. The GRE tunnel runs between the virtual IPsec public interface on the FortiGate unit and the Cisco router.

To configure the GRE tunnel:

```
config system gre-tunnel
    edit gre1
        set interface tocisco
        set local-gw 172.20.120.141
        set remote-gw 192.168.5.113
        set keepalive-interval <integer>
        set keepalive-failtimes <integer>
    next
end
```

The Cisco router configuration requires an address for its end of the GRE tunnel, so you need to add the tunnel end addresses.

To add the tunnel end addresses:

```
config system interface
    edit gre1
        set ip 10.0.1.1 255.255.255.255
```

```
        set remote-ip 10.0.1.2
    next
end
```

Configuring the security policies

Two sets of security policies are required:

- Policies to allow traffic to pass in both directions between the GRE virtual interface and the IPsec virtual interface.
- Policies to allow traffic to pass in both directions between the protected network interface and the GRE virtual interface.

To configure security policies in the GUI:

1. Go to *Policy & Objects* > *Firewall Policy* and click *Create New*.
2. Enter the following to allow traffic between the protected network and the GRE tunnel:

Name	LANtoGRE
Incoming Interface	Interface that connects to the private network behind the FortiGate (port2)
Outgoing Interface	GRE tunnel virtual interface (gre1)
Source	All
Destination	All
Action	ACCEPT
NAT	Disable

3. Click *OK*.
4. Create a new policy and enter the following to allow traffic between the GRE tunnel and the protected network:

Name	GREtoLAN
Incoming Interface	GRE tunnel virtual interface (gre1)
Outgoing Interface	Interface that connects to the private network behind the FortiGate (port2)
Source	All
Destination	All
Action	ACCEPT
NAT	Disable

5. Click *OK*.
6. Create a new policy and enter the following to allow traffic between the GRE virtual interface and the IPsec virtual interface:

Name	GREtoIPsec
Incoming Interface	GRE tunnel virtual interface (gre1)
Outgoing Interface	Virtual IPsec interface (tocisco)
Source	All
Destination	All
Action	ACCEPT
NAT	Disable

7. Click *OK*.
8. Create a new policy and enter the following to allow traffic between the IPsec virtual interface and the GRE virtual interface:

Name	IPsectoGRE
Incoming Interface	Virtual IPsec interface (tocisco)
Outgoing Interface	GRE tunnel virtual interface (gre1)
Source	All
Destination	All
Action	ACCEPT
NAT	Disable

9. Click *OK*.

To configure security policies in the CLI:

```
config firewall policy
    edit 1
        set name LANtoGRE
        set srcintf port2
        set dstintf gre1
        set srcaddr all
        set dstaddr all
        set action accept
        set schedule always
        set service ALL
    next
    edit 2
        set name GREtoLAN
        set srcintf gre1
        set dstintf port2
        set srcaddr all
        set dstaddr all
        set action accept
        set schedule always
        set service ALL
```

```
    next
    edit 3
        set name GREtoIPsec
        set srcintf gre1
        set dstintf tocisco
        set srcaddr all
        set dstaddr all
        set action accept
        set schedule always
        set service ALL
    next
    edit 4
        set name IPsectoGRE
        set srcintf tocisco
        set dstintf gre1
        set srcaddr all
        set dstaddr all
        set action accept
        set schedule always
        set service ALL
    next
end
```

Configuring routing

to direct traffic destined for the network behind the Cisco router into the GRE-over-IPsec tunnelTraffic destined for the network behind the Cisco router must be routed to the GRE tunnel. To do this, create a static route

To create the static route in the GUI:

1. Go to *Network* > *Static Routes* and click *Create New*.
2. Enter the following:

Destination	IP and netmask for the network behind the Cisco router (10.21.101.0 255.255.255.0)
Interface	GRE tunnel virtual interface (gre1)
Administrative Distance	Leave the default setting

3. Click *OK*.

To create the static route in the CLI:

```
config router static
    edit 0
        set device gre1
        set dst 10.21.101.0 255.255.255.0
    next
end
```

Configuring the Cisco router

For more information, refer to Configuring and verifying a GRE over IPsec tunnel in the Fortinet Knowledge Base.

In this type of deployment where you configure GRE over IPsec VPN, NP7 offloading is not natively supported, even though it is supported individually for GRE and for IPsec.

To workaround this, configure two separate VDOMs where one performs IPsec tunneling and the other performs GRE encapsulation.

For more information, see the following KB: Technical Tip: GRE + IPSec not supported for NP7 offloading.

Cloud SDN Orchestration VPN wizard for AWS NEW

The Cloud SDN Orchestration VPN wizard simplifies configuration of a VPN tunnel between a FortiGate and a virtual private gateway or transit gateway on AWS. When a FortiGate has an SDN connector with the proper permissions established with AWS, the VPN wizard creates the FortiGate VPN configurations and pushes the necessary customer gateway and VPN tunnel configurations to AWS under the configured VPC. This reduces the chance of mis-configurations and the number of steps needed to configure a VPN tunnel.

```
config sys sdn-vpn
    edit <name>
        set *sdn <string>
        set *remote-type {vgw | tgw}
        set *routing-type {static | dynamic}
        set *vgw-id <string>
        set nat-traversal {enable | disable}
        set *tunnel-interface <string>
        set *internal-interface <string>
        set *local-cidr <class_ip&net_netmask>
        set *remote-cidr <class_ip&net_netmask>
        set cgw-name <string>
        set psksecret <passwd>
    next
end
```

Option	Description
`config sys sdn-vpn`	Configure public cloud VPN service.
`edit <name>`	Public cloud VPN name.
`*sdn <string>`	SDN connector name.
`*remote-type {vgw | tgw}`	Type of remote device: • `vgw`: virtual private gateway • `tgw`: transit gateway
`*routing-type {static | dynamic}`	Type of routing: • `static`: static routing

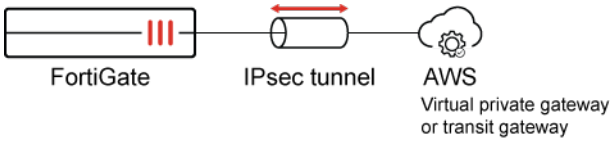
Option	Description
	• `dynamic`: dynamic routing
`*vgw-id <string>`	Virtual private gateway ID.
`nat-traversal {enable | disable}`	Enable/disable use for NAT traversal. Please enable if your FortiGate device is behind a NAT/PAT device.
`*tunnel-interface <string>`	Tunnel interface with public IP.
`*internal-interface <string>`	Internal interface with local subnet.
`*local-cidr <class_ip&net_ netmask>`	Local subnet address and subnet mask.
`*remote-cidr <class_ ip&net_netmask>`	Remote subnet address and subnet mask.
`cgw-name <string>`	AWS customer gateway name to be created.
`psksecret <passwd>`	Pre-shared secret for PSK authentication. Auto-generated if not specified.

Diagnose command:

```
# diagnose debug app sdnvpnd -1

# diagnose test application awsd 5
5. list the settings created by sdn-vpn widgets
```

Example



This example demonstrates how to use the Cloud SDN Orchestration VPN wizard on FortiGate to create VPN configurations and push the necessary customer gateway and VPN tunnel configurations to AWS under the configured VPC.

Following are the requirements for using the wizard:

- On AWS, create IAM and certificates for use with SDN connector.
- On FortiGate, create a regional SDN connector for AWS and establish a connection to AWS. The wizard uses the AWS SDN connector. See AWS SDN connector using access keys for information about creating an AWS SDN connector.
- On AWS, ensure the FortiGate SDN connector for AWS has the following permissions required by the wizard:

```
- ec2:DescribeVpcs
- ec2:DescribeSubnets
- ec2:DescribeRouteTables
- ec2:CreateRoute
```

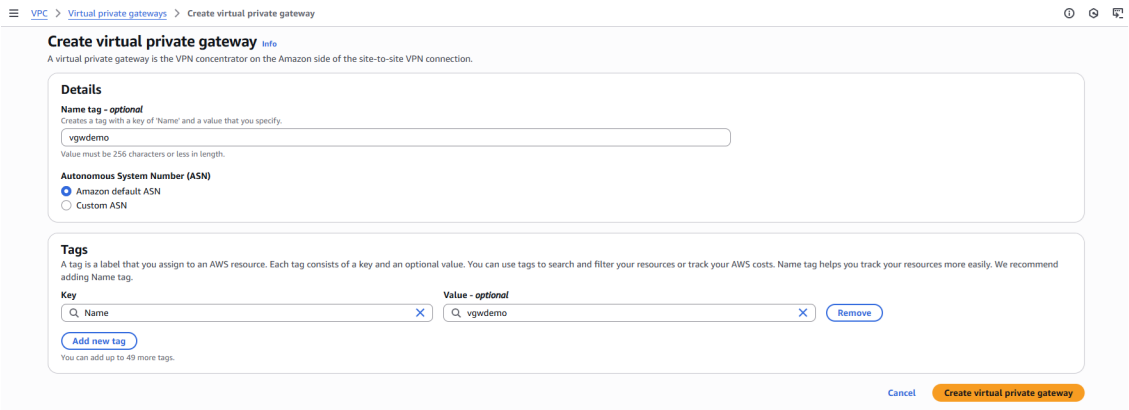
```
    - ec2:DeleteRoute
    - ec2:DescribeCustomerGateways
    - ec2:CreateCustomerGateway
    - ec2:DeleteCustomerGateway
    - ec2:DescribeVpnGateways
    - ec2:EnableVgwRoutePropagation
    - ec2:DescribeTransitGateways
    - ec2:CreateTransitGatewayRouteTable
    - ec2:DeleteTransitGatewayRouteTable
    - ec2:EnableTransitGatewayRouteTablePropagation
    - ec2:DisassociateTransitGatewayRouteTable
    - ec2:AssociateTransitGatewayRouteTable
    - ec2:DescribeTransitGatewayRouteTables
    - ec2:CreateTransitGatewayRoute
    - ec2:DescribeTransitGatewayAttachments
    - ec2:DescribeTransitGatewayVpcAttachments
    - ec2:DescribeVpnConnections
    - ec2:CreateVpnConnection
    - ec2:DeleteVpnConnection
    - ec2:CreateVpnConnectionRoute
    - ec2:DeleteVpnConne
```

- On AWS, provision a VPC with subnets.
- On AWS, provision one of the following and attach it to the VPC:
  - Virtual private gateway (VPG)
    This example uses a VPG.
  - Transit gateway(TGW)
    When you attach a TGW to the VPC, ensure you set *Type* to *VPN*.
- Use FortiGate local admin privileges or higher

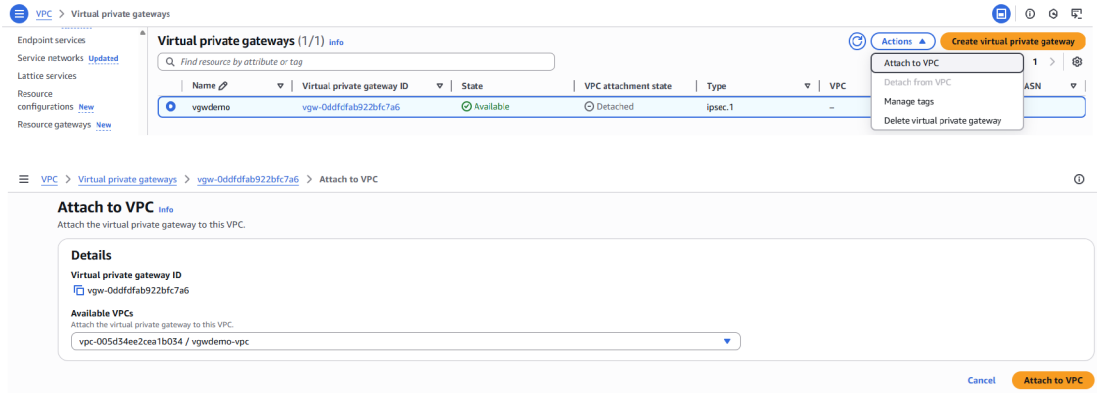
Security Groups are manually edited after the wizard is finished to allow access from on-premise network.

To create VPN tunnels using the Cloud SDN Orchestration VPN wizard:

1. On AWS, create a new virtual private gateway and associate it with the target AWS VPC:
   a. Go to an existing VPC or create a new VPC.
   b. In the *VPC* side menu, go to *Virtual private network (VPN) > Virtual private gateways*. Click *Create virtual private gateway*.

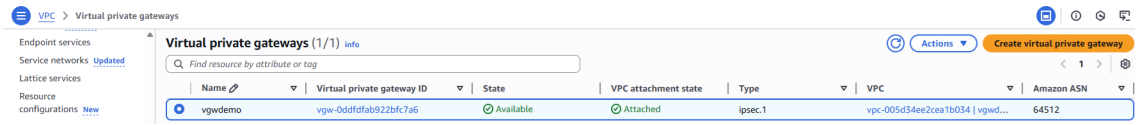


c. After the VPG is created, select it and click *Actions*. Select *Attach to VPC*.



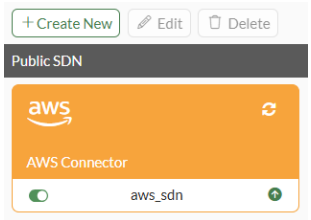
d. Choose the VPC to attach this VPG to. Click *Attach to VPC*.

The new virtual private gateway is ready to for FortiGate configurations.



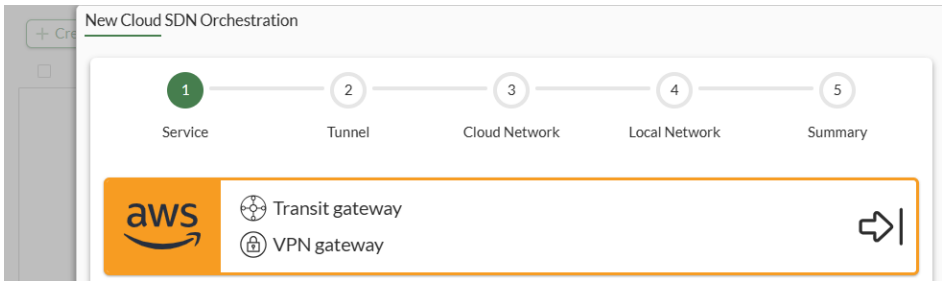
2. On FortiGate, go to *Security Fabric > External Connectors*, and click the *AWS Connector* to check that *Status* is *Up*.

This step assumes that the AWS Connector has already been configured.



3. On FortiGate, use the Cloud SDN Orchestration wizard to create VPN tunnels:

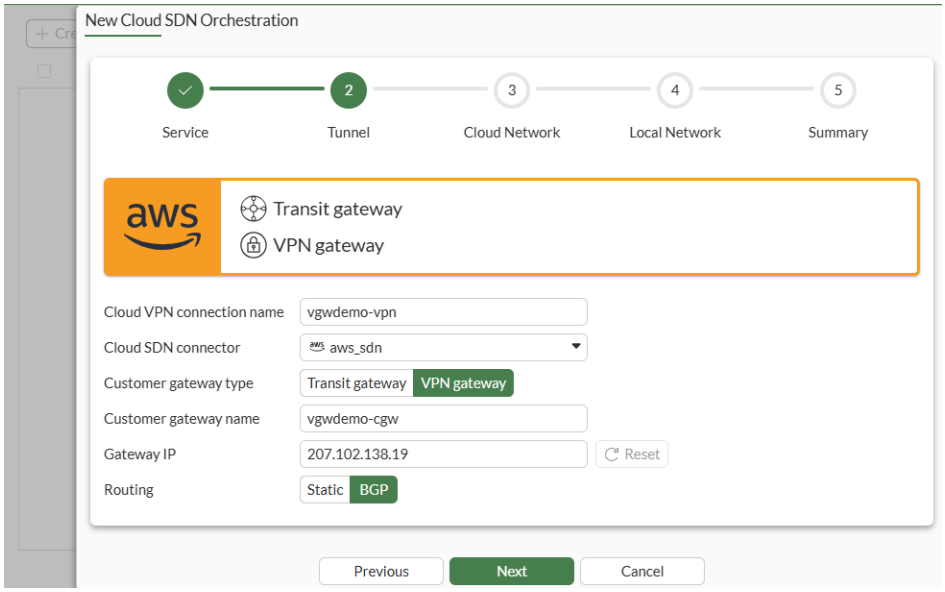
a. Go to *VPN > Cloud SDN Orchestration*, and click *Create new*. The *New Cloud SDN Orchestration* wizard is displayed on step 1 for *Service*.



b. Click the AWS icon to confirm orchestration for AWS and to display step 2 for *Tunnel*.

c. On the *Tunnel* page, complete the options, and click *Next*.

Option	Description
Cloud VPN connection name	Enter a name for the configuration.
Cloud SDN connector	Select the previously created AWS SDN connector.
Customer gateway type	Select the type of gateway created on AWS (*Transit gateway* or *VPN gateway*).
Customer gateway name	Enter the name of the gateway created on AWS.
Gateway IP	The IP address is automatically populated.
Routing	Select the type of routing to use for the tunnels (*Static* or *BGP*).



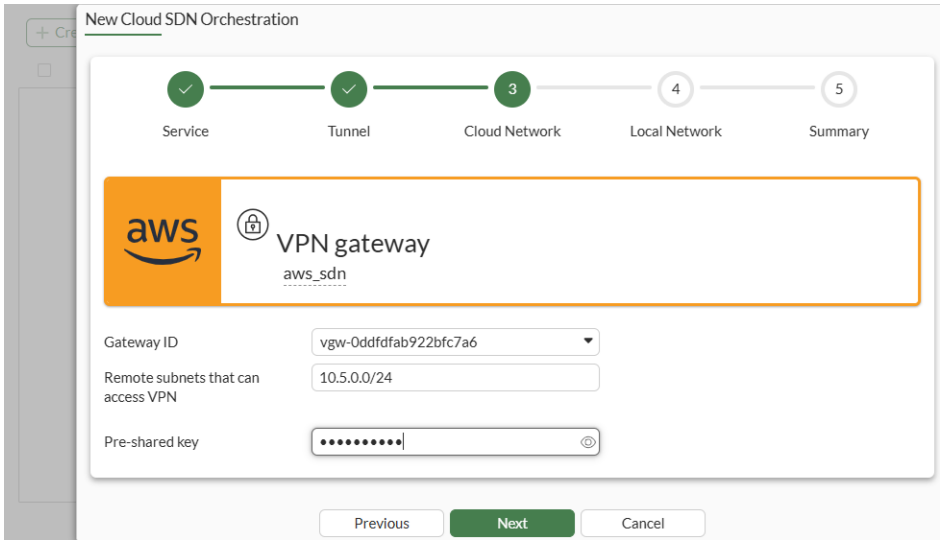
If permissions for the AWS SDN connector cannot be validated, the following error may display, and you my be unable to advance to the next wizard steps until you correct the permissions:

Failed to validate permission, ensure the SDN connector credentials are correct and you have the required permission from the cloud service.

The wizard moves to step 3 for *Cloud Network*.

d. On the *Cloud Network* page, complete the options, and click *Next*.

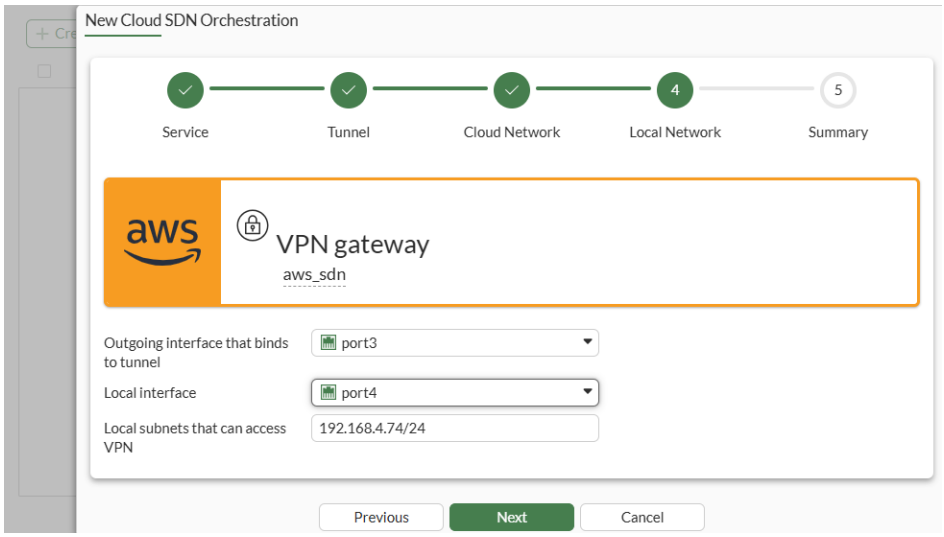
Option	Description
Gateway ID	Select the gateway ID created in AWS.
Remote subnets that can access VPN	Enter the AWS subnets that can access VPN.
Pre-shared key	Enter the pre-shared key (PSK) for PSK authentication. Auto-generated if not specified.



The wizard moves to step 4 for *Local Network*.

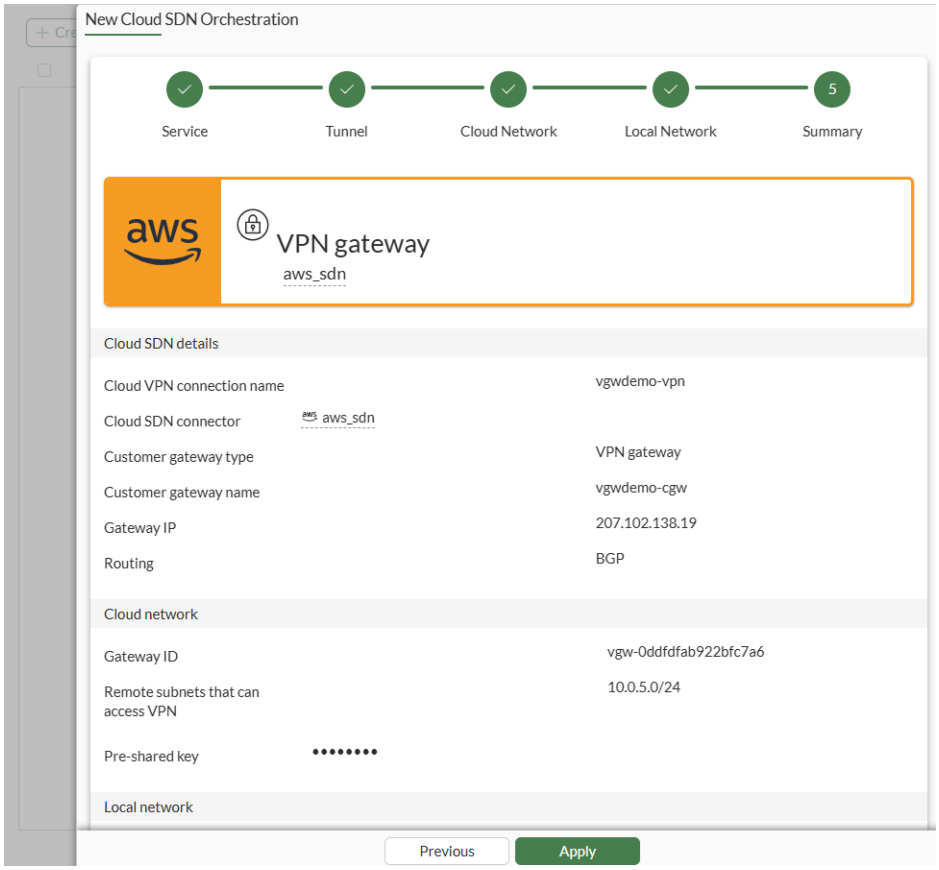
e. On the *Local Network* page, complete the options, and click *Next*.

Option	Description
Outgoing interface that binds to tunnel	Select the FortiGate outbound interface for VPN.
Local interface	Select the FortiGate inbound interface for VPN.
Local subnets that can access VPN	Enter the FortiGate subnets that can access VPN.



The wizard moves to step 5 for *Summary*.

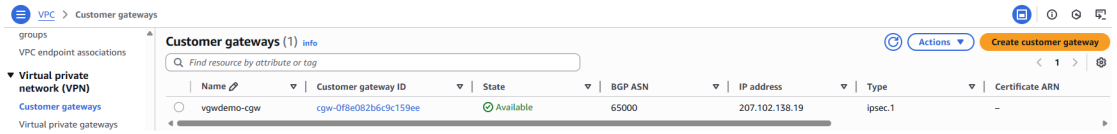
f. On the *Summary* page, review the settings, and click *Apply*.



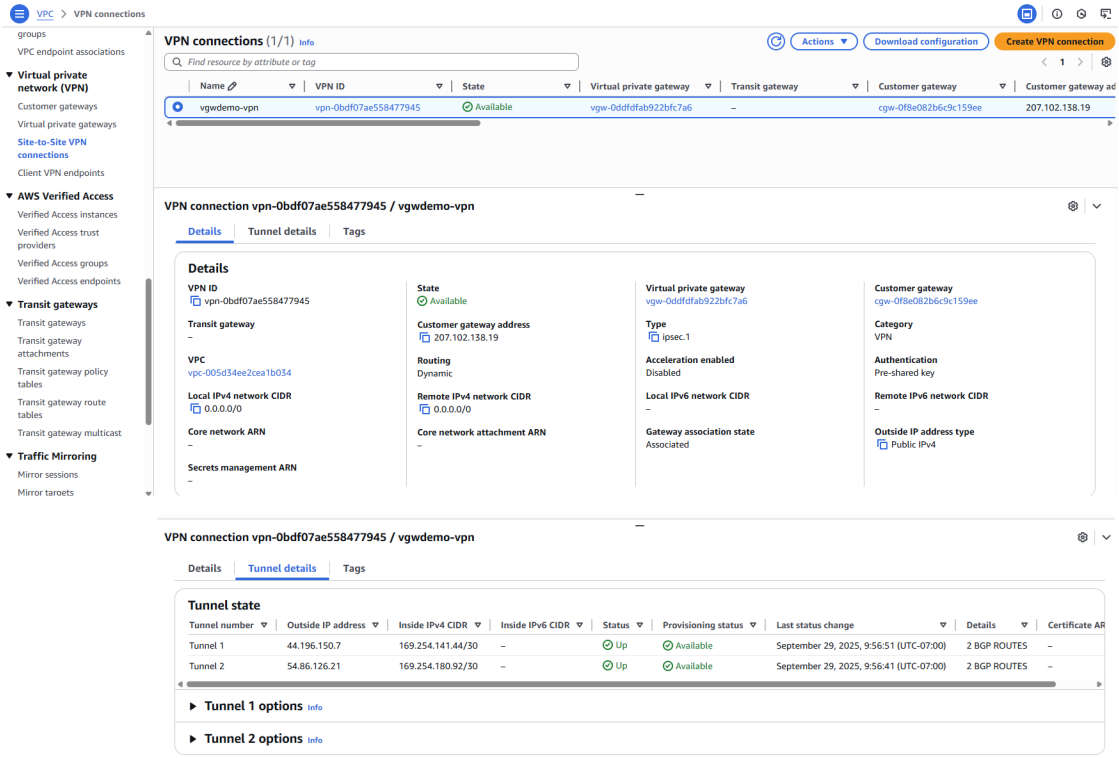
The wizard creates the VPN tunnels and pushes the Customer Gateway and VPN tunnel configurations to AWS under the configured VPC.

4. On AWS console, ensure the FortiGate wizard successfully created the *Customer gateway* and *VPN connection*.

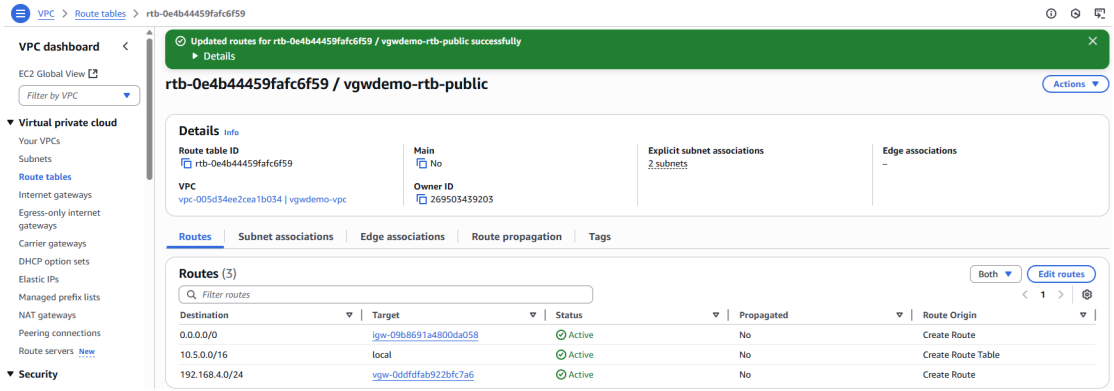
a. Go to *Virtual private network (VPN)* > *Customer gateways*.



b. Under *Virtual private network (VPN)*, click *Site-to-Site VPN connections*.



5. On AWS, go to *Virtual private cloud* > *Route tables*, and add route entry for the routing table of AWS VPC target subnet, and make the traffic to local FGW 192.168.4.0/24 use the VGW as the gateway.



To verify the VPN tunnel configurations in the GUI:

1. Go to *VPN* > *Cloud SDN Orchestration*. Select the configuration, and click *View*:

To verify the VPN tunnel configurations in the CLI:

1. Show the `system sdn-vpn` settings:

```
show system sdn-vpn
config system sdn-vpn
    edit "vgwdemo-vpn"
        set sdn "aws_sdn"
        set vgw-id "vgw-0ddfdfab922bfc7a6"
        set cgw-gateway 207.102.138.19
        set tunnel-interface "port3"
        set internal-interface "port4"
        set local-cidr 192.168.4.0 255.255.255.0
        set remote-cidr 10.5.0.0 255.255.255.0
        set cgw-name "vgwdemo-cgw"
        set psksecret xxx
    next
end
```

2. Show the `vpn ipsec phase1-interface` settings:

```
show vpn ipsec phase1-interface
config vpn ipsec phase1-interface
    edit "vgwdemo-vpn-0"
        set interface "port3"
        set ike-version 2
        set keylife 28800
        set peertype any
        set net-device disable
        set proposal aes128-sha1
        set comments "Automatically generated by site-to-site VPN wizard."
        set dhgrp 2
        set wizard-type cloud-sdn-orchestration
        set transport auto
        set remote-gw 44.196.150.7
        set psksecret xxx
    next
    edit "vgwdemo-vpn-1"
        set interface "port3"
        set ike-version 2
        set keylife 28800
        set peertype any
        set net-device disable
```

```
        set proposal aes128-sha1
        set comments "Automatically generated by site-to-site VPN wizard."
        set dhgrp 2
        set wizard-type cloud-sdn-orchestration
        set transport auto
        set remote-gw 54.86.126.21
        set psksecret xxx
    next
end
```

3. Show the `vpn ipsec phase2-interface` settings:

```
show vpn ipsec phase2-interface
config vpn ipsec phase2-interface
    edit "vgwdemo-vpn-0"
        set phase1name "vgwdemo-vpn-0"
        set proposal aes128-sha1
        set dhgrp 2
        set auto-negotiate enable
        set comments "Automatically generated by site-to-site VPN wizard."
        set keylifeseconds 3600
    next
    edit "vgwdemo-vpn-0-inside"
        set phase1name "vgwdemo-vpn-0"
        set proposal aes128-sha1
        set dhgrp 2
        set auto-negotiate enable
        set comments "Automatically generated by site-to-site VPN wizard."
        set keylifeseconds 3600
    next
    edit "vgwdemo-vpn-1"
        set phase1name "vgwdemo-vpn-1"
        set proposal aes128-sha1
        set dhgrp 2
        set auto-negotiate enable
        set comments "Automatically generated by site-to-site VPN wizard."
        set keylifeseconds 3600
    next
    edit "vgwdemo-vpn-1-inside"
        set phase1name "vgwdemo-vpn-1"
        set proposal aes128-sha1
        set dhgrp 2
        set auto-negotiate enable
        set comments "Automatically generated by site-to-site VPN wizard."
        set keylifeseconds 3600
    next
end
```

4. Show the `system interface vgwdemo-vpn-0` settings:

```
show system interface vgwdemo-vpn-0
config system interface
```

```
    edit "vgwdemo-vpn-0"
        set vdom "root"
        set ip 169.254.141.46 255.255.255.255
        set allowaccess ping
        set type tunnel
        set tcp-mss 1379
        set remote-ip 169.254.141.45 255.255.255.252
        set description "Automatically generated by site-to-site VPN wizard."
        set snmp-index 16
        set interface "port3"
        set mtu-override enable
        set mtu 1427
    next
end
```

5. Show the `system interface vgwdemo-vpn-1` settings:

```
show system interface vgwdemo-vpn-1
config system interface
    edit "vgwdemo-vpn-1"
        set vdom "root"
        set ip 169.254.180.94 255.255.255.255
        set allowaccess ping
        set type tunnel
        set tcp-mss 1379
        set remote-ip 169.254.180.93 255.255.255.252
        set description "Automatically generated by site-to-site VPN wizard."
        set snmp-index 17
        set interface "port3"
        set mtu-override enable
        set mtu 1427
    next
end
```

6. Show the `config firewall policy` settings:

```
show firewall policy
config firewall policy
    edit 1
        set name "AWS_IPSEC_WIZ_vgwdemo-vpn-0_in"
        set uuid 0c945192-9d55-51f0-2ca8-e0de305845d8
        set srcintf "vgwdemo-vpn-0"
        set dstintf "port4"
        set action accept
        set srcaddr "all"
        set dstaddr "all"
        set schedule "always"
        set service "ALL"
        set comments "Automatically generated by site-to-site VPN wizard."
    next
    edit 2
        set name "AWS_IPSEC_WIZ_vgwdemo-vpn-0_out"
```

```
        set uuid 0c95b67c-9d55-51f0-7f37-75b1fe7ad6fa
        set srcintf "port4"
        set dstintf "vgwdemo-vpn-0"
        set action accept
        set srcaddr "all"
        set dstaddr "all"
        set schedule "always"
        set service "ALL"
        set comments "Automatically generated by site-to-site VPN wizard."
    next
    edit 3
        set name "AWS_IPSEC_WIZ_vgwdemo-vpn-1_in"
        set uuid 0c9d02f6-9d55-51f0-bb0d-cdd46a5f0145
        set srcintf "vgwdemo-vpn-1"
        set dstintf "port4"
        set action accept
        set srcaddr "all"
        set dstaddr "all"
        set schedule "always"
        set service "ALL"
        set comments "Automatically generated by site-to-site VPN wizard."
    next
    edit 4
        set name "AWS_IPSEC_WIZ_vgwdemo-vpn-1_out"
        set uuid 0c9f31a2-9d55-51f0-a940-be65d2761bf9
        set srcintf "port4"
        set dstintf "vgwdemo-vpn-1"
        set action accept
        set srcaddr "all"
        set dstaddr "all"
        set schedule "always"
        set service "ALL"
        set comments "Automatically generated by site-to-site VPN wizard."
    next
end
```

7. Show the `config router bgp` settings:

```
show router bgp
config router bgp
    set as 65000
    set router-id 207.102.138.19
    config neighbor
        edit "169.254.141.45"
            set capability-default-originate enable
            set remote-as 64512
        next
        edit "169.254.180.93"
            set capability-default-originate enable
            set remote-as 64512
        next
```

```
    end
    config network
        edit 1
            set prefix 192.168.4.0 255.255.255.0
        next
    end
    config redistribute "connected"
    end
    config redistribute "rip"
    end
    config redistribute "ospf"
    end
    config redistribute "static"
    end
    config redistribute "isis"
    end
    config redistribute6 "connected"
    end
    config redistribute6 "rip"
    end
    config redistribute6 "ospf"
    end
    config redistribute6 "static"
    end
    config redistribute6 "isis"
    end
end
```

8. View the VPN tunnel list:

```
# diagnose vpn tunnel list
list all ipsec tunnel in vd 0

Remote access

Remote access allows users to connect to the office network over VPN for remote work from home scenarios. This could be for accessing servers and services in the office network, or routing the entire Internet access over the VPN gateway. The latter scenario, often called Secure Internet Access (SIA), allows remote workers to secure the Internet traffic through the corporate firewall which will perform standard NGFW inspection on the traffic.

The following topics provide instructions on configuring remote access:

- FortiGate as dialup client on page 2898
- FortiClient as dialup client on page 2909
- Add FortiToken multi-factor authentication on page 2921
- Add LDAP user authentication on page 2924
- Configure FortiClient SIA for IPsec VPN tunnels on page 2929
- LDAP authentication with TCP as transport on page 2939
- VPN 2FA with EAP and certificate authentication on page 2950
- Using single or multiple user groups for user authentication on page 2955

- Native VPN as dialup client - Windows New on page 2957
- Native VPN as dialup client - iOS on page 2975
- Dialup IPsec VPN with certificate authentication on page 2982
- SAML-based authentication for FortiClient remote access VPNs on page 2992
- Enhancing IPsec security using EMS SN verification on page 3014
- IKE Mode Config clients on page 3014
- IPsec split DNS on page 3019
- Defining gateway IP addresses in IPsec with mode-config and DHCP on page 3020
- IPsec DNS suffix on page 3022
- Dialup IPsec VPN using custom TCP port on page 3023
- Matching IPsec tunnel gateway based on address parameters on page 3036
- Enforcing security posture verification before dial-up VPN connection on page 3038

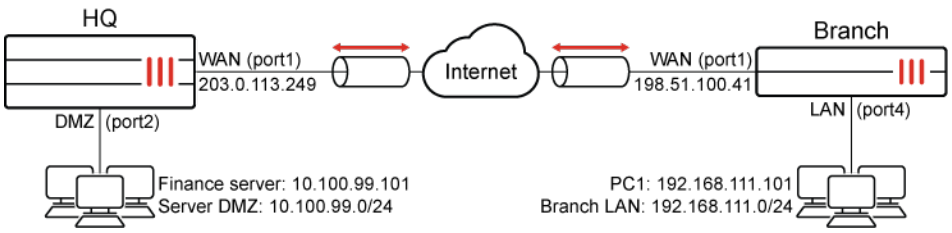
FortiGate as dialup client

A FortiGate configured as a dial-up client initiates an IPsec VPN connection to a remote IPsec VPN gateway while using a dynamically assigned WAN IP address, making it useful in networks with no static IP availability. It is also suitable for environments where the client FortiGate is located behind a NAT device.

The dial-up VPN significantly reduces configuration complexity and overhead when deploying new branches. Because the IPsec VPN server or IPsec VPN hub is preconfigured to accept dynamic IPsec connections, there is no need to reconfigure it for each new branch FortiGate deployment. This makes scaling easier, allowing organizations to add new sites without delays.

In this example, users in the Branch LAN subnet require connectivity with the HQ DMZ subnet to access servers over VPN. The IP address of the Branch's Internet (port1) interface is assigned dynamically using DHCP.

The Branch FortiGate is configured as a dialup VPN client to authenticate and connect to the HQ FortiGate. For mutual authentication, the default Fortinet_Factory certificates are used. This method is more secure than using a pre-shared key.



After the IPsec VPN tunnel is successfully established, PC1 (192.168.111.101) can ping the Finance server (10.100.99.101).

To configure the HQ FortiGate as an IPsec VPN dialup server using the VPN Wizard:

1. Go to *VPN* > *VPN Wizard*.
2. Enter a name for the VPN in the *Tunnel name* field. In this example, *vpn-server*
3. Set *Select a template* to *Site to Site*.
4. Click *Begin*.

5. Configure the *VPN tunnel* settings:

Field	Value
Authentication method	*Signature*
Certificate name	Fortinet_Factory
Peer certificate CA	Fortinet_CA
IKE	*Version 2*
Transport	Use default *UDP*. If IKE over TCP is required, enable *Allow VPN negotiation over TCP* in *VPN > VPN Tunnels > Settings* before using the VPN wizard, and then set *Transport* to *Auto* in the wizard.
NAT traversal	*Enable* Set *Keepalive frequency* to *10*.

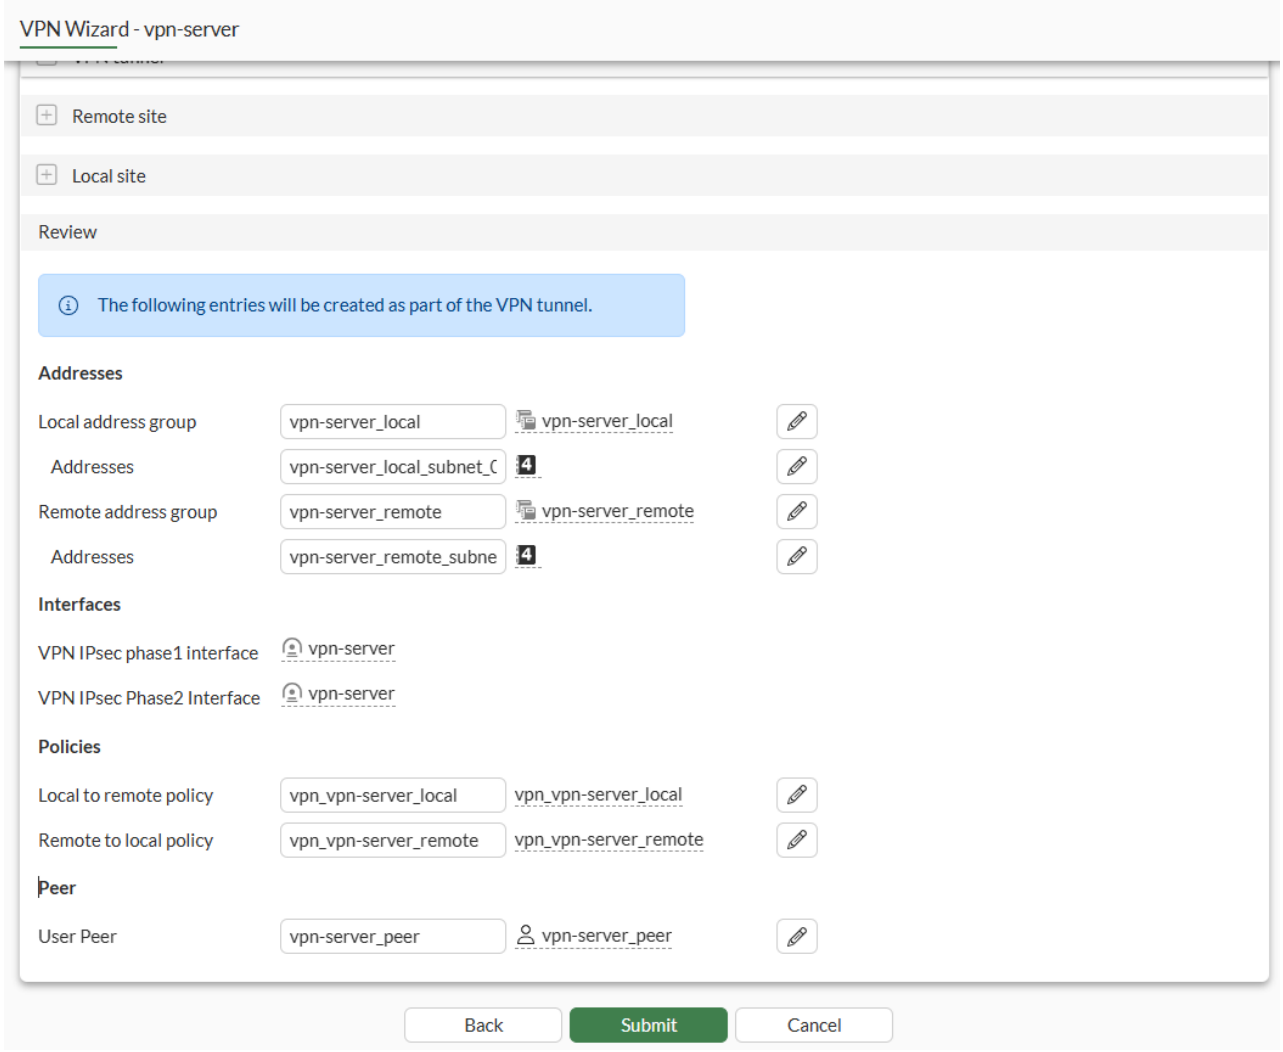
6. Click *Next*.
7. Configure the *Remote site* settings:

Field	Value
Remote site device type	*FortiGate*
Remote site device	*Behind NAT or dynamic*
Remote site subnets that can access VPN	*192.168.111.0/24* (The Branch's LAN subnet)

8. Click *Next*.
9. Configure the *Local site* settings:

Field	Value
Outgoing interface that binds to tunnel	*WAN (port1)* Disable *Create and add interface to zone*.
Local interface	*DMZ (port2)*
Local subnets that can access VPN	This field automatically uses the IP address related to the selected local interface. In this example, 10.100.99.0/24
Allow remote site's internet traffic through this device	Disabled

10. Click *Next*.
11. Review the configuration and, if everything is correct, click *Submit*.



The *vpn-server* IPsec tunnel is configured by the wizard and is visible in *VPN > VPN Tunnels* under *Dialup - FortiGate tunnels*.

To configure Branch FortiGate as IPsec VPN dialup client using the VPN Wizard:

1. Go to *VPN > VPN Wizard*.
2. Enter a name for the VPN in the *Tunnel name* field. In this example, *vpn-client*
3. Set *Select a template* to *Site to Site*.
4. Click *Begin*.
5. Configure the *VPN tunnel* settings:

Field	Value
Authentication method	*Signature*
Certificate name	Fortinet_Factory
Peer certificate CA	Fortinet_CA

Field	Value
IKE	*Version 2*
Transport	Use default *UDP*. If IKE over TCP is required, enable *Allow VPN negotiation over TCP* in *VPN > VPN Tunnels > Settings* before using the VPN wizard, and then set *Transport* to *Auto* in the wizard.
NAT traversal	*Enable* Set *Keepalive frequency* to *10*.

6. Click *Next*.
7. Configure the *Remote site* settings:

Field	Value
Remote site device type	*FortiGate*
Remote site device	*Accessible and static* Set *IP/FQDN* to *203.0.113.249*. The WAN interface IP address of the HQ FortiGate, or its FQDN (the FQDN must resolve to the WAN IP address).
Route this device's internet traffic through the remote site.	Disabled
Remote site subnets that can access VPN	*10.100.99.0/24* (The HQ's DMZ subnet).

8. Click *Next*.
9. Configure the *Local site* settings:

Field	Value
Outgoing interface that binds to tunnel	*WAN (port1)* Disable *Create and add interface to zone*.
Local interface	*LAN (port4)*
Local subnets that can access VPN	This field automatically uses the IP address related to the selected local interface. In this example, 192.168.111.0/24
Allow remote site's internet traffic through this device	Disabled

10. Click *Next*.
11. Review the configuration and, if everything is correct, click *Submit*.
    The *vpn-client* IPsec tunnel is configured by the wizard and is visible under *VPN > VPN Tunnels*.

To configure the HQ FortiGate as an IPsec VPN dialup server in the CLI:

1. Configure the WAN interface and default route.
   The WAN interface is the interface connected to the ISP and it is recommended to configure it with a static IP address to ensure that the IPsec VPN configuration on the Branch stays unchanged if the WAN IP changes on the HQ. The IPsec tunnel is established over the WAN interface.

```
config system interface
    edit "port1"
        set vdom "root"
        set ip 203.0.113.249 255.255.255.0
        set alias "WAN"
    next
end
config router static
    edit 1
        set gateway 203.0.113.250
        set device "port1"
    next
end
```

2. Configure address objects for the HQ server DMZ subnet (10.100.99.0/24) and Branch LAN subnet (192.168.111.0/24):

```
config firewall address
    edit "HQ Server DMZ"
        set subnet 10.100.99.0 255.255.255.0
    next
    edit "Branch LAN"
        set subnet 192.168.111.0 255.255.255.0
    next
end
```

3. Configure the DMZ interface:

```
config system interface
    edit "port2"
        set vdom "root"
        set alias "DMZ"
        set ip 10.100.99.1 255.255.255.0
    next
end
```

4. Create a peer user:

```
config user peer
    edit "vpn-server_peer"
        set ca "Fortinet_CA"
    next
end
```

5. Configure the IPsec phase1-interface:

```
config vpn ipsec phase1-interface
    edit "vpn-server"
        set type dynamic
        set interface "port1"
        set ike-version 2
        set authmethod signature
        set net-device disable
        set proposal aes128-sha256 aes256-sha256 aes128gcm-prfsha256 aes256gcm-prfsha384
chacha20poly1305-prfsha256
        set dhgrp 20 21
        set certificate "Fortinet_Factory"
        set peer "vpn-server_peer"
    next
end
```

6. Configure the IPsec phase2-interface:

```
config vpn ipsec phase2-interface
    edit "vpn-server"
        set phase1name "vpn-server"
        set proposal aes128-sha256 aes256-sha256 aes128gcm aes256gcm chacha20poly1305
        set dhgrp 20 21
        set src-addr-type name
        set dst-addr-type name
        set src-name "HQ Server DMZ"
        set dst-name "Branch LAN"
    next
end
```

7. Configure two firewall policies to allow the Branch LAN users to access the HQ DMZ subnet over the IPsec tunnel and vice versa:

```
config firewall policy
    edit 1
        set name "HQ DMZ to Branch LAN"
        set srcintf "port2"
        set dstintf "vpn-server"
        set action accept
        set srcaddr "HQ Server DMZ"
        set dstaddr "Branch LAN"
        set schedule "always"
        set service "ALL"
    next
    edit 2
        set name "Branch LAN to HQ DMZ"
        set srcintf "vpn-server"
        set dstintf "port2"
        set action accept
        set srcaddr "Branch LAN"
        set dstaddr "HQ Server DMZ"
        set schedule "always"
        set service "ALL"
```

```
    next
end
```

To configure Branch FortiGate as IPsec VPN dialup client in the CLI:

1. Configure the WAN interface and default route.

   The WAN interface is the interface connected to the ISP. It can work in static mode, DHCP (as in this example), or PPPoE. The IPsec tunnel is established over the WAN interface.

   ```
   config system interface
       edit "port1"
           set vdom "root"
           set mode dhcp
           set alias "WAN"
           set defaultgw enable
       next
   end
   ```

   Setting `defaultgw` to `enable` automatically injects a default route with an administrative distance (AD) of five, using the gateway IP address provided in DHCP Option 3 by the DHCP server. If the DHCP server does not supply this information, administrators will need to manually configure a default route.
2. Configure address objects for the HQ server DMZ subnet (10.100.99.0/24) and Branch LAN subnet (192.168.111.0/24):

   ```
   config firewall address
       edit "HQ Server DMZ"
           set allow-routing enable
           set subnet 10.100.99.0 255.255.255.0
       next
       edit "Branch LAN"
           set subnet 192.168.111.0 255.255.255.0
       next
   end
   ```

   Setting `allow-routing` to `enable` is optional. It allows address objects to be directly referenced when defining static routes. When this setting is disabled, administrators must manually specify subnets instead of using address objects for static route configuration. Enabling this option streamlines route management and ensures consistency by leveraging predefined address objects.
3. Configure the LAN interface:

   ```
   config system interface
       edit "port4"
           set vdom "root"
           set alias "LAN"
           set ip 192.168.111.0 255.255.255.0
       next
   end
   ```

4. Create a peer user:

```
config user peer
    edit "vpn-server_peer"
        set ca "Fortinet_CA"
    next
end
```

5. Configure the IPsec phase1-interface:

```
config vpn ipsec phase1-interface
    edit "vpn-client"
        set interface "port1"
        set ike-version 2
        set authmethod signature
        set net-device disable
        set proposal aes128-sha256 aes256-sha256 aes128gcm-prfsha256 aes256gcm-prfsha384
chacha20poly1305-prfsha256
        set dhgrp 20 21
        set remote-gw 203.0.113.249
        set certificate "Fortinet_Factory"
        set peer "vpn-client_peer"
    next
end
```

6. Configure the IPsec phase2-interface:

```
config vpn ipsec phase2-interface
    edit "vpn-client"
        set phase1name "vpn-client"
        set proposal aes128-sha256 aes256-sha256 aes128gcm aes256gcm chacha20poly1305
        set dhgrp 20 21
        set src-addr-type name
        set dst-addr-type name
        set src-name "Branch LAN"
        set dst-name "HQ Server DMZ"
    next
end
```

7. Configure the static routes on the Branch to route traffic from the LAN subnet to the DMZ subnet.
   The blackhole route is important to ensure that IPsec traffic does not match the default route when the IPsec tunnel is down.

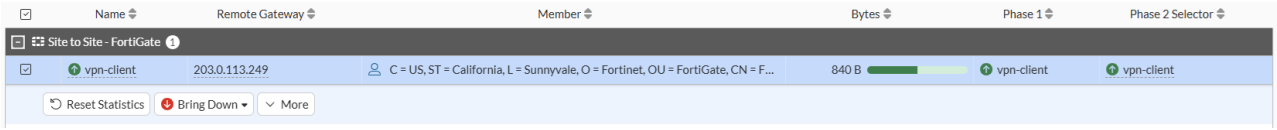
```
config router static
    edit 1
        set device "vpn-client"
        set dstaddr "HQ Server DMZ"
    next
    edit 2
        set distance 254
        set blackhole enable
        set dstaddr "HQ Server DMZ"
    next
end
```

8. Configure two firewall policies to allow the Branch LAN users to access the HQ DMZ subnet over the IPsec tunnel and vice versa:

```
config firewall policy
    edit 1
        set name "Branch LAN to HQ DMZ"
        set srcintf "port4"
        set dstintf "vpn-client"
        set action accept
        set srcaddr "Branch LAN"
        set dstaddr "HQ Server DMZ"
        set schedule "always"
        set service "ALL"
    next
    edit 2
        set name "HQ DMZ to Branch LAN"
        set srcintf "vpn-client"
        set dstintf "port4"
        set action accept
        set srcaddr "HQ Server DMZ"
        set dstaddr "Branch LAN"
        set schedule "always"
        set service "ALL"
    next
end
```

To verify the tunnel status in the GUI:

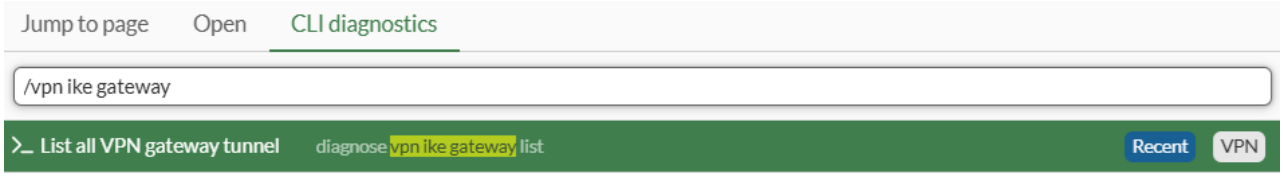
1. On the Branch FortiGate, go to *Dashboard > Network Monitor > VPN*.
2. Find the new tunnel and check the statuses of the *Phase 1* and *Phase 2* selectors.



3. If the Phase 2 selector is not up, click on the tunnel, and select *Bring Up > All Phase 2 Selectors*.

To verify the tunnel status in the CLI:

1. Verify the IPsec Phase 1 tunnel status on either the Branch or HQ using following diagnose command or the command palette (CTRL+P) > CLI diagnostics:



```
Branch # diagnose vpn ike gateway list name vpn-client
vd: root/0
name: vpn-client
version: 2
```

```
interface: port1 3
addr: 198.51.100.41:4500 -> 203.0.113.249:4500
tun_id: 203.0.113.249/::203.0.113.249
remote_location: 0.0.0.0
network-id: 0
transport: UDP
created: 84005s ago
peer-id: C = US, ST = California, L = Sunnyvale, O = Fortinet, OU = FortiGate, CN =
FGVM02TM2500xxxx, emailAddress = support@fortinet.com
peer-id-auth: yes
nat: peer
pending-queue: 0
IKE SA: created 1/1  established 1/1  time 10/10/10 ms
IPsec SA: created 1/3  established 1/3  time 10/13/20 ms

  id/spi: 0 1b29fe469e07695f/bb46729f1ce4b621
  direction: initiator
  status: established 84005-84005s ago = 10ms
  proposal: aes128-sha256
  key: 03b3a13938d3691d-b0b74a7a6e480f74
  QKD: no
  PQC-KEM (IKE): no
  PQC-KEM (all IPsec): no
  lifetime/rekey: 86400/2094
  DPD sent/recv: 00000000/00000000
  peer-id: C = US, ST = California, L = Sunnyvale, O = Fortinet, OU = FortiGate, CN =
FGVM02TM2500xxxx, emailAddress = support@fortinet.com
```

Note that the IPsec tunnel is established using port 4500 due to NAT Traversal (NAT-T) detection, and the Branch FortiGate acts as the initiator, thus functioning as IPsec VPN dialup client.

2. Verify the IPsec Phase 2 tunnel status on either the Branch or HQ using following diagnose command or the command palette (CTRL+P) > CLI diagnostics:

```
Branch # diagnose vpn tunnel list name vpn-client
list all ipsec tunnel in vd 0
------------------------------------------------------
name=vpn-client ver=2 serial=1 198.51.100.41:4500->203.0.113.249:4500 nexthop=203.0.113.1 tun_

npuid=0
```

Note the decryption, encryption, and authentication keys negotiated in Phase 2 to protect subnets under the `src` and `dst` fields.

To verify the traffic flow from PC1 to the Finance server:

1. From a PC1 (192.168.111.101), ping the Finance server (10.100.99.101).
   The ping should be successful.

```
C:\>ping 10.100.99.101

Pinging 10.100.99.101 with 32 bytes of data:
Reply from 10.100.99.101: bytes=32 time=5ms TTL=62
Reply from 10.100.99.101: bytes=32 time=2ms TTL=62
Reply from 10.100.99.101: bytes=32 time=9ms TTL=62
Reply from 10.100.99.101: bytes=32 time=2ms TTL=62

Ping statistics for 10.100.99.101:
    Packets: Sent = 4, Received = 4, Lost = 0 (0% loss),
Approximate round trip times in milli-seconds:
    Minimum = 2ms, Maximum = 9ms, Average = 4ms
```

To verify the traffic flow on the Branch and HQ FortiGate in the GUI:

1. On either FortiGate, go to *Log & Report* > *Forward Traffic*.
2. Filter the content using the search bar based on the respective Policy ID.

To make sure that the logs are collected and shown under *Forward Traffic*, set *Log Allowed Traffic* to *All Sessions* in the corresponding firewall policy configured under *Policy & Objects* > *Firewall Policy*.

To verify the traffic flow on the Branch and HQ FortiGate in the CLI:

1. Verify traffic on the Branch:

```
Branch # diagnose sniffer packet any 'host 10.100.99.101 and icmp' 4 0 l
Using Original Sniffing Mode
interfaces=[any]
filters=[host 10.100.99.101 and icmp]
2025-01-16 08:37:22.515436 port4 in 192.168.111.101 -> 10.100.99.101: icmp: echo request
2025-01-16 08:37:22.515478 vpn-client out 192.168.111.101 -> 10.100.99.101: icmp: echo request
2025-01-16 08:37:22.520118 vpn-client in 10.100.99.101 -> 192.168.111.101: icmp: echo reply
2025-01-16 08:37:22.520141 port4 out 10.100.99.101 -> 192.168.111.101: icmp: echo reply
```

2. Verify traffic on the HQ:

```
HQ # diagnose sniffer packet any 'host 10.100.99.101 and icmp' 4 0 l
Using Original Sniffing Mode
interfaces=[any]
filters=[host 10.100.99.101 and icmp]
2025-01-16 08:37:22.518421 vpn-server in 192.168.111.101 -> 10.100.99.101: icmp: echo request
2025-01-16 08:37:22.518459 port2 out 192.168.111.101 -> 10.100.99.101: icmp: echo request
2025-01-16 08:37:22.518900 port2 in 10.100.99.101 -> 192.168.111.101: icmp: echo reply
2025-01-16 08:37:22.518914 vpn-server out 10.100.99.101 -> 192.168.111.101: icmp: echo reply
```

For more information, see Performing a sniffer trace or packet capture on page 4825.

3. Optionally, run real time IKE debug using appropriate filters for troubleshooting if the IPsec tunnel does not come up:

```
Branch # diagnose vpn ike log filter rem-addr4 203.0.113.249
Branch # diagnose debug application ike -1
Branch # diagnose debug enable
```

For more information, see VPN IPsec troubleshooting on page 3207.

FortiClient as dialup client

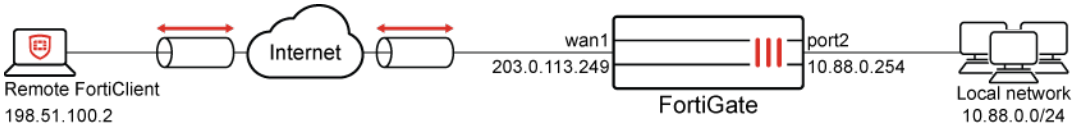
When FortiGate is configured as a dial-up VPN gateway, remote FortiClient users with dynamic IP addresses can establish secure connections over the Internet to access private resources protected by FortiGate.

This topic demonstrates using the *Remote Access* template on the VPN Wizard to configure FortiClient as a dialup client.

> The FortiClient *Secure Internet Access (SIA)* template for the *VPN Wizard* also creates a remote access VPN with the addition of routing all Internet traffic through the FortiGate IPsec VPN tunnel for security inspection. For more information, see Configure FortiClient SIA for IPsec VPN tunnels on page 2929.

Example

In this example, the FortiGate protects a local network (10.88.0.0/24) that a remote FortiClient user needs to securely access over the Internet using a VPN connection. The FortiGate is configured as a dialup VPN server on port3, and the FortiClient is the dialup IPsec VPN client.



This example uses IKE version 2 over UDP transport. For remote user authentication, a local user is configured to be a part of a local user group on the FortiGate.

Starting with FortiClient 7.4.4, IKEv1 is no longer supported on the client. IKEv1 is now considered a legacy configuration.

Also, FortiClient 7.4.4 does not support IPv6. Use FortiClient 7.4.6 or later.

For other authentication methods, see the following topics:

- Add FortiToken multi-factor authentication on page 2921
- Add LDAP user authentication on page 2924
- VPN 2FA with EAP and certificate authentication on page 2950
- SAML-based authentication for FortiClient remote access VPNs on page 2992

Some ISPs may block ESP and UDP ports. Therefore, consider using TCP as Transport.

Go to *VPN > VPN Tunnels > Settings* and enable *Allow VPN negotiations over TCP*. Once enabled, dialup VPNs will use *Auto* for *Transport* mode, allowing clients to attempt a UDP connection first before failing over to TCP.

For more details, see LDAP authentication with TCP as transport on page 2939.

To configure IPsec VPN with FortiClient as the dialup client in the GUI:

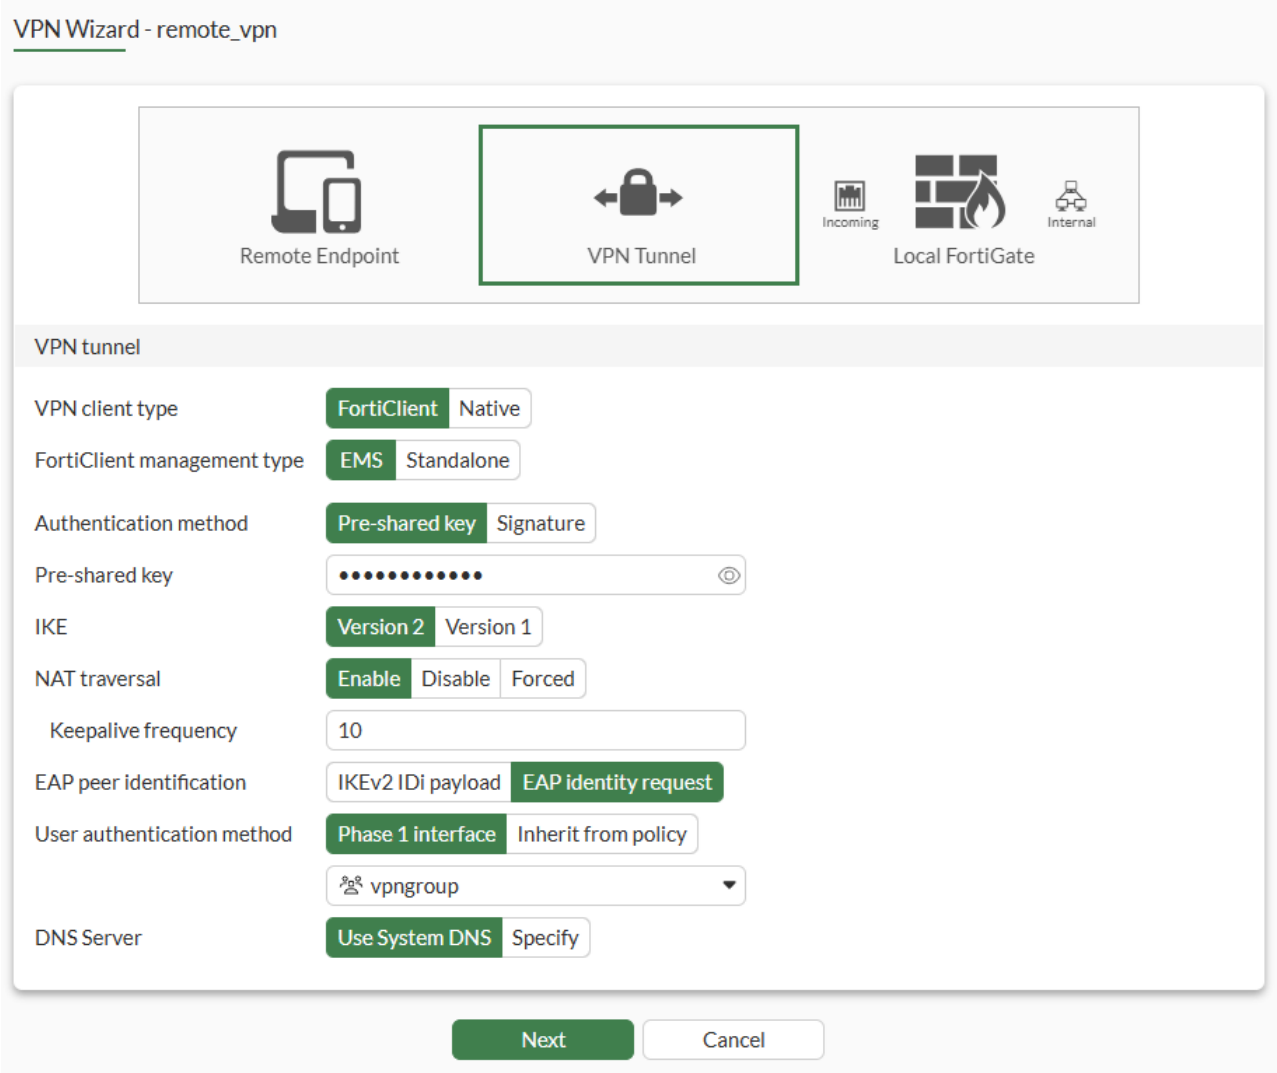
1. Configure a local user:
   a. Go to *User & Authentication > User Definition* and click *Create New*.
   b. Set the *User Type* to *Local User*, then click *Next*.
   c. Set the *Login Credentials*, then click *Next*:
      - *Username*: *vpnuser1*
      - *Password*: Enter a suitable password
   d. Disable *Two-factor Authentication*, then click *Next*.
   e. Set *User Account Status* to *Enabled* and disable *User Group*, then click *Submit*.
2. Configure a local user group:
   a. Go to *User & Authentication > User Groups* and click *Create New*.
   b. Configure the following:

Field	Value
Name	*vpngroup*
Type	*Firewall*
Members	*vpnuser1*

   c. Click *OK*.

   For other types of authentication, such as LDAP, PKI, or SAML, see User & Authentication on page 3356.
3. Go to *VPN > VPN Wizard*.
4. Enter a name for the VPN in the *Tunnel name* field. In this example, *remote_vpn*
5. Set *Select a template* to *Remote Access*.
6. Click *Begin*.
7. Configure the *VPN tunnel* settings:

Field	Value
VPN client type	*FortiClient* For configuring remote access for Native clients, see: • Native VPN as dialup client - Windows New on page 2957 • Native VPN as dialup client - iOS on page 2975
FortiClient management type	*EMS* (default) In most enterprise deployments, EMS is used to manage FortiClients and remote VPN settings. FortiClients managed this way are licensed through EMS. In 8.0 and later, standalone FortiClients can be purchased that are directly licensed through FortiCloud and FortiIdentity Cloud.
Authentication method	*Pre-shared key*
Pre-shared key	Enter a suitable key. The same pre-shared key is used by all remote users on the FortiClient to connect to the dialup VPN. For better security, use a digital certificate instead.
IKE	*Version 2*
NAT traversal	*Enable* Set *Keepalive frequency* to *10*.
EAP peer identification	*EAP identity request*
User authentication method	*Phase 1 interface* Select *vpngroup* from the drop-down list. Optionally, if you have multiple user groups configured, select *Inherit from policy* and then specify the groups. See Using single or multiple user groups for user authentication on page 2955 for details.
DNS Server	*Use System DNS*



8. Click *Next*.
9. Configure the *Remote Endpoint* settings:

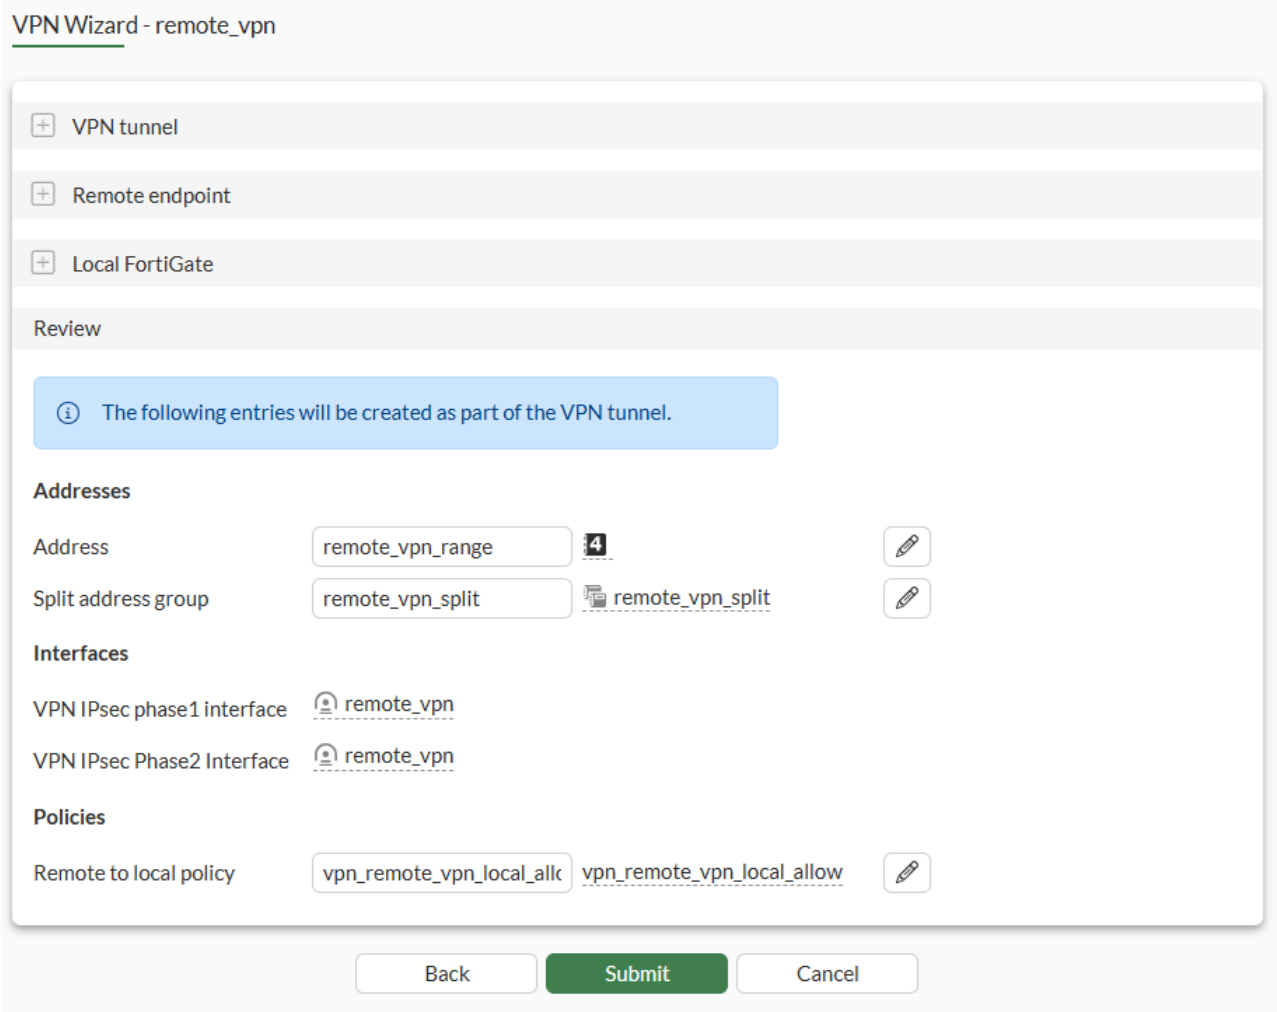
Field	Value
Addressing mode for connected endpoints	*Manual* IPAM is the preferred method.
Addresses to assign to connected endpoints	*10.10.2.1-10.10.2.200*
Subnet for connected endpoints	*255.255.255.255*
Security posture gateway matching	Disable
EMS SN verification	Disable

Field	Value
Save password	Enable
Auto Connect	Disable
Always up (keep alive)	Disable

10. Click *Next*.
11. Configure the *Local FortiGate* settings:

Field	Value
Incoming interface that binds to tunnel	*WAN (port3)* Disable *Create and add interface to zone*.
Local interface	*DMZ (port2)*
Local address	*DMZ_network* Click + to create a new address object with *Type* set to *Subnet* and *IP/Netmask* set to *10.88.0.0/24*, if not already configured.

12. Click *Next*.
13. Review the configuration and, if everything is correct, click *Submit*.



Because internet traffic is not routed through this firewall, the VPN Wizard automatically configures split tunneling. Only traffic destined for the Split address group remote_vpn_split will go through this tunnel.

To configure IPsec VPN with FortiClient as the dialup client in the CLI:

1. Configure a local user:

```
config user local
    edit "vpnuser1"
        set type password
        set passwd ******
    next
end
```

2. Configure a local user group:

```
config user group
    edit "vpngroup"
        set member "vpnuser1"
```

```
   next
end
```

3. Configure the DMZ (port2) interface that connects to the corporate internal network:

```
config system interface
    edit "port2"
        set vdom "root"
        set ip 10.88.0.254 255.255.255.0
    next
end
```

4. Configure the address group for split tunneling:

```
config firewall address
    edit "DMZ_Network"
        set subnet 10.88.0.0 255.255.255.0
    next
end
```

```
config firewall addrgrp
    edit "remote_vpn_split"
        set member "DMZ_Network"
    next
end
```

5. Configure the WAN interface.

   The WAN interface is the interface connected to the ISP. It can be configured in static mode (as shown here), DHCP, or PPPoE mode. It is recommended to configure it with a static IP address to ensure that the IPsec VPN configuration on the on the FortiClient stays unchanged if the WAN IP changes on the FortiGate. The IPsec tunnel is established over the WAN interface.

```
config system interface
    edit "port3"
        set vdom "root"
        set ip 203.0.113.249 255.255.255.0
    next
end
```

6. Configure the client address pool.

   You must create a firewall address to assign an IP address to a VPN client from the address pool.

```
config firewall address
    edit "remote_vpn_range"
        set type iprange
        set start-ip 10.10.2.1
        set end-ip 10.10.2.200
    next
end
```

7. Configure the IPsec phase1-interface.

   PSK is used as the authentication method in this example. Signature authentication is also an option.

```
config vpn ipsec phase1-interface
    edit "remote_vpn"
        set type dynamic
        set interface "port3"
        set ike-version 2
        set peertype any
        set net-device disable
        set mode-cfg enable
        set proposal es128-sha256 aes256-sha256 aes128gcm-prfsha256 aes256gcm-prfsha384
chacha20poly1305-prfsha256
        set dhgrp 20 21
        set eap enable
        set eap-identity send-request
        set wizard-type dialup-forticlient
        set authusrgrp "vpngroup"
        set assign-ip-from name
        set dns-mode auto
        set ipv4-split-include "remote_vpn_split"
        set ipv4-name "remote_vpn_range"
        set save-password enable
        set psksecret *****
    next
end
```

8. Configure the IPsec phase2-interface:

```
config vpn ipsec phase2-interface
    edit "remote_vpn"
        set phase1name "remote_vpn"
        set proposal aes128-sha256 aes256-sha256 aes128gcm aes256gcm chacha20poly1305
        set dhgrp 20 21
    next
end
```

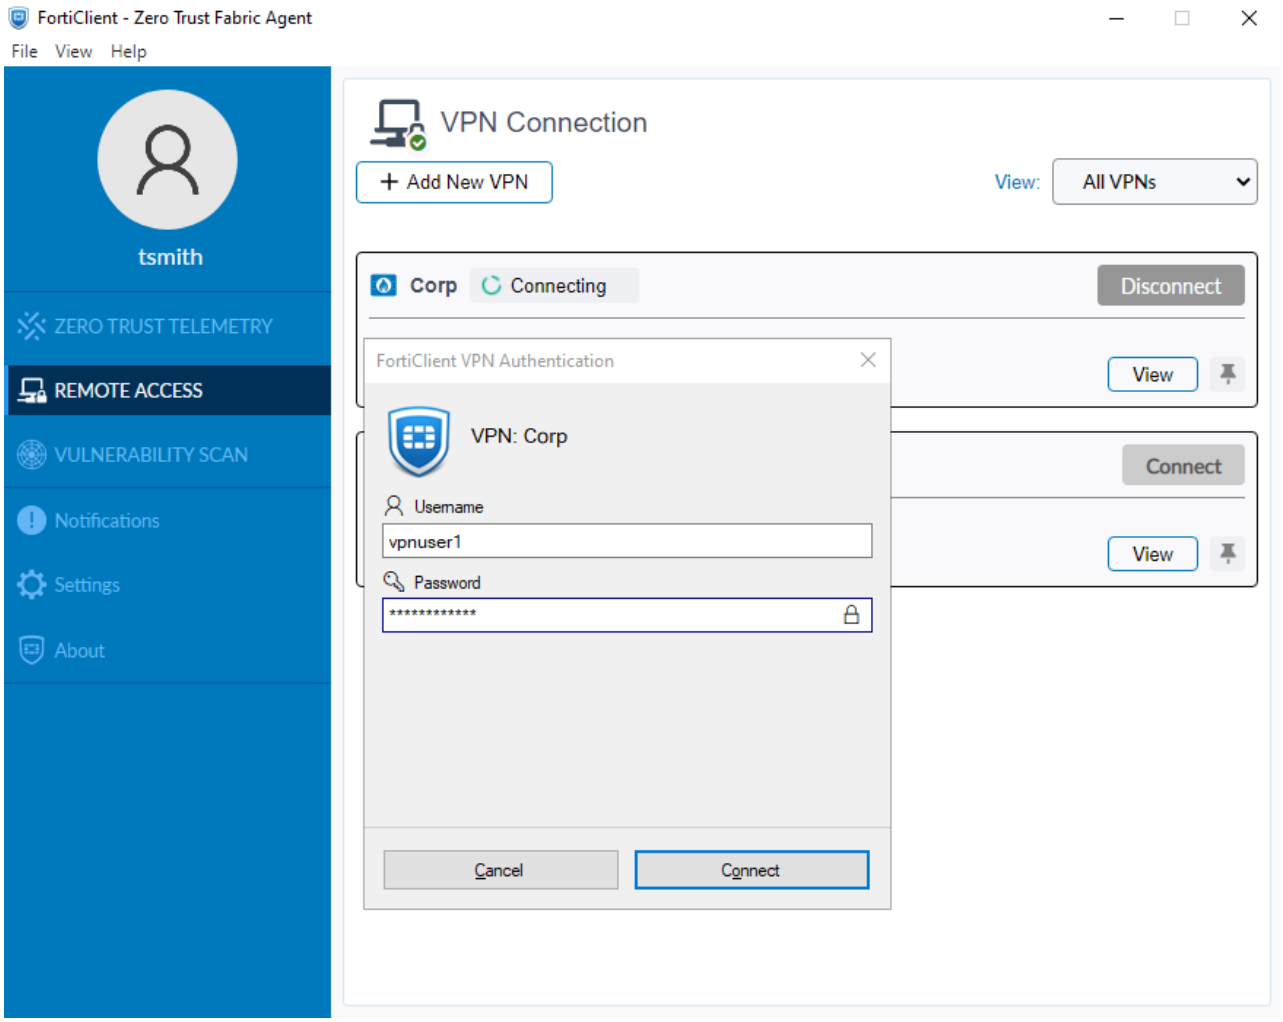
9. Configure a firewall policy to allow client traffic flow over the IPsec VPN tunnel to the FortiGate's lan interface:

```
config firewall policy
   edit 1
        set name "inbound"
        set srcintf "remote_vpn"
        set dstintf "port2"
        set action accept
        set srcaddr "remote_vpn_range"
        set dstaddr "DMZ_Network"
        set schedule "always"
        set service "ALL"
        set nat enable
    next
end
```

One or more user groups for user authentication can be configured under a single IPsec VPN tunnel. See Using single or multiple user groups for user authentication on page 2955 for details.

To configure a VPN directly on the FortiClient:

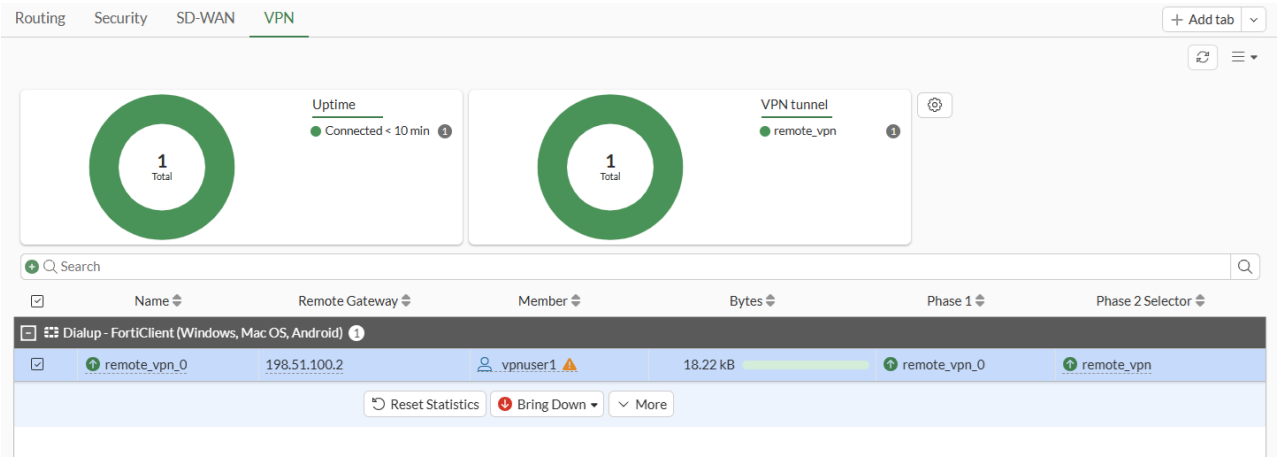
1. In FortiClient, go to *Remote Access* and click *Add a new connection*.
2. Set *VPN* to *IPsec VPN* and specify a *Connection Name*.
3. Set *Remote Gateway* to the FortiGate's WAN IP address (203.0.113.249).
4. Set *Authentication Method* to *Pre-Shared Key* and enter the key.
5. Configure the remaining settings as needed, then click *Save*.
6. Go to the *Remote Access* tab, select the VPN, and then click *Connect*.



To establish an IPsec tunnel, the Phase 1 and Phase 2 configurations of the dial-up IPsec VPN on FortiGate must precisely match the corresponding settings on FortiClient.

To verify the tunnel status in the GUI:

1. On the FortiGate, go to *Dashboard* > *Network Monitor* > *VPN*.
2. Find the new tunnel, *remote_vpn_0* in this example.

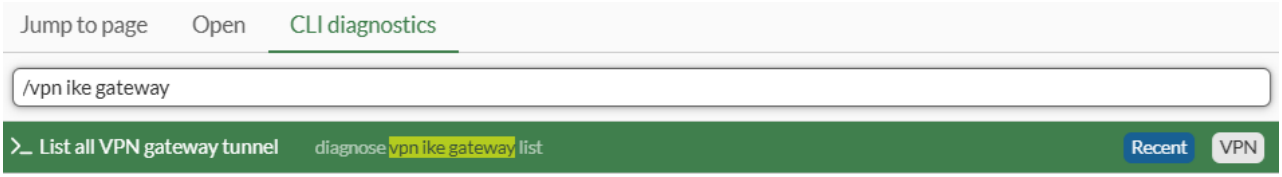


> Successfully established dialup IPsec VPN tunnels are displayed using a parent name followed by an index, creating a structured and organized association with the parent tunnel. For example, the parent name *remote_vpn* results in tunnel names such as *remote_vpn_0*, *remote_vpn_1*, and so on.

3. Hover the cursor over the tunnel name to see additional details.

To verify the tunnel status:

1. Verify the IPsec Phase 1 tunnel status on the FortiGate, either using the CLI or the Command palette (CTRL+P) > CLI diagnostics:



```
# diagnose vpn ike gateway list name remote_vpn_0

vd: root/0
name: remote_vpn_0
version: 2
interface: port3 5
addr: 203.0.113.249:4500 -> 198.51.100.2:61978
tun_id: 10.10.2.1/::10.0.0.3
remote_location: 0.0.0.0
network-id: 0
transport: UDP
created: 496s ago
eap-user: vpnuser1
2FA: no
```

```
peer-id: 198.51.100.2
peer-id-auth: no
FortiClient UID: 9A016B5A6E914B42AD4168C066EB04CA
assigned IPv4 address: 10.10.2.1/255.255.255.255
nat: me peer
pending-queue: 0
PPK: no
IKE SA: created 1/1  established 1/1  time 7880/7880/7880 ms

  DPD sent/recv: 00000000/00000000
  peer-id: 198.51.100.2
```

Note that FortiGate acts as the responder, establishes the IKEv2 VPN tunnel with remote FortiClient user with IP 198.51.100.2 over UDP NAT-T port 4500 on its port3 interface, and dynamically assigns a VPN IP of 10.10.2.1 to FortiClient endpoint. The authenticated username is also displayed in the `eap-user` field.

2. Verify the IPsec Phase 2 tunnel status on the FortiGate:

```
# diagnose vpn tunnel list name remote_vpn_0

list all ipsec tunnel in vd 0
------------------------------------------------------
name=remote_vpn_0 ver=2 serial=8 203.0.113.249:4500->198.51.100.2:61978 nexthop=203.0.113.3

  dec_npuid=0 enc_npuid=0 dec_engid=-1 enc_engid=-1 dec_saidx=-1 enc_saidx=-1
```

Note the decryption, encryption, and authentication keys negotiated in Phase 2 to protect subnets under the src and dst fields. FortiOS also automatically adds the dynamically assigned VPN IP of 10.10.2.1 to its traffic selectors for dialup tunnel remote_vpn_0.

To verify traffic through the IPsec tunnel:

1. 1. On the remote FortiClient user, initiate ICMP traffic to a machine in the 10.88.0.0/24 network and verify that traffic goes through:

```
# ping 10.88.0.7
Pinging 10.88.0.7 with 32 bytes of data:
Reply from 10.88.0.7: bytes=32 time=2ms TTL=63
Reply from 10.88.0.7: bytes=32 time=2ms TTL=63
```

2. On FortiGate, run a sniffer trace for ICMP packets destined to 10.88.0.7:

```
# diagnose sniffer packet any 'host 10.88.0.7' 4 0 l
Using Original Sniffing Mode
interfaces=[any]
filters=[host 10.88.0.7]
2026-04-13 12:08:17.297621 remote_vpn in 10.10.2.1 -> 10.88.0.7: icmp: echo request
2026-04-13 12:08:17.297733 port2 out 10.88.0.254 -> 10.88.0.7: icmp: echo request
2026-04-13 12:08:17.298459 port2 in 10.88.0.7 -> 10.88.0.254: icmp: echo reply
2026-04-13 12:08:17.298487 remote_vpn out 10.88.0.7 -> 10.10.2.1: icmp: echo reply
```

The ICMP request packets are received on remote_vpn_0 tunnel interface and routed to the port2 interface. ICMP reply packets are received on the port2 interface and routed back out on remote_vpn_0 tunnel interface.

For more information, see Performing a sniffer trace or packet capture on page 4825.

3. Optionally, run real time IKE debug using appropriate filters for troubleshooting if the IPsec tunnel does not come up:

```
# diagnose vpn ike log filter rem-addr4 198.51.100.2
# diagnose debug application ike -1
# diagnose debug enable
```

For more information, see VPN IPsec troubleshooting on page 3207.

Add FortiToken multi-factor authentication

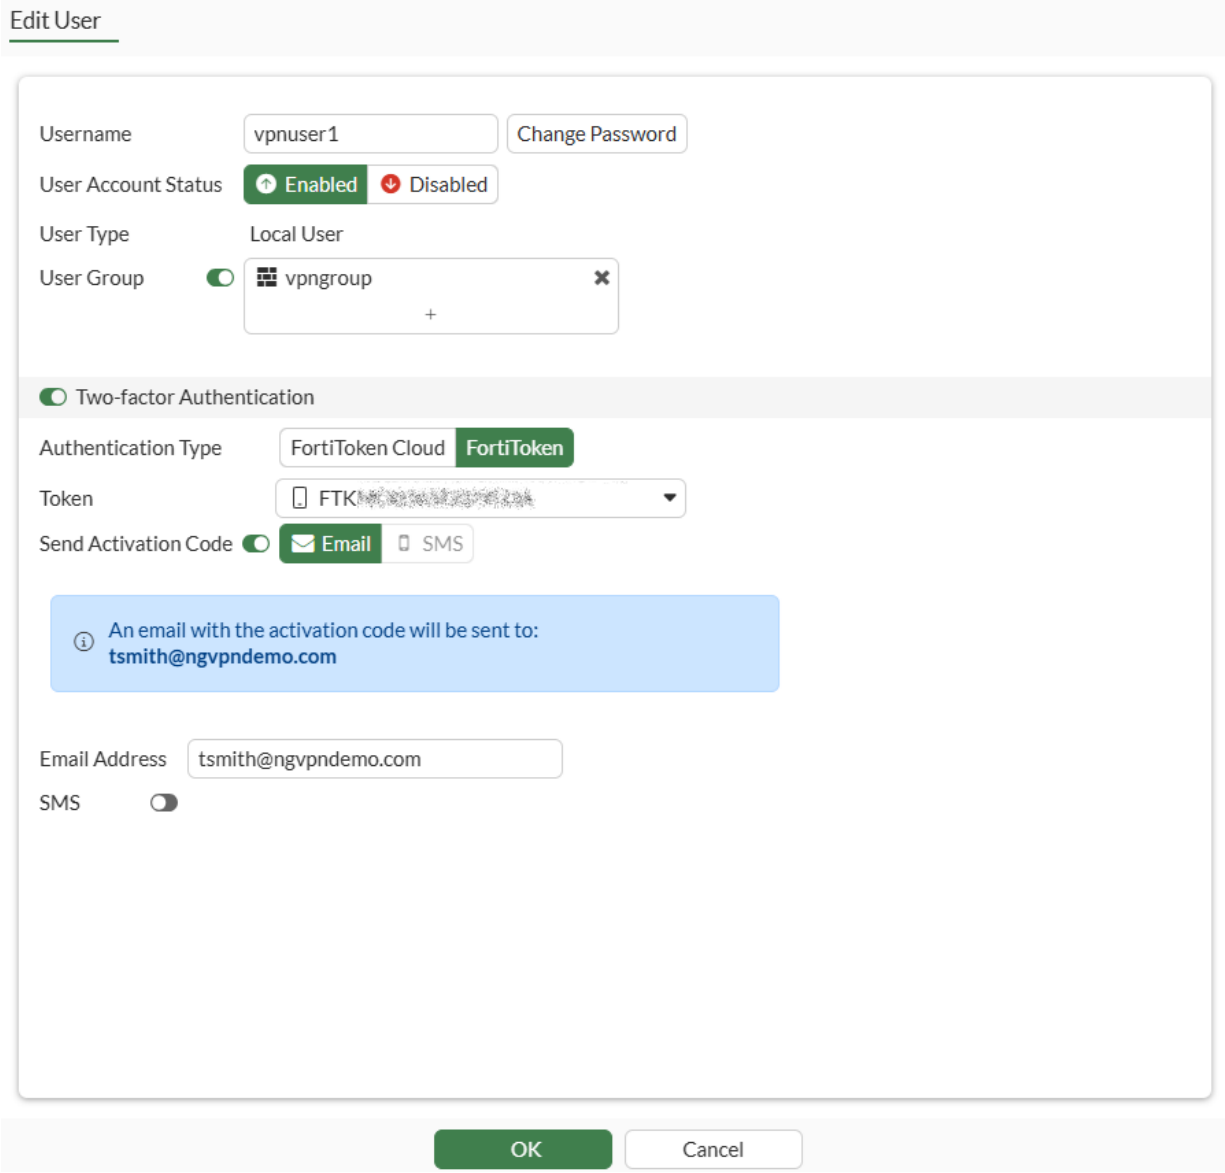
This configuration adds multi-factor authentication (MFA) to the FortiClient dialup VPN configuration (FortiClient as dialup client on page 2909). It uses one of the two free mobile FortiTokens that is already installed on the FortiGate.

For large number of users, it is recommended to use FortiAuthenticator for user and identity management. Also consider FortiIdentity Cloud for mass deployments of mobile tokens.

FortiGates with FortiCare Premium or FortiCare Elite has 3 free seats to FortiIdentity Cloud. See FortiCloud Subscriptions for details.

To configure MFA using the GUI:

1. Edit the user:
   a. Go to *User & Authentication* > *User Definition* and edit local user *vpnuser1*.
   b. Enable *Two-factor Authentication*.
   c. For *Authentication Type*, click *FortiToken* and select one mobile *Token* from the list.
   d. Enter the user's *Email Address*.
   e. Enable *Send Activation Code* and select *Email*.



f. Click *OK*.

2. Activate the mobile token.

   When a FortiToken is added to user *vpnuser1*, an email is sent to the user's email address. Follow the instructions to install your FortiToken mobile application on your device and activate your token.

To configure MFA using the CLI:

1. Edit the user and user group:

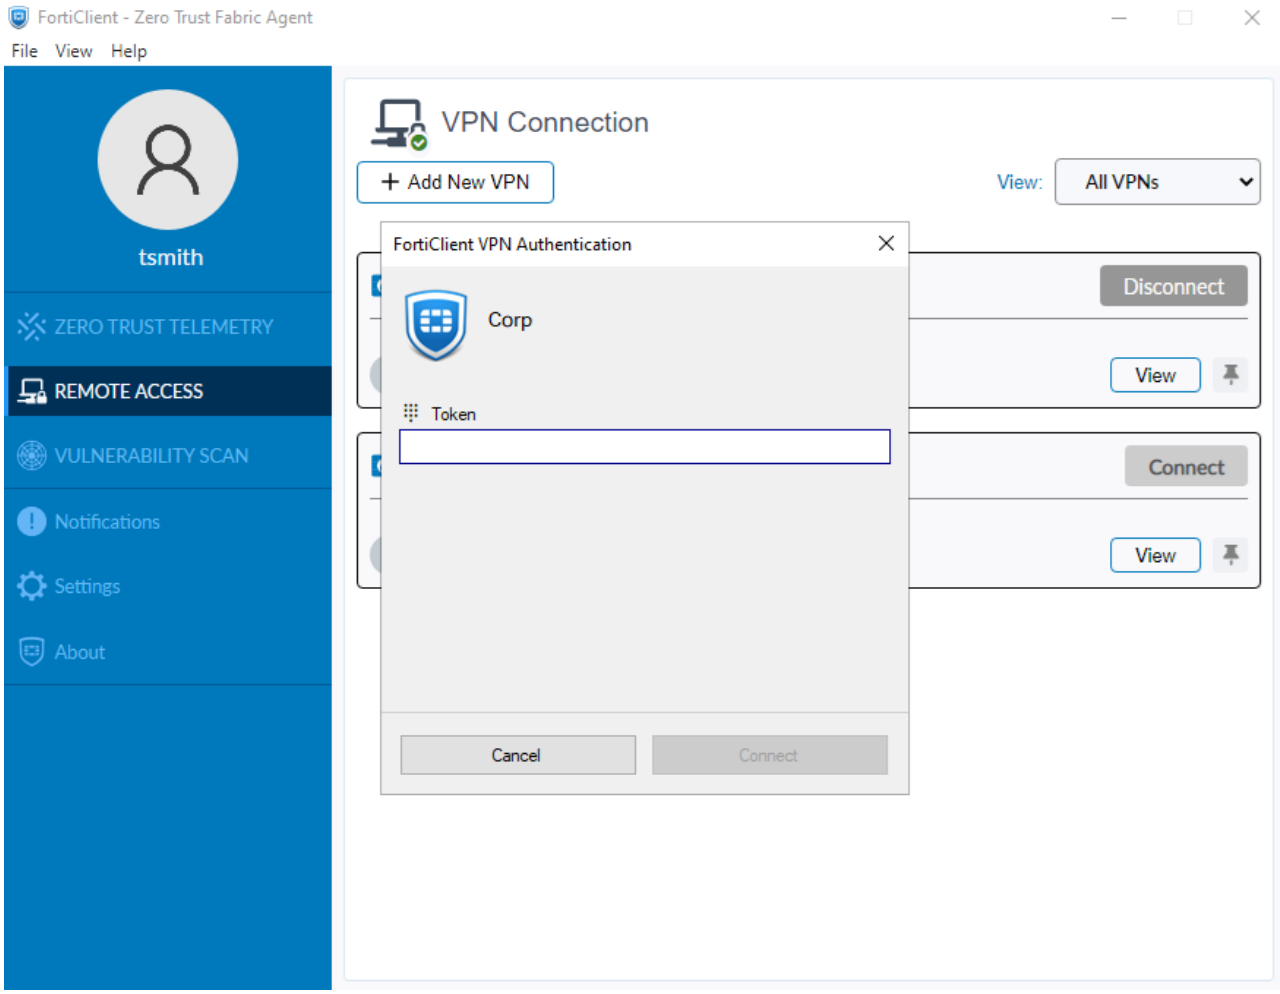
```
config user local
    edit "vpnuser1"
        set type password
        set two-factor fortitoken
        set fortitoken <select mobile token for the option list>
        set email-to <user's email address>
```

```
        set passwd <user's password>
    next
end
```

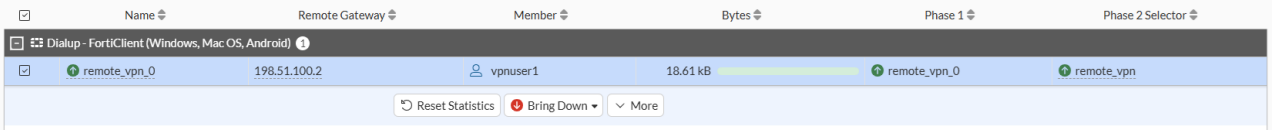
2. Activate the mobile token.
   When a FortiToken is added to user *vpnuser1*, an email is sent to the user's email address. Follow the instructions to install your FortiToken mobile application on your device and activate your token.

To verify the connection:

1. On the FortiClient, go to *Remote Access* and find the VPN tunnel to connect.
2. Click *Connect*.
3. When prompted, enter the username and password.
4. On the next screen, when prompted for your FortiToken code, locate the code on your FortiToken Mobile app and enter the code.



5. Click *Connect*.
6. Once connected, go to the *FortiGate > Dashboard > Network Monitor > VPN*.
   The user will be shown in the *Member* column. There will not be any warning icon indicating the need for 2FA.



7. In the debug command `diagnose vpn ike gateway list`, confirm that the `2FA` field displays `Yes`:

```
# diagnose vpn ike gateway list

vd: root/0
name: remote_vpn_0
version: 2
interface: port3 5
addr: 203.0.113.249:4500 -> 198.51.100.2:49720
tun_id: 10.10.2.1/::10.0.0.5
remote_location: 0.0.0.0
network-id: 0
transport: UDP
created: 443s ago
eap-user: vpnuser1
2FA: yes
peer-id: 198.51.100.2
peer-id-auth: no
FortiClient UID: 9A016B5A6E914B42AD4168C066EB04CA
assigned IPv4 address: 10.10.2.1/255.255.255.255
```

Add LDAP user authentication

This configuration adds LDAP user authentication to the FortiClient dialup VPN configuration (FortiClient as dialup client on page 2909). You must have already generated and exported a CA certificate from your AD server.

Since IPsec uses IKEv2 by default, the FortiClient must utilize EAP-TTLS for authenticating against the FortiGate and the LDAPS authentication server. This requires FortiClient running 7.4.3 or later, and configurations synchronized from FortiClient EMS.

This example demonstrates the EMS configurations needed to configure the Remote Access profile.

For a complete end-to-end configuration with options to configure VPN over TCP, see LDAP authentication with TCP as transport on page 2939.

To configure LDAP user authentication using the GUI:

1. Import the CA certificate into FortiGate:
   a. Go to *System* > *Certificates*.
      If the *Certificates* option is not visible, enable it in *Feature Visibility*. See Feature visibility on page 3820 for details.
   b. Click *Import* > *CA Certificate*.
   c. Set *Type* to *File*.
   d. Click *Upload* then find and select the certificate file.

e. Click *OK*.

The CA certificate now appears in the list of *External CA Certificates*. In this example, it is called *CA_Cert_1*.

f. Optionally, rename the system generated *CA_Cert_1* to something more descriptive:

```
config vpn certificate ca
    rename CA_Cert_1 to LDAPS-CA
end
```

2. Configure the LDAP user:

a. Go to *User & Authentication > LDAP Servers* and click *Create New*.

b. Set *Name* to *ldaps-server* and specify *Server IP/Name*.

c. Specify *Common Name Identifier* and *Distinguished Name*.

d. Set *Bind Type* to *Regular*.

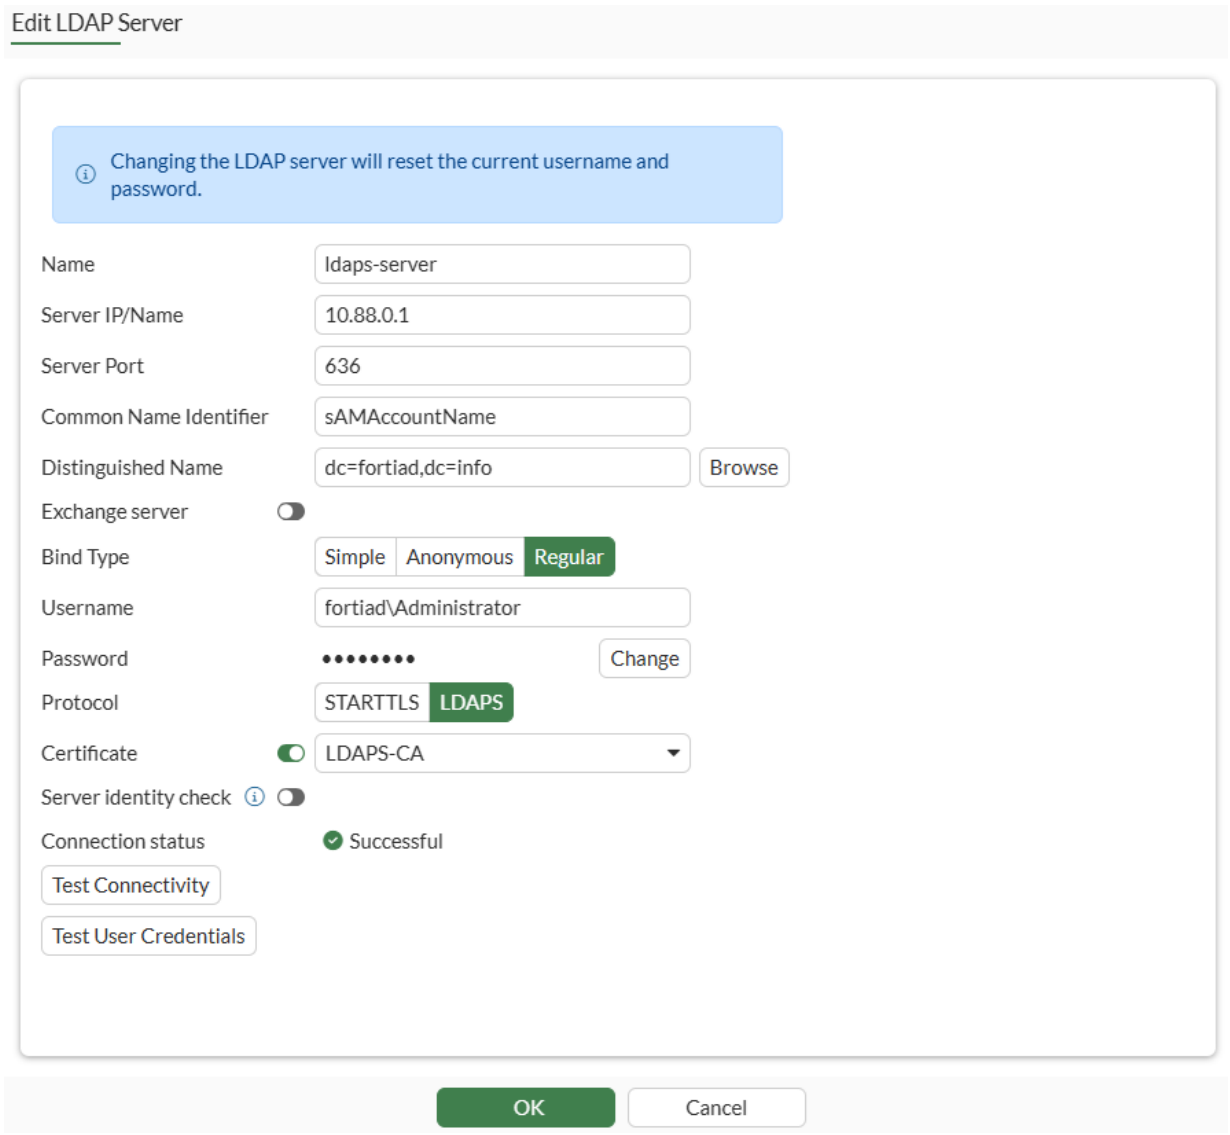
e. Specify *Username* and *Password*.

f. Set *Protocol* to *LDAPS*.

g. Enable *Certificate* and select *LDAPS-CA* from the list.

h. Optionally, enable *Server identity check* if you need to verify the server domain name/IP address against the server certificate.

i. Click *Test Connectivity*. The *Connection status* should change to *Successful*.



j. Click *OK*.

3. Add the LDAP user to the user group:
   a. Go to *User & Authentication* > *User Groups* and edit the *vpngroup* group.
   b. In *Remote Groups*, click *Add* to add the *ldaps-server* remote server.
   c. Click *OK*.

To configure LDAP user authentication using the CLI:

1. Import the CA certificate using the GUI.
2. Configure the LDAP user:

```
config user ldap
    edit "ldaps-server"
        set server "10.88.0.1"
        set server-identity-check disable
```

```
        set cnid "sAMAccountName"
        set dn "dc=fortiad,dc=info"
        set type regular
        set username "fortiad\\Administrator"
        set password ENC **********
        set secure ldaps
        set ca-cert "LDAPS-CA"
        set port 636
    next
end
```

3. Add the LDAP user to the user group:

```
config user group
    edit "vpngroup"
        append member "ldaps-server"
    next
end
```

To configure the Remote Access profile from EMS:

1. On FortiClient EMS, navigate to *Endpoint Profiles > Remote Access* and click *Edit* on the *Default* endpoint profile.
2. Under *VPN Tunnels*, click *Add Tunnel*.
3. Set *VPN type* as *Manual*.
4. Click *Next*.
5. Under *Basic Settings*, enter the following:

Field	Value
Name	*Corp_remote*
Remote Gateway	*203.0.113.249*
Authentication Method	*Pre-shared Key*
Pre-Shared Key	Enter pre-shared key that was configured on FortiGate's dialup VPN configuration.
Prompt for Username	*Enabled*

6. Click *VPN Settings*, enter the following:

Field	Value
IKE	*Version 2*
Address Assignment	*Mode Config*
Encapsulation	*IKE UDP Port*
IKE TCP Port	*500*

7. Click *Phase 1*, enter the following details:

Field		Value
IKE Proposal		
	Encryption, Authentication	*AES128, SHA256*
	Encryption, Authentication	*AES256, SHA256*
DH Groups		*20, 21*
Key Life		*86400*
EAP Authentication Method		*EAP-TTLS*
Dead Peer Detection		*Enable*
NAT Traversal		*Enable*

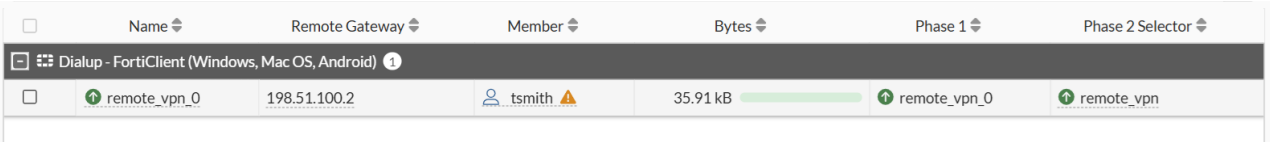
8. Click *Phase 2*, enter the following details:

Field		Value
IKE Proposal		
	Encryption, Authentication	*AES128, SHA256*
	Encryption, Authentication	*AES256, SHA256*
DH Groups		*20*
Key Life		*43200*
Enable Replay Detection		*Enable*
Enable Perfect Forward Secrecy (PFS)		*Enable*

9. Click *Save* to save the VPN Tunnel configuration.
10. Click *Save* to save *Remote Access* endpoint profile.

To verify the connection:

1. On the FortiClient, go to *Remote Access* and find the VPN tunnel Corp_remote to connect.
2. Click *Connect*.
3. When prompted, enter the LDAP username and password.
4. Once connected, go to the *FortiGate > Dashboard > Network Monitor > VPN*.
   The LDAP user will be shown in the *Member* column:



5. In the debug command `diagnose vpn ike gateway list`, the `eap-user` field displays the LDAP user name:

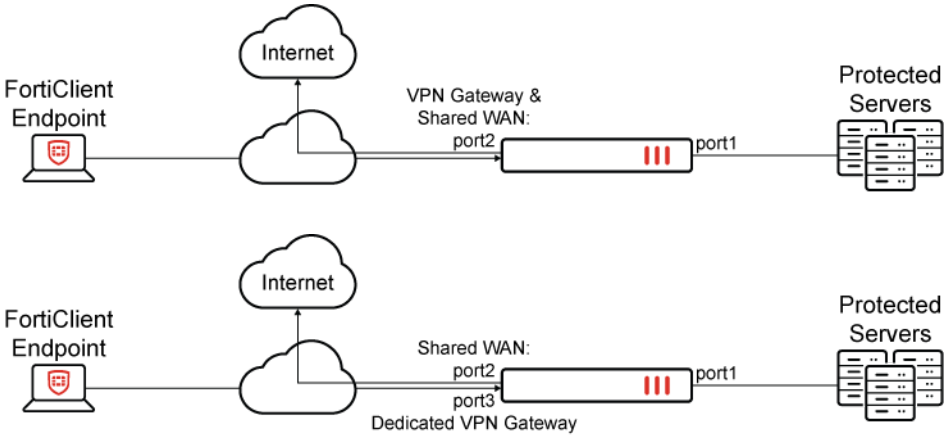
```
# diagnose vpn ike gateway list

vd: root/0
name: remote_vpn_0
version: 2
interface: port3 5
addr: 203.0.113.249:4500 -> 198.51.100.2:58861
tun_id: 10.10.2.1/::10.0.0.6
remote_location: 0.0.0.0
network-id: 0
transport: UDP
created: 1048s ago
eap-user: tsmith
2FA: no
peer-id: 198.51.100.2
peer-id-auth: no
FortiClient UID: 9A016B5A6E914B42AD4168C066EB04CA
assigned IPv4 address: 10.10.2.1/255.255.255.255
```

Configure FortiClient SIA for IPsec VPN tunnels

The FortiClient *Secure Internet Access (SIA)* template for the *VPN Wizard* enables the configuration of a remote access IPsec VPN to ensure all FortiClient traffic is routed through the FortiGate IPsec VPN tunnel for security inspection. The template allows administrators to select the desired security profile, including certificate or deep inspection, and configure policies to block access to botnet and C&C servers. Additionally, it provides an option to allow remote VPN users access to specified local subnets and local interfaces.

Typical deployment scenarios can be broken down into these topologies:



In the first use case, port2 acts as the VPN Gateway interface as well as the shared WAN interface. Therefore, when VPN is established, a policy needs to be created to allow traffic from the VPN interface to port2.

In the second use case, port3 acts as a dedicated VPN Gateway interface. Traffic entering the VPN interface will egress on port2 which is the acting shared WAN.

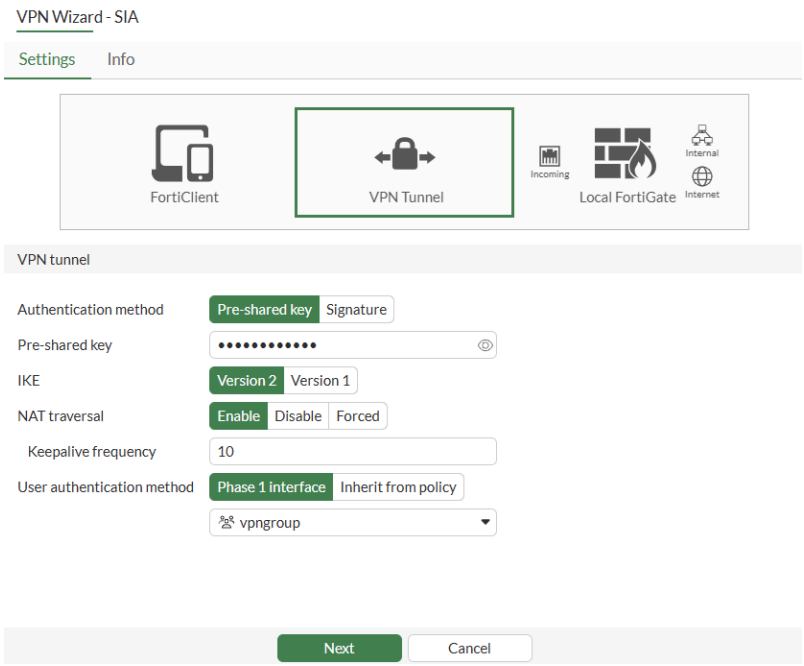
The following example uses the second use case.

To configure IPsec VPN with FortiClient as the dialup client in the GUI:

1. Configure a user and user group:
   a. Go to *User & Authentication* > *User Definition* and create a user. See Users on page 3357 for different types of users.
   b. Go to *User & Authentication* > *User Groups* and create a user group with the new user added as a member. See User groups on page 3359.
2. Go to *VPN* > *VPN Wizard* and configure the tunnel settings:
   a. Enter a VPN *Tunnel name*.
   b. For *Select a template*, select *FortiClient Secure Internet Access (SIA)*.

   c. Click *Begin*.
3. Configure the following *VPN tunnel* settings:
   a. Set *Authentication method* to *Pre-shared key*.
   b. Enter the *Pre-shared key*.
   c. Set *IKE* to *Version 2*.
   d. For *User authentication method*, select *Phase 1 interface*.

> One or more user groups for user authentication can be configured under a single IPsec VPN tunnel. See Using single or multiple user groups for user authentication on page 2955 for details.



e. Click *Next*.

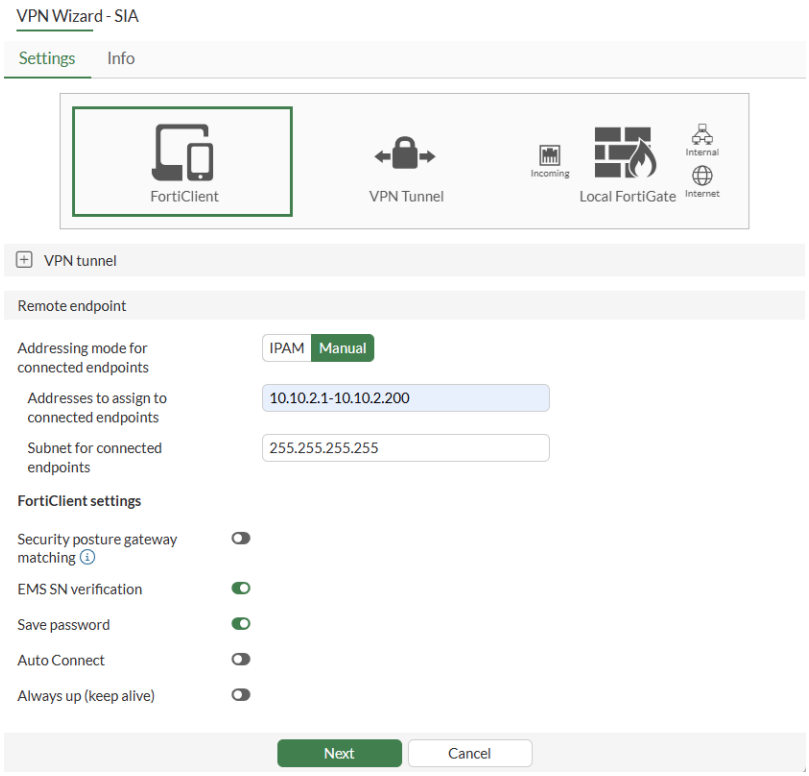
4. Configure the following *Remote endpoint* settings:

a. In Address mode, the default is *IPAM*. To use this option, IPAM must be enabled and a subnet must be assigned, then you can configure the *Network size* and *Subnet for connected endpoints* according to the number of remote endpoints.

Alternatively, change the Address mode to *Manual*. Configure *Addresses to assign to connected endpoints* by entering the client address range manually. Enter the *Subnet* for connected endpoints.

b. Enable *FortiClient settings* as needed:

Field	Description
Security posture gateway matching	A tunnel connection will only be established when the endpoint is matched by a security posture tag. See Enforcing security posture verification before dial-up VPN connection on page 3038.
EMS SN verification	Enable/disable verification of EMS serial number. Requires both the FortiGate and FortiClient endpoints must be connected to the same FortiClient EMS. See Enhancing IPsec security using EMS SN verification on page 3014.
Save password	Enable/disable saving username and password on VPN clients.
Auto Connect	Enable/disable allowing the VPN client to bring up the tunnel when there is no traffic.
Always up (keep alive)	Enable/disable allowing the VPN client to keep the tunnel up when there is no traffic.



c. Click *Next*.

5. Configure the following *Local FortiGate* and *Secure Internet Access (SIA)* settings:

a. From the *Incoming interface that binds to tunnel* dropdown list, select the port. This port may be your WAN interface, or a dedicated interface designated for establishing the IPsec tunnel on.

b. Enable *Local subnets that remote endpoints can access*.

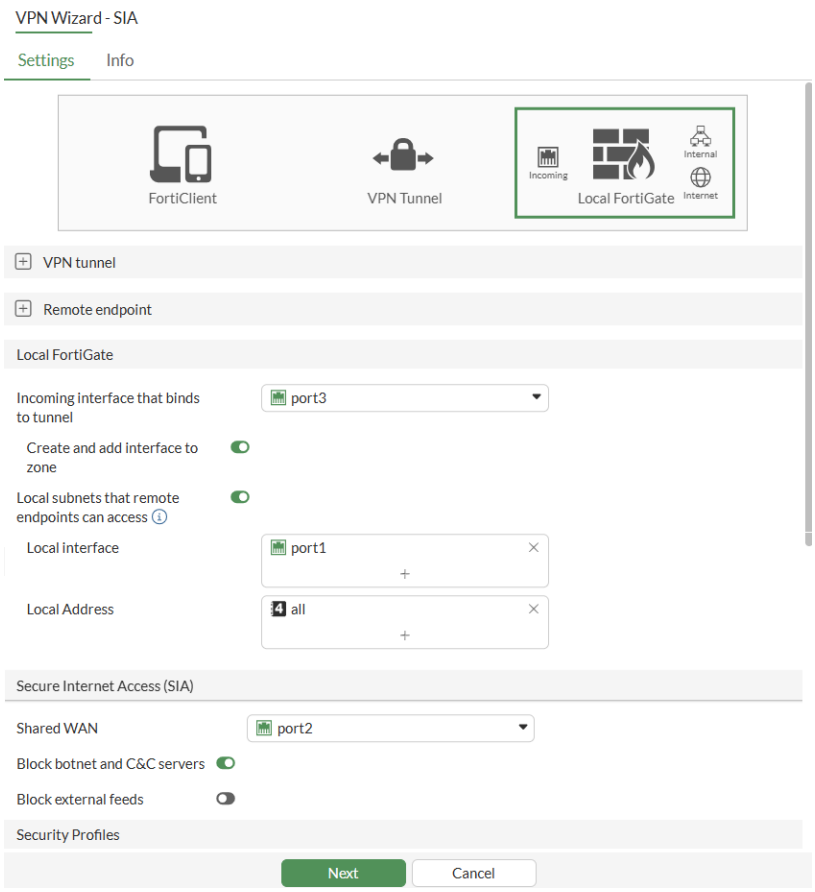
c. Set the *Local interface* and *Local Address*.

d. From the *Shared WAN* dropdown list, select WAN interface. This interface can also be the same interface used for establishing the IPsec tunnel if your internet access is through it.

e. Enable the other *Secure Internet Access (SIA)* fields, as needed.

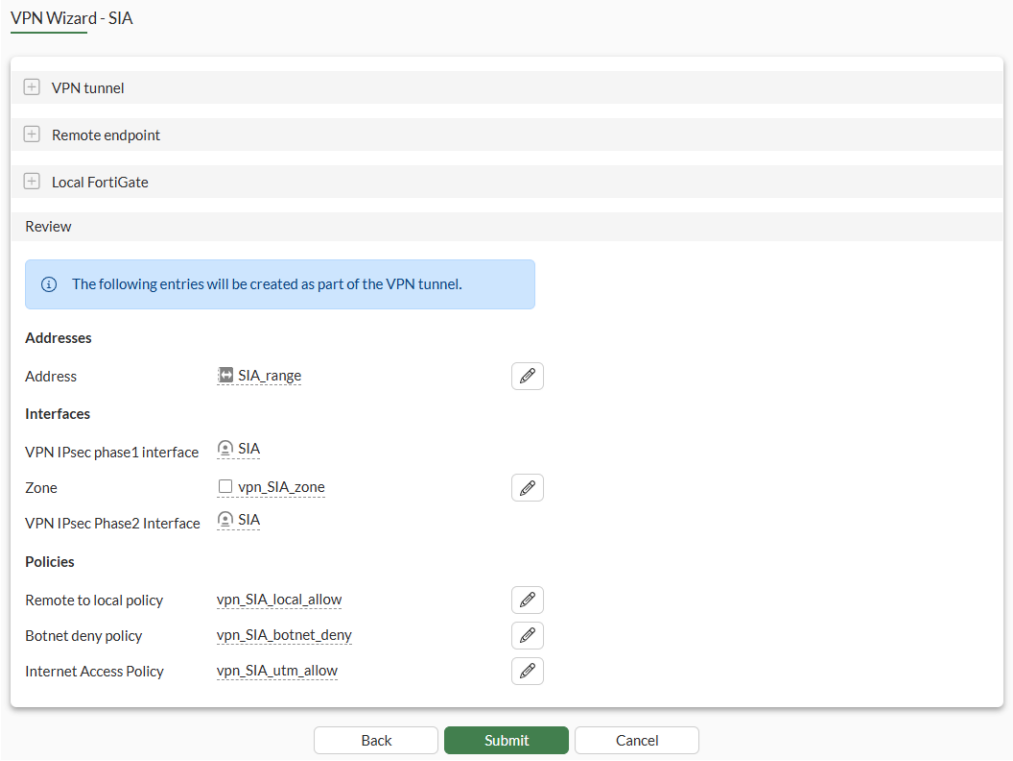
> The *Block external feeds* field is an optional feature that allows you to block specific external feeds. After enabling the field, select an *Address External Feed* or *Dynamic Address* option to proceed.

f. Enable the required *Security Profiles*. These profiles protect the internet traffic that is passing through the SIA connection.



g. Click *Next*.

6. Click *Submit*.



The VPN wizard creates three policies:

- *Remote to local policy* allows traffic to the local subnet without any inspection.
- *Botnet deny policy* blocks any internet traffic to Botnet and C&C server destinations.
- *Internet Access Policy* applies the Security Profiles to the Secure Internet Access policy.

To configure IPsec tunnels for FortiClient Secure Internet Access (SIA) in the CLI:

1. Configure the user and user group:

```
config user local
    edit "vpnuser1"
        set type password
        set passwd ********
    next
end
config user group
    edit "vpngroup"
        set member "vpnuser1"
    next
end
```

2. Configure the LAN interface, such as port1:

```
config system interface
    edit "port1"
        set vdom "root"
        set ip 192.168.5.4 255.255.255.0
```

```
    next
end
config firewall address
    edit "local_subnet_1"
        set subnet 192.168.5.0 255.255.255.0
    next
end
config firewall addrgrp
    edit "local_network"
        set member "local_subnet_1"
    next
end
```

3. Configure the WAN interface for establishing the IPsec tunnel. Additionally, configure a separate WAN interface for internet access if applicable. If both functions use the same interface, configure only that single interface.
   a. Configure the interface on which the IPsec tunnel is established:

```
config system interface
    edit "port3"
        set vdom "root"
        set ip 172.16.200.4 255.255.255.0
    next
end
```

   b. Configure the interface on which Internet access is enabled:

```
config system interface
    edit "port2"
        set vdom "root"
        set ip 172.17.200.4 255.255.255.0
    next
end
```

4. Configure the client address pool:

```
config firewall address
    edit "client_range"
        set type iprange
        set comment "VPN client range"
        set start-ip 10.10.2.1
        set end-ip 10.10.2.200
    next
end
```

5. Configure the IPsec Phase 1 interface:

```
config vpn ipsec phase1-interface
    edit "SIA"
        set type dynamic
        set interface "port3"
        set ike-version 2
```

```
        set peertype any
        set mode-cfg enable
        set proposal aes128-sha256 aes256-sha256 aes128gcm-prfsha256 aes256gcm-prfsha384
chacha20poly1305-prfsha256
        set dhgroup 20 21
        set eap enable
        set authusrgrp "vpngroup"
        set assign-ip-from name
        set ipv4-start-ip 10.10.2.1
        set ipv4-end-ip 10.10.2.200
        set dns-mode auto
        set eap-identity send-request
        set save-password enable
        set psksecret ********
        set transport auto
    next
end
```

One or more user groups for user authentication can be configured under a single IPsec VPN tunnel. See Using single or multiple user groups for user authentication on page 2955 for details.

6. Configure the IPsec Phase 2 interface:

```
config vpn ipsec phase2-interface
    edit "SIA"
        set phase1name "SIA"
        set dhgroup 20 21
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm aes256gcm
chacha20poly1305
    next
end
```

7. Configure the firewall policy to allow client traffic to flow over the IPsec VPN tunnel:

```
config firewall policy
    edit 1
        set name "vpn_SIA_local_allow"
        set srcintf "SIA"
        set dstintf "port1"
        set action accept
        set srcaddr "SIA_range"
        set dstaddr "local_network"
        set schedule "always"
        set service "ALL"
        set nat enable
    next
    edit 2
        set name "vpn_SIA_botnet_deny"
        set srcintf "SIA"
        set dstintf "port2"
        set srcaddr "all"
```

```
        set internet-service enable
        set internet-service-name "Botnet-C&C.Server"
        set schedule "always"
        set logtraffic all
    next
    edit 3
        set name "vpn_SIA_utm_allow"
        set srcintf "SIA"
        set dstintf "port2"
        set action accept
        set srcaddr "SIA_range"
        set dstaddr "all"
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set av-profile "default"
        set webfilter-profile "default"
        set dnsfilter-profile "default"
        set file-filter-profile "default"
        set ips-sensor "default"
        set application-list "default"
        set logtraffic all
        set nat enable
    next
end
```

8. Configure the FortiClient to connect to IPsec tunnel using the IP address configured on port 3. Review the IPsec tunnel details using CLI once it establishes:

```
# diagnose vpn ike gateway list

vd: root/0
name: SIA_0
version: 2
interface: port3 7
addr: 172.16.200.4:500 -> 172.16.200.242:500

LDAP authentication with TCP as transport

EAP-TTLS for LDAP based user authentication in IKEv2

When configuring IPsec VPNs, the user authentication mechanism used depends on the IKE version in use:

- IKE version 1 uses XAUTH (Extended Authentication) for user authentication.
- IKE version 2 uses EAP (Extensible Authentication Protocol) for user authentication.

XAUTH in IKEv1 natively supports LDAP based user authentication. In IKEv2, LDAP based user authentication is not directly supported through all EAP methods. To authenticate users against an LDAP server in IKEv2, you must use EAP-TTLS (Tunneled Transport Layer Security). EAP-TTLS allows credentials to be securely transmitted between FortiClient and FortiGate over a TLS tunnel, ensuring secure user authentication.

EAP-TTLS configuration is supported on FortiClient EMS and FortiClient version 7.4.3 and later, see EAP-TTLS support for IPsec VPN.

Both FortiClient and FortiClient EMS must be running compatible versions to enable this functionality, see EMS Compatibility chart.

Transport options: UDP, TCP or Auto mode

Different options can be selected between transport methods such as UDP, TCP, or Auto mode for IKE negotiation and encapsulation of ESP packets.

Traditionally, dial-up IPsec VPNs use UDP as the transport protocol for IKE negotiations and encrypted traffic. IPsec VPNs can now operate over TCP, providing greater flexibility and compatibility in restrictive network environments. Using TCP as transport is beneficial in scenarios where ISPs, firewalls, or proxy servers only allow inbound and outbound TCP traffic and block UDP traffic. You can also specify a custom TCP port for IPsec communication for both FortiGate and FortiClient. For details on configuring a custom TCP port on FortiClient, see IPsec VPN over TCP. For details on configuring a custom TCP port on FortiGate, see Dialup IPsec VPN using custom TCP port on page 3023.

Requirements for using TCP as transport:

- IKE version 2
- FortiClient version 7.4.1 or later, that supports TCP as transport

VPN over TCP can be enabled on a per-VDOM basis. When configured, a dialup VPN tunnel defaults to Auto mode. In Auto mode, IKE initially uses UDP encapsulation. If the UDP connection fails to establish within the defined time threshold, it uses TCP encapsulation as fallback.

To configure the transport mode in the GUI:

1. Go to *VPN > VPN Tunnels > Settings*.
2. Enable *Allow VPN negotiation over TCP*.
   Use TLS is supported with FortiGate as a client. It is not currently supported by FortiClient in 7.4.
3. Change TCP port for IKE/IPsec traffic as needed.

To configure the transport mode in the CLI:

```
config system settings
    set ike-tcp-service enable
    set ike-tcp-port <port>
end
```

On FortiClient EMS, you can configure the transport method using the FortiClient EMS GUI (see Example) or the XML tag `<transport_mode>`.

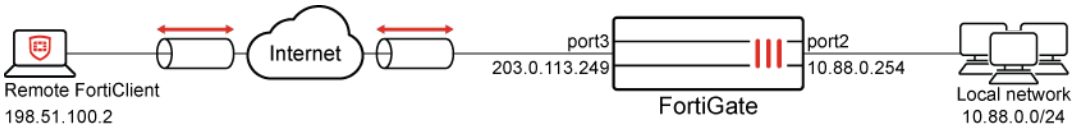
Example

This example demonstrates how to configure an IPsec VPN tunnel using IKEv2 with Auto transport protocol and LDAP for user authentication.

On FortiGate, an LDAP server named *LDAP-Server* is pre-configured to connect to LDAP directory server and is referenced in user group named *LDAP-Group*. For configuration steps, see Configuring an LDAP server on page 3381 and User groups on page 3359.

The *Group Name* option is configured to match users who belong to the *Domain Users* group on the LDAP server. As a result, only members of the *Domain Users* group are permitted to connect to the IPsec VPN. For more information on group-based user matching, see Tracking users in each Active Directory LDAP group on page 3390.

FortiClient is managed by FortiClient EMS. To enable support for both TCP transport and EAP-TTLS (required for secure LDAP authentication with IKEv2), ensure that both FortiClient and FortiClient EMS are running version 7.4.3 or later.



To configure dialup IPsec VPN using IKE version 2 and TCP as transport using GUI:

1. Enable VPN over TCP:
   a. Go to *VPN > VPN Tunnels > Settings*.
   b. Enable *Allow VPN negotiation over TCP*.
   c. Optionally, change the TCP port.
   d. Click *Apply*.
2. Go to *VPN > VPN Wizard*.
3. Enter a name for the VPN in the *Tunnel name* field. In this example, it is *dialup_vpn*.
4. Set *Select a template* to *Remote Access*.

5. Click *Begin*.
6. Configure the *VPN tunnel* settings:

Field	Value
VPN client type	*FortiClient*
FortiClient Management Type	*EMS*
Authentication method	*Pre-shared key*
Pre-shared key	Enter a suitable key. The same pre-shared key is configured on FortiClient EMS to connect to this IPsec tunnel.
IKE	*Version 2*
NAT traversal	*Enable*
Keepalive frequency	*10*
EAP peer identification	*EAP identity request*
User authentication method	*Phase 1 interface* Select *LDAP-Group* from the dropdown list. Optionally, if you have multiple user groups configured, select *Inherit from policy* and then specify the groups. See Using single or multiple user groups for user authentication on page 2955 for details.
DNS Server	*Use System DNS*

7. Click *Next*.
8. Configure the *Remote Endpoint* settings:

Field	Value
Addresses to assign to connected endpoints	*10.10.2.1-10.10.2.200*
Subnet for connected endpoints	*255.255.255.255*
Security posture gateway matching	*Disable*
EMS SN verification	*Disable*
Save password	*Enable*
Auto Connect	*Disable*
Always up (keep alive)	*Disable*

9. Click *Next*.
10. Configure the *Local FortiGate* settings:

Field	Value
Incoming interface that binds to tunnel	*port3*
Create and add interface to zone	*Disable*
Local interface	*port2*
Local Address	*local_network* Click *+* to create a new address object with *Type* set to *Subnet* and *IP/Netmask* set to *10.88.0.0/24*, if not already configured.

11. Click *Next*.
12. Review the configuration and click *Submit*.

To configure dialup IPsec VPN using IKE version 2 and TCP as transport using CLI:

1. Configure a LDAP server on FortiGate:

```
config user ldap
    edit "ldaps-server"
        set server "10.88.0.1"
        set server-identity-check disable
        set cnid "sAMAccountName"
        set dn "dc=fortiad,dc=info"
        set type regular
        set username "fortiad\\Administrator"
        set password ENC **********
        set secure ldaps
        set ca-cert "LDAPS-CA"
        set port 636
    next
end
```

2. Configure a user group that uses the LDAP server along with group matching (`group-name`):

```
config user group
    edit "LDAP-Group"
        set member "ldaps-server"
        config match
            edit 1
                set server-name "ldaps-server"
                set group-name "CN=Administrators,CN=Builtin,DC=fortiad,DC=info"
            next
        end
    next
end
```

3. Configure the internal interface:

```
config system interface
    edit "port2"
        set vdom "root"
        set ip 10.88.0.254 255.255.255.0
    next
end
config firewall address
    edit "local_subnet_1"
        set subnet 10.88.0.0 255.255.255.0
    next
end
config firewall addrgrp
    edit "local_network"
        set member "local_subnet_1"
    next
end
```

4. Configure the WAN interface.

   The WAN interface is the interface connected to the ISP. It can be configured in static mode (as shown here), DHCP, or PPPoE mode. It is recommended to configure it with a static IP address to ensure that the IPsec VPN configuration on the FortiClient stays unchanged if the WAN IP changes on the FortiGate. The IPsec tunnel is established over the WAN interface.

```
config system interface
    edit "port3"
        set vdom "root"
        set ip 203.0.113.249 255.255.255.0
    next
end
```

5. Configure the client address pool.

   You must create a firewall address to assign an IP address to a client from the address pool.

```
config firewall address
    edit "client_range"
        set type iprange
        set start-ip 10.10.2.1
        set end-ip 10.10.2.200
    next
end
```

6. Enable VPN over TCP. Optionally change the TCP port:

```
config system settings
    set ike-tcp-service enable
    set ike-tcp-port <port>
end
```

When using TCP port 443 for IKE/IPsec traffic, GUI access can be affected for interfaces that are bound to an IPsec tunnel when the GUI admin port is also using port 443. To ensure continued functionality, change either the IKE/IPsec port or the administrative access port.

To change the administrative access port:

```
config system global
    set admin-sport <port>
end
```

Command	Description
`admin-sport <port>`	Set the administrative access port for HTTPS (1 - 65535, default = 443).

For port conflicts with ZTNA and SSL VPN, ZTNA and SSL VPN will take precedence. To avoid any port conflicts with other services, review the FortiOS Ports guide for other incoming ports used on the FortiGate.

7. Configure the IPsec phase 1 interface:

```
config vpn ipsec phase1-interface
    edit "dialup_vpn"
        set type dynamic
        set interface "port3"
        set ike-version 2
        set peertype any
        set net-device disable
        set mode-cfg enable
        set proposal aes128-sha256 aes256-sha256 aes128gcm-prfsha256 aes256gcm-prfsha384
chacha20poly1305-prfsha256
        set dhgrp 20 21
        set eap enable
        set eap-identity send-request
        set authusrgrp "LDAP-Group"
        set assign-ip-from name
        set ipv4-name "client range"
        set dns-mode auto
        set ipv4-split-include "local_network"
        set save-password enable
        set psksecret ******
    next
end
```

8. Configure the IPsec phase 2 interface:

```
config vpn ipsec phase2-interface
    edit "dialup_vpn"
        set phase1name "dialup_vpn"
        set proposal aes128-sha256 aes256-sha256 aes128gcm aes256gcm chacha20poly1305
        set dhgrp 20 21
```

```
    next
end
```

9. Configure a firewall policy to allow client traffic flow over the IPsec VPN tunnel to the FortiGate's LAN (port2) interface:

```
config firewall policy
    edit 1
        set name "inbound"
        set srcintf "dialup_vpn"
        set dstintf "port2"
        set srcaddr "client_range"
        set dstaddr "local_network"
        set action accept
        set schedule "always"
        set service "ALL"
    next
end
```

One or more user groups for user authentication can be configured under a single IPsec VPN tunnel. See Using single or multiple user groups for user authentication on page 2955 for details.

To configure the Remote Access profile to use EAP-TTLS with IKEv2 on FortiClient EMS:

1. On FortiClient EMS, navigate to *Endpoint Profiles* > *Remote Access* and click *Edit* on the *Default* endpoint profile.
2. Under *VPN Tunnels*, click *Add Tunnel*.
3. Set *VPN type* as *Manual*.
4. Click *Next*.
5. Under *Basic Settings*, enter the following:

Field	Value
Name	*IPsec-IKEv2*
Remote Gateway	*203.0.113.249*
Authentication Method	*Pre-shared Key*
Pre-Shared Key	Enter pre-shared key that was configured on FortiGate's dialup VPN configuration.
Prompt for Username	*Enabled*

6. Click *VPN Settings*, enter the following:

Field	Value
IKE	*Version 2*
Address Assignment	*Mode Config*

Field	Value
Encapsulation	*Auto* (Optional) To use TCP mode only, set to *IPsec over TCP*. Otherwise Auto will attempt UDP first, and fallback to TCP.
IKE TCP Port	*443*
IKE UDP Port	*500*

7. Click *Phase 1*, enter the following details:

Field	Value
IKE Proposal	
Encryption, Authentication	*AES128, SHA256*
Encryption, Authentication	*AES256, SHA256*
DH Groups	*20, 21*
Key Life	*86400*
EAP Authentication Method	*EAP-TTLS* This setting is available in the GUI of FortiClient 7.4.4 and later.
Dead Peer Detection	*Enable*
NAT Traversal	*Enable*

8. Click *Phase 2*, enter the following details:

Field	Value
IKE Proposal	
Encryption, Authentication	*AES128, SHA256*
Encryption, Authentication	*AES256, SHA256*
DH Groups	*20*
Key Life	*43200*
Enable Replay Detection	*Enable*
Enable Perfect Forward Secrecy (PFS)	*Enable*

9. Click *Save* to save the VPN Tunnel configuration.
10. Click *Save* to save *Remote Access* endpoint profile.

To connect and fallback to TCP:

In this example, UDP is blocked by the ISP. FortiClient will detect that connection over TCP fails, so it will connect over TCP.

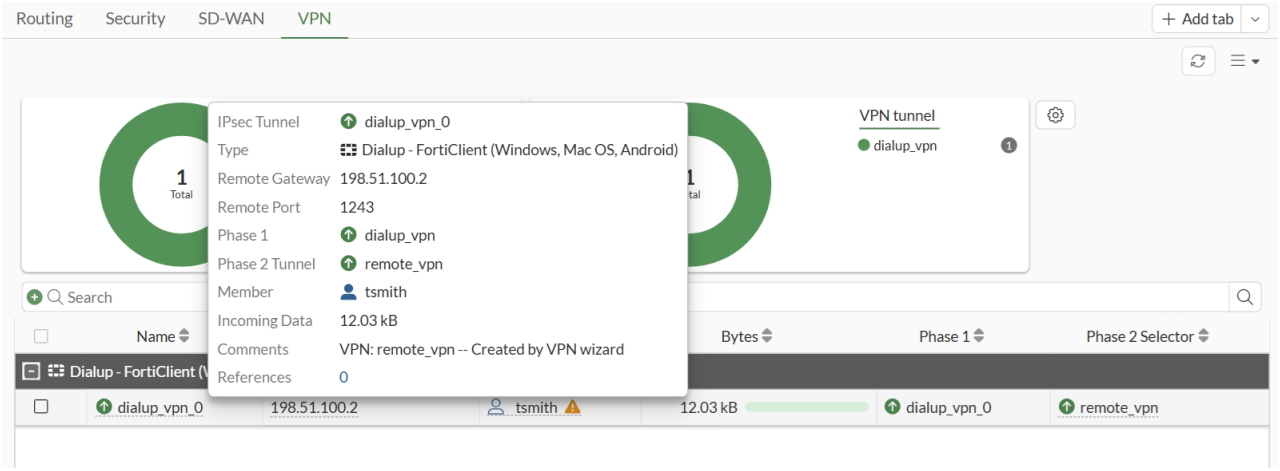
1. On FortiClient endpoint that received the configuration, in the *Remote Access* tab, find the tunnel *IPsec-IKEv2* and click *Connect*.
   The client will first initiate the connection over UDP. After some time, it will fallback to TCP.
2. Once the VPN connection is initiated over TCP, user is prompted for their LDAP credentials. Do not wait too long to enter the username and password or the connection will timeout.
   Once the correct credentials are entered, the connection will establish.

To verify VPN tunnel status using FortiGate GUI:

1. On the FortiGate, go to *Dashboard* > *Network Monitor* > *VPN*.
2. Find the new tunnel, *dialup_vpn_0* in this example, and check the statuses of the *Phase 1* and *Phase 2* selectors.

   Successfully established dialup IPsec VPN tunnels are displayed using a parent name followed by an index, creating a structured and organized association with the parent tunnel. For example, the parent name *dialup_vpn* results in tunnel names such as *dialup_vpn_0*, *dialup_vpn_1*, and so on.

3. Hover the cursor over the tunnel name to see additional details.



To verify VPN tunnel status:

1. Verify the IPsec Phase 1 tunnel status on the FortiGate, either using the CLI or the Command palette (CTRL+P) > CLI diagnostics:

```
# diagnose vpn ike gateway list name dialup_vpn_0

vd: root/0
name: dialup_vpn_0
version: 2
```

```
interface: port3 5
addr: 203.0.113.249:443 -> 198.51.100.2:1243

```

Note that FortiGate acts as the responder, establishes the IPsec tunnel with remote FortiClient user with IP 198.51.100.2 over TCP port 443 on its port3 interface, and dynamically assigns a VPN IP of 10.10.2.1 to FortiClient endpoint. The authenticated username is also displayed in eap-user field.

2. Verify the IPsec Phase 2 tunnel status on the FortiGate:

```
# diagnose vpn tunnel list name dialup_vpn_0

list all ipsec tunnel in vd 0
------------------------------------------------------
name=dialup_vpn_0 ver=2 serial=d 203.0.113.249:443->198.51.100.2:1243 nexthop= tun_
id=10.10.2.1 tun_id6=::10.0.0.8 status=up dst_mtu=0 weight=1 country=ZZ
```

```
bound_if=5 real_if=0 lgwy=static/1 tun=intf mode=dial_inst/3 encap=none options[0x23a8]=npu
rgwy-chg rport-chg frag-rfc  run_state=0 role=primary accept_traffic=1 overlay_id=0

  dec_npuid=0 enc_npuid=0 dec_engid=-1 enc_engid=-1 dec_saidx=-1 enc_saidx=-1
```

Note the decryption, encryption, and authentication keys negotiated in Phase 2 to protect subnets under the `src` and `dst` fields. FortiOS also automatically adds the dynamically assigned VPN IP of 10.10.2.1 to its traffic selectors for dialup tunnel dialup_vpn_0.

To verify traffic through the IPsec tunnel:

1. On the remote FortiClient user with IP address 198.51.100.2, initiate ICMP traffic to a machine in the 10.88.0.0/24 network and verify that traffic goes through:

```
# ping 10.88.0.7
Pinging 10.88.0.7 with 32 bytes of data:
Reply from 10.88.0.7: bytes=32 time=2ms TTL=63
Reply from 10.88.0.7: bytes=32 time=2ms TTL=63
```

2. On FortiGate, run a sniffer trace for ICMP packets destined to 10.10.111.3:

```
# diagnose sniffer packet any 'host 10.10.111.3’ 4 0 l

Using Original Sniffing Mode
interfaces=[any]
filters=[host 10.88.0.7 and icmp]
2026-04-13 21:06:46.543624 dialup_vpn in 10.10.2.1 -> 10.88.0.7: icmp: echo request
2026-04-13 21:06:46.543694 port2 out 10.88.0.254 -> 10.88.0.7: icmp: echo request
2026-04-13 21:06:46.544223 port2 in 10.88.0.7 -> 10.88.0.254: icmp: echo reply
2026-04-13 21:06:46.544247 dialup_vpn out 10.88.0.7 -> 10.10.2.1: icmp: echo reply
```

The ICMP request packets are received on dialup_vpn_0 tunnel interface and routed to the port2 interface. ICMP reply packets are received on the port2 interface and routed back out on dialup_vpn_0 tunnel interface.

For more information, see Performing a sniffer trace or packet capture on page 4825.

3. Optionally, run real time IKE debug using appropriate filters for troubleshooting if the IPsec tunnel does not come up:

```
# diagnose vpn ike log filter rem-addr4 198.51.100.2
# diagnose debug application ike -1
# diagnose debug enable
```

For more information, see VPN IPsec troubleshooting on page 3207.

To verify LDAP authentication using EAP-TTLS on FortiClient:

1. Ensure that the logging level is set to *Debug* on FortiClient.
2. After the VPN tunnel establishes on FortiClient, go to the folder located under *C:\%ProgramFiles%\Fortinet\FortiClient\logs\trace* and open the file *FortiIKE_1.log*. The following shows expected log output for this feature:

```
[7868:11132] [FortiIKE  524    info] IPsec daemon start ipsec.exe -s FC_{73EFB30F-1CAD-4a7a-
AE2E-150282B6CE25}_000002 -i 2 -g 198.51.100.2 IPsec-IKEv2

[7868:11132] [FortiIKE  419   debug] EAP-TTLS method loaded
[7868:11132] [FortiIKE  427   debug] EAP-GTC method loaded

[7868:11132] [FortiIKE  4939   debug] 0:IPsec-IKEv2:0: initiator received EAP msg
[7868:11132] [FortiIKE  400   debug] EAP: Initialize selected EAP method: vendor 0 method 21
(TTLS)

[7868:11132] [FortiIKE  145   debug] EAP-TTLS: Phase2 type: PAP
[7868:11132] [FortiIKE  4779   debug] 0:IPsec-IKEv2:0: authentication succeeded
```

VPN 2FA with EAP and certificate authentication

IPsec IKEv2 VPNs now support certificate authentication and EAP authentication at the same time from a dialup FortiClient. With the eap-cert-auth setting enabled, FortiGate will validate the X.509 certificate sent from FortiClient when establishing an IKEv2 tunnel. After it is authenticated, FortiGate will continue to perform EAP authentication.

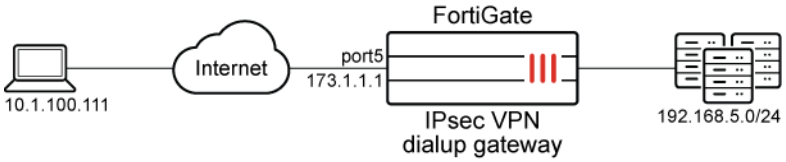
```
config vpn ipsec phase1-interface
    edit <tunnel>
        set eap enable
        set eap-cert-auth {*disable | enable}
        set peer <user peer>
    next
end
```

Setting	Description
eap enable	Enable EAP to perform user authentication.

Setting	Description
`eap-cert-auth {*disable | enable}`	Enable/Disable certificate authentication in addition to EAP (default = disable).
`peer <user peer>`	When eap-cert-auth is enabled, the peer certificate is validated if `peer <user peer>` is configured. If eap-cert-auth is disabled, the peer certificate is not validated even if `peer <user peer>` is configured.

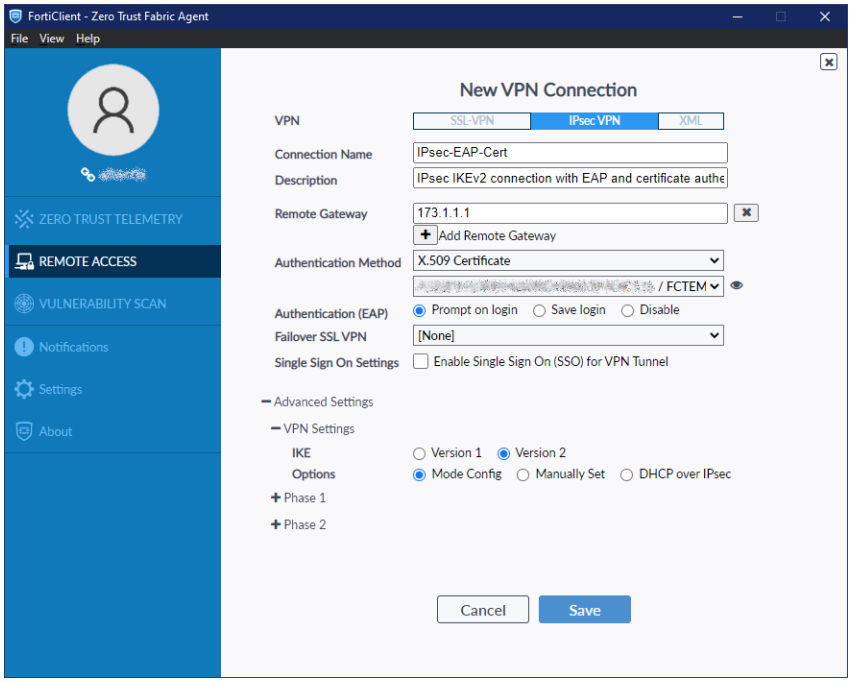
Example

In this example, FortiClient is configured to use an X.509 certificate and EAP to perform certificate and user authentication. The certificate is issued by a CA that is trusted by the FortiGate.



To configure FortiClient:

1. Go to *Remote Access*, click the sandwich menu, and select *Add a new connection*.
2. Configure the new VPN connection.



Field	Value
VPN	IPsec VPN
Connection Name	IPsec-EAP-Cert

Field	Value
Description	(Optional)
Remote Gateway	173.1.1.1
Authentication Method	X.509 Certificate
Authentication (EAP)	Prompt on login
Failover SSL VPN	[None]
Advanced Settings > VPN Settings	
IKE	Version 2
Options	Mode Config

3. Click *Save*.

To configure local users and peer (certificate authentication):

```
config user group
    edit "local-group"
        set member "usera" "userc" "bi_local"
    next
end
config user peer
    edit "peer-test3"
        set ca "Eternity-CA"
        set subject "test3"
    next
end
```

A certificate issued by Eternity-CA with `test3` in the subject will be trusted by the FortiGate.

To configure the IPsec VPN phase1:

```
config vpn ipsec phase1-interface
    edit "fct-eapcert"
        set type dynamic
        set interface "port5"
        set ike-version 2
        set authmethod signature
        set net-device disable
        set mode-cfg enable
        set proposal aes128-sha1 aes256-sha256
        set comments "VPN: fct3459 -- Created by VPN wizard"
        set dhgrp 20
        set eap enable
        set eap-identity send-request
        set eap-cert-auth enable
        set wizard-type dialup-forticlient
        set authusrgrp "local-group"
```

```
        set certificate "test1"
        set peer "peer-test3"
        set ipv4-start-ip 3.3.1.1
        set ipv4-end-ip 3.3.1.100
        set dns-mode auto
        set ipv4-split-include "fct3459_split1"
        set save-password enable
        set client-auto-negotiate enable
        set client-keep-alive enable
    next
end
```

The FortiGate will validate the client certificate based on the eap-cert-auth setting. The following examples show different outcomes from different configuration scenarios.

Scenario 1: eap-cert-auth is enabled and FortiGate receives a valid and trusted certificate

Using IKE debugs, we can observe the steps when FortiGate receives the connection request with the client certificate, validates it, and continues to perform EAP authentication before establishing the VPN connection.

```
# diagnose debug application ike -1
# diagnose debug enable
ike V=root:0:fct-eapcert:11: received FCT-UID : 4E98BCE511844FA8B161FA5DF047B12C

…
```

Checking the IPsec VPN tunnel list:

```
# diagnose vpn tunnel list
list all ipsec tunnel in vd 0
…
name=fct-eapcert_0 ver=2 serial=6 173.1.1.1:0->10.1.100.111:0 tun_id=3.3.1.1 tun_id6=::10.0.0.5
dst_mtu=1500 dpd-link=on weight=1
bound_if=13 lgwy=static/1 tun=intf mode=dial_inst/3 encap=none/74408 options[122a8]=npu rgwy-chg
frag-rfc  run_state=0 role=primary accept_traffic=1 overlay_id=0
parent=fct-eapcert index=0
proxyid_num=1 child_num=0 refcnt=5 ilast=1 olast=13 ad=/0
stat: rxp=2 txp=97 rxb=16460 txb=53465
dpd: mode=on-demand on=1 idle=20000ms retry=3 count=0 seqno=0
natt: mode=none draft=0 interval=0 remote_port=0
fec: egress=0 ingress=0
proxyid=fct3459 proto=0 sa=1 ref=6 serial=1 add-route
  src: 0:0.0.0.0-255.255.255.255:0
  dst: 0:3.3.1.1-3.3.1.1:0
…
```

The result shows that the tunnel is established.

Scenario 2: eap-cert-auth is enabled and FortiGate receives an invalid certificate

In this example, a user peer object is used that does not trust the issuer Eternity-CA.

```
# diagnose debug application ike -1
# diagnose debug enable
ke V=root:0:fct-eapcert:9: received FCT-UID : 4E98BCE511844FA8B161FA5DF047B12C
ike V=root:0:fct-eapcert:9: received peer identifier DER_ASN1_DN 'C = CA, ST = BC, L = Burnaby, O
= Fortinet, OU = QA, CN = test3'
ike V=root:0:fct-eapcert:9: re-validate gw ID
ike V=root:0:fct-eapcert:9: gw validation OK
ike V=root:0:fct-eapcert:9: Validating X.509 certificate
ike V=root:0:fct-eapcert:9: peer cert, subject='test3', issuer='Eternity-CA'
ike V=root:0:fct-eapcert:9: peer ID verified
ike V=root:0:fct-eapcert:9: building fnbam peer candidate list
ike V=root:0:fct-eapcert:9: FNBAM_GROUP_NAME candidate 'peer-test3'
ike V=root:0:fct-eapcert:9: certificate validation before eap pending
ike V=root:0:fct-eapcert:9: fnbam cert group matching failed
ike V=root:0:fct-eapcert:9: certificate validation failed
```

The result shows that the tunnel is not established.

Scenario 3: eap-cert-auth is disabled and FortiGate receives an invalid certificate

In this example, eap-cert-auth is disabled, so the incoming peer certificate is not validated.

```
# diagnose debug application ike -1
# diagnose debug enable
ike V=root:0:fct-eapcert:3: received FCT-UID : 4E98BCE511844FA8B161FA5DF047B12C
ike V=root:0:fct-eapcert:3: received peer identifier DER_ASN1_DN 'C = CA, ST = BC, L = Burnaby, O
= Fortinet, OU = QA, CN = test3'
ike V=root:0:fct-eapcert:3: re-validate gw ID
ike V=root:0:fct-eapcert:3: gw validation OK
ike V=root:0:fct-eapcert:3: responder preparing EAP identity request
ike V=root:0:fct-eapcert:3: local cert, subject='test1', issuer='Eternity-CA'
ike 0:fct-eapcert:3: enc
…
ike V=root:0:fct-eapcert:3: responder received EAP msg
ike V=root:0:fct-eapcert:3: send EAP message to FNBAM
ike V=root:0:fct-eapcert:3: initiating EAP authentication
ike V=root:0:fct-eapcert: EAP user "bi_local"
ike V=root:0:fct-eapcert: auth group local-group
ike V=root:0:fct-eapcert: EAP 1600011502 pending
ike V=root:0:fct-eapcert:3 EAP 1600011502 result FNBAM_CHALLENGED
ike V=root:0:fct-eapcert: EAP challenged for user "bi_local"
ike V=root:0:fct-eapcert:3: responder preparing EAP pass through message
```

Checking the IPsec VPN tunnel list:

```
# diagnose vpn tunnel list
list all ipsec tunnel in vd 0
…
name=fct-eapcert_0 ver=2 serial=5 173.1.1.1:0->10.1.100.111:0 tun_id=3.3.1.1 tun_id6=::10.0.0.4
dst_mtu=1500 dpd-link=on weight=1
bound_if=13 lgwy=static/1 tun=intf mode=dial_inst/3 encap=none/74408 options[122a8]=npu rgwy-chg
frag-rfc  run_state=0 role=primary accept_traffic=1 overlay_id=0
parent=fct-eapcert index=0
proxyid_num=1 child_num=0 refcnt=5 ilast=0 olast=0 ad=/0
stat: rxp=641 txp=747 rxb=16325 txb=471587
dpd: mode=on-demand on=1 idle=20000ms retry=3 count=0 seqno=0
natt: mode=none draft=0 interval=0 remote_port=0
fec: egress=0 ingress=0
proxyid=fct3459 proto=0 sa=1 ref=6 serial=1 add-route
  src: 0:0.0.0.0-255.255.255.255:0
  dst: 0:3.3.1.1-3.3.1.1:0
```

The result shows that the tunnel is established even though the client sent an untrusted certificate.

Using single or multiple user groups for user authentication

User groups enable remote users to authenticate themselves before establishing a connection to the IPsec VPN tunnel. One or more user groups for user authentication can be configured under a single IPsec VPN tunnel. For information about configuring user groups, see User groups on page 3359.

When configuring dialup or remote access IPsec VPNs, user groups can be specified in either the phase 1 settings or the firewall policy associated with the tunnel. They must not be configured in both.

The workflow for configuring user groups varies depending on whether the IPsec tunnel is set up using the VPN Wizard or a custom IPsec configuration.

VPN Wizard IPsec tunnel configuration

When configuring the tunnel, you can specify one or more user groups in the *User authentication method* option.

- Single user group:

  Set *User Authentication Method* to either:
  - *Phase 1 Interface*: Select the required user group.
  - *Inherit from Policy*: Select the user group, which will automatically populate the *User/Group* fields in the firewall policies created by the wizard.
- Multiple user groups:

  Set *User Authentication Method* to *Inherit from Policy* and select the required user groups. These will be added to the *User/Group* fields in the firewall policies created by the wizard.
- For any additional firewall policies created outside the VPN Wizard, administrators must manually assign the appropriate user group or groups in the *User/Group* fields.

Custom IPsec tunnel configuration

The custom IPsec tunnel configuration offers more granular settings to configure IPsec VPN. To configure a custom IPsec VPN tunnel, go to *VPN > VPN Tunnels* and click *Create New > Custom IPsec tunnel*.

- Single user group:
  - GUI:

    In the VPN tunnel configuration, enable XAUTH for IKEv1 or EAP for IKEv2, and either:
    - Set *User Group* to *Specify* and select the required user group, or
    - Set *User Group* to *Inherit from Policy* and in the policy configuration, specify the user group in the *User/group* field.
  - CLI:

    For IKEv1, enable XAUTH:

    ```
    config vpn ipsec phase1-interface
        edit <tunnel-name>
            set xauthtype {pap | chap | auto}
        next
    end
    ```

    For IKEv2, enable EAP:

    ```
    config vpn ipsec phase1-interface
        edit <tunnel-name>
            set eap enable
            set eap-identity send-request
    ```

```
    next
end
```

In the VPN tunnel configuration, either:

- Set the user group (`set authusrgrp <group-name>`), or
- Remove any configured user group (`unset authusrgrp`), then specify the user group in the firewall policy (`set groups <group-name>`).

- Multiple user groups:
  - GUI:

    In the VPN tunnel configuration, enable XAUTH for IKEv1 or EAP for IKEv2, and set *User Group* to *Inherit from Policy*. In the policy configuration, specify the user groups in the *User/group* field.
  - CLI:

    For IKEv1, enable XAUTH:

```
config vpn ipsec phase1-interface
    edit <tunnel-name>
        set xauthtype {pap | chap | auto}
    next
end
```

    For IKEv2, enable EAP:

```
config vpn ipsec phase1-interface
    edit <tunnel-name>
        set eap enable
        set eap-identity send-request
    next
end
```

    In the VPN tunnel configuration, remove any configured user group (`unset authusrgrp`), then specify the user groups in the firewall policy (`set groups <group-name> ... <group-name>`).

Starting with FortiClient 7.4.4, IKEv1 is no longer supported on the client. IKEv1 is now considered a legacy configuration.

Also, FortiClient 7.4.4 does not support IPv6. Use FortiClient 7.4.6 or later.

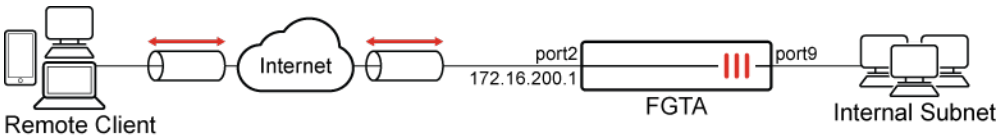
Native VPN as dialup client - Windows NEW

Native VPN remote access configurations have been improved on the VPN wizard. For supported OS's, configurations from the VPN wizard will work out of the box. Native VPN client defaults to using L2TP over IPsec for Windows, Android, and macOS/iOS clients. Administrators can also configure IKEv2 for Windows and Android clients. DH groups and proposals have been updated to work with native clients.

In L2TP over IPsec mode, only pre-shared key is supported; signature cannot be chosen as Authentication method. Addressing mode must be set to Manual. These limitations do not apply to IKEv2 mode.

Organizations that manage a mixed environment (Windows, macOS, iOS, Android) can use the wizard to deploy a VPN tunnel that automatically aligns with each OS's native VPN client defaults.

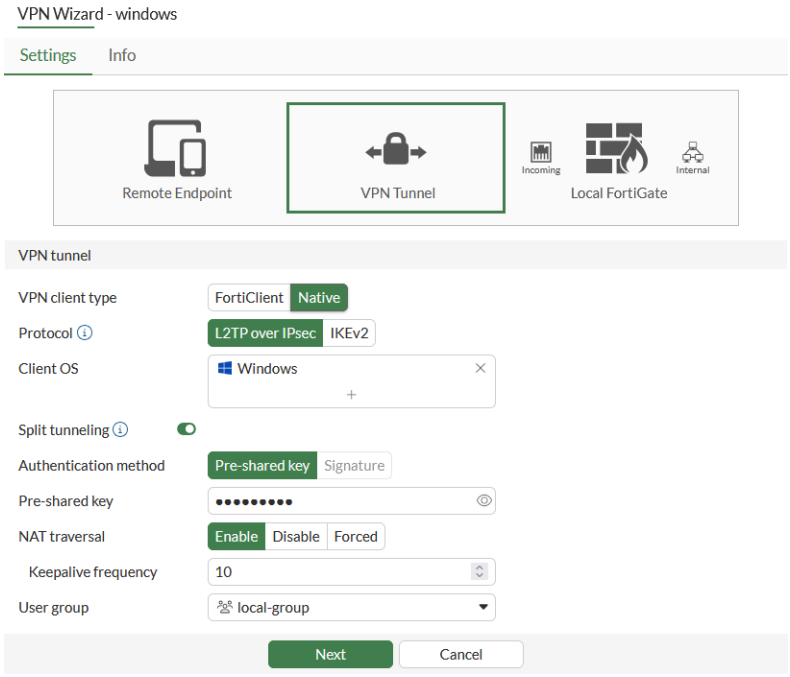
Example 1: Configure IPsec tunnel for native VPN clients



In this example, the FortiGate acts as a VPN gateway to provide secure internet access (SIA) through the shared WAN on port2, and for remote access to the Internal network through port9. The settings are compatible for Windows, Android, and macOS/iOS clients connecting through L2TP over IPsec. However, connecting from a Windows client is demonstrated here. User authentication is based on pre-defined usergroup *local-group* that contains a user called *userc*.

To configure L2TP IPsec tunnel from a template for Windows, Android, and macOS:

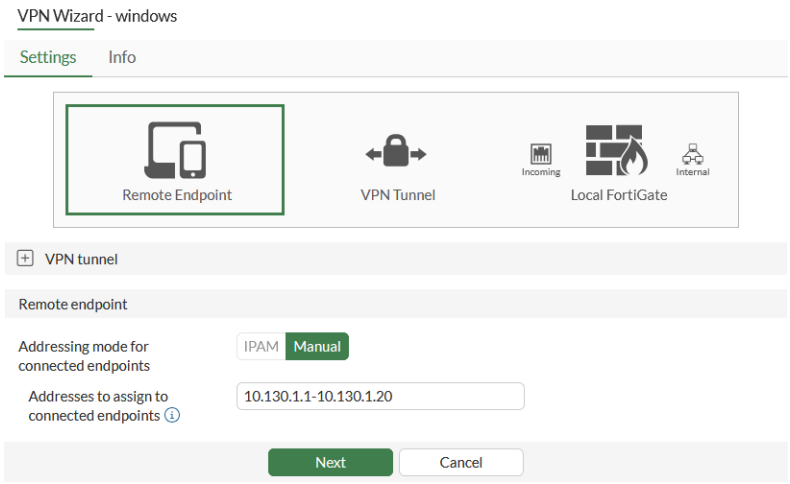
1. Go to *VPN > VPN Wizard*.
2. Name the VPN tunnel, select *Remote Access* template, and click *Begin*.
3. Configure the VPN tunnel settings, then click *Next*:



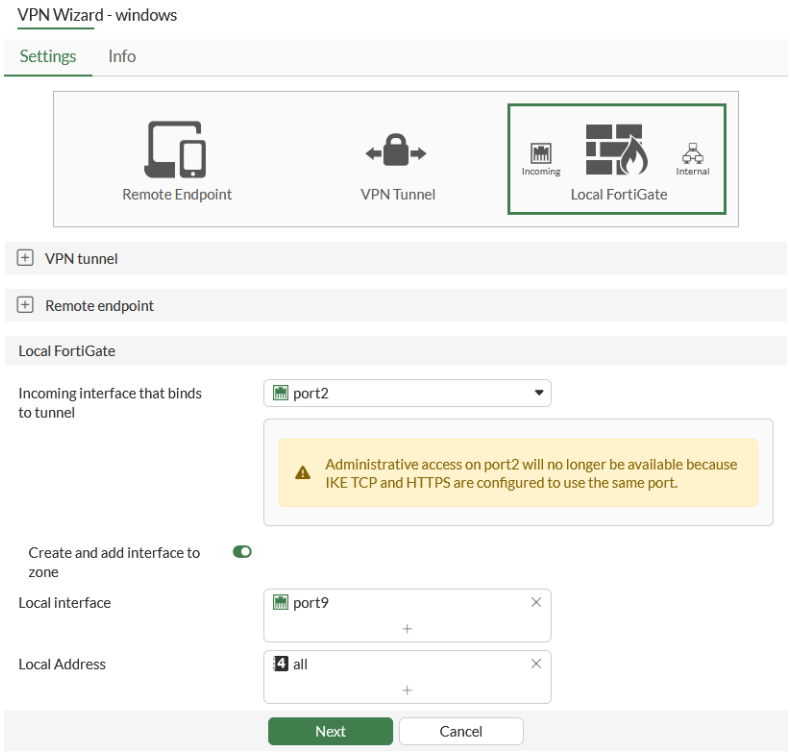
Parameter	Value
VPN client type	Native
Protocol	L2TP over IPsec
Client OS	Windows
Shared WAN	port2
Authentication method	Pre-Shared key

Parameter	Value
Pre-Shared key	Enter the pre-shared key
User group	local-group

4. Set *Addresses to assign to connected endpoints* to *10.130.1.1-10.130.1.20*, then click *Next*.

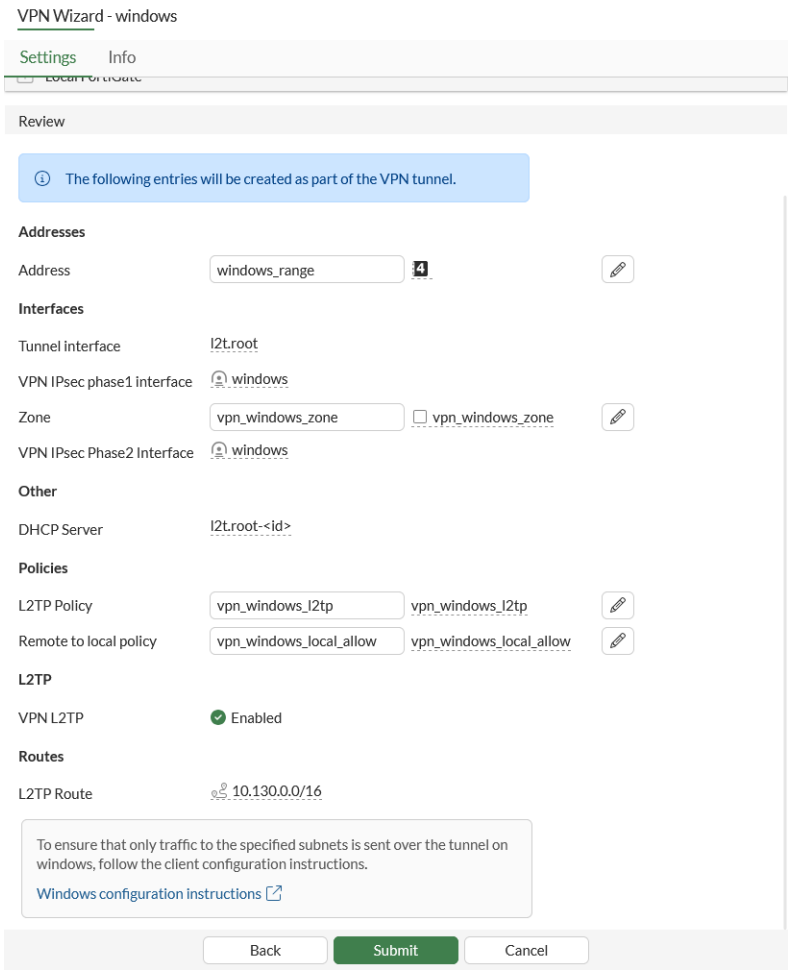


5. Configure the local FortiGate options, then click *Next*:



Parameter	Value
Incoming interface that binds to tunnel	port2
Local interface	port9
Local Address	all

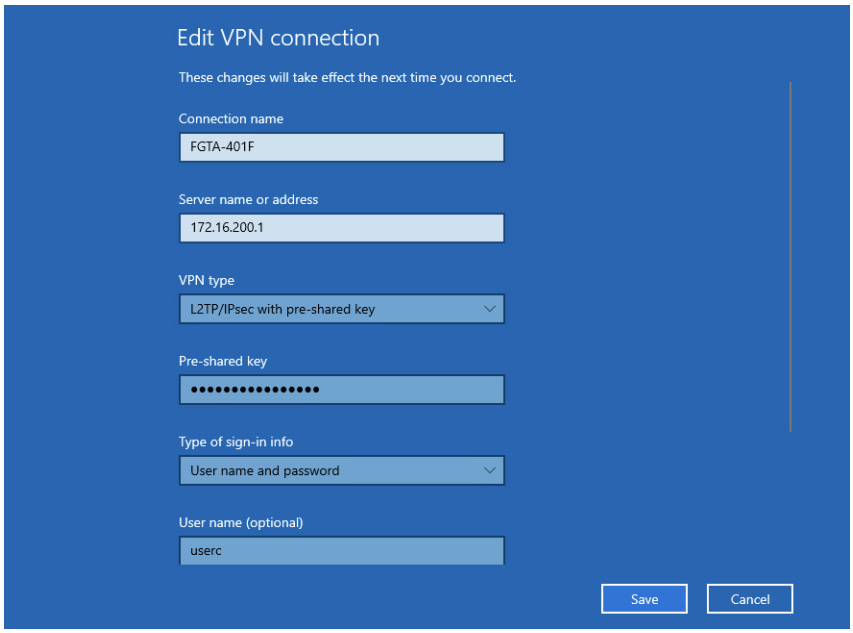
6. Review the configuration, then click *Submit*.



Only Android 12 and below are supported for L2TP VPN.

To configure L2TP connection for Windows:

1. Open *VPN* or go to *Settings* > *Network & internet*.
2. Add and configure a VPN:



Parameter	Value
VPN provider	Windows (built-in)
Connection name	Enter a connection name.
Server name or address	Enter your FortiGate Firewall's hostname or IP address.
VPN type	L2TP/IPsec with pre-shared key
Pre-shared key	Enter the pre-shared key.
Type of sign-in info	Username and password
Username (optional)	Enter the username.
Password (optional)	Enter the password.

3. Click *Save*.

To configure L2TP IPsec tunnel in the CLI:

```
config user group
    edit "local-group"
        set member "usera" "userc"
    next
end
```

```
config vpn ipsec phase1-interface
    edit "windows"
        set type dynamic
        set interface "port1"
        set ike-version 1
        set peertype any
```

```
        set net-device disable
        set proposal aes256-sha512 aes256-sha256 aes256-sha1
        set dhgrp 19 14 2
        set wizard-type dialup-l2tp
        set psksecret <password>
    next
end
```

```
config vpn ipsec phase2-interface
    edit "windows"
        set phase1name "windows"
        set proposal aes256-sha512 aes256-sha256 aes256-sha1
        set pfs disable
        set keepalive enable
        set encapsulation transport-mode
        set l2tp enable
    next
end
```

```
config vpn l2tp
    set status enable
    set eip 10.130.1.20
    set sip 10.130.1.1
    set enforce-ipsec enable
    set usrgrp "local-group"
end
```

```
config firewall address
    edit "windows_range"
        set type iprange
        set start-ip 10.130.1.1
        set end-ip 10.130.1.20
    next
end
```

Three policies are created:

- One to allow L2TP traffic into the WAN interface
- One to allow VPN traffic to the local subnet
- One to allow VPN traffic to the Internet

```
config firewall policy
    edit 3
        set name "vpn_windows_l2tp"
        set srcintf "windows"
        set dstintf "port2"
        set action accept
        set srcaddr "all"
        set dstaddr "all"
        set schedule "always"
        set service "L2TP"
    next
```

```
    edit 4
        set name "vpn_windows_local_allow"
        set srcintf "l2t.root"
        set dstintf "port9"
        set action accept
        set srcaddr "windows_range"
        set dstaddr "all"
        set schedule "always"
        set service "ALL"
        set nat enable
    next
    edit 5
        set name "vpn_windows_utm_allow"
        set srcintf "l2t.root"
        set dstintf "port2"
        set action accept
        set srcaddr "windows_range"
        set dstaddr "all"
        set schedule "always"
        set service "ALL"
        set nat enable
    next
end
```

```
config router static
    edit 2
        set dst 10.130.0.0 255.255.0.0
        set device "l2t.root"
    next
end
```

To check the IPsec phase1/phase2 interface status:

```
# diagnose vpn ike gateway list

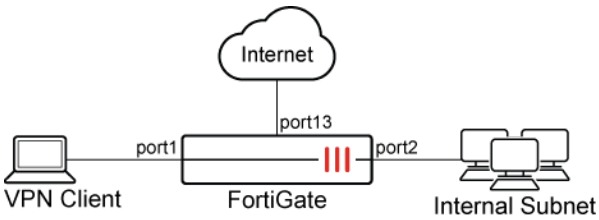
Example 2: Configure IKE v2 IPsec tunnel from template for Windows

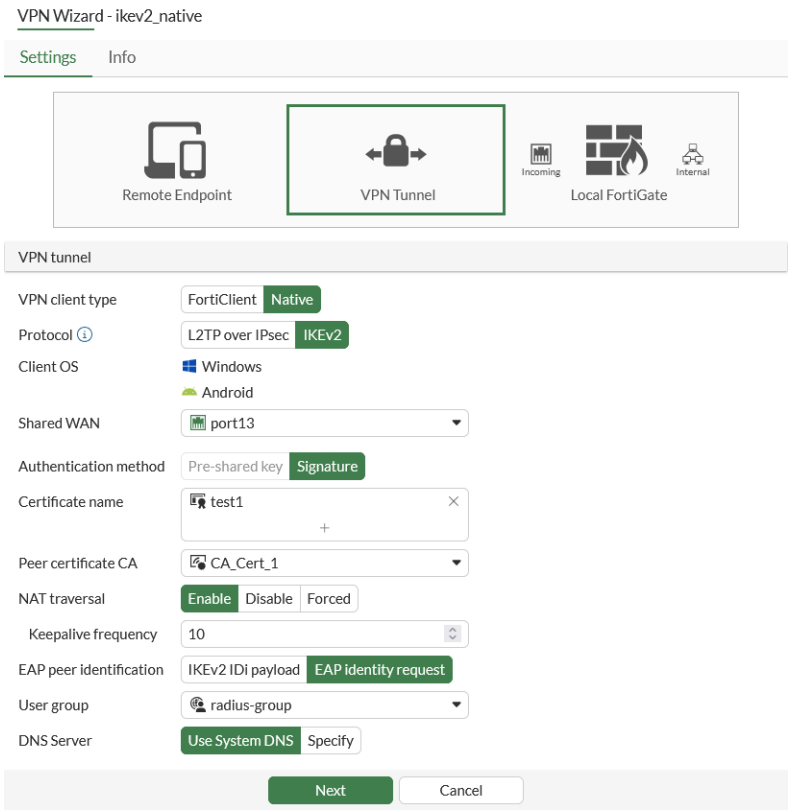


In this example, the FortiGate acts as a VPN gateway to provide secure internet access (SIA) through the shared WAN on port13, and for remote access to the Internal network through port2. The settings are compatible for Windows and Android clients only connecting through IKEv2. However, connecting from a Windows client is demonstrated here. Signature authentication is used, and user authentication is based on RADIUS authentication.

To configure IKE v2 IPsec tunnel from a template for Windows:

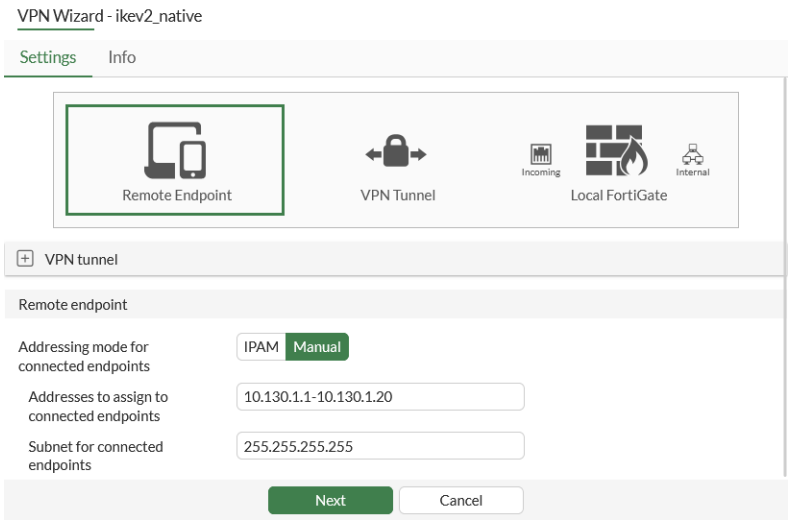
1. Go to *VPN* > *VPN Wizard*.
2. Name the VPN tunnel, select *Remote Access* template, and click *Begin*.

3. Configure the VPN tunnel settings, then click *Next*:

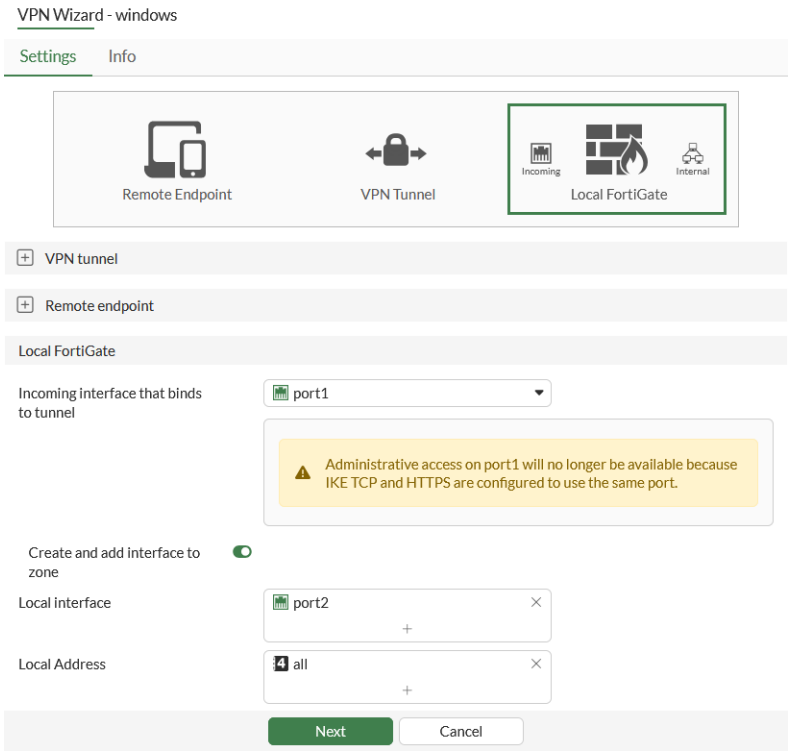


Parameter	Value
VPN client type	Native
Protocol	IKEv2
Shared WAN	port13
Authentication method	Signature
Certificate names	test1
Peer Certificate CA	CA_Cert_1
User group	radius-group

4. Set *Addressing mode for connected endpoints* to *Manual* and set *Addresses to assign to connected endpoints* to *10.130.1.1-10.130.1.20*, then click *Next*.

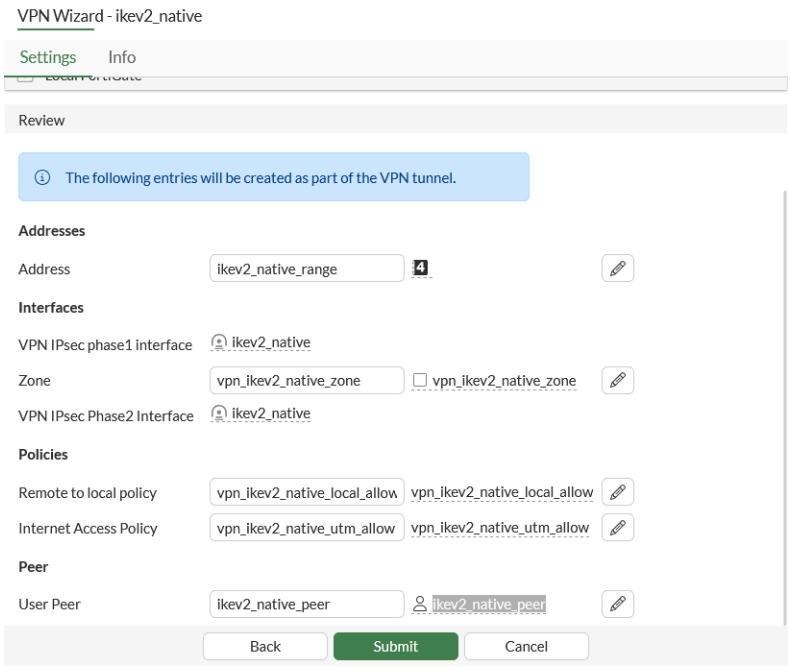


5. Configure the local FortiGate options, then click *Next*:



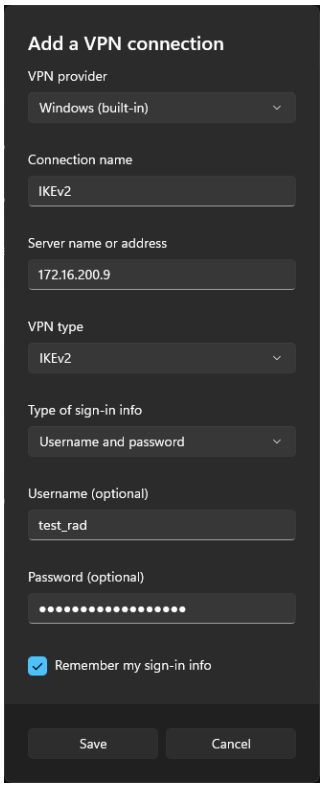
Parameter	Value
Incoming interface that binds to tunnel	port1
Local interface	port2
Local Address	all

6. Review the configuration, then click *Submit*.



To configure IKEv2 VPN connection for Windows:

1. Open *VPN* or go to *Settings* > *Network & internet*.
2. Add and configure a VPN:



Parameter	Value
VPN provider	Windows (built-in)
Connection name	Enter a connection name.
Server name or address	Enter your FortiGate Firewall's hostname or IP address.
VPN type	IKEv2
Type of sign-in info	Username and password
Username (optional)	Enter the username.
Password (optional)	Enter the password.

3. Click *Save*.

To configure IKE v2 IPsec tunnel for Windows in the CLI:

```
config vpn ipsec phase1-interface
    edit "ikev2_native"
        set type dynamic
        set interface "port1"
        set ike-version 2
        set authmethod signature
        set net-device disable
        set mode-cfg enable
        set proposal aes256-sha256 aes256gcm-prfsha256 aes256gcm-prfsha384
        set dhgrp 20 14 2
        set eap enable
        set eap-identity send-request

Native VPN as dialup client - iOS

When FortiGate is configured as a dialup VPN server, Apple devices, such as iPhones or iPads, with dynamic or unknown IP addresses can establish secure connections over the Internet to access private resources protected by FortiGate.

In this example, the FortiGate protects a local network (10.10.111.0/24) that a remote user on an iOS device needs to securely access over the Internet using a VPN connection. The FortiGate is configured as a dialup VPN server on wan1, and the iOS device is the dial-up IPsec VPN client.

You can configure dialup IPsec VPN with an iOS device as the dialup client using the VPN Wizard in the GUI or the CLI.

To configure IPsec VPN with an iOS device as the dialup client in the GUI:

1. Configure a local user:
   a. Go to *User & Authentication > User Definition* and click *Create New*.
   b. Set the *User Type* to *Local User*, then click *Next*.
   c. Set the *Login Credentials*, then click *Next*:
      - *Username*: *vpnuser1*
      - *Password*: Enter a suitable password
   d. Disable *Two-factor Authentication*, then click *Next*.
   e. Set *User Account Status* to *Enabled* and disable *User Group*, then click *Submit*.
2. Configure a local user group:
   a. Go to *User & Authentication > User Groups* and click *Create New*.
   b. Configure the following:

Field	Value
Name	vpngroup
Type	Firewall
Members	vpnuser1

   c. Click *OK*.

   For other types of authentication, such as LDAP, PKI, or SAML, see User & Authentication on page 3356.
3. Go to *VPN > VPN Wizard*.
4. Enter a name for the VPN in the *Tunnel name* field. In this example, *ios_client*
5. Set *Select a template* to *Remote Access*.
6. Click *Begin*.
7. Configure the *VPN tunnel* settings:

Field	Value
VPN client type	Native
Protocol	L2TP over IPsec
Client OS	macOS/iOS
Share WAN	wan1
Authentication method	Pre-shared key
Pre-shared key	Enter a suitable key. The same pre-shared key is used by the remote user on the iOS device to connect to the dialup VPN.
User group	vpngroup

8. Click *Next*.
9. Configure the *Remote Endpoint* settings:

Field	Value
Addresses to assign to connected endpoints	10.10.2.1-10.10.2.200

10. Click *Next*.
11. Configure the *Local FortiGate* settings:

Field	Value
Incoming interface that binds to tunnel	wan1 Disable Create and add interface to zone.
Local interface	lan
Local address	local_network Click + to create a new address object with *Type* set to *Subnet* and *IP/Netmask* set to *10.10.111.0/24*, if not already configured.

12. Click *Next*.
13. Review the configuration and, if everything is correct, click *Submit*.
    The IPsec VPN is configured and is visible on the *VPN > VPN Tunnels* page.

To configure IPsec VPN with an iOS device as the dialup client in the CLI:

1. Configure a local user:

```
config user local
    edit "vpnuser1"
        set type password
        set passwd ******
    next
end
```

2. Configure a local user group:

```
config user group
    edit "vpngroup"
        set member "vpnuser1"
    next
end
```

3. Configure the internal interface.
   The LAN interface connects to the corporate internal network. Traffic from this interface routes out the IPsec VPN tunnel. Creating an address group for the protected network behind this FortiGate causes traffic to this network group to go through the IPsec tunnel.

```
config system interface
    edit "lan"
        set vdom "root"
        set ip 10.10.111.1 255.255.255.0
```

```
   next
end
```

```
config firewall address
    edit "local_subnet_1"
        set subnet 10.10.111.0 255.255.255.0
    next
end
```

```
config firewall addrgrp
    edit "local_network"
        set member "local_subnet_1"
    next
end
```

4. Configure the WAN interface.

   The WAN interface is the interface connected to the ISP. It can be configured in static mode (as shown here), DHCP, or PPPoE mode. It is recommended to configure it with a static IP address to ensure that the IPsec VPN configuration on the on the iOS device stays unchanged if the WAN IP changes on the FortiGate. The IPsec tunnel is established over the WAN interface.

```
config system interface
    edit "wan1"
        set vdom "root"
        set ip 203.0.113.249 255.255.255.0
    next
end
```

5. Configure the client address pool.

   You must create a firewall address to assign an IP address to a client from the address pool.

```
config firewall address
    edit "client_range"
        set type iprange
        set comment "VPN client range"
        set start-ip 10.10.2.1
        set end-ip 10.10.2.200
    next
end
```

6. Configure the IPsec phase1-interface.

   PSK is used as the authentication method in this example. Signature authentication is also an option.

```
config vpn ipsec phase1-interface
    edit "ios_client"
        set type dynamic
        set interface "wan1"
        set ike-version 2
        set peertype any
        set net-device disable
        set mode-cfg enable
```

```
        set proposal aes128-sha256 aes256-sha256 aes128gcm-prfsha256 aes256gcm-prfsha384
chacha20poly1305-prfsha256
        set dpd on-demand
        set dpd-retryinterval 20
        set xauthtype auto
        set authusrgrp "vpngroup"
        set assign-ip-from name
        set ipv4-name "client_range"
        set dns-mode auto
        set ipv4-split-include "local_network"
        set save-password enable
        set psksecret *****
    next
end
```

7. Configure the IPsec phase2-interface:

```
config vpn ipsec phase2-interface
    edit "ios_client"
        set phase1name "ios_client"
        set proposal aes128-sha256 aes256-sha256 aes128gcm aes256gcm chacha20poly1305
        set pfs disable
    next
end
```

8. Configure a firewall policy to allow client traffic flow over the IPsec VPN tunnel to the FortiGate's lan interface:

```
config firewall policy
    edit 1
        set name "inbound"
        set srcintf "ios_client"
        set dstintf "lan"
        set srcaddr "client_range"
        set dstaddr "local_network"
        set action accept
        set schedule "always"
        set service "ALL"
    next
end
```

To configure the iOS device:

1. On the iOS device, go to *Settings* > *General* > *VPN & Device Management* > *VPN* and select *Add VPN Configuration*.
2. Configure the following details:

Field	Value
Type	IPsec
Description	Enter a suitable description.

Field	Value
Server	203.0.113.249 (the wan1 IP address of the FortiGate the is configured as the IPsec VPN dialup server)
Account	vpnuser1 (the local user configured on the FortiGate)
Password	Enter the password configured for the user.
Secret	Enter the pre-shared key that is configured on the FortiGate.

3. Leave the remaining settings as their default values and press *Done*.
4. Go to *Settings* > *General* > *VPN & Device Management* > *VPN*
5. Highlight the IPsec VPN configuration (indicated by a checkmark) and press the *Not Connected* toggle to enable the VPN.
6. If prompted, enter your user credentials.
7. The *VPN Status* changes to *Connected* and a VPN icon appears at the top of the screen.

To verify the tunnel status in the GUI:

1. On the FortiGate, go to *Dashboard* > *Network Monitor* > *VPN*.
2. Find the new tunnel, *ios_client_0* in this example, and check the statuses of the *Phase 1* and *Phase 2* selectors.

> Successfully established dialup IPsec VPN tunnels are displayed using a parent name followed by an index, creating a structured and organized association with the parent tunnel. For example, the parent name *ios_client* results in tunnel names such as *ios_client_0*, *ios_client_1*, and so on.

3. Hover the cursor over the tunnel name to see additional details.

To verify the tunnel status in the CLI:

1. Verify the IPsec Phase 1 tunnel status on the FortiGate:

```
FortiGate # diagnose vpn ike gateway list name ios_client_0

vd: root/0
name: ios_client_0
version: 1
interface: wan1 3
addr: 203.0.113.249:4500 -> 198.51.100.171:40398
tun_id: 198.51.100.171/::10.0.0.8
remote_location: 0.0.0.0
network-id: 0
transport: UDP
created: 22s ago
xauth-user: vpnuser1
2FA: no
peer-id: 0.0.0.0
peer-id-auth: no
assigned IPv4 address: 10.10.2.1/255.255.255.255
```

```
nat: me peer
pending-queue: 0
IKE SA: created 1/1  established 1/1  time 330/330/330 ms
IPsec SA: created 1/1  established 1/1  time 280/280/280 ms

  id/spi: 5 456ee87e1ccab0d5/a2d3d3f43d7c1147
  direction: responder
  status: established 22-22s ago = 330ms
  proposal: aes256-sha256
  key: c5b56bf00a715ad4-7332f707363766b5-9d7fc85b5003227c-18ab12ec2a8c4823
  QKD: no
  PQC-KEM (IKE): no
  PQC-KEM (all IPsec): no
  lifetime/rekey: 3600/3307
  DPD sent/recv: 00000000/00000000
  peer-id: 0.0.0.0
```

Note that FortiGate acts as the responder, establishes the IPsec tunnel with remote iOS device with IP 198.51.100.171 over UDP NAT-T port 4500 on its wan1 interface, and dynamically assigns a VPN IP of 10.10.2.1 to the iOS device. The authenticated username is also displayed in `xauth-user` field.

2. Verify the IPsec Phase 2 tunnel status on either the Branch or HQ:

```
FortiGate # diagnose vpn tunnel list name ios_client_0
list ipsec tunnel by names in vd 0
------------------------------------------------------
name=ios_client_0 ver=1 serial=a 203.0.113.249:4500->198.51.100.171:40398

npuid=0
```

Note the decryption, encryption, and authentication keys negotiated in Phase 2 to protect subnets under the `src` and `dst` fields. FortiOS also automatically adds the dynamically assigned VPN IP of 10.10.2.1 to its traffic selectors for dialup tunnel for_client_0.

To verify traffic through the IPsec tunnel:

1. On the iOS device with public IP 198.51.100.171 open an app that has the ping utility and initiate ICMP requests the a machine in the 10.10.111.0/24 network, then verify that traffic goes through:

```
# ping 10.10.111.3
PING 10.10.111.3 (10.10.111.3) 56(84) bytes of data.
64 bytes from 10.10.111.3: icmp_seq=1 ttl=62 time=9.82 ms
64 bytes from 10.10.111.3: icmp_seq=2 ttl=62 time=0.809 ms
```

2. On FortiGate, run a sniffer trace for ICMP packets destined to 10.10.111.3:

```
# diagnose sniffer packet any 'host 10.10.111.3’ 4 0 l
Using Original Sniffing Mode
interfaces=[any]
filters=[host 10.10.111.3]
2024-11-05 12:06:05.509711 ios_client_0 in 10.10.2.1 -> 10.10.111.3: icmp: echo request
2024-11-05 12:06:05.509791 lan out 10.10.2.1 -> 10.10.111.3: icmp: echo request
2024-11-05 12:06:05.518809 lan in 10.10.111.3 -> 10.10.2.1: icmp: echo reply
2024-11-05 12:06:05.518899 ios_client_0 out 10.10.111.3 -> 10.10.2.1: icmp: echo reply
```

   The ICMP request packets are received on ios_client_0 tunnel interface and routed to the lan interface. ICMP reply packets are received on the lan interface and routed back out on ios_client_0 tunnel interface.

   For more information, see Performing a sniffer trace or packet capture on page 4825.

3. Optionally, run real time IKE debug using appropriate filters for troubleshooting if the IPsec tunnel does not come up:

```
FortiGate # diagnose vpn ike log filter rem-addr4 198.51.100.171
FortiGate # diagnose debug application ike -1
FortiGate # diagnose debug enable
```

   For more information, see VPN IPsec troubleshooting on page 3207.

Dialup IPsec VPN with certificate authentication

In a dialup IPsec VPN setup, a company may choose to use X.509 certificates as their authentication solution for remote users. This method includes the option to verify the remote user using a user certificate, instead of a username and password. This method can be simpler for end users.

Administrators need to issue unique user certificates to each user for remote access management. The user certificate can be verified by the subject field, common name, or the subject identity in the Subject Alternative Name (SAN) field.

Subject field verification

This is the basic method that verifies the subject string defined in the PKI user setting matches a substring in the subject field of the user certificate. For example:

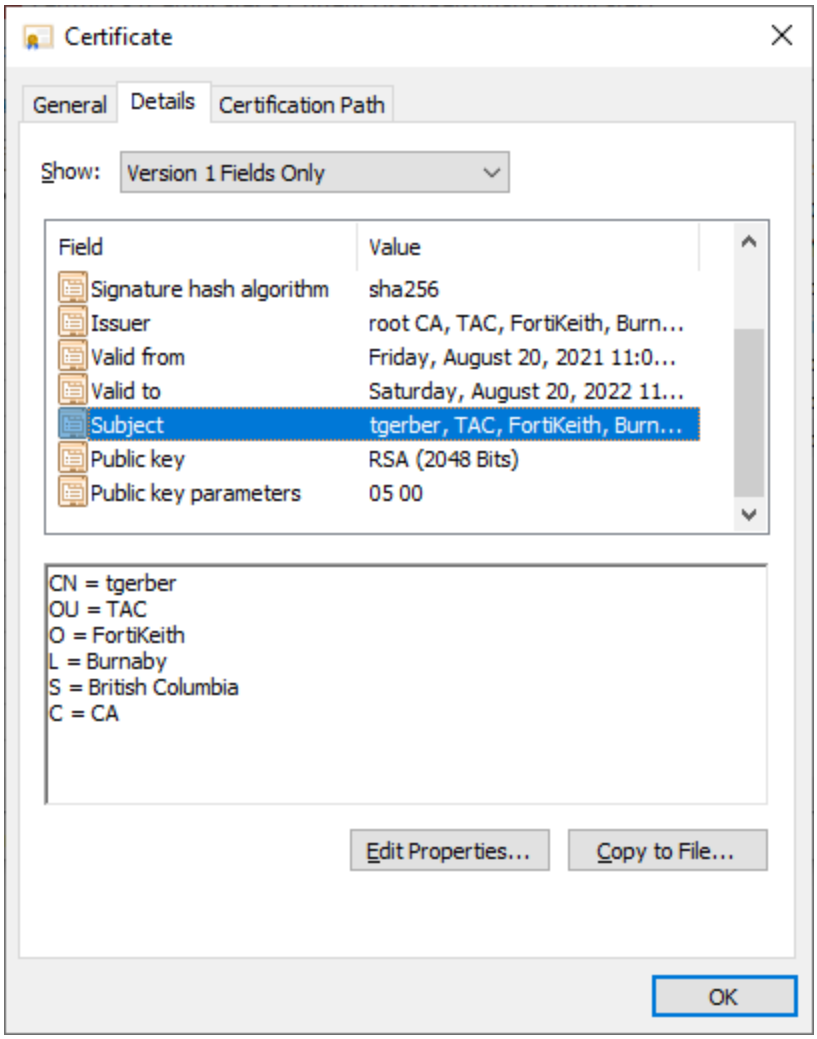
```
config user peer
    edit "tgerber"
        set ca "CA_Cert_2"
        set subject "CN=tgerber"
    next
end
```

Common name verification

In this method, administrators can define the CN string to match the common name (CN) in the subject field of the certificate. For example:

```
config user peer
    edit "tgerber"
        set ca "CA_Cert_2"
        set cn "tgerber"
    next
end
```

The matching certificate looks like the following:



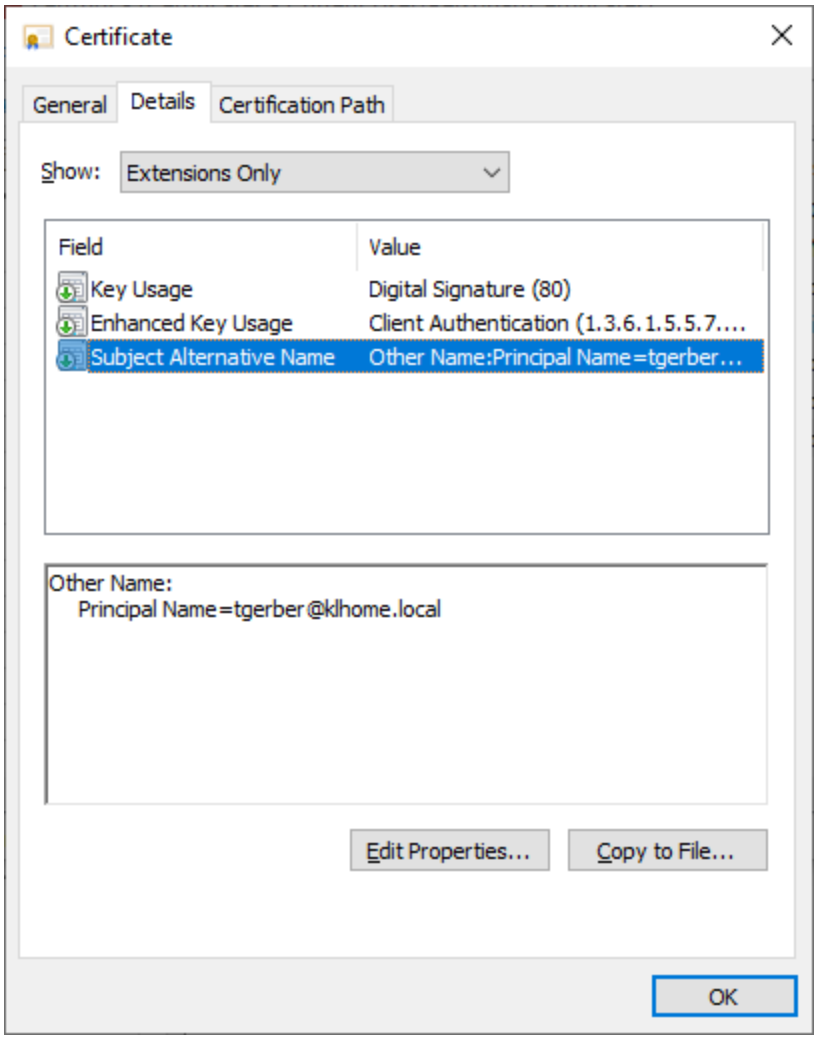
A PKI user must be created on the FortiGate for each remote user that connects to the VPN with a unique user certificate.

Principal name with LDAP integration

In this method, the PKI user setting references an LDAP server. When `mfa-mode` is set to `subject-identity`, the UPN in the user certificate's SAN field is used to look up the user in the LDAP directory. If a match is found, then authentication succeeds. For example:

```
config user peer
    edit "ldap-peer"
        set ca "CA_Cert_2"
        set mfa-server "WIN2K16-KLHOME-LDAPS"
        set mfa-mode subject-identity
    next
end
```

The matching certificate looks like the following:



This method is more scalable because only one PKI user needs to be created on the FortiGate. Remote users connect with their unique user certificate that are matched against users in the LDAP server.

The `two-factor` and `passwd` settings in the user peer configuration are not supported by IPsec. If enabled, the setting will be ignored.

```
config user peer
    edit <user>
        set two-factor enable
        set passwd **********
    next
end
```

Certificate management

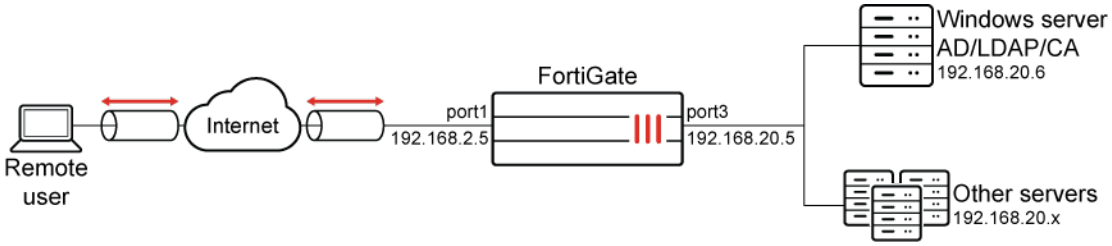
Dialup IPsec VPN with certificate authentication requires careful certificate management planning. Assuming that a company's private certificate authority (CA) is used to generate and sign all the certificates, the following

certificates are needed:

Certificate type	Description
Server certificate	The server certificate is used to identify the FortiGate IPsec dialup gateway. A CSR can be generated on the FortiGate and signed by the CA, or the CA can generate the private and public keys and export the certificate package to the FortiGate.
User certificate	The user certificate is generated and signed by the CA with unique CNs in the subject field and/or unique Principal Names in the SAN field. They are used to identify the user that is connecting to the VPN. User certificates must be installed on client machines.
CA certificate	The root CA certificate, and any subordinate CA that signed the actual user and server certificates, must be imported into the FortiGate and client machines. The CA certificate is used to verify the certificate chain of the server and user certificates.

Example

In this example, a dialup IPsec VPN tunnel is configured with certificate authentication using the subject field verification method and the LDAP integration method.



The company CA, named root CA, signs all the server and user certificates. The user, tgerber@klhome.local, has a user certificate signed by root CA installed on their endpoint. The corresponding user account is also present under the company's Active Directory.

This example shows VPN configurations in IKEv1. Starting with FortiClient 7.4.4, IKEv1 is no longer supported on the client. Therefore, plan accordingly when choosing your IKE version. Use IKEv2 if you plan on deploying FortiClient 7.4.4 and later.

There are five major steps to configure this example:

1. Importing the certificates
2. Configuring user authentication
3. Configuring the VPN
4. Configuring FortiClient and the endpoints
5. Testing and verifying the certificate authentication

Importing the certificates

The server certificate and CA certificate need to be imported into the FortiGate.

To import the server certificate:

1. Go to *System* > *Certificates* and select *Import* > *Local Certificate*.
2. For *Type*, select *PKCS #12 Certificate*.
3. Upload the key file exported from the CA and enter the password.
4. Click *OK*. The certificate now appears in the *Local Certificate* section.

To import the CA certificate:

1. Go to *System* > *Certificates* and select *Import* > *CA Certificate*.
2. For *Type*, select *File*.
3. Upload the CA certificate (usually a .CRT file). This certificate only contains the public key.
4. Click *OK*. The certificate now appears in the *Remote CA Certificate* section.

If any subordinate CA is involved in signing the certificates, you need to import its certificate.

Configuring user authentication

FortiGate PKI users do not appear in the GUI until at least one PKI user has been created in the CLI. The following instructions create the PKI users in the CLI.

To configure PKI users for subject field verification:

1. Create the PKI user and choose the CA certificate that was imported (if the certificate was signed by a subordinate CA, choose the subordinate CA's certificate):

```
config user peer
    edit "tgerber"
        set ca "CA_Cert_2"
        set subject "CN=tgerber"
    next
end
```

   For an example of CN field matching, see Common name verification.
2. Create additional users as needed.
3. Place the users into a peer group:

```
config user peergrp
    edit "pki-users"
        set member "tgerber" <user> ... <user>
    next
end
```

To configure PKI users for LDAP integration:

1. Configure the LDAP server that users connect to for authentication:

```
config user ldap
    edit "WIN2K16-KLHOME-LDAPS"
        set server "192.168.20.6"
        set cnid "sAMAccountName"
        set dn "dc=KLHOME,dc=local"
        set type regular
        set username "KLHOME\\Administrator"
        set password ************
        set secure ldaps
        set ca-cert "CA_Cert_1"
        set port 636
    next
end
```

2. Configure the PKI user to reference the LDAP server using the CA certificate that was imported:

```
config user peer
    edit "ldap-peer"
        set ca "CA_Cert_2"
        set mfa-server "WIN2K16-KLHOME-LDAPS"
        set mfa-mode subject-identity
    next
end
```

3. Place the user into a peer group:

```
config user peergrp
    edit "pki-ldap"
        set member "ldap-peer"
    next
end
```

Configuring the VPN

To configure the VPN, the address objects must be defined first so they can be used in the VPN and policy configurations. In this example, the VPN is configured in custom mode to define the authentication settings.

To configure the address objects:

1. Create the address range for the dialup clients:
   a. Go to *Policy & Objects* > *Addresses* and select *Address*.
   b. Click *Create new*.
   c. For *Name*, enter *remote-user-range*.
   d. For *Type*, select *IP Range* and enter *172.18.200.10-172.18.200.99* in the *IP Range* field.
   e. Click *OK*.
2. Create the address subnet for the destination 192.168.20.0/24:

a. Click *Create new*.
b. For *Name*, enter *192.168.20.0*.
c. For *Type*, select *Subnet* and enter *192.168.20.0/24* in the *IP/Netmask* field.
d. Click *OK*.

To configure the IPsec dialup tunnel:

1. Go to *VPN > IPsec Tunnels* and click *Create New > IPsec Tunnel*.
2. Enter a name for the tunnel, *Dialup-cert_0*.
3. For *Template type*, select *Custom* then click *Next*.
4. In the *Network* section, enter the following:

Remote Gateway	*Dialup User*
Interface	*port1*
Mode Config	Enable
Assign IP From	*Range*
IPv4 mode config > Client Address Range	*172.18.200.10-172.18.200.99*
Enable IPv4 Split Tunnel	Enable
Accessible Networks	*192.168.20.0*

5. In the *Authentication* section, enter the following:

Method	*Signature*
Certificate Name	Select the server certificate that was imported.
Mode	*Aggressive*
Peer Options > Accept Types	*Peer certificate group*
Peer Options > Peer certificate group	Select the group based on the preferred method: • For subject verification, select *pki-users*. • For LDAP integration, select *pki-ldap*.

When IKEv1 is used, aggressive mode should be selected so that the connecting endpoint will provide its peer ID in the first message of the IKE exchange. The peer identifier allows the FortiGate to match the correct tunnel when multiple dialup tunnels are defined.

6. For *Phase 2 Selectors*, leave the local and remote selectors as *0.0.0.0/0.0.0.0*.
7. Click *OK*.

To configure the firewall policy:

1. Go to *Policy & Objects > Firewall Policy* and click *Create New*.
2. Configure the following:

Name	Enter a policy name.
Incoming interface	*Dialup-cert_0*
Outgoing Interface	*port3*
Source	*remote-user-range*
Destination	*192.168.20.0*
Schedule	*always*
Service	*ALL*
Action	*ACCEPT*

3. Configure the other settings as needed.
4. Click *OK*.

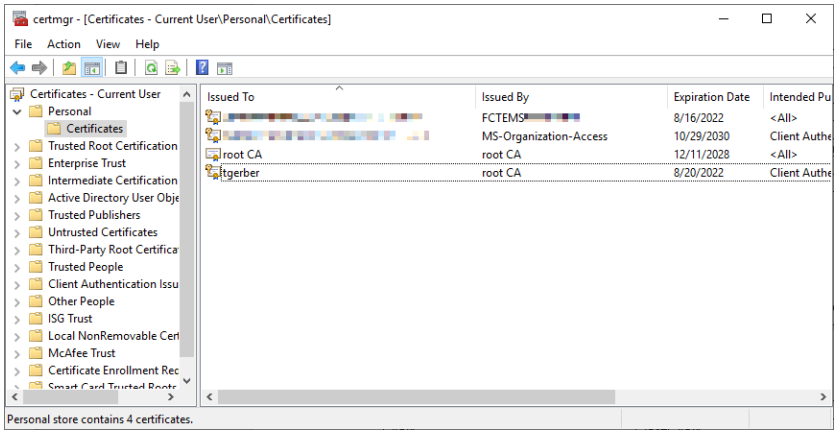
Configuring FortiClient and the endpoints

The following example is configured on a Windows PC with FortiClient 7.0.0. Other configurations may differ slightly.

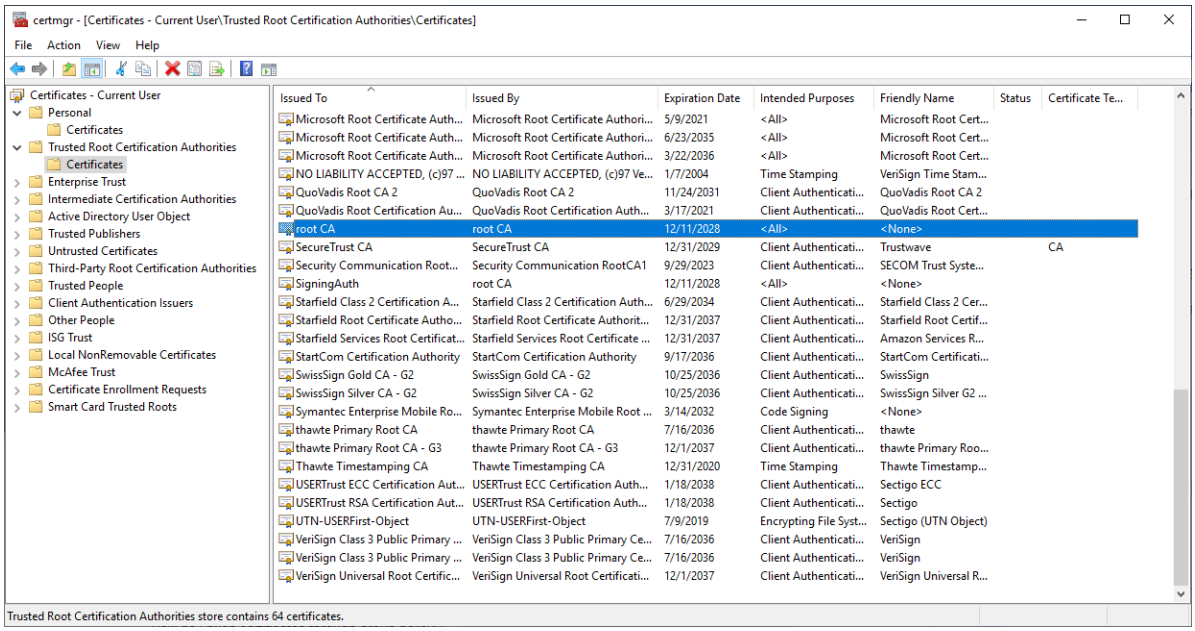
The user certificate and CA certificate must be installed on the endpoint device. They may be pushed by the administrator through group policies or another method. This example assumes that the user certificate and CA certificate are already installed on the endpoint.

To verify the user and CA certificates:

1. Open the Windows certificate manager (certmgr):
   a. In the Control Panel, type *Manage user certificate* in the search box.
   b. Click the result, *Manage user certificates*.
2. Go to *Personal* > *Certificate*. The user certificate should be listed.



3. Go to *Trusted Root Certification Authorities* > *Certificates*. The company CA certificate should be listed.



To configure the FortiClient endpoint settings:

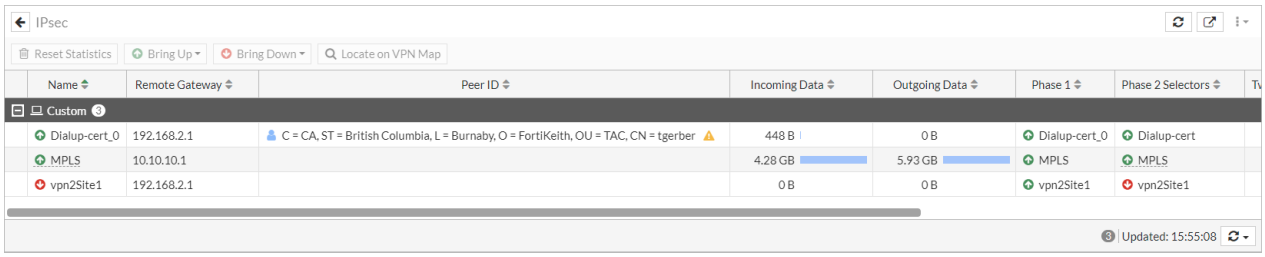
1. In FortiClient, click the *Remote Access* tab and add a new connection:
   a. If there are no existing connections, click *Configure VPN*.
   b. If there are existing connections, click the menu icon and select *Add a new connection*.
2. Configure the following:

VPN	*IPsec VPN*
Connection Name	*Dialup-cert_0*
Remote Gateway	*192.168.2.5*
Authentication Method	*X.509 Certificate* Select the user certificate, *tgerber/root CA*, from the dropdown.
Authentication (XAuth)	*Disable*

3. Click *Save*.

Testing and verifying the certificate authentication

1. On the client PC, open FortiClient and click the *Remote Access* tab.
2. Select the VPN tunnel, *Dialup-cert_0*, and click *Connect*.
   If the connection is successful, a FortiClient pop-up will appear briefly indicating that the IKE negotiation succeeded. The *Remote Access* window now displays *VPN Connected* and the associated VPN tunnel details.
3. On the FortiGate, go to *Dashboard > Network Monitor > VPN* to view the VPN tunnel monitor.
   The widget displays tunnel information, including the *Peer ID* containing the subject field of the user certificate.



4. Go to *Log & Report* > *System Events* and select the *VPN Events* card. Several tunnel related logs are recorded.
5. The same logs can be viewed in the CLI:

```
# execute log filter category 1
# execute log filter field subtype vpn
# execute log display
7: date=2021-08-23 time=15:53:08 eventtime=1629759188862005740 tz="-0700" logid="0101037138"
type="event" subtype="vpn" level="notice" vd="root" logdesc="IPsec connection status changed"
msg="IPsec connection status change" action="tunnel-up" remip=192.168.2.1 locip=192.168.2.5
remport=64916 locport=4500 outintf="port1" cookies="19f05ebc8c2f7a0d/7716190005538db5" user="C
= CA, ST = British Columbia, L = Burnaby, O = FortiKeith, OU = TAC, CN = tgerber" group="pki-
ldap" useralt="C = CA, ST = British Columbia, L = Burnaby, O = FortiKeith, OU = TAC, CN =
tgerber" xauthuser="N/A" xauthgroup="N/A" assignip=172.18.200.10 vpntunnel="Dialup-cert_0"
tunnelip=172.18.200.10 tunnelid=3418215253 tunneltype="ipsec" duration=0 sentbyte=0 rcvdbyte=0
nextstat=0
```

6. If any issues arise during the connection, run the following debug commands to troubleshoot the issue:

```
# diagnose debug application ike -1
# diagnose debug application fnbamd -1
# diagnose debug enable
```

SAML-based authentication for FortiClient remote access VPNs

SAML-based authentication for FortiClient remote access VPNs can be configured using FortiClient 7.2.4 and later. Support is only available using IKEv2. Two factor authentication using FortiToken push is also supported.

The FortiGate authd daemon can support SAML authentication by listening for authentication messages from the FortiClient on the TCP port number configured in the `auth-ike-saml-port` setting (0 - 65535, default = 1001). This setting can be configured in the CLI:

```
config system global
    set auth-ike-saml-port <integer>
end
```

This allows the FortiGate to act as a SAML service provider (SP) for IKEv2 FortiClient remote access IPsec VPN clients by forwarding the FortiClient's SAML request to the configured SAML identity provider (IdP) for user authentication.

In 7.6.1 and later, FortiGate can also listen for SAML authentication messages on the port defined in `ike-tcp-port`. This is helpful in the scenario where administrators have configured IPsec VPN over TCP and they are constrained by the port(s) allowed by their ISP provider. Usually in these cases, VPN can only be established on port 443. As such, the single port defined in `ike-tcp-port` will be used by the iked process to listen for VPN traffic as well as authentication messages. If the packet does not contain the IKE TCP special message, it will pass the traffic to the authd daemon.

In this scenario, it is recommended to use different ports for `ike-tcp-port` and `auth-ike-saml-port` to prevent the authd daemon from accidentally processing IKE TCP packets and dropping them.

```
config system setting
    set ike-tcp-port <port listened by iked>
end
```

```
config system global
    set auth-ike-saml-port <unique port>
end
```

Using TCP as transport requires FortiClient 7.4.1 or later. See IPsec VPN over TCP.

For more information and an example on using a single port for VPN over TCP and SAML authentication, see the community article Using the same TCP port for IPsec SAML authentication and IKE TCP encapsulation in FortiOS v7.6.1.

The `ike-saml-server` setting enables a configured SAML server to listen on a FortiGate interface for SAML authentication requests from FortiClient remote access IPsec VPN clients. It must be configured on the interface that is directly receiving the SAML authentication requests from FortiClient. This setting can be configured in the CLI:

```
config system interface
    edit <name>
        set ike-saml-server <saml_server>
    next
end
```

The `ike-saml-server` setting must be configured on the interface that is the first point of contact for FortiClient traffic.

For example, if FortiClient user SAML authentication traffic is always routed to the FortiGate on the WAN1 interface, then `ike-saml-server` must be configured for WAN1. If it is configured for WAN2, then the authentication traffic will not reach it on WAN1, even if the FortiGate allows traffic to flow from WAN1 to WAN2.

FortiClient will validate the certificate presented to it by FortiGate during its initial SAML connection. This certificate can be configured on the FortiGate from the GUI under *User & Authentication > Authentication Settings > Certificate* under *User Authentication Options*. To import the certificate on the FortiGate, see Import a certificate on page 3830.

This certificate can also be configured in the CLI:

```
config user setting
     set auth-cert <certificate>
end
```

To prevent an invalid server certificate prompt on FortiClient, the certificate's common name (CN) should match the IPsec VPN remote gateway's FQDN. If the certificate is signed by a custom Certificate Authority or one that is not well-known, the Certificate Authority's (CA) certificate should be imported in FortiClient endpoint's Trusted Root Certificate Authority store. For details on installing a CA certificate on the endpoint, see Installing certificates on the client.

Dialup IPsec VPN with SAML using an external browser for authentication is supported starting from FortiOS 7.6.1, FortiClient (Windows) and (macOS) 7.2.5 and 7.4.1 and FortiClient (Linux) 7.4.3.

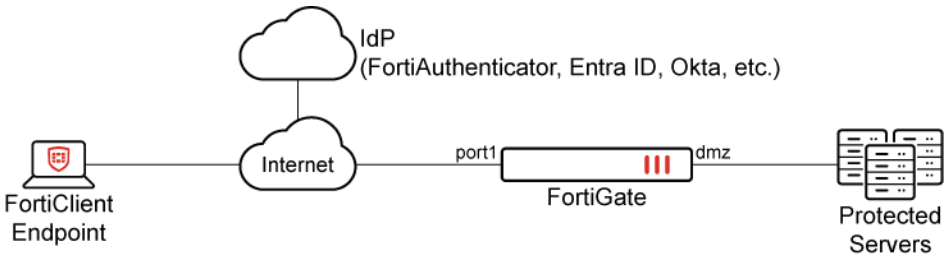
SAML authentication flow with IPsec

The SAML Authentication flow when using IPsec where FortiGate is the Service Provider (SP), FortiAuthenticator, Entra ID, Okta, or another SAML IdP is the Identity Provider (IdP) and FortiClient is the web-browser:

1. When the FortiClient user clicks on Connect on FortiClient to connect to IPsec VPN Gateway (i.e. FortiGate), FortiClient first initiates a connection to FortiGate on the `auth-ike-saml-port` configured on FortiGate.
2. The FortiGate sends a SAML Authentication Requests inside a redirect to FortiClient. The redirect consists of URLs to reach the IdP.
3. FortiClient uses these redirects to send SAML Authentication Request to the IdP after which the login page on the IdP opens up.
4. The user authenticates to the IdP using their SAML credentials configured on the IdP.
5. The IdP sends a SAML Authentication Response that contains the user and group information in form of SAML Assertions to FortiClient.
6. FortiClient sends a SAML Authentication Response to FortiGate.
7. The FortiGate consumes the SAML Authentication Response and SAML Assertions after verifying the IdP using its IdP's certificate and provides FortiClient with a temporary token ID.
8. FortiClient initiates IPsec tunnel and presents the token ID for authentication. Upon successful verification of token ID, IPsec tunnel establishes.

SAML configuration example with different IdPs

The following example shows configuring IPsec with SAML authentication using different IdPs on FortiGate and FortiClient. These examples are based on VPN over UDP.



The configuration steps on the FortiGate, different IdPs and FortiClient are as follows:

1. Configure IKE-SAML authentication port number on FortiGate.
2. Configure IPsec VPN certificate on FortiGate.

3. Configure SAML IdP and SAML SP.
4. Configure IPsec IKEv2 on FortiGate.
5. Configure firewall policies on FortiGate.
6. Configure IPsec VPN profile on FortiClient.
7. Verify the IPsec connection.

Only Configuring SAML IdP and SAML SP on page 2996 is unique to individual IdPs. All other steps listed above are the same on FortiGate and FortiClient when using different IdPs.

Configuring IKE-SAML authentication port number on FortiGate

Configure a suitable TCP port number for SAML authentication (`auth-ike-saml-port`) used by FortiGate. This example uses port 9443 and the setting is configurable using the CLI.

```
config system global
    set auth-ike-saml-port 9443
end
```

If VPN over TCP is used, then the port defined in ike-tcp-port takes precedence:

```
config system setting
    set ike-tcp-port <port listened by iked>
end
```

Use the `ike-tcp-port` in your user.saml definitions. Do not assign the same port to `ike-tcp-port` and `auth-ike-saml-port` when VPN over TCP is used.

Configuring IPsec VPN certificate

In this step, using either the GUI or the CLI, configure the IPsec VPN certificate that is presented to FortiClient upon its initial connection.

To configure the IPsec VPN certificate in the GUI:

1. Go to *User & Authentication > Authentication Settings*.
2. Select the certificate from the *Certificate* dropdown menu. To import the certificate on FortiGate, see Import a certificate on page 3830.

To configure the IPsec VPN certificate in the CLI:

If the certificate *VPN_Certificate* has already been imported on the FortiGate, then use the following CLI commands:

```
config user setting
    set auth-cert "VPN_Certificate"
end
```

Configuring SAML IdP and SAML SP

The SAML configuration on SP (FortiGate) will vary based on selected IdPs from the list below. Select the preferred combination of SP and IdP as per your requirement from the following list.

1. Configure FortiAuthenticator as SAML IdP and FortiGate as SAML SP
2. Configure Microsoft Entra ID as SAML IdP and FortiGate as SAML SP

SAML IdPs other than FortiAuthenticator or Microsoft Entra ID can be used. Please refer to the documentation of the respective SAML IdP for details.

Configuring IPsec IKEv2 on FortiGate

Configuring Remote access VPN on FortiGate enables FortiClient to connect to the IPsec VPN gateway configured on FortiGate. FortiClient 7.2.4 GA and above supports only IKEv2 for SAML authentication.

Different options can be selected between transport methods such as UDP, TCP, or Auto mode for IKE negotiation and encapsulation of ESP packets.

Traditionally, dial-up IPsec VPNs use UDP as the transport protocol for IKE negotiations and encrypted traffic. IPsec VPNs can now operate over TCP, providing greater flexibility and compatibility in restrictive network environments. Using TCP as transport is beneficial in scenarios where ISPs, firewalls, or proxy servers only allow inbound and outbound TCP traffic and block UDP traffic. You can also specify a custom TCP port for IPsec communication for both FortiGate and FortiClient. For details on configuring a custom TCP port on FortiClient, see IPsec VPN over TCP. For details on configuring a custom TCP port on FortiGate, see Dialup IPsec VPN using custom TCP port on page 3023.

Using TCP as transport requires IKEv2 and FortiClient 7.4.1 or later. See IPsec VPN over TCP.

The example discussed uses full-tunnel IPsec VPN. For split-tunnel configuration and other advanced configurations as per your requirement, see Remote access on page 2897.

To configure IPsec VPN on FortiGate with FortiClient as the dialup client:

1. Go to *VPN > VPN Tunnels*.
2. Click *Create New > Custom IPsec Tunnel*.
3. Configure the following options:

Field	Value
Name	*FCT_SAML*
Comments	(Optional)
Network	
IP Version	*IPv4*
Remote Gateway	*Dialup User*
Interface	*port1*

Field	Value
	Select the IPsec tunnel gateway interface.
Mode Config	*Enable* Select *IPv4*.
Assign client IP	*Enable* Select *Address/Address Group* from the dropdown list.
IPv4 client IP range	*VPN_Client_IP_Range* *VPN_Client_IP_Range* is configured from *10.212.134.1* to *10.212.134.200*. If it is not already created, select *Create > Address* from the dropdown menu to create a new address object. See IP range on page 1969 for more information.
Subnet Mask	*255.255.255.255*
DNS	*Specify*
IPv4 DNS	*8.8.8.8*
IPv4 split tunnel	*Disable*
Transport	*UDP* Optionally, if using FortiClient 7.4.1 or later for remote access: • Select *TCP encapsulation* to use TCP as transport. • Select *Auto* to use Auto mode.
Authentication	
Method	*Pre-shared key*
Pre-shared key	Enter the unique pre-shared key. Use the same key on FortiClient.
IKE	*version 2*
EAP	*Enable* Select *EAP identity request*
Network overlay	Enable when multiple dialup tunnels are configured. Specify a different network ID for each.
User group	*Inherit from policy* One or more user groups can be used; see Using single or multiple user groups for user authentication on page 2955.

4. In the *Phase 2 selectors* table click *Create New*:
   a. Set *Name* to *FCT_SAML*.
   b. Click *OK*.
5. Click *OK*. The newly created IPsec tunnel would be now visible under *VPN > IPsec Tunnels*.

For other advanced custom configurations as per your requirement, see Remote access on page 2897.

The SAML group configured, `<group-name>`, must be either configured inside the IPsec Phase 1 setting, `set authusrgrp <group-name>`, or in the firewall policy, `set groups <group-name>`, to allow the traffic to flow through the IPsec tunnel. If the SAML group is configured in both IPsec Phase 1 and firewall policy, the traffic stops to flow through the IPsec tunnel. In the example discussed, it is configured it in the firewall policy.

See Using single or multiple user groups for user authentication on page 2955 for more information.

Configuring firewall policies for IPsec tunnel

To configure firewall policies for IPsec tunnel:

1. Go to *Policy & Object > Firewall Policy*.
2. Click *Create New*.
3. Enter the following configuration:

Name	*IPsec to DMZ* Enter the desired name.
Incoming interface	*FCT_SAML* Select the configured IPsec tunnel.
Outgoing interface	*DMZ* Select the interfaces that FortiClient needs access to when it connects to VPN.
Source	Under *Address*, select *VPN_Client_IP_Range*. Under *User*, select *SAML-FAC-Group* (or *SAML-ENTRA-ID-Group*). The group under *User* is the SAML user group configured in the earlier steps.
Destination	*DMZ subnet* Click *Create* if it is not already created. See Subnet on page 1966 for more information.
Service	*ALL*

4. Click *OK*.
5. As IPsec tunnel configured as full-tunnel, create another policy to allow traffic from *IPsec to Internet*, to allow FortiClient to access Internet through IPsec tunnel.

For additional custom settings as per your requirement, see Firewall policy on page 1777.

Configuring IPsec VPN profile on FortiClient

To configure an IPsec VPN profile on FortiClient:

1. In FortiClient, go to *Remote Access* > *Configure VPN* or *Add a new connection*.
2. Set the following settings to configure an IPsec IKEv2 profile on FortiClient:

Connection Name	*VPN-Tunnel*
Remote Gateway	*<VPN Gateway FQDN>* or *<VPN Gateway IP>*
Authentication Method	*Pre-shared key* with *Enable Single Sign On (SSO) for VPN Tunnel* enabled.
Customize port	*9443*
Advanced Settings > VPN Settings	
IKE	*Version 2*
Options	*Mode Config*
Advanced Settings > Phase 1	
IKE Proposal	Encryption: *AES 128*, Authentication: *SHA 256* Encryption: *AES 256*, Authentication: *SHA 256*
DH Group	*20*, *21*
Advanced Settings > Phase 2	
IKE Proposal	Encryption: *AES 128*, Authentication: *SHA 256* Encryption: *AES 256*, Authentication: *SHA 256*
DH Group	*20*

3. Make sure that the Phase 1 and Phase 2 settings, including encryption algorithms, authentication methods, Diffie-Hellman (DH) groups, and other parameters, that are configured on FortiClient exactly match the corresponding Phase 1 and Phase 2 settings defined on the FortiGate IPsec tunnel. A mismatch in any of these parameters will cause the tunnel negotiation to fail.
4. Click *Save*.

To explore additional custom options to configure IPsec VPN profile, see Configuring an IPsec VPN connection.

FortiClient EMS 7.4.4 and later support configuring the Network ID on the IPsec VPN Phase 1 settings in the GUI. For earlier versions, refer to the XML reference guide for IKE settings for details on configuring the `<networkid>` setting.

Verifying IPsec connection

To verify the IPsec connection in the GUI:

1. On the client PC, open FortiClient and select the *Remote Access* tab.
2. Select the VPN tunnel, *VPN-Tunnel*, and click *Connect*.

3. If the connection is successful, a FortiClient pop-up will appear briefly indicating that the IKE negotiation succeeded. The *Remote Access* window now displays *VPN Connected* and the associated VPN tunnel details.
4. In FortiOS, go to *Dashboard > Network Monitor > VPN*.

To verify the IPsec connection in the CLI:

The following debugs are from FortiGate when used with FortiAuthenticator as the IdP. The debugs should be similar for other IdPs depending on the SAML attributes supported and sent by the IdP.

1. Verify the IKE gateway list:

```
# diagnose vpn ike gateway list
vd: root/0
name: FCT_SAML_0
version: 2
interface: port1 3
addr: 10.100.66.99:4500 -> 208.91.115.30:64917

  peer-id: 172.19.50.196
```

2. Verify the authd daemon debug output:

```
# diagnose debug application authd -1
...
[authd_http_on_method_post:5151]: src 10.1.100.253 flag 00008000
[authd_local_saml_auth:5602]: SAML login with UID '19E1FA565259468FB46EDAA9D595176F'.
[authd_http_prepare_javascript_redir:3852]: https://<VPN Gateway
FQDN>:9443/saml?0704048f9683e491
...
```

3. Verify the samld daemon debug output:

```
# diagnose debug application samld -1
...
</Session>
samld_send_common_reply [99]:     Attr: 17, 31, magic=040c07809dafc13e
samld_send_common_reply [99]:     Attr: 18, 29, 2024-03-19T21:42:21Z
samld_send_common_reply [95]:     Attr: 10, 26, 'username' 'testuser'
samld_send_common_reply [95]:     Attr: 10, 17, 'group' 'IT'
...
```

4. Verify the fnbamd daemon debug output:

```
# diagnose debug application fnbamd -1
...
[2426] handle_req-Rcvd auth cache message
[133] __saml_auth_cache_push-Auth cache created, user='19E1FA565259468FB46EDAA9D595176F',
SAML_server='saml-fac', vfid=0
[140] __saml_auth_cache_push-Hash bucket 227
[182] __saml_auth_cache_push-New auth cache entry is created,
user='19E1FA565259468FB46EDAA9D595176F', expires=1648598587, SAML_server='saml-fac', vfid=0
[1918] handle_req-Rcvd auth req 994781475 for 19E1FA565259468FB46EDAA9D595176F in ipsec
opt=00000000 prot=5
[466] __compose_group_list_from_req-Group 'saml-fac', type 1

```

Configuring FortiAuthenticator as SAML IdP and FortiGate as SAML SP

This topic discusses the configuration steps required on FortiAuthenticator to act as the Identity Provider (IdP) and FortiGate to act as Service Provider (SP) during SAML Authentication for IPsec connection, as a part of the overall configuration in SAML-based authentication for FortiClient remote access VPNs on page 2992.

In FortiOS 7.6.1 and later, if TCP is used as the transport protocol for IPsec connections, you can use the same TCP port for both IKEv2 IPsec tunnels and the SAML Service Provider (SP) configuration. This reduces open ports and helps simplify deployment, particularly in restrictive network environments. When the same port is used, the `ike-tcp-port` setting takes precedence, and the `auth-ike-saml-port` setting is irrelevant; FortiGate automatically handles both services over the shared port.

Using TCP as transport requires FortiClient 7.4.1 or later. See IPsec VPN over TCP.

In the example discussed, the following assumptions and configuration steps are used:

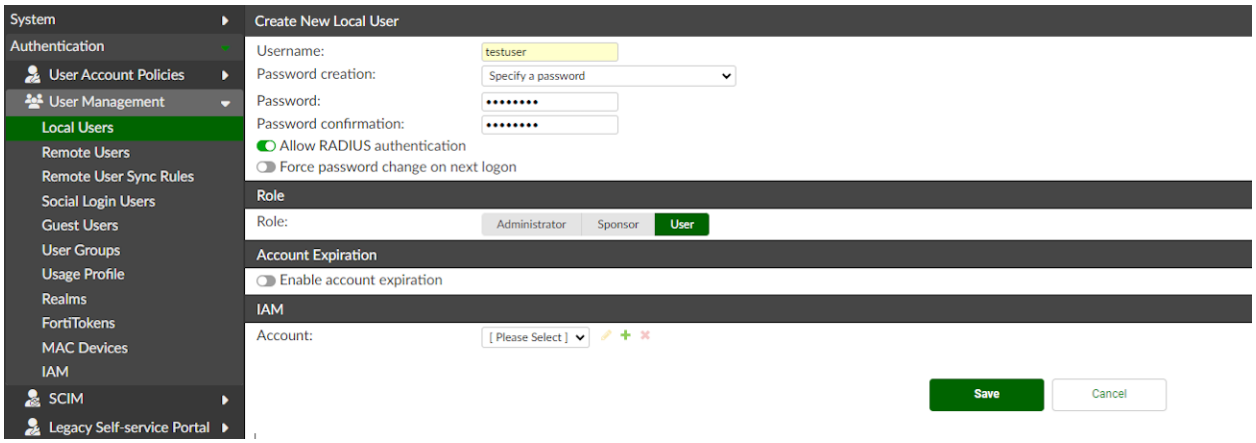
1. FortiAuthenticator is configured with local user (*testuser*) inside a User group (*IT*).
2. This user belongs to a unique realm (*samlrealm*).
3. FortiAuthenticator also requires a server certificate (also called as IdP certificate) for itself signed by a well-known CA or trusted by FortiClient endpoint and FortiGate.
4. The IdP certificate must be imported into FortiGate after which FortiAuthenticator can use the certificate to sign the SAML messages.
5. FortiAuthenticator must then be configured as SAML IdP and FortiGate as SAML SP.

To configure a local user on FortiAuthenticator:

1. Go to *Authentication* > *User Management* > *Local Users* and select *Create New*.
2. Enter the following details shown below and leave other settings as the defaults.

Username	*testuser*
Password creation	*Specify a password*
Password	Enter a desired password
Password confirmation	Re-enter the password

3. Click *Save*.



For more advanced and custom configuration options, see Local users.

To configure a user group on FortiAuthenticator:

1. Go to *Authentication > User Management > User Groups* and select *Create New*.
2. To create a user group with a local user:
   a. In the *Name* field, enter the group name as *IT*.
   b. Set the *Type* as *Local*.
   c. Under *Users*, from the *Available Users* table, select *testuser* and move it to the *Chosen Users* table.
3. Click *Save*.

For more advanced options, see User Groups.

To configure a user realm on FortiAuthenticator:

1. Go to *Authentication > User Management > Realms* and select *Create New*.
2. Name the realm as *samlrealm*.
3. In *User source*, from the dropdown, select *Local Users*.
4. Click *Save*.

For more advanced options, see Realms.

To import a server certificate on FortiAuthenticator:

1. Go to *Certificate Management > End Entities > Local Services* and select *Import*.
2. Depending on which file format your certificate is in, select the suitable *Type*.
3. Select *Upload a file* to locate the certificate file on your computer.
4. Click *Import*.

See End entities for more information on certificates on FortiAuthenticator.

To configure general SAML IdP settings on FortiAuthenticator for SAML:

1. Go to *Authentication > SAML IdP > General*, and select *Enable SAML Identity Provider portal*.
2. Configure the following settings:

Device FQDN	*<FortiAuthenticator FQDN>* To configure this setting, you must enter a *Device FQDN* in the *System Information* widget in the *Dashboard*.
Server address	*<FortiAuthenticator FQDN>* Enter the IP address or FQDN of the FortiAuthenticator device. This address must be accessible by the FortiClient endpoint.
Username input format	*username@realm*
Use default realm when user-provided realm is different from all configured realms	*Disabled*
Realms	*Realm*: *samlrealm* (Optional) *Groups* > *Filter*: *IT* Use *Groups* and *Filter* to add specific user groups. These user groups may be local users configured on the FortiAuthenticator itself or remote users populated from different remote authentication servers. See User Groups and Remote users for more information.
Legacy login sequence	*Disabled*
Default IdP certificate	*<IdP certificate>* This certificate is used by IdP to sign SAML messages before sending it to IdP. To import this certificate on FortiAuthenticator see Importing a server certificate. This certificate also needs to be imported on the SP (FortiGate) to be used in the SAML configuration. See Remote certificate on page 3836.

3. Select *Save* to apply any changes that you have made.

To configure service provider SAML settings on FortiAuthenticator for SAML:

1. Go to *SAML IdP* > *Service Providers*.
2. Click *Create New*.
3. Enter the following:

SP name	*FortiGate* Use any suitable SP name.
Server certificate	*<IdP certificate>* This certificate is used by IdP to sign SAML messages before sending it to IdP. To import this certificate on FortiAuthenticator, see Importing a server certificate. This certificate also needs to be imported on the SP (FortiGate) to be used in the SAML configuration. See Remote certificate on page 3836.
IdP Metadata	

Select an identifier to display IdP info	Click *+* to create a new IdP prefix. In the *IdP identifier* field, enter the prefix as *fac* and click *OK*. Fields such as *IdP entity id*, *IdP single sign-on URL*, and *IdP single logout URL* will populate automatically with this prefix information. These URLs must be accessible by FortiClient endpoints. Copy and paste this URL information in a separate notepad file as it will be used to configure IdP information on SP (FortiGate) later.
Authentication	
Authentication Method	*Password-only*
Assertion Attributes	Click *+* to expand it. Configure two SAML assertion attributes (*username* and *group*) as follows:
Assertion attribute	
SAML attribute	*username*
User attribute	*FortiAuthenticator > Username*
Assertion attribute	
SAML attribute	*group*
User attribute	*FortiAuthenticator > Group*

4. Click *Save*.

To export SAML IdP server certificate and import it on FortiGate:

1. On FortiAuthenticator, go to *Certificate Management > End Entities > Local Services*.
2. Select the certificate, *<IdP certificate>*, by selecting the left checkbox for the certificate entry in the table and clicking *Export Certificate*.
3. Go to the file location on your local computer and click *Save*.
4. On FortiGate, go to *System > Certificates*, and from the *Create/Import* dropdown, select *Remote Certificate*.
5. Select *Upload* to locate and upload the .cer remote certificate from your computer.
6. Click *OK*.
   The new certificate is now visible in the *System > Certificates* page under *Remote Certificate*.

To configure SAML server on FortiGate:

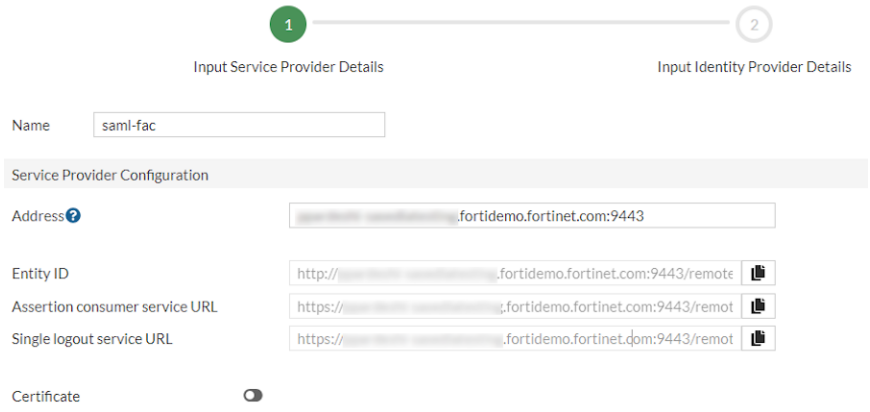
1. Go to *User & Authentication > Single Sign-On*.
2. Click *Create New*.
3. Enter the *Name* as *saml-fac*.
4. In the *Address* field, enter the FQDN/IP information in the following format:
   <ipsec-vpn-gateway-fqdn/ip-address>:<saml-ike-authentication-port>
   The *Address* field is used by FortiClient to initiate IPsec connection to FortiGate.
   If your IPsec VPN is configured to use TCP as the transport protocol on a specific port, the same TCP port can be configured for the saml-ike-authentication-port setting (FortiOS 7.4.1 and later). This allows using a

shared TCP port for both IPsec VPN and SAML SP configuration.

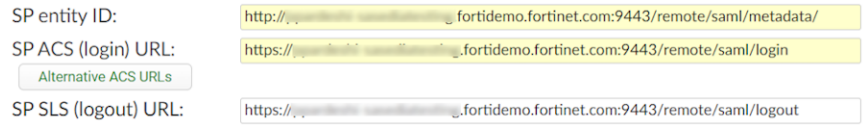
5. On the FortiGate, from *Service Provider Configuration*, copy the following URLs (*Entity ID*, *Assertion consumer service URL*, *Single logout service URL*). In FortiAuthenticator, enter it in *Authentication > SAML IdP > Service Providers > FortiGate*, inside the *SP Metadata* fields according to following mapping:

FortiGate settings	FortiAuthenticator settings
Entity ID	SP entity ID
Assertion consumer service URL	SP ACS (login) URL
Single logout service URL	SP SLS (logout) URL

The following demonstrates on the FortiGate:



The following demonstrates on FortiAuthenticator:

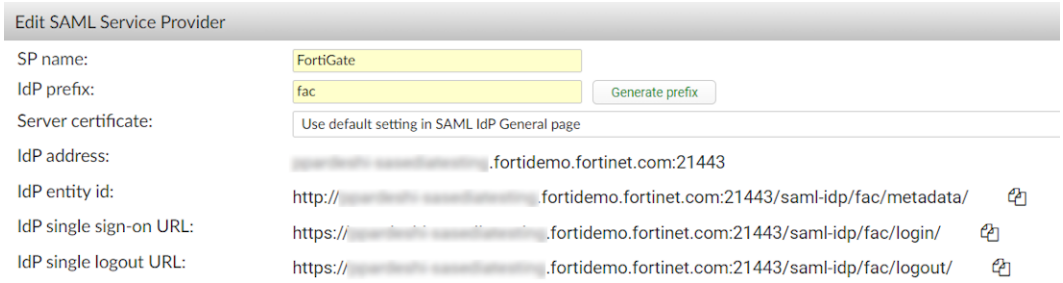


6. Click *Save* on FortiAuthenticator to save the SP URLs.
7. Return to FortiGate GUI, and click *Next*.

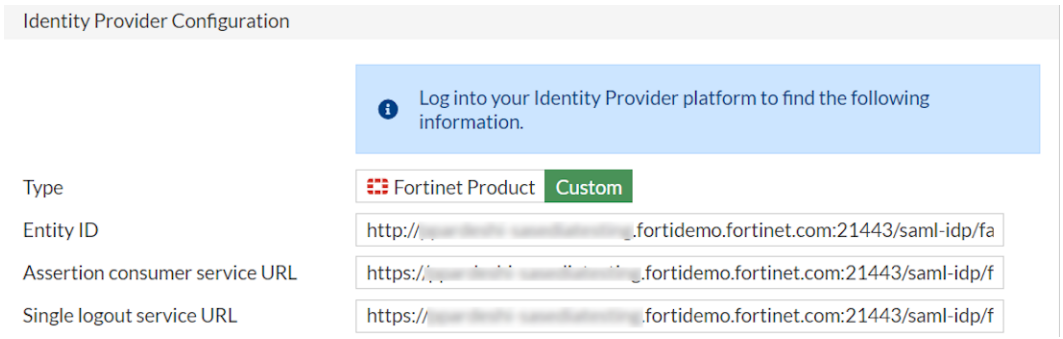
   Set the *Type* as *Custom*.The *Entity ID*, *Assertion consumer service URL*, and *Single logout service URL* fields required are available from FortiAuthenticator.
8. To copy the following URLs (*IdP entity id*, *IdP single sign-on URL*, *IdP single logout URL*) from FortiAuthenticator, go to *Authentication > SAML IdP > Service Providers > FortiGate* under *IdP Metadata*. Copy the URLs from FortiAuthenticator and paste it on FortiGate according to the following mapping:

FortiAuthenticator settings	FortiGate settings
IdP entity ID	Entity ID
IdP single sign-onURL	Assertion consumer service URL
IdP single logout URL	Single logout service URL

The following demonstrates on FortiAuthenticator:



The following demonstrates on the FortiGate:



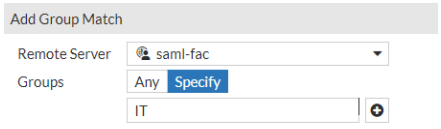
9. In the *Certificate* dropdown, select the IdP certificate that was imported on FortiGate.
10. Enter the following details in *Additional SAML Attributes*.

Attribute used to identify users	*username*
Attribute used to identify groups	*group*

11. Click *Submit* to save the changes.

To create SAML user group on FortiGate:

1. Go to *User & Authentication* > *User Groups* .
2. Click *Create New*.
3. Enter *Name* as *SAML-FAC-Group*.
4. In *Remote Groups*, click *Add*.
5. From the *Remote Server* dropdown, select *saml-fac* SAML server.
6. In the *Groups* field, click *Specify* and enter *IT*.



7. Click *OK*.
8. Click *OK*.

To associate SAML server with IPsec gateway interface:

Use FortiGate CLI to bind and associate the SAML server with the VPN gateway interface (port1) as follows:

```
config system interface
    edit "port1"
        set ike-saml-server "saml-fac"
    next
end
```

Configuring SAML on IdP and SP is now complete. The next step is to use SAML configuration inside IPsec configuration. To configure IPsec, see Configuring IPsec IKEv2 on FortiGate on page 2996.

Configuring Microsoft Entra ID as SAML IdP and FortiGate as SAML SP

This topic discusses the configurations steps required if your users are managed through Microsoft Entra ID (formerly Azure Active Directory), as a part of the overall configuration in SAML-based authentication for FortiClient remote access VPNs on page 2992. Microsoft Entra ID will be configured as Identity Provider (IdP) and FortiGate as Service Provider (SP) during SAML Authentication for IPsec connection.

In FortiOS 7.6.1 and later, if TCP is used as the transport protocol for IPsec connections, you can use the same TCP port for both IKEv2 IPsec tunnels and the SAML Service Provider (SP) configuration. This reduces open ports and helps simplify deployment, particularly in restrictive network environments. When the same port is used, the `ike-tcp-port` setting takes precedence, and the `auth-ike-saml-port` setting is irrelevant; FortiGate automatically handles both services over the shared port.

Using TCP as transport requires FortiClient 7.4.1 or later. See IPsec VPN over TCP.

To configure a user on Microsoft Entra ID:

1. Login to the Azure portal (portal.azure.com).
2. Search for *Microsoft Entra ID service* in the search bar and click on it.
3. In the left side menu, go to *Users*.
4. Select *New user* > *Create new user*.
5. In the *Basic* properties:
   a. In the *Display name* field, enter *testuser*.
   b. In the *User principal name* field, enter the username@companydomain.extension. For example, *testuser@<mydomain>.onmicrosoft.com*.
   c. Select *Show password* and then write down the value that's displayed in the *Password* box.
   d. Select *Review + create*.
6. Select *Create*.

To configure a Security group and add user to it on Microsoft Entra ID:

In this section, we create a security group named *IT* in Microsoft Entra ID for the *testuser*. FortiGate will use this security group to grant the user network access through the VPN.

1. In the Azure portal, navigate to *Microsoft Entra ID* service.
2. In the left side menu, go to *Groups*.

a. Select *New Group*.
b. In the *Group type* list, select *Security*.
c. In the *Group name* field, enter *IT*.
d. (Optional) In the *Group description* field, enter *Group for granting FortiGate VPN access*.
e. For the *Microsoft Entra roles can be assigned to the group (Preview) settings*, select *No*.
f. In the *Membership type* field, select *Assigned*.
g. Under *Members*, select *No members selected*.
h. In the *Users and groups* dialog field, select *testuser* from the *Users* list, and then click *Select*.
i. Select *Create*.

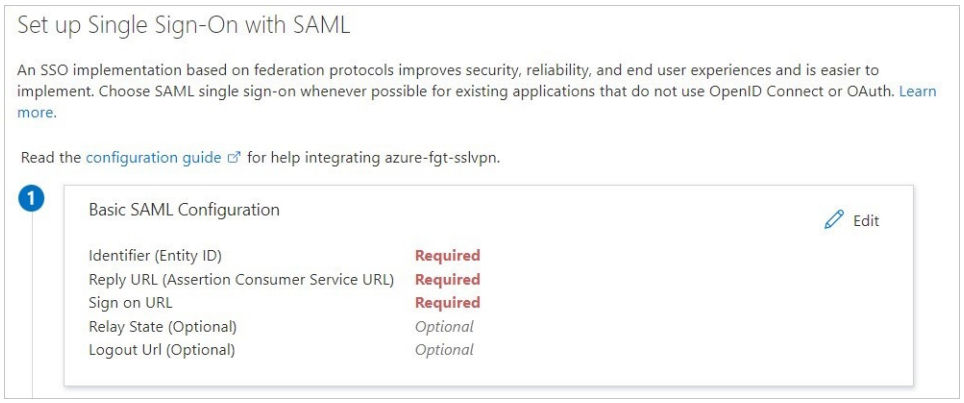
3. Back in the *Groups* section in Microsoft Entra ID, find the *IT* group and note the *Object Id*. This will be needed later.

To configure Enterprise application on Azure portal:

1. Configure user and groups:
   a. In the Azure portal, search for *Enterprise applications service* in the search bar.
   b. Click on *New application* and search for *FortiGate SSL VPN*.

      The application is named for "SSL VPN" but should still work with the IPsec VPN configuration.

   c. Once the application is found, select it, change the *Name* to *FortiGate IPsec VPN*, and click *Create*. It may take a few seconds to create the application.
   d. Once the application is created, go to *Enterprise application* > *All applications* > *FortiGate IPsec VPN*.
   e. On the application's overview page, in the *Manage* section, select *Users and groups*.
   f. Select *Add user/group*, then select *Users* in the *Add Assignment* dialog.
   g. In the *Users and groups* dialog, select *testuser* in the *Users* list, and then click *Select*.
   h. (Optional) If you are expecting any role value in the SAML assertion, in the *Select Role* dialog, select the appropriate role for the user from the list. Click *Select*.
   i. In the *Add Assignment* dialog, select *Assign*.
2. Configure single sign-on:
   a. Browse to *Enterprise application* > *All applications* > *FortiGate IPsec VPN application*.
   b. In the *Manage* section, select *Single sign-on*.
   c. In the *Select a single sign-on method* page, select *SAML*.
   d. In the *Set up Single Sign-On with SAML* page, select *Edit* for *Basic SAML Configuration* to edit the settings:



i. In *Identifier*, enter a URL in the pattern https://<FortiGate IP or FQDN address>:<Custom SAML-IKE port>/remote/saml/metadata
ii. In *Reply URL*, enter a URL in the pattern https://<FortiGate IP or FQDN address>:<Custom SAML-IKE port>/remote/saml/login
iii. In *Sign on URL*, enter a URL in the pattern https://<FortiGate IP or FQDN address>:< Custom SAML-IKE port >/remote/saml/login
iv. In *Logout URL*, enter a URL in the pattern https://<FortiGate IP or FQDN address>:< Custom SAML-IKE port >/remote/saml/logout

These URLs can be retrieved and copied directly from the FortiGate. Go to To configure SAML server on FortiGate: on page 3005 to get these URLs.

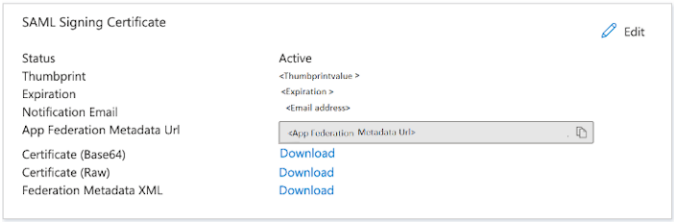
e. Click *Save*.
f. The FortiGate IPsec VPN application expects SAML assertions in a specific format, which requires you to add custom attribute mappings to the configuration.
g. The claims required by FortiGate IPsec VPN are shown in the following table. Names are case-sensitive.

Name	Source attribute
username	user.userprincipalname
group	user.groups

To create these additional claims:

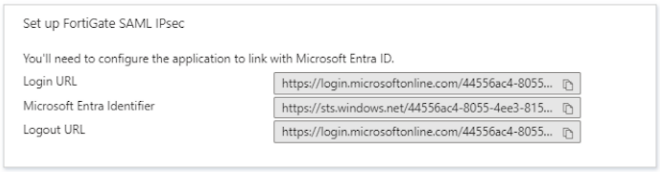
i. Next to *User Attributes & Claims*, select *Edit*.
ii. Select *Add new claim*.
iii. For *Name*, enter *username*.
iv. For *Source attribute*, select *user.userprincipalname*.
v. Select *Save*.
vi. Select *Add a group claim*.
vii. Select *All groups*.
viii. Under *Advanced options*, select the *Customize the name of the group claim*.
ix. For *Name*, enter *group*.
x. Select *Save*.

h. In the *Set up Single Sign-On with SAML* page, in the *SAML Signing Certificate* section, select *Download* next to *Certificate (Base64)* to download the certificate and save it on your computer. This will be needed in the step To export SAML IdP server certificate and import it on FortiGate: on page 3011



i. In the *SAML Signing Certificate* section, click *Edit*, set *Signing Option* to *Sign SAML response and assertion*, then click *Save*.

j. In the *Set up FortiGate SAML IPsec* section, copy the URLs (*Login URL*, *Microsoft Entra Identifier*, *Logout URL*) and paste it inside FortiGate's SAML server configuration, discussed in To configure SAML server on FortiGate: on page 3011.



To export SAML IdP server certificate and import it on FortiGate:

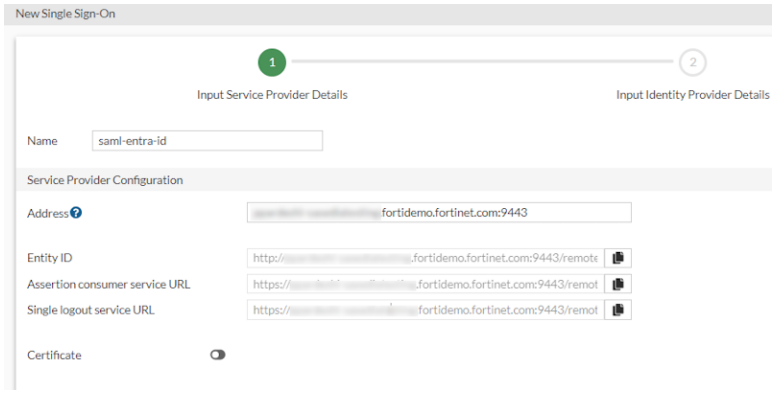
1. On FortiGate, go to *System* > *Certificates*, and from the *Create/Import* dropdown, select *Remote Certificate*.
2. Select *Upload* to locate and upload the .cer remote certificate from your computer.
3. Click *OK*. The certificate will now be visible under *System* > *Certificates* > *Remote Certificate*.

To configure SAML server on FortiGate:

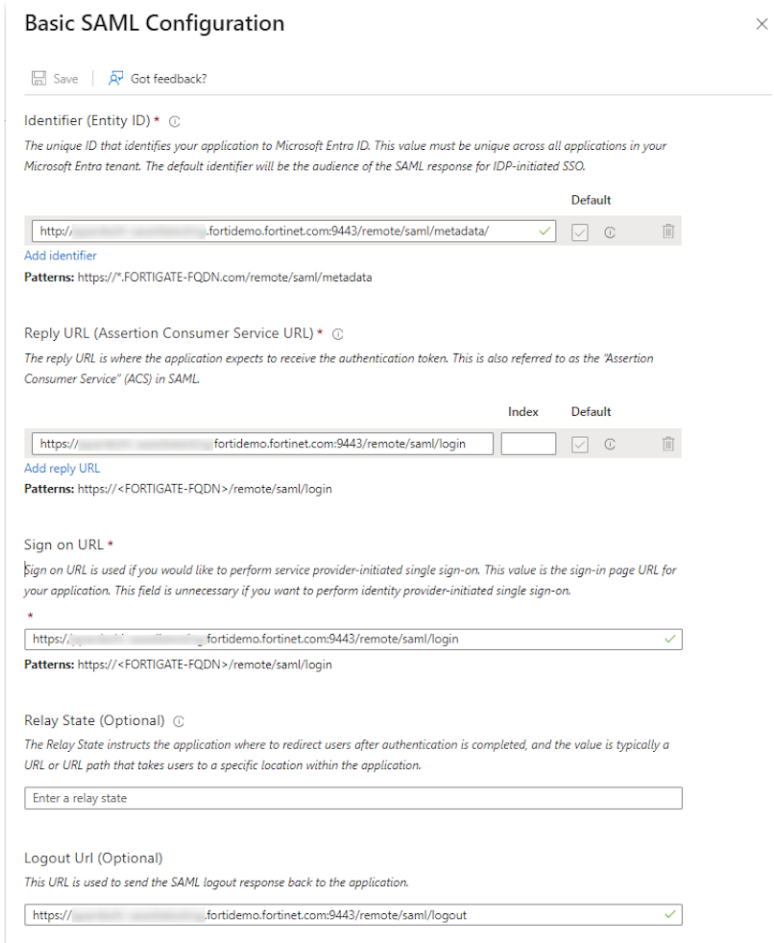
1. On the FortiGate, go to *User & Authentication* > *Single Sign-On* > *Create new*.
2. Enter the *Name* as *saml-entra-id*.
3. In the *Address* field, enter the FQDN/IP information in the following format:
   <ipsec-vpn-gateway-fqdn/ip-address>:<saml-ike-authentication-port>
   The *Address* field is used by FortiClient to initiate IPsec connection to FortiGate.
   If your IPsec VPN is configured to use TCP as the transport protocol on a specific port, the same TCP port can be configured for the saml-ike-authentication-port setting (FortiOS 7.4.1 and later). This allows using a shared TCP port for both IPsec VPN and SAML SP configuration.
4. In *Service Provider Configuration*, copy the following URLs (*Entity ID*, *Assertion consumer service URL*, *Single logout service URL*) and use it in *Azure in Enterprise application* > *All applications* > *FortiGate IPsec VPN* > *Single sign-on page* > *Basic SAML Configuration*. Use the following mapping to copy the required values:

FortiGate settings	Microsoft Entra ID settings
Entity ID	Identifier (Entity ID)
Assertion consumer service URL	Reply URL (Assertion Consumer Service URL)
Assertion consumer service URL	Sign on URL
Single logout service URL	Logout URL (Optional)

The following demonstrates on the FortiGate:



The following demonstrates on Microsoft Entra ID:



5. On the FortiGate GUI, click *Next*.
6. In *Identity Provider Details*, set the *Type* as *Custom*.
7. Paste the URLs copied from last step of section To configure Enterprise application on Azure portal: on page 3009 according to the following mapping:

Microsoft Entra IDsettings	FortiGate settings
Login URL	Assertion consumer service URL
Microsoft Entra Identifier	Entity ID
Logout URL	Single logout service URL

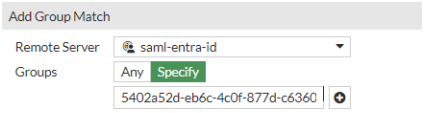
8. Select the *Certificate* from the dropdown. This certificate was imported into FortiGate in section To export SAML IdP server certificate and import it on FortiGate: on page 3011.
9. In the *Additional SAML Attributes* section, enter the following attributes:

Attribute used to identify users	*username*
Attribute used to identify groups	*group*

10. Click *Submit* to save the changes.

To configure SAML user group on FortiGate:

1. Go to *User & Authentication* > *User Groups* > *Create New*.
2. Enter *Name* as *SAML-ENTRA-ID-Group*.
3. In *Remote Groups*, click *Add*.
4. From the *Remote Server* dropdown, select *saml-entra-id SAML server*.
5. In *Groups*, click *Specify* and paste the Object ID copied in the section To configure a Security group and add user to it on Microsoft Entra ID: on page 3008.



6. Click *OK*.
7. Click *OK*.

To associate SAML server with IPsec gateway interface:

Use the FortiGate CLI to bind and associate the SAML server with the VPN gateway interface (port1) as follows:

```
config system interface
    edit "port1"
        set ike-saml-server "saml-entra-id"
    next
end
```

Configuring SAML on IdP and SP is now complete. The next step is to use SAML configuration inside IPsec configuration. To configure IPsec, see Configuring IPsec IKEv2 on FortiGate on page 2996.

Enhancing IPsec security using EMS SN verification

This feature ensures that only licensed FortiClient endpoints can establish an IPsec VPN connection with FortiGate. The FortiGate performs EMS SN verification, and for this feature to work, both the FortiGate and FortiClient endpoints must be connected to the same FortiClient EMS.

To enable the EMS SN verification in the CLI:

```
config vpn ipsec phase1-interface
    edit <name>
        set ems-sn-check {enable | disable}
    next
end
```

Command	Description
`set ems-sn-check`	Enable or disable EMS serial number verification.

IKE Mode Config clients

IKE Mode Config allows dialup VPN clients to obtain virtual IP address, network, and DNS configurations amongst others from the VPN server.

IKE Mode Config can configure the host IP address, domain, DNS addresses ,and WINS addresses. IPsec parameters such as gateway address, encryption, and authentication algorithms must be configured. Several network equipment vendors support IKE Mode Config.

An IKE Mode Config server or client is configured using `config vpn ipsec phase1-interface` and involves the following parameters:

Parameter	Description
ike-version {1 | 2}	IKE v1 is the default for FortiGate IPsec VPNs. IKE Mode Config is also compatible with IKE v2.
mode-cfg {enable | disable}	Enable/disable IKE Mode Config.
type {static | dynamic | ddns}	If you set `type` to `dynamic`, an IKE Mode Config server is created. The other settings create an IKE Mode Config client.
assign-ip {enable | disable}	Enable to request an IP address from the server. This configuration is for IKE Mode Config clients only.
interface <interface_name>	Specify the physical, aggregate, or VLAN interface to which the IPsec tunnel will be bound.
proposal <encryption_ combination>	The encryption and authentication settings that the client will accept.
ip-version {4 | 6}	By default, IPsec VPNs use IPv4 addressing.

Parameter	Description
ipv4-split-include <string> ipv6-split-include <string>	Mode Config server configuration. Applicable to IKEv1 and IKEv2. Specify the firewall address or address group that represents the subnets that the clients will have access to. This information is sent to the clients so that default traffic should not flow over the IPsec tunnel except for the specified subnets.
split-include-service <string>	Mode Config server configuration. Applicable to IKEv1 and IKEv2. Specify the service or service group that represents the services that the clients will have access to. This information is sent to the clients so that default traffic should not flow over the IPsec tunnel except for the specified services.
ipv4-split-exclude <string> ipv6-split-exclude <string>	Specify the subnets that should not be accessed over the IPsec tunnel. This information is sent to the clients so that all default traffic should flow over the IPsec tunnel except for the specified subnets. See Split-exclude in IKEv1.
domain <string>	Allows the configuration of a DNS suffix and is available only in IKE v1. To enable this feature, unity-support must be enabled using the `set unity-support enable` command in the phase 1 configuration. A maximum of one DNS suffix can be specified per IPsec tunnel.

Creating an IKE Mode Config client

In this example, the FortiGate connects to a VPN gateway with a static IP address that can be reached through port 1. Only the port, gateway, and proposal information needs to be configured. All other configuration information will come from the IKE Mode Config server.

To configure an IKE Mode Config client:

```
config vpn ipsec phase1-interface
    edit vpn1
        set ip-version 4
        set type static
        set remote-gw <gw_address>
        set interface port1
        set proposal 3des-sha1 aes128-sha1
        set mode-cfg enable
        set assign-ip enable
    next
end
```

Creating an IKE Mode Config server

To configure IKE Mode config settings, the following must be configured first :

```
config vpn ipsec phase1-interface
    edit "vpn-p1"
        set type dynamic
        set interface <interface_name>
        set ike-version {1 | 2}
        set mode-cfg enable
        set proposal <encryption_combination>
        set ip-version {4 | 6}
    next
end
```

In this example, the FortiGate assigns IKE Mode Config clients addresses in the range of 10.11.101.160 - 10.11.101.180. DNS and WINS server addresses are also provided. The public interface of the FortiGate unit is port1.

When IKE Mode-Configuration is enabled, multiple server IPs can be defined in IPsec phase 1.

The `ipv4-split-include` parameter specifies a firewall address (`OfficeLAN`), which represents the networks that the clients will have access to. This destination IP address information is sent to the clients.

To configure an IKE Mode Config server:

```
config vpn ipsec phase1-interface
    edit "vpn-p1"
        set type dynamic
        set interface "wan1"
        set xauthtype auto
        set mode aggressive
        set mode-cfg enable
        set proposal 3des-sha1 aes128-sha1
        set dpd disable
        set dhgrp 2
        set authusrgrp "FG-Group1"
        set ipv4-start-ip 10.10.10.10
        set ipv4-end-ip 10.10.10.20
        set ipv4-dns-server1 1.1.1.1
        set ipv4-dns-server2 2.2.2.2
        set ipv4-dns-server3 3.3.3.3
        set ipv4-wins-server1 4.4.4.4
        set ipv4-wins-server2 5.5.5.5
        set domain "fgt1c-domain"
        set banner "fgt111C-banner"
        set backup-gateway "100.100.100.1" "host1.com" "host2"
        set ipv4-split-include OfficeLAN
    next
end
```

Assigning IP addresses

Once the basic configuration is enabled, you can configure IP address assignment for clients, as well as DNS and WINS server assignments. Usually you will want to assign IP addresses to clients. The easiest way is to assign addresses from a specific range, similar to a DHCP server.

To assign an IP from an address range:

```
config vpn ipsec phase1-interface
    edit vpn1
        set ip-version 4
        set assign-ip enable
        set assign-ip-from range
        set ipv4-start-ip <range_start>
        set ipv4-end-ip <range_end>
        set ipv4-netmask <netmask>
    next
end
```

To assign an IP from a named firewall address or group:

```
config vpn ipsec phase1-interface
    edit vpn1
        set type dynamic
        set assign-ip-from name
        set ipv4-name <name>
        set ipv6-name <name>
    next
end
```

RADIUS server

If the client is authenticated by a RADIUS server, you can obtain the user's IP address assignment from the Framed-IP-Address attribute. The user must be authenticated using XAuth.

The users must be authenticated by a RADIUS server and assigned to the FortiGate user group `<grp_name>`. Since the IP address is not static, type is set to dynamic and `mode-cfg` is enabled. With IKE Mode Config, compatible clients can configure themselves with settings provided by the FortiGate.

To assign an IP from a RADIUS server:

```
config vpn ipsec phase1-interface
    edit vpn1
        set type dynamic
        set mode-cfg enable
        set assign-ip enable
        set assign-ip-from usrgrp
        set xauthtype auto
        set authusrgrp <grp_name>
```

```
    next
end
```

DHCP server

IKE Mode Config can use a remote DHCP server to assign the client IP addresses. Up to eight server addresses can be selected for either IPv4 or IPv6. The DHCP proxy must be enabled first.

To assign an IP from a DHCP server:

```
config system settings
    set dhcp-proxy enable
    set dhcp-server-ip <address>
    set dhcp6-server-ip <address>
end
```

```
config vpn ipsec phase1-interface
    edit vpn1
        set mode-cfg enable
        set assign-ip-from dhcp
    next
end
```

Certificate groups

IKE certificate groups consisting of up to four RSA certificates can be used in IKE phase 1. Since CA and local certificates are global, the IKE daemon loads them once for all VDOMs and indexes them into trees based on subject and public key hash (for CA certificates), or certificate name (for local certificates). Certificates are linked together based on the issuer, and certificate chains are built by traversing these links. This reduces the need to keep multiple copies of certificates that could exist in multiple chains.

To configure the IKE local ID:

```
config vpn certificate local
    edit <name>
        set ike-localid <string>
        set ike-localid-type {asnldn | fqdn}
    next
end
```

Split-exclude

The `split-exclude` setting specifies that default traffic flows over the IPsec tunnel except for specified subnets. This is the opposite of `split-include`, which specifies that default traffic should not flow over the IPsec tunnel except for specified subnets. The `split-include` and `split-exclude` settings can be specified at the same time.

To configure split-exclude:

```
config vpn ipsec phase1-interface
    edit <name>
        set ike-version {1 | 2}
        set type dynamic
        set mode-cfg enable
        set ipv4-split-exclude <string>
        set ipv6-split-exclude <string>
    next
end
```

DNS suffix

The DNS suffix enables DNS resolution of network resources using their hostnames, without requiring clients to specify their fully qualified domain names (FQDN). This feature is particularly useful in environments where users access internal resources over VPN connections. By appending a DNS suffix to unqualified domain names (such as hostnames), it enables end systems to generate FQDNs required for DNS resolution.

DNS suffix configuration is natively supported for IKE version 1. Only one DNS suffix is configurable per IPsec tunnel.

For IKE version 2, DNS suffix is supported when connecting from a Windows FortiClient running 7.4.4 or later. More than one DNS suffix can be configured per IPsec tunnel.

The configuration of a DNS suffix on an IPsec IKEv1 tunnel requires enabling unity-support in the phase 1 configuration of the IPsec tunnel:

```
config vpn ipsec phase1-interface
    edit <name>
        set unity-support enable
        set domain <string>
    next
end
```

For more information, see IPsec DNS suffix on page 3022.

IPsec split DNS

This functionality empowers clients to determine whether DNS traffic should utilize the tunnel's DNS or the local DNS server for query resolution. This is achieved by letting users specify a list of FQDNs. Only FQDNs that match the specified list are directed to the tunnel for resolution, while all other queries are handled by the local DNS server.

The `internal-domain-list` option is available on IKEv2 phase1 dialup gateways if `mode-cfg` is enabled.

To enable IPsec Split DNS in the CLI:

```
config vpn ipsec phase1-interface
    edit <name>
        set type dynamic
        set ike-version 2
        set mode-cfg enable
        set dns-mode {manual | auto}
        set internal-domain-list <domain name>
    next
end
```

Command	Description
`set internal-domain-list`	One or more internal domain names in quotes separated by spaces.

Two scenarios need attention:

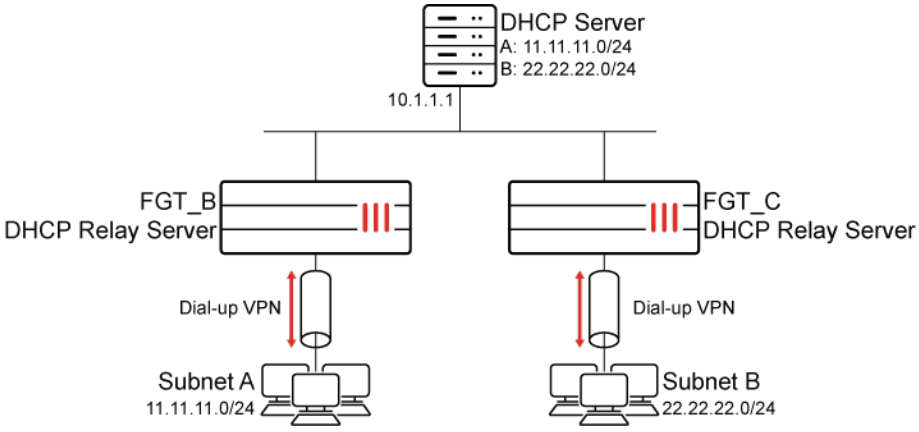
1. When there is no split tunnel, or the split tunnel is set to address *all*, the user must manually select the *Enable Local LAN* checkbox in the FortiClient by navigating to *Advanced Settings > Phase 1*. If not, only the FQDN matching the `internal-domain-list` will be resolved, discarding other DNS queries. However, once this setting is enabled on FortiClient, any non-matching DNS query will be resolved through the local DNS server.
2. If the `dns-mode` is set to `manual`, but the *ipv4-dns-server1* is not configured, the VPN tunnel's DNS will default to 0.0.0.0 and all DNS queries will be routed through the local DNS server.

Defining gateway IP addresses in IPsec with mode-config and DHCP

For an IPsec tunnel, the gateway IP address (giaddr) can be defined on a DHCP relay agent. Both IPv4 and IPv6 addresses are supported. An IPsec tunnel with mode-config and DHCP relay cannot specify a DHCP subnet range to the DHCP server.

The DHCP server assigns an IP address based on the giaddr set on the IPSec phase1 interface and sends an offer to this subnet. The DHCP server must have a route to the specified subnet giaddr.

Example



To define the gateway IP address on the DHCP relay server:

1. Configure the VPN IPsec phase1 interface:

```
config vpn ipsec phase1-interface
    edit "ipv4"
        set type dynamic
        set interface "port2"
        set peertype any
        set net-device disable
        set mode-cfg enable
        set proposal des-md5 des-sha1
        set dpd on-idle
        set dhgrp 5
        set assign-ip-from dhcp
        set dhcp-ra-giaddr 11.11.11.1
        set psksecret ***********
        set dpd-retryinterval 60
    next
end
```

IPv6 could also be configured:

```
config vpn ipsec phase1-interface
    edit "ipv6"
        set type dynamic
        set interface "port2"
        set peertype any
        set net-device disable
        set mode-cfg enable
        set proposal des-md5 des-sha1
        set dpd on-idle
        set dhgrp 5
        set assign-ip-from dhcp
        set dhcp6-ra-linkaddr 2000:11:11:11::1
```

```
        set psksecret **********
        set dpd-retryinterval 60
    next
end
```

2. Enable DHCP proxy and configure the DHCP server IP address:

```
config system settings
    set dhcp-proxy enable
    set dhcp-server-ip "10.1.1.1"
end
```

3. Repeat the above steps for FGT_C and subnet B.

IPsec DNS suffix

The DNS suffix enables DNS resolution of network resources using their hostnames, without requiring clients to specify their fully qualified domain names (FQDN). This feature is particularly useful in environments where users access internal resources over VPN connections. By appending a DNS suffix to unqualified domain names (such as hostnames), it enables end systems to generate FQDNs required for DNS resolution.

When a DNS suffix is configured for an IPsec tunnel, the configuration is pushed to FortiClient during VPN negotiations and is added to the DNS suffix list for the VPN adapter on the endpoint machine. This setting ensures accurate name resolution for unqualified domain names by appending the specified DNS suffix, which is essential for proper DNS resolution.

DNS suffix configuration is natively supported for IKE version 1. Only one DNS suffix is configurable per IPsec tunnel.

For IKE version 2, DNS suffix is supported when connecting from a Windows FortiClient running 7.4.4 or later. More than one DNS suffix can be configured per IPsec tunnel.

If we assume that a DNS suffix named example.com is set for an IPsec tunnel, when a VPN client performs DNS query for server1 using only its hostname server1, the end system appends the DNS suffix it to make the FQDN server1.example.com. A DNS query is sent using this FQDN to the DNS servers configured for VPN clients.

Split Tunneling:

If split tunneling is enabled on the IPsec tunnel, ensure that the address object used for split tunneling includes the IP address of the DNS server used by VPN clients. This ensures that DNS traffic flows correctly through the VPN adapter. Without this configuration, the DNS suffix is not applied, as DNS queries will bypass the VPN adapter.

Unqualified domains:

The DNS suffix is only appended if VPN clients make DNS queries for unqualified domain names. The DNS suffix is not appended for DNS queries made for FQDNs (such as server1.example.com) or partially qualified domain names (such as server1.example).

The configuration of a DNS suffix on an IPsec IKEv1 tunnel requires enabling unity-support in the phase 1 configuration of the IPsec tunnel:

```
config vpn ipsec phase1-interface
    edit <name>
        set unity-support enable
        set domain <string>
    next
end
```

Command	Description
`unity-support enable`	Enables unity support to allow pushing DNS suffixes to VPN clients.
`domain <string>`	Specify the DNS suffix that is required to be pushed to VPN clients.

The configuration of a DNS suffix on an IPsec IKEv2 tunnel requires phase 1 to be a dynamic gateway with `mode-cfg enabled`:

```
config vpn ipsec phase1-interface
    edit <tunnel_name>
        set mode-cfg enable
        set ike-version 2
        set type dynamic
        set dns-suffix-search example.com
    next
end
```

Command	Description
`dns-suffix-search <suffix>`	Specify one or more DNS suffixes in quotes separated by spaces.

Dialup IPsec VPN using custom TCP port

Dialup IPsec VPN may operate over UDP or TCP, enabling VPN traffic from FortiClient to traverse restrictive firewalls that only permit TCP-based traffic. You can configure an IPsec VPN tunnel to exclusively use UDP, or you can configure the tunnel to automatically switch to TCP mode when the firewall blocks UDP.

In high-latency or congested networks, UDP-based VPN connections may suffer from packet loss or performance degradation. TCP, with its built-in error correction and retransmission mechanisms, enhances the reliability and stability of VPN connections in such environments.

Dialup IPsec over TCP is particularly advantageous in mobile or dynamic settings such as public WiFi, hotel networks, or cellular data where network conditions and restrictions often vary. This feature ensures more seamless and dependable VPN connectivity across a broader range of scenarios.

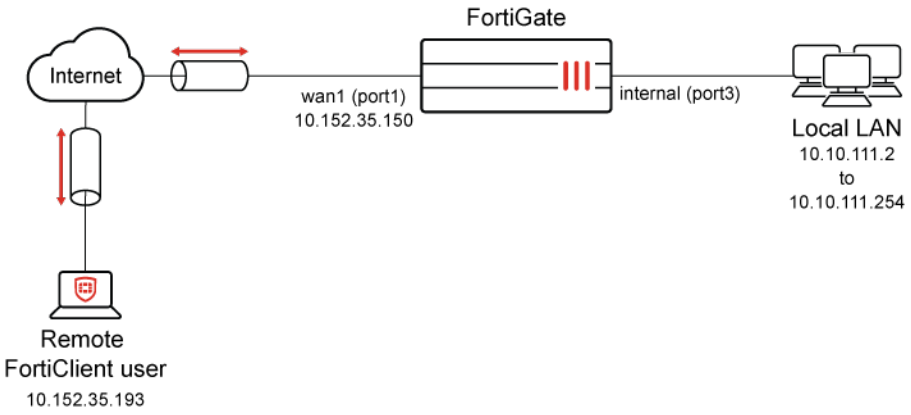
The custom TCP port functionality for IPsec is exclusively supported with IKE version 2 (IKEv2), and does not support NPU offloading.

Example

In this example, FortiGate is configured as a dialup IPsec server using IKE version 2 (IKEv2) and operating on a custom TCP port (5500). IKEv2 is configured to use EAP for user authentication. The initial setup leverages the VPN wizard to create the dialup IPsec tunnel.

On the client side, FortiClient is managed by FortiClient EMS and configured to act as the dialup IPsec client. The client is configured to connect to the FortiGate server over the custom TCP port 5500. This feature requires FortiClient 7.4.1 or later.

For a detailed description of the steps to configure FortiClient EMS to use the custom TCP port 5500 for IPsec VPN connections, see IPsec VPN over TCP.



To enable TCP and configure a custom port in the GUI:

1. Go to *VPN > VPN Tunnels* and select the *Settings* tab.
2. Enable *Allow VPN negotiation over TCP*.
3. Set *TCP port for IKE/IPsec traffic* to port *5500*.
4. Click *Apply*.

To enable TCP and configure a custom port in the CLI:

```
config system settings
    set ike-tcp-service enable
    set ike-tcp-port 5500
end
```

Command	Description
`ike-tcp-servicer {enable | disable}`	Enable/disable VPN over TCP. This is a per-vdom setting.
`ike-tcp-port <port>`	Set the TCP port for IKE/IPsec traffic (1 - 65535, default = 443).

When using TCP port 443 for IKE/IPsec traffic, GUI access can be affected for interfaces that are bound to an IPsec tunnel when the GUI admin port is also using port 443. To ensure continued functionality, change either the IKE/IPsec port or the administrative access port.

To change the administrative access port:

```
config system global
    set admin-sport <port>
end
```

Command	Description
`admin-sport <port>`	Set the administrative access port for HTTPS (1 - 65535, default = 443).

For port conflicts with ZTNA and Agentless VPN, ZTNA and Agentless VPN will take precedence. To avoid any port conflicts with other services, review the FortiOS Ports guide for other incoming ports used on the FortiGate.

To configure FortiGate as IPsec dialup server using VPN Wizard:

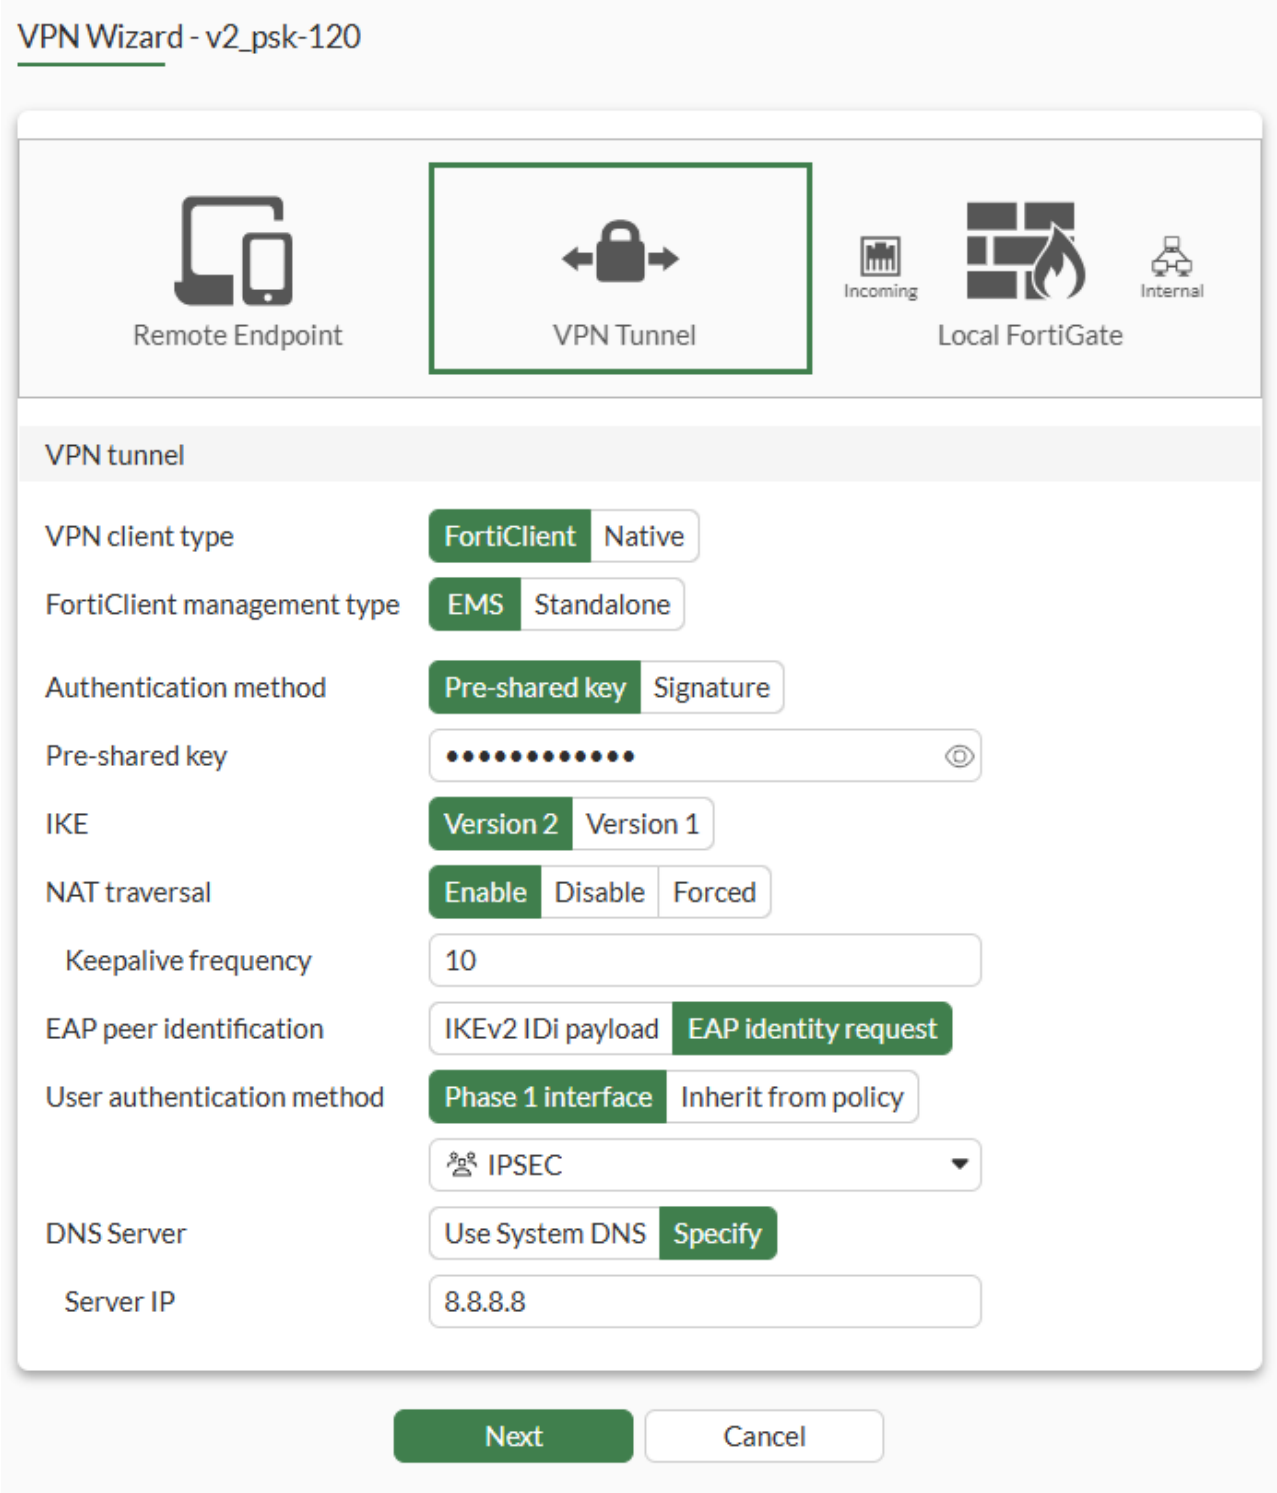
1. Go to *VPN* > *VPN Wizard*, and enter the following:

Field	Value
Tunnel name	v2_psk-120
Select a template	Remote Access

2. Click *Begin*.
3. In the *VPN Tunnel* section, enter the following:

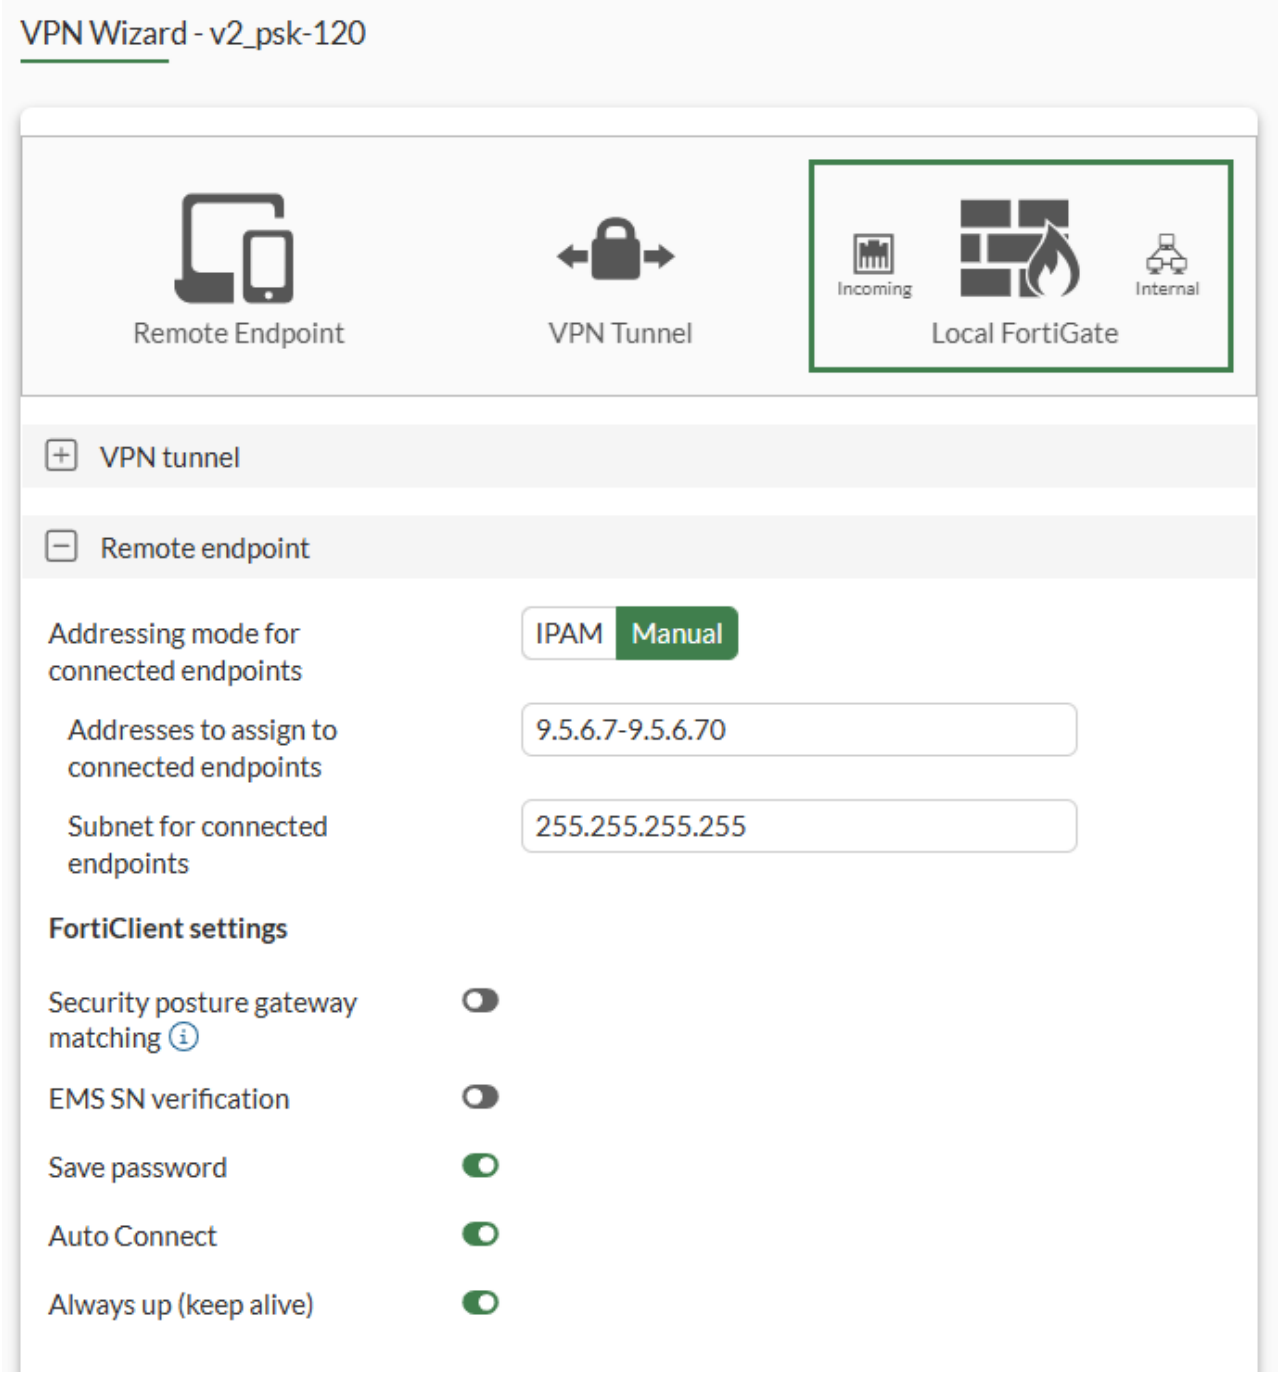
Field	Value
VPN client type	FortiClient
FortiClient management type	EMS
Authentication method	Pre-shared key
Pre-shared key	Enter suitable key
IKE	Version 2
NAT traversal	Enable
Keepalive frequency	10
EAP peer identification	EAP identity request
User authentication method	Phase 1 interface Use dropdown to select user group *IPSEC*. To configure user groups for authentication, see User groups on page 3359.

Field	Value
	(Optional) To use multiple user groups, select *Inherit from policy*. See Using single or multiple user groups for user authentication on page 2955 for details.
DNS Server	Specify
Server IP	8.8.8.8



4. Click *Next*.
5. Under *Remote Endpoint* section, enter the following:

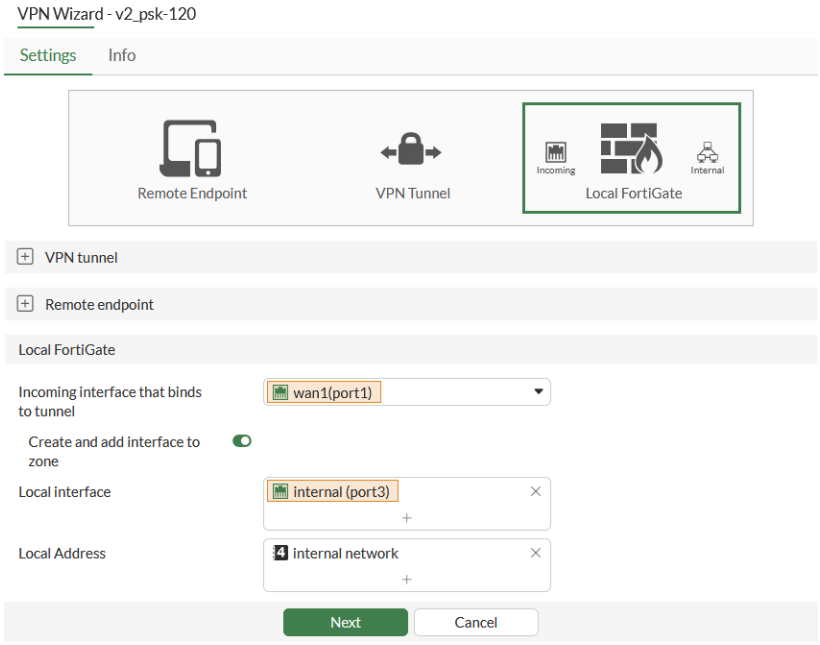
Field	Value
Addressing mode for connected endpoints	Manual
Address to assign to connected endpoints	9.5.6.7-9.5.6.70
Subnet for connected endpoints	255.255.255.255
FortiClient settings	
Security posture gateway matching	Disable
EMS SN verification	Disable
Save password	Enable
Auto Connect	Enable
Always up (keep alive)	Enable



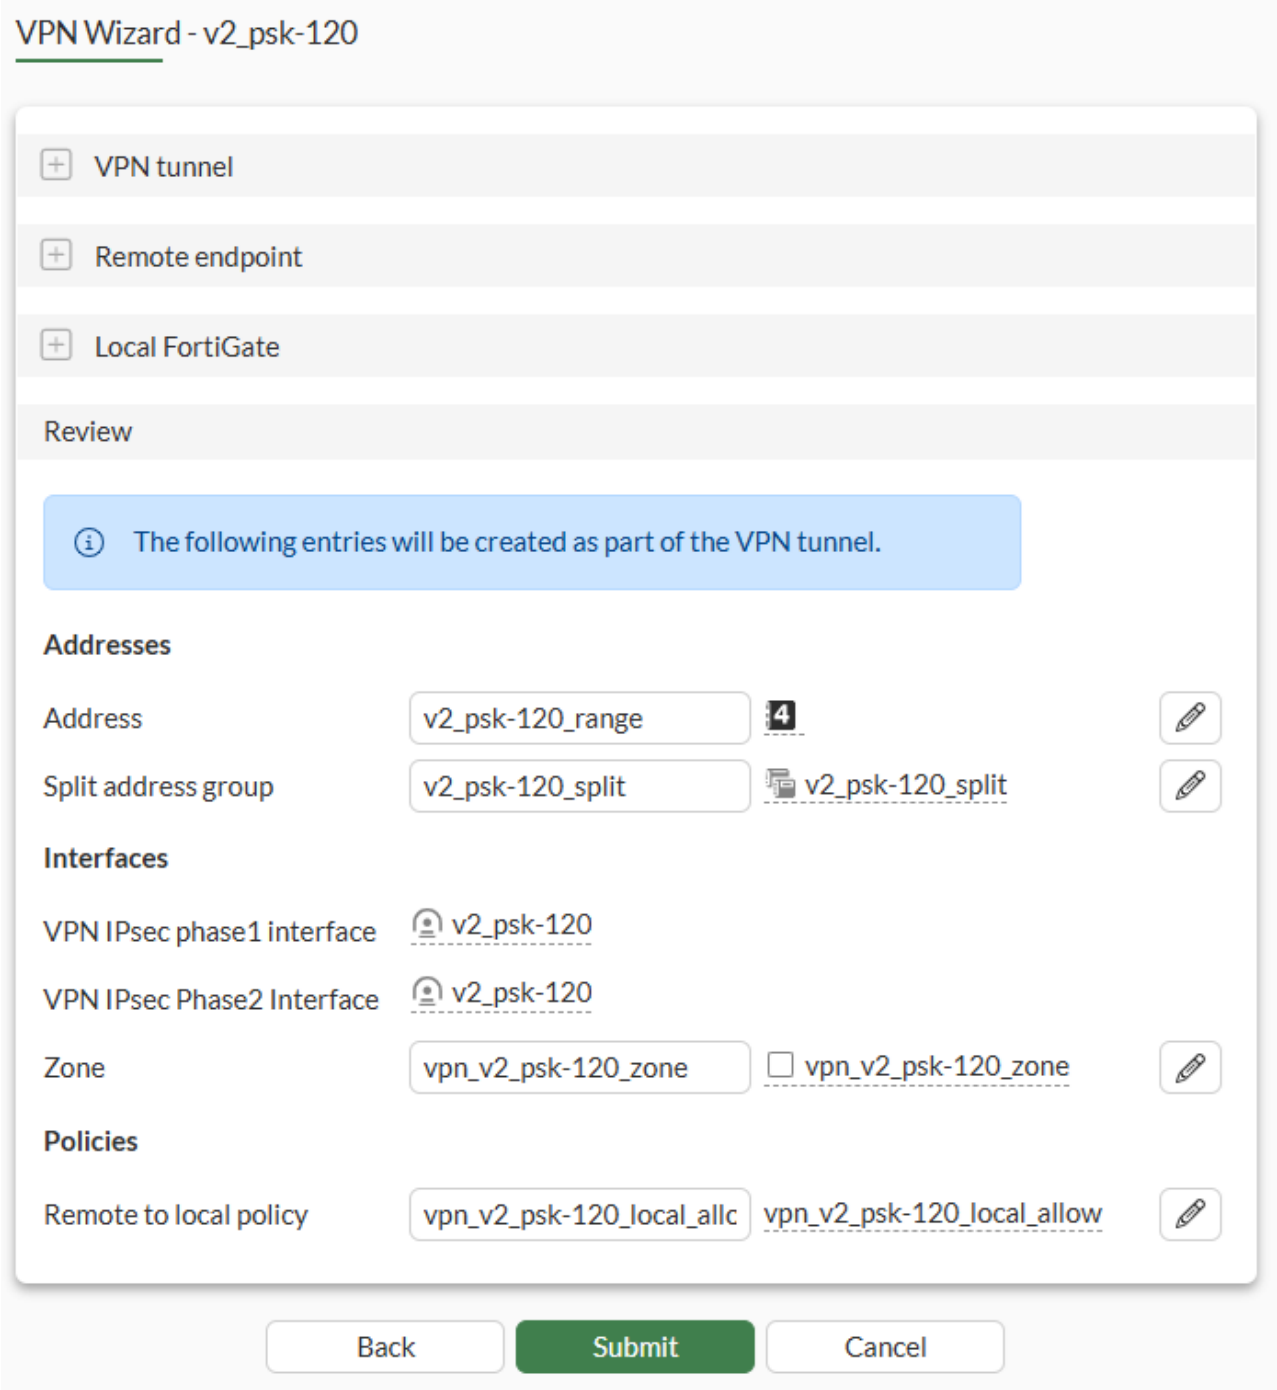
6. Click *Next*.
7. Under *Local FortiGate* section, enter the following:

Field	Value
Incoming interface that binds to tunnel	wan1(port1)

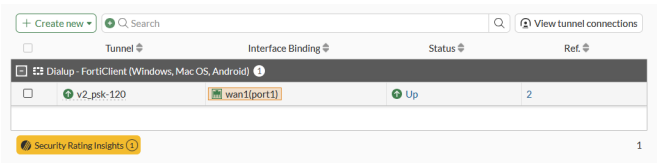
Field	Value
Create and add interface to Zone	Enable
Local interface	internal (port3)
Local Address	internal network



8. Click *Next*.
9. Under *Review* section, review the configuration pending configuration by the wizard.



10. Click *Submit*.
    The tunnel is configured and visible under *VPN > VPN Tunnels*.



To configure FortiGate as IPsec dialup server using the CLI:

1. Configure a local user:

```
config user local
    edit "ipsec"
        set type password
        set passwd *****
    next
end
```

2. Configure a local user group:

```
config user group
    edit "IPSEC"
        set member "ipsec"
    next
end
```

3. Configure the internal interface and its address group.

   The internal interface connects to the corporate internal network. Traffic from this interface routes out the IPsec VPN tunnel. Creating an address group for the protected network behind this FortiGate causes traffic to this network group to go through the IPsec tunnel.

```
config system interface
    edit "port3"
        set vdom "root"
        set ip 10.100.55.1 255.255.255.0
        set type physical
        set alias "internal"
    next
end
config firewall address
    edit "internal network"
        set subnet 10.10.111.0 255.255.255.0
    next
end
config firewall addrgrp
    edit "v2_psk-120_split"
        set member "internal network"
    next
end
```

4. Configure the WAN interface and default route.

   The WAN interface is the interface connected to the ISP and it is recommended to configure it with a static IP address to ensure that the IPsec VPN configuration on the branch stays unchanged if the WAN IP changes on the HQ. The IPsec tunnel is established over the WAN interface.

```
config system interface
    edit "port1"
        set vdom "root"
        set ip 10.152.35.150 255.255.255.0
```

```
        set type physical
        set alias "wan1"
    next
end
config router static
    edit 1
        set gateway 10.152.35.151
        set device "port1"
    next
end
```

5. Configure IPsec Phase 1 interface:

```
config vpn ipsec phase1-interface
    edit "v2_psk-120"
        set type dynamic
        set interface "port1"
        set ike-version 2
        set peertype any
        set net-device disable
        set mode-cfg enable
        set ipv4-dns-server1 8.8.8.8
        set proposal aes128-sha256 aes256-sha256 aes128gcm-prfsha256 aes256gcm-prfsha384
chacha20poly1305-prfsha256
        set dhgrp 20 21
        set eap enable
        set eap-identity send-request
        set authusrgrp "IPSEC"
        set ipv4-start-ip 9.5.6.7
        set ipv4-end-ip 9.5.6.70
        set ipv4-split-include "v2_psk-120_split"
        set save-password enable
        set client-auto-negotiate enable
        set client-keep-alive enable
        set psksecret *******
    next
end
```

One or more user groups for user authentication can be configured under a single IPsec VPN tunnel. See Using single or multiple user groups for user authentication on page 2955 for details.

6. Configure IPsec Phase 2 interface:

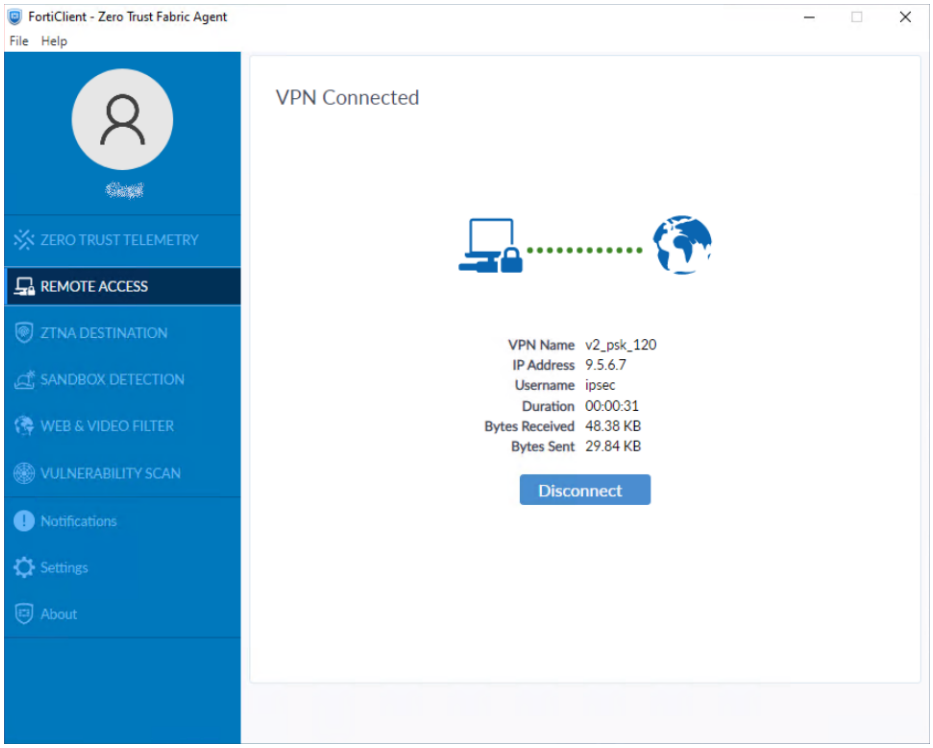
```
config vpn ipsec phase2-interface
    edit "v2_psk-120"
        set phase1name "v2_psk-120"
        set proposal aes128-sha256 aes256-sha256 aes128gcm aes256gcm chacha20poly1305
        set dhgrp 20 21
    next
end
```

7. Configure firewall policies to allow traffic from IPsec tunnel to internal network:

```
config firewall policy
    edit 1
        set name "vpn_v2_psk-120_local_allow"
        set srcintf "vpn_v2_psk-120_zone"
        set dstintf "port3"
        set action accept
        set srcaddr "v2_psk-120_range"
        set dstaddr "internal network"
        set schedule "always"
        set service "ALL"
        set nat enable
    next
end
```

To verify the VPN connection:

1. Using FortiClient, connect to the IPsec VPN gateway.



2. On FortiGate, run `diagnose vpn ike gateway list` to verify the IPsec VPN tunnel status. Note that `addr` shows the custom TCP port value, and `transport` shows `TCP`:

```
vd: root/0
name: v2_psk-120_0
version: 2
interface: port1 3
addr: 10.152.35.150:5500 -> 10.152.35.193:54854
tun_id: 9.5.6.7/::10.0.0.23
remote_location: 0.0.0.0
network-id: 0
```

```
transport: TCP

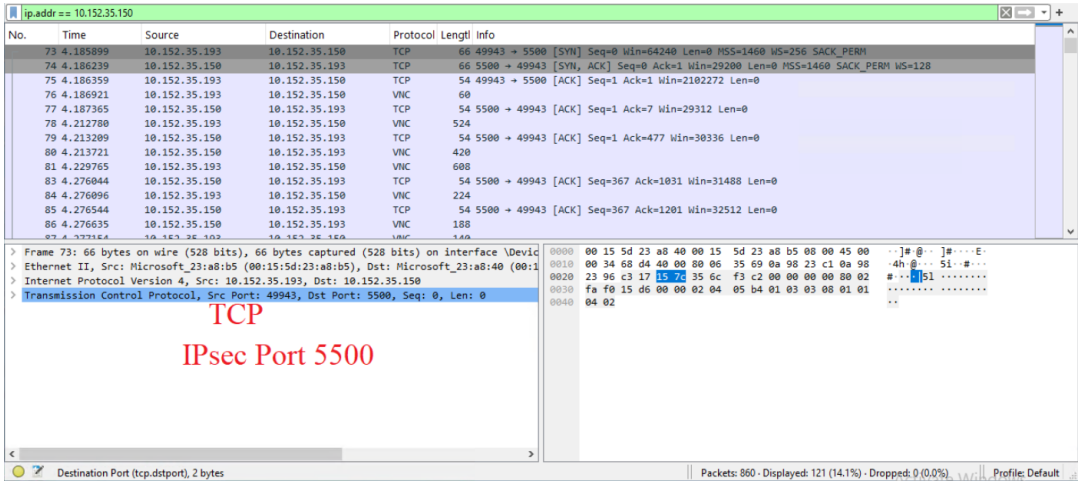
  lifetime/rekey: 86400/85537
  DPD sent/recv: 00000000/00000000
  peer-id: 120
```

3. Run a packet capture using the packet capture tool on FortiGate GUI under *Network* > *Diagnostic* tab for wan1(port1) interface with TCP port number 5500.



For more information, see Using the packet capture tool on page 973.

4. (Optional) Run the packet capture using the following command:

```
diagnose sniffer packet wan1 “port 5500” 4 0 l.
```

For more information, see Performing a sniffer trace or packet capture on page 4825.

Because there is no NP offloading for the RFC compliant version of IPsec over TCP, its performance is lower than standard ESP and ESP over UDP, which fully utilizes NP offloading to accelerate the performance.

Matching IPsec tunnel gateway based on address parameters

FortiOS supports remote gateway matching in a dial-up IPsec tunnel connection based on the public source IP geolocation of dial-up clients. See Remote gateway matching on page 2690.

The following example uses the source IP address of the client to match the IPsec tunnel gateway based on the country/region parameters. The client, PC1, is behind a NAT'd device with address 160.106.x.x, which resolves to Canada. Two IPsec tunnels, `TestMatchA` and `TestMatchB`, will be configured on the phase1 interface to test remote gateway country matching. The tunnel that is assigned to Canada will match while the other will not.

This example only includes configurations related to the `remote-gw-match` feature. Other configurations, such as those for the phase2 interface, are omitted for brevity.

To match dialup IPsec tunnel gateway based on country:

1. On the phase1 interface, configure two IPsec tunnels on the FGT VPN Gateway, with `TestMatchA` set to the United States (US) and `TestMatchB` set to Canada (CA):

```
config vpn ipsec phase1-interface
    edit "TestMatchA"
        set type dynamic
        set ike-version 2
        set remote-gw-match geography
        set remote-gw-country "US"
    next
    edit "TestMatchB"
        set type dynamic
        set ike-version 2
        set remote-gw-match geography
        set remote-gw-country "CA"
    next
end
```

2. From PC2, initiate a dial-up VPN connection.

3. On the FortiGate, review the gateway list.

```
# diagnose vpn ike gateway list

vd: root/0
name: TestMatchB_0
version: 2
interface: port5 13
addr: 173.1.1.1:500 -> 160.106.x.x:500
tun_id: 160.106.x.x/::10.0.0.35
remote_location: 0.0.0.0
network-id: 0
created: 162s ago
peer-id: C = US, ST = California, L = Sunnyvale, O = Fortinet, OU = FortiGate, CN =
FG201EXXXXXXXXX, emailAddress = support@fortinet.com
peer-id-auth: yes
PPK: no
IKE SA: created 1/1  established 1/1  time 10/10/10 ms
IPsec SA: created 1/1  established 1/1  time 0/0/0 ms

  id/spi: 10884 54ab158a7d192cbc/ef82ff5e91d72f59
  direction: responder
  status: established 162-162s ago = 10ms
  proposal: aes128-sha256
  child: no
  SK_ei: f1d74e0f026674b1-7687368f42305b31
  SK_er: b693bc06ea670ad3-643a6562cca05617
  SK_ai: 7edea8cfc3f82ce0-9a8ac426e05205b5-b71efc76d940589c-e9725108e7309cf5
  SK_ar: da3eaa37cc171369-1261fc51d4404bc7-c38bbaa9efa1bcfe-de3c285f3eb18617
  PPK: no
  message-id sent/recv: 0/8
  lifetime/rekey: 86400/85967
  DPD sent/recv: 00000000/00000000
  peer-id: C = US, ST = California, L = Sunnyvale, O = Fortinet, OU = FortiGate, CN =
FG201EXXXXXXXXX, emailAddress = support@fortinet.com
```

Since the client IP address is geolocated in Canada, `TestMatchB` matched.

4. Change the country assignments of the two IPsec tunnels so that `TestMatchA` is set to Canada (CA) and `TestMatchB` is set to China (CN):

```
config vpn ipsec phase1-interface
    edit "TestMatchA"
        set type dynamic
        set ike-version 2
        set remote-gw-match geography
        set remote-gw-country "CA"
    next
    edit "TestMatchB"
        set type dynamic
        set ike-version 2
        set remote-gw-match geography
        set remote-gw-country "CN"
```

```
    next
end
```

5. From PC2, initiate a dial-up VPN connection.
6. On the FortiGate, review the gateway list again.

```
# diagnose vpn ike gateway list

vd: root/0
name: TestMatchA_0
version: 2
interface: port5 13
addr: 173.1.1.1:500 -> 160.106.x.x:500
tun_id: 160.106.x.x/::10.0.0.37
remote_location: 0.0.0.0
network-id: 0
created: 1856s ago
peer-id: C = US, ST = California, L = Sunnyvale, O = Fortinet, OU = FortiGate, CN =
FG201EXXXXXXXXX, emailAddress = support@fortinet.com
peer-id-auth: yes
PPK: no
IKE SA: created 1/1  established 1/1  time 0/0/0 ms
IPsec SA: created 1/1  established 1/1  time 0/0/0 ms

  id/spi: 10886 fec7cd972847a2ac/0c1ee0b54ddc155e
  direction: responder
  status: established 1856-1856s ago = 0ms
  proposal: aes128-sha256
  child: no

  peer-id: C = US, ST = California, L = Sunnyvale, O = Fortinet, OU = FortiGate, CN =
FG201EXXXXXXXXX, emailAddress = support@fortinet.com
```

Since the client IP address is geolocated in Canada, `TestMatchA` matched.

Enforcing security posture verification before dial-up VPN connection

IPsec dial-up VPN can enforce ZTNA security posture verification before clients establish a VPN tunnel. This ensures the client has appropriate security posture before FortiGate grants a tunnel connection. The endpoint must be managed by FortiClient EMS, and its tags are synchronized with both EMS and FortiGate.

When a tag is defined on an IKEv2 IPsec tunnel, only the client IP addresses resolved by the tag can establish connection to the tunnel. When multiple tags are used, tags are checked sequentially until a match is made. If no tags match, then the client cannot establish a VPN connection.

Furthermore, to enhance resiliency, FortiClient endpoints can send security posture tags in JSON Web Token (JWT) format directly to FortiGate. The JWT tags are received during the VPN establishment process after authentication. They are also received periodically on tag changes and tag token expiration. This provides a backup mechanism for FortiGate to verify tags when FortiClient EMS is unreachable or slow to respond. FortiGate continues to prioritize querying FortiClient EMS for tag verification as the primary method.

JWT format security posture tags requires FortiClient 7.4.5 and FortiClient EMS 7.4.4 or above. See Improvements to tag compliance check for VPN connection for more background on FortiClient settings.

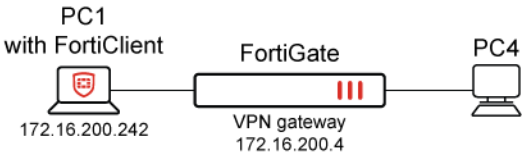
CLI syntax

```
config vpn ipsec phase1-interface
    edit <name>
        set ike-version 2
        set remote-gw-match {any | ipmask | iprange | geography | ztna}
        set remote-gw-ztna-tags <IPv4 ZTNA posture tags>
    next
end
```

When `set remote-gw-match ztna` is enabled, `remote-gw-ztna-tags` can be configured.

Example 1: basic configurations

A PC (172.16.200.242) makes a connection to the dial-up VPN gateway (172.16.200.4). The following example configuration and outputs show a successful connection with a matching ZTNA security posture tag (`EMS1_ZTNA_all_registered_clients`) and an unsuccessful connection when a ZTNA security posture tag cannot be matched.



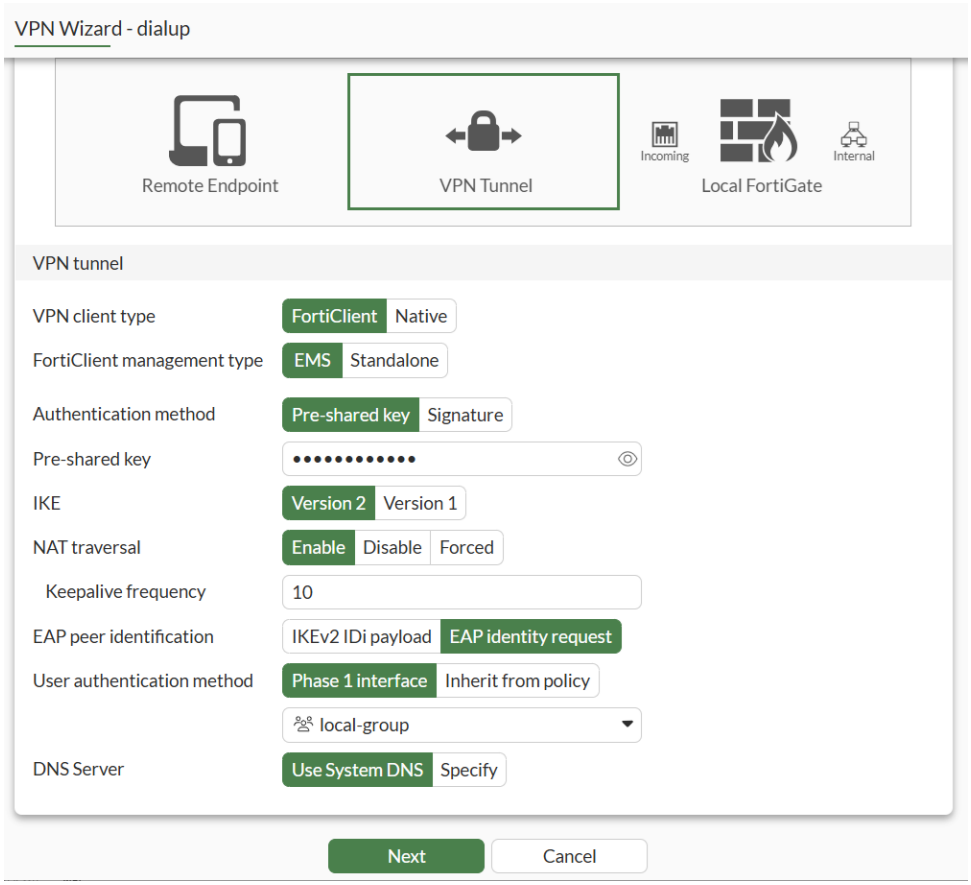
It is assumed that the following mandatory pre-configurations are complete before configuring VPN:

- FortiGate has established a connection with FortiClient EMS and has synchronized the ZTNA security posture tags, including the `EMS1_ZTNA_all_registered_clients` tag.
- FortiClient is registered to EMS and has the ZTNA security posture tag (`EMS1_ZTNA_all_registered_clients`).

In this example, the VPN Wizard is used in the GUI to configure the IPsec tunnel and use the ZTNA tag EMS1_ZTNA_all_registered_clients. This requires that IKEv2 is enabled. The example mostly uses the default settings in the wizard, but these can be modified as required by your use case.

To configure the VPN gateway with the GUI:

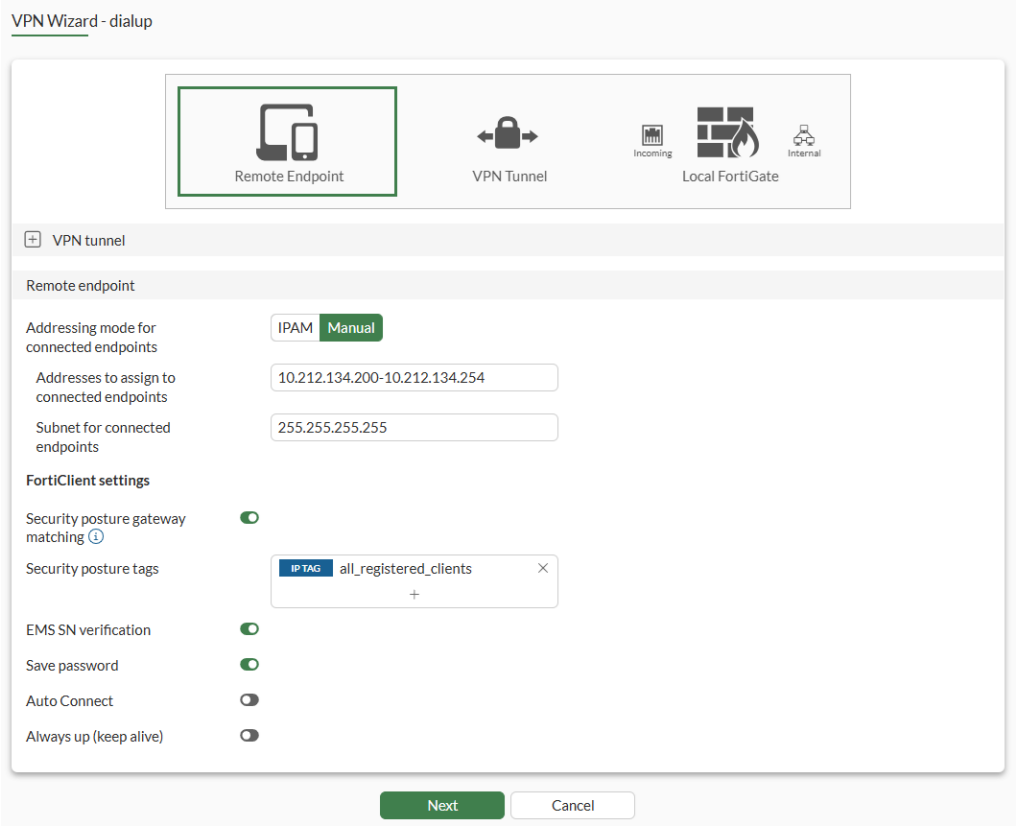
1. Go to *VPN* > *VPN Wizard*.
2. Enter the *Tunnel name*, such as *dialup*.
3. Set *Select a Template* to *Remote Access* then click *Begin*.
4. Configure the *VPN tunnel*:



VPN client type	FortiClient
FortiClient management typ	EMS
Authentication method	Pre-shared key
Pre-shared key	Enter the pre-shared key.
IKE	Version 2
NAT traversal	Enable
EAP peer identification	EAP identity request
User authentication method	Phase1 interface Select a user group for user authentication from the drop-down list.
DNS Server	Use System DNS

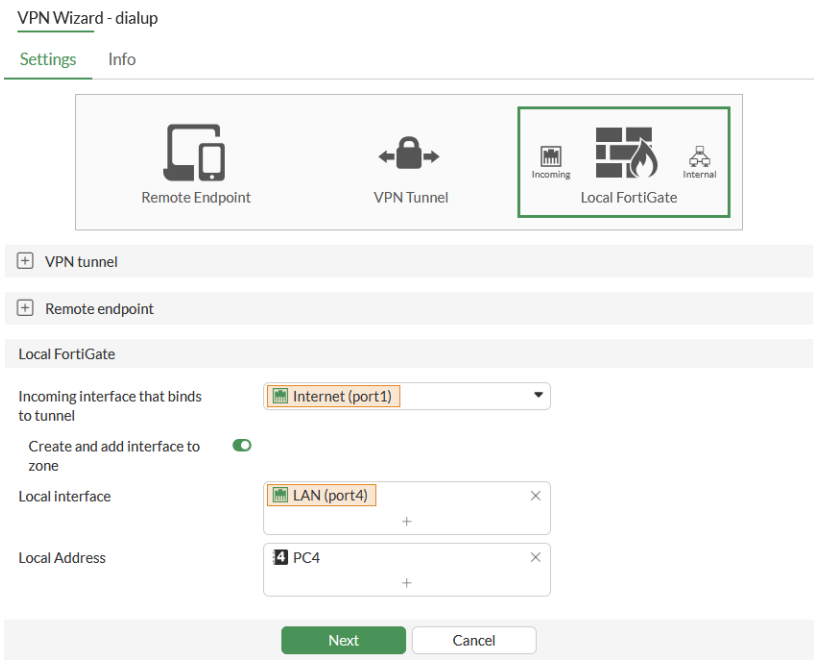
5. Click *Next*.

6. Configure the *Remote endpoint*:



Addressing mode for connected endpoints	IPAM or Manual. This example uses Manual.
Addresses to assign to connected endpoints	Enter the VPN IP address range that needs to be assigned to VPN endpoints: 10.212.134.200-10.212.134.254
Subnet for connected endpoints	255.255.255.255
Security posture gateway matching	Enable
Security posture tags	Add one or more ZTNA Tags, for example: IP TAG all_registered_clients
EMS SN verification	Enable
Save password	Enable
Auto Connect	Disable
Always up (keep alive)	Disable

7. Click *Next*.
8. Configure the *Local FortiGate*:



Incoming interface that binds to tunnel	Select the WAN Interface. In this example, that is the interface with IP address 172.16.200.4.
Create and add interface to zone	Enable
Local interface	Select the LAN interface. In this example, that is the interface that is connected to PC4.
Local Address	Select a local address to allow access from the VPN. In this example, that is the IP address of PC4.

9. Click *Next*.
10. Review the configuration. If everything looks correct, click *Submit*.

To configure the VPN gateway with the CLI:

```
config firewall address
    edit "dialup_range"
        set type iprange
        set start-ip 10.212.134.200
        set end-ip 10.212.134.254
    next
end
config vpn ipsec phase1-interface
    edit "dialup"
        set type dynamic
        set interface "port1"
        set ike-version 2
        set peertype any
```

```
        set net-device disable
        set mode-cfg enable
        set proposal aes128-sha256 aes256-sha256 aes128gcm-prfsha256 aes256gcm-prfsha384
chacha20poly1305-prfsha256
        set eap enable
        set eap-identity send-request
        set authusrgrp "local-group"
        set ems-sn-check enable
        set remote-gw-match ztna
        set assign-ip-from name
        set dns-mode auto
        set ipv4-split-include "dialup_split"
        set ipv4-name "dialup_range"
        set save-password enable
        set psksecret xxxxxxxx
        set remote-gw-ztna-tags "EMS1_ZTNA_all_registered_clients"
    next
end
config vpn ipsec phase2-interface
    edit "DY"
        set phase1name "dialup"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm aes256gcm
chacha20poly1305
    next
end
```

Results

When a client (172.16.200.242) has the appropriate ZTNA security posture tag, it is synchronized to FortiClient EMS and FortiGate.

To view the IP address that is resolved to tag:

```
# diagnose firewall dynamic list EMS1_ZTNA_all_registered_clients

CMDB name: EMS1_ZTNA_all_registered_clients
TAG name: all_registered_clients
EMS1_ZTNA_all_registered_clients: ID(6)
        ADDR(172.16.200.242)
Total IP dynamic range blocks: 0.
Total IP dynamic addresses: 1.
```

The address resolves to the IP address that is configured on the client endpoint. It does not resolve to the NAT'd public IP address when the client is behind NAT. In other words, the address resolves to the `IP Address` in the following output, and not the `Public IP Address`:

```
# diagnose endpoint ec-shm list

Record #0:
                IP Address = 172.16.200.242
                MAC Address = **:**:**:**:67:74
```

```
                MAC list =
                VDOM = root (0)
                TOKEN VDOM =  (-1)
                EMS serial number: FCTEMS**********
                EMS tenant id: ************1EDB589FBC4626
                Client cert SN: ************60ACA9FE283DEEC3B
                Public IP address: ************
                Quarantined: no
                Online status: online
                Registration status: registered
                On-net status: on-net
                Gateway Interface: port1
                FortiClient version: 7.2.4
                …
                Number of Routes: (1)
                        Gateway Route #0:
                                - IP:172.16.200.242, MAC: **:**:**:**:67:74, VPN: no
                                - Interface:port1, VDOM:root (0), SN: FG5H************
```

From the PC1 client, establish a tunnel with the FortiGate VPN gateway. When enabled, the following debug information displays the output when the security posture tag is matched:

```
# diagnose debug application ike -1
…
ike V=root:0:DY:155: received FCT-UID : 6108A9179A5C40D7BD57504E15114C1F
ike V=root:0:DY:155: received EMS SN : FCTEMS**********
ike V=root:0:DY:155: received EMS tenant ID : ************1EDB589FBC4626
ike V=root:0:DY:155: peer identifier IPV4_ADDR 172.16.200.242
ike V=root:0:DY:155: re-validate gw ID
ike V=root:0:DY:155: gw validation OK
ike V=root:0:DY:155: responder preparing EAP identity request
…
ike V=root:0:FCT:22: responder received AUTH msg
ike V=root:0:FCT:22: peer identifier IPV4_ADDR 172.16.200.242
ike V=root:0:FCT:22: auth verify done
ike V=root:0:FCT:22: responder AUTH continuation
ike V=root:0:FCT:22: authentication succeeded
ike V=root:0:FCT:22: EMS SN check passed
ike V=root:0:FCT:22: EMS ZTNA tags check success ZTNA_all_registered_clients
ike V=root:0:FCT:22: responder creating new child
```

The following tunnel output indicates a dial-up tunnel has been established:

```
# diagnose vpn ike gateway list
vd: root/0
name: dialup_0
version: 2
interface: port1 9
addr: 172.16.200.4:500 -> 172.16.200.242:500

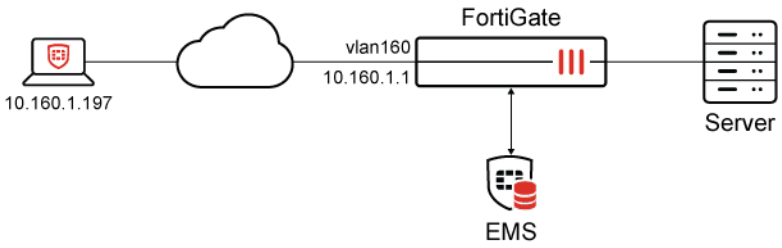
ike V=root:FCT Negotiate SA Error: EMS ZTNA tags check failed
ike V=root:0:FCT:23: sending IKE_AUTH ZTNA TAGS check failure notification response
```

Example 2: EMS unreachable

In this example, FortiClient EMS is configured to use ZTNA token, which enables FortiClient to send security posture tags in JWT format.

A remote employee connects to the FortiGate VPN gateway while the FortiClient EMS connection is temporarily unavailable. FortiGate falls back to verifying the JWT security posture tag and allows the VPN connection to be established.



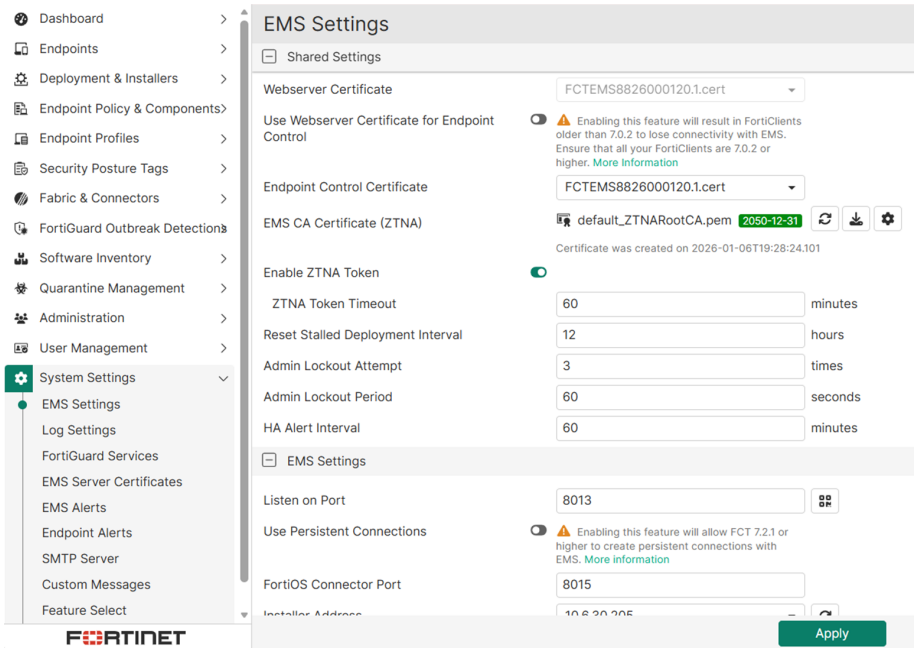
This example includes the following sections:

- Configuring FortiClient EMS on page 3046
- Configuring FortiGate on page 3047
- Verifying on page 3048

Configuring FortiClient EMS

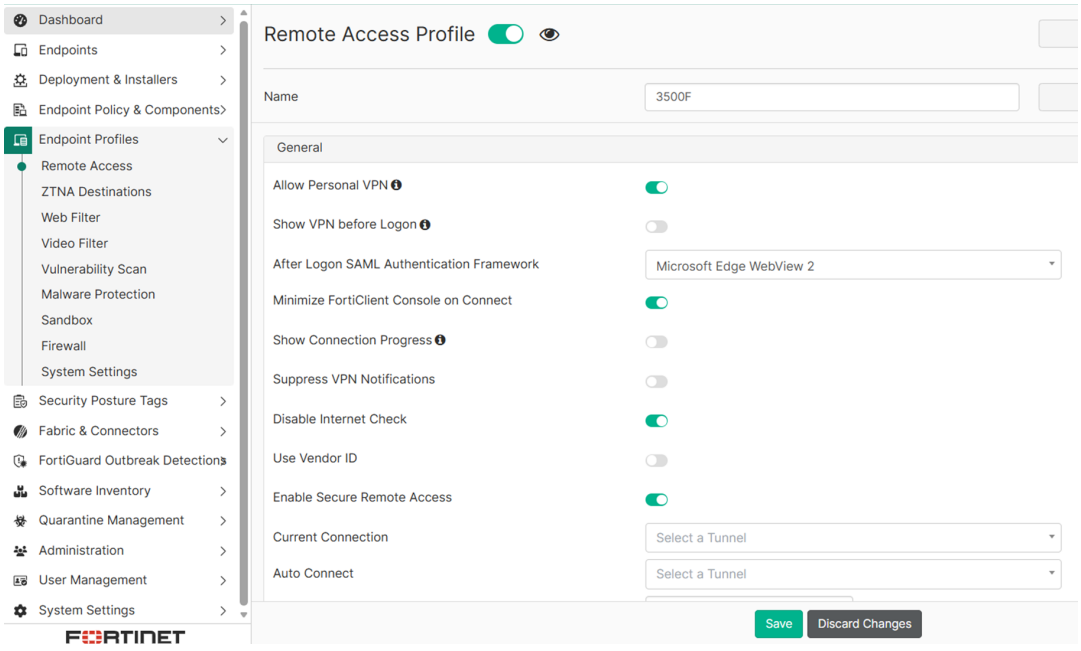
To configure FortiClient EMS:

1. On FortiClient EMS, go to *System Settings* > *EMS Settings*, and enable *Enable ZTNA Token*.
2. Set the *ZTNA Token Timeout* and interval time.



3. Go to *Endpoints Profiles* > *Remote Access*, and edit a Remote Access profile.

4. Under *General*, enable *Enable Secure Remote Access*.



5. Under *VPN Tunnels*, add or edit a tunnel.
6. In *Advanced Settings*, select the security posture tags.
7. Save the profile and push to FortiClient endpoints.

Configuring FortiGate

These steps assume FortiClient EMS fabric settings are already configured, and security posture tags have been synchronized to the FortiGate.

To configure the VPN tunnel on FortiGate:

1. On FortiGate, configure VPN phase1. Enable `remote-gw-match-ztna` and choose your ZTNA tags:

```
config vpn ipsec phase1-interface
    edit "FCT_EMS_TAG_ph2"
        set type dynamic
        set interface "vlan160"
        set ike-version 2
        set peertype any
        set net-device disable
        set mode-cfg enable
        set proposal aes128-sha256 aes256-sha256 aes128gcm-prfsha256 aes256gcm-prfsha384
chacha20poly1305-prfsha256
        set dpd on-idle
        set dhgrp 20 21
        set eap enable
        set eap-identity send-request
        set authusrgrp "local_group"
        set ems-sn-check enable
```

```
        set remote-gw-match ztna
        set ipv4-start-ip 10.139.1.2
        set ipv4-end-ip 10.139.1.20
        set dns-mode auto
        set ipv4-split-include "all"
        set save-password enable
        set psksecret <password>
        set dpd-retryinterval 60
        set remote-gw-ztna-tags "EMS3_ZTNA_a"
    next
end
```

2. Configure VPN phase2:

```
config vpn ipsec phase2-interface
    edit "FCT_EMS_TAG_ph2"
        set phase1name "FCT_EMS_TAG_ph2"
        set proposal aes128-sha256 aes256-sha256 aes128gcm aes256gcm chacha20poly1305
        set dhgrp 20 21
    next
end
```

3. Configure a firewall policy:

```
config firewall policy
    edit 14
        set name "FCT_EMS_TAG_ph2"
        set srcintf "FCT_EMS_TAG_ph2"
        set dstintf "mgmt1"
        set action accept
        set srcaddr "all"
        set dstaddr "all"
        set schedule "always"
        set service "ALL"
        set nat enable
    next
end
```

Verifying

To verify:

1. Initiate a VPN connection from the remote FortiClient endpoint while the EMS connection failed.
2. During the VPN negotiation, use these commands to view the real-time debugs:

```
# diagnose debug application ike -1
# diagnose debug enable
ike V=root:0: udp comes 10.160.1.197:55846->10.160.1.1:4500,ifindex=1123,vrf=0,len=466....
…
ike V=root:0:FCT_EMS_TAG_ph2:FCT_EMS_TAG_ph2: created connection: 0x55e62c7d8a50 1123
10.160.1.1->10.160.1.197:55846.
```

```
,,,
ike V=root:0:FCT_EMS_TAG_ph2:40481: responder received AUTH msg
ike V=root:0:FCT_EMS_TAG_ph2:40481: processing notify type INITIAL_CONTACT
ike V=root:0:FCT_EMS_TAG_ph2:40481: peer identifier IPV4_ADDR 10.160.1.197
ike V=root:0:FCT_EMS_TAG_ph2:40481: eap-peer=yes
ike V=root:0:FCT_EMS_TAG_ph2:40481: re-validate gw ID
ike V=root:0:FCT_EMS_TAG_ph2:40481: gw validation OK
ike V=root:0:FCT_EMS_TAG_ph2:40481: responder preparing EAP identity request
…
ike V=root:0:FCT_EMS_TAG_ph2:40481: authentication succeeded
ike V=root:0:FCT_EMS_TAG_ph2:40481: processing notify type FORTICLIENT_CONNECT
ike V=root:0:FCT_EMS_TAG_ph2:40481: received FCT data len = 309, data = 'VER=1
FCTVER=7.4.5.1949
UID=F8A6AFF3531843B4972CBDBEEEB30E3C
IP=10.160.1.197
MAC=00-0c-29-2c-4d-d7;00-0c-29-2c-4d-e1;00-0c-29-2c-4d-eb;
HOST=DESKTOP-EMS-TAG-PH2
USER=tester
OSVER=Microsoft Windows 8.0 , 64-bit (build 9200)
REG_STATUS=0
EMSSN=FCTEMS8826000120
EMSID=00000000000000000000000000000000
FCTTAGS=1
```

The tag `FCTTAGS=1` indicates that FortiClient has JWT enabled and is sending security posture tags to FortiGate directly.

```
ike V=root:0:FCT_EMS_TAG_ph2:40481: received FCT-UID : F8A6AFF3531843B4972CBDBEEEB30E3C
…
ike V=root:0:FCT_EMS_TAG_ph2_0:40481: processing notify type ZTNA_TAG
```

This indicates FortiClient JWT has been received by the FortiGate:

```
...
ike V=root:0:FCT_EMS_TAG_ph2_0:40481: received ZTNA tags update token (len=791)
data=eyJhbGciOiJSUzI1NiIsInR5cCI6IkpXVCJ9.eyJlbmRwb2ludCI6eyJ1aWQiOiJGOEE2QUZGMzUzMTg0M0I0OTcy

Aggregate and redundant VPN

The following topics provide instructions on configuring aggregate and redundant VPNs:

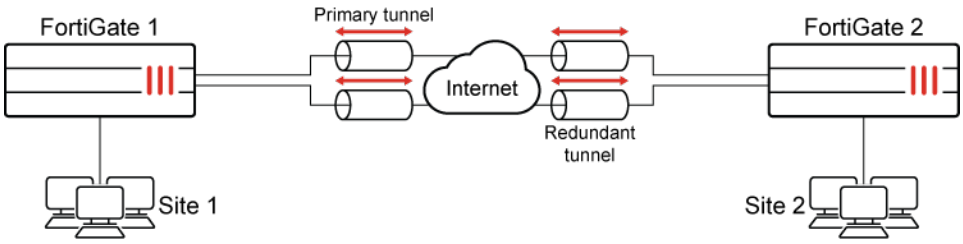
- Manual redundant VPN configuration on page 3051
- OSPF with IPsec VPN for network redundancy on page 3054

- IPsec VPN in an HA environment on page 3062
- Packet distribution and redundancy for aggregate IPsec tunnels on page 3069
- Packet distribution for aggregate dial-up IPsec tunnels using location ID on page 3081
- Packet distribution for aggregate static IPsec tunnels in SD-WAN on page 3086
- Packet distribution for aggregate IPsec tunnels using weighted round robin on page 3091
- Redundant hub and spoke VPN on page 3092

Manual redundant VPN configuration

A FortiGate with two interfaces connected to the internet can be configured to support redundant VPNs to the same remote peer. Four distinct paths are possible for VPN traffic from end to end. If the primary connection fails, the FortiGate can establish a VPN using the other connection.

Topology



The redundant configuration in this example uses route-based VPNs. The FortiGates must operate in NAT mode and use auto-keying.

This example assumes the redundant VPNs are essentially equal in cost and capability. When the original VPN returns to service, traffic continues to use the replacement VPN until the replacement VPN fails. If the redundant VPN uses more expensive facilities, only use it as a backup while the main VPN is down.

A redundant configuration for each VPN peer includes:

- One phase 1 configuration for each path between the two peers with dead peer detection enabled
- One phase 2 definition for each phase 1 configuration
- One static route for each IPsec interface with different distance values to prioritize the routes
- Two firewall policies per IPsec interface, one for each direction of traffic

To configure the phase 1 and phase 2 VPN settings:

1. Go to *VPN* > *IPsec Wizard* and select the *Custom* template.
2. Enter the tunnel name and click *Next*.
3. Enter the following phase 1 settings for path 1:

Remote Gateway	Static IP Address
IP Address	Enter the IP address of the primary interface of the remote peer.

Interface	Select the primary public interface of this peer.
Dead Peer Detection	On-Demand

4. Configure the remaining phase 1 and phase 2 settings as needed.
5. Click *OK*.
6. Repeat these steps for the remaining paths.
   a. Path 2:

Remote Gateway	Static IP Address
IP Address	Enter the IP address of the secondary interface of the remote peer.
Interface	Select the primary public interface of this peer.
Dead Peer Detection	On-Demand

   b. Path 3:

Remote Gateway	Static IP Address
IP Address	Enter the IP address of the primary interface of the remote peer.
Interface	Select the secondary public interface of this peer.
Dead Peer Detection	On-Demand

   c. Path 4:

Remote Gateway	Static IP Address
IP Address	Enter the IP address of the secondary interface of the remote peer.
Interface	Select the secondary public interface of this peer.
Dead Peer Detection	On-Demand

To configure the static routes:

1. Go to *Network* > *Static Routes* and click *Create New*.
2. In the *Destination* field, enter the subnet of the private network.
3. For *Interface*, select one of the IPsec interfaces on the local peer.
4. Enter a value for *Administrative Distance*.
5. Click *OK*.
6. Repeat these steps for the three remaining paths, and enter different values for *Administrative Distance* to prioritize the paths.

To configure the firewall policies:

1. Create the policies for the local primary interface:
   a. Go to *Policy & Objects* > *Firewall Policy* and click *Create New*.
   b. Enter the following:

Name	Enter a name for the policy.
Incoming Interface	Select the local interface to the internal (private) network.
Outgoing Interface	Select one of the virtual IPsec interfaces.
Source	All
Destination	All
Schedule	Always
Service	All
Action	ACCEPT

   c. Click *OK*.
   d. Click *Create New* and configure the policy for the other direction of traffic:

Name	Enter a name for the policy.
Incoming Interface	Select one of the virtual IPsec interfaces.
Outgoing Interface	Select the local interface to the internal (private) network.
Source	All
Destination	All
Schedule	Always
Service	All
Action	ACCEPT

   e. In the policy list, drag the VPN policies above any other policies with similar source and destination addresses.
2. Repeat these steps to create the policies for the three remaining paths.

Creating a backup IPsec interface

A route-based VPN can be configured to act as a backup IPsec interface when the main VPN is out of service. This can only be configured in the CLI.

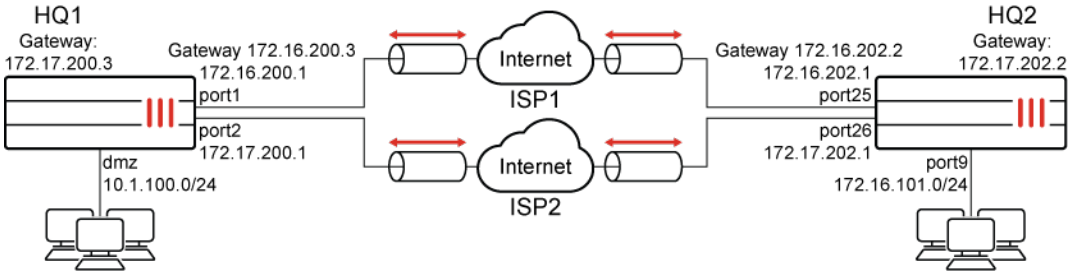
The backup feature works on interfaces with static addresses that have dead peer detection enabled. The `monitor` option creates a backup VPN for the specified phase 1 configuration.

To create a backup IPsec interface:

```
config vpn ipsec phase1-interface
    edit main_vpn
        set dpd on-demand
        set interface port1
        set nattraversal enable
        set psksecret ********
        set remote-gw 192.168.10.8
        set type static
    next
    edit backup_vpn
        set dpd on-demand
        set interface port2
        set monitor main_vpn
        set nattraversal enable
        set psksecret ********
        set remote-gw 192.168.10.8
        set type static
    next
end
```

OSPF with IPsec VPN for network redundancy

This is a sample configuration of using OSPF with IPsec VPN to set up network redundancy. Route selection is based on OSPF cost calculation. You can configure ECMP or primary/secondary routes by adjusting OSPF path cost.



Because the GUI can only complete part of the configuration, we recommend using the CLI.

To configure OSPF with IPsec VPN to achieve network redundancy using the CLI:

1. Configure the WAN interface and static route.

   Each FortiGate has two WAN interfaces connected to different ISPs. The ISP1 link is for the primary FortiGate and the IPS2 link is for the secondary FortiGate.

   a. Configure HQ1:

   ```
   config system interface
       edit "port1"
           set alias to_ISP1
   ```

```
        set ip 172.16.200.1 255.255.255.0
    next
    edit "port2"
        set alias to_ISP2
        set ip 172.17.200.1 255.255.255.0
    next
end
config router static
    edit 1
        set gateway 172.16.200.3
        set device "port1"
    next
    edit 2
        set gateway 172.17.200.3
        set device "port2"
        set priority 100
    next
end
```

b. Configure HQ2:

```
config system interface
    edit "port25"
        set alias to_ISP1
        set ip 172.16.202.1 255.255.255.0
    next
    edit "port26"
        set alias to_ISP2
        set ip 172.17.202.1 255.255.255.0
    next
end
config router static
    edit 1
        set gateway 172.16.202.2
        set device "port25"
    next
    edit 2
        set gateway 172.17.202.2
        set device "port26"
        set priority 100
    next
end
```

2. Configure the internal (protected subnet) interface:

a. Configure HQ1:

```
config system interface
    edit "dmz"
        set ip 10.1.100.1 255.255.255.0
    next
end
```

b. Configure HQ2:

```
config system interface
    edit "port9"
        set ip 172.16.101.1 255.255.255.0
    next
end
```

3. Configure IPsec phase1-interface and phase-2 interface. On each FortiGate, configure two IPsec tunnels: a primary and a secondary:

a. Configure HQ1:

```
config vpn ipsec phase1-interface
    edit "pri_HQ2"
        set interface "port1"
        set peertype any
        set net-device enable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set remote-gw 172.16.202.1
        set psksecret sample1
    next
    edit "sec_HQ2"
        set interface "port2"
        set peertype any
        set net-device enable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set remote-gw 172.17.202.1
        set psksecret sample2
    next
end
config vpn ipsec phase2-interface
    edit "pri_HQ2"
        set phase1name "pri_HQ2"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
aes256gcm chacha20poly1305
        set auto-negotiate enable
    next
    edit "sec_HQ2"
        set phase1name "sec_HQ2"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
aes256gcm chacha20poly1305
        set auto-negotiate enable
    next
end
```

b. Configure HQ2:

```
config vpn ipsec phase1-interface
    edit "pri_HQ1"
        set interface "port25"
        set peertype any
        set net-device enable
```

```
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set remote-gw 172.16.200.1
        set psksecret sample1
    next
    edit "sec_HQ1"
        set interface "port26"
        set peertype any
        set net-device enable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set remote-gw 172.17.200.1
        set psksecret sample2
    next
end
config vpn ipsec phase2-interface
    edit "pri_HQ1"
        set phase1name "pri_HQ1"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
aes256gcm chacha20poly1305
        set auto-negotiate enable
    next
    edit "sec_HQ1"
        set phase1name "sec_HQ1"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
aes256gcm chacha20poly1305
        set auto-negotiate enable
    next
end
```

4. Configure an inbound and outbound firewall policy for each IPsec tunnel:
   a. Configure HQ1:

```
config firewall policy
    edit 1
        set name "pri_inbound"
        set srcintf "pri_HQ2"
        set dstintf "dmz"
        set srcaddr "172.16.101.0"
        set dstaddr "10.1.100.0"
        set action accept
        set schedule "always"
        set service "ALL"
    next
    edit 2
        set name "pri_outbound"
        set srcintf "dmz"
        set dstintf "pri_HQ2"
        set srcaddr "10.1.100.0"
        set dstaddr "172.16.101.0"
        set action accept
        set schedule "always"
        set service "ALL"
    next
```

```
    edit 3
        set name "sec_inbound"
        set srcintf "sec_HQ2"
        set dstintf "dmz"
        set srcaddr "172.16.101.0"
        set dstaddr "10.1.100.0"
        set action accept
        set schedule "always"
        set service "ALL"
    next
    edit 4
        set name "sec_outbound"
        set srcintf "dmz"
        set dstintf "sec_HQ2"
        set srcaddr "10.1.100.0"
        set dstaddr "172.16.101.0"
        set action accept
        set schedule "always"
        set service "ALL"
    next
end
```

b. Configure HQ2:

```
config firewall policy
    edit 1
        set name "pri_inbound"
        set srcintf "pri_HQ1"
        set dstintf "port9"
        set srcaddr "10.1.100.0"
        set dstaddr "172.16.101.0"
        set action accept
        set schedule "always"
        set service "ALL"
    next
    edit 2
        set name "pri_outbound"
        set srcintf "port9"
        set dstintf "pri_HQ1"
        set srcaddr "10.1.100.0"
        set dstaddr "172.16.101.0"
        set action accept
        set schedule "always"
        set service "ALL"
    next
    edit 3
        set name "sec_inbound"
        set srcintf "sec_HQ1"
        set dstintf "port9"
        set srcaddr "10.1.100.0"
        set dstaddr "172.16.101.0"
        set action accept
```

```
        set schedule "always"
        set service "ALL"
    next
    edit 4
        set name "sec_outbound"
        set srcintf "port9"
        set dstintf "sec_HQ1"
        set srcaddr "172.16.101.0"
        set dstaddr "10.1.100.0"
        set action accept
        set schedule "always"
        set service "ALL"
    next
end
```

5. Assign an IP address to the IPsec tunnel interface:
   a. Configure HQ1:

```
config system interface
    edit "pri_HQ2"
        set ip 10.10.10.1 255.255.255.255
        set remote-ip 10.10.10.2 255.255.255.255
    next
    edit "sec_HQ2"
        set ip 10.10.11.1 255.255.255.255
        set remote-ip 10.10.11.2 255.255.255.255
    next
end
```

   b. Configure HQ2:

```
config system interface
    edit "pri_HQ1"
        set ip 10.10.10.2 255.255.255.255
        set remote-ip 10.10.10.1 255.255.255.255
    next
    edit "sec_HQ1"
        set ip 10.10.11.2 255.255.255.255
        set remote-ip 10.10.11.1 255.255.255.255
    next
end
```

6. Configure OSPF:
   a. Configure HQ1:

```
config router ospf
    set router-id 1.1.1.1
    config area
        edit 0.0.0.0
        next
    end
    config ospf-interface
```

```
        edit "pri_HQ2"
            set interface "pri_HQ2"
            set cost 10
            set network-type point-to-point
        next
        edit "sec_HQ2"
            set interface "sec_HQ2"
            set cost 20
            set network-type point-to-point
        next
    end
    config network
        edit 1
            set prefix 10.10.10.0 255.255.255.0
        next
        edit 2
            set prefix 10.10.11.0 255.255.255.0
        next
        edit 3
            set prefix 10.1.100.0 255.255.255.0
        next
    end
end
```

b. Configure HQ2:

```
config router ospf
    set router-id 2.2.2.2
    config area
        edit 0.0.0.0
        next
    end
    config ospf-interface
        edit "pri_HQ1"
            set interface "pri_HQ1"
            set cost 10
            set network-type point-to-point
        next
        edit "sec_HQ1"
            set interface "sec_HQ1"
            set cost 20
            set network-type point-to-point
        next
    end
    config network
        edit 1
            set prefix 10.10.10.0 255.255.255.0
        next
        edit 2
            set prefix 10.10.11.0 255.255.255.0
        next
        edit 3
```

```
            set prefix 172.16.101.0 255.255.255.0
        next
    end
end
```

To check VPN and OSPF states using diagnose and get commands:

1. Run the `HQ1 # diagnose vpn ike gateway list` command. The system should return the following:

```
vd: root/0
name: pri_HQ2
version: 1
interface: port1 11
addr: 172.16.200.1:500 -&gt; 172.16.202.1:500

    dec:pkts/bytes=1/68, enc:pkts/bytes=1/136
```

3. Run the `HQ1 # get router info ospf neighbor` command. The system should return the following:

```
OSPF process 0, VRF 0:
Neighbor ID Pri State Dead Time Address Interface
2.2.2.2 1. Full/ - 00:00:37 10.10.10.2 pri_HQ2
2.2.2.2 1. Full/ - 00:00:32 10.10.11.2 sec_HQ2
```

4. Run the `HQ1 # get router info routing-table ospf` command. The system should return the following:

```
Routing table for VRF=0
O 172.16.101.0/24 [110/20] via 10.10.10.2, pri_HQ2 , 00:03:21
```

In case the primary tunnel is down after route convergence.

5. Run the `HQ1 # get router info routing-table ospf` command. The system should return the following:

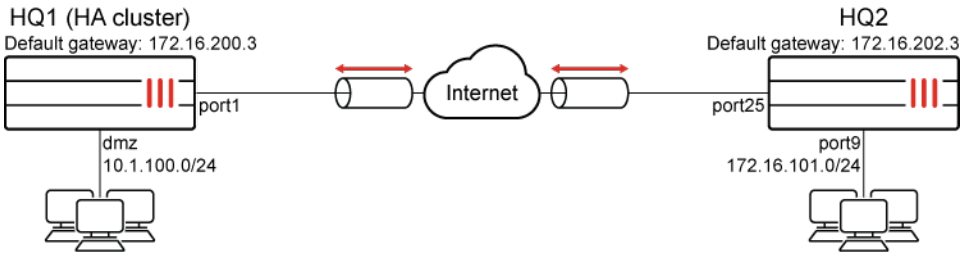
```
Routing table for VRF=0
O 172.16.101.0/24 [110/110] via 10.10.11.2, sec_HQ2 , 00:00:01
```

IPsec VPN in an HA environment

This is a sample configuration of site-to-site IPsec VPN in an HA environment.

For this example, set up HA as described in the HA topics. When setting up HA, enable the following options to ensure IPsec VPN traffic is not interrupted during an HA failover:

- `session-pickup` under HA settings.
- `ha-sync-esp-seqno` under IPsec phase1-interface settings.



You can configure IPsec VPN in an HA environment using the GUI or CLI.

In this example, the VPN name for HQ1 is "to_HQ2", and the VPN name for HQ2 is "to_HQ1".

To configure IPsec VPN in an HA environment in the GUI:

1. Set up IPsec VPN on HQ1 (the HA cluster):
   a. Go to *VPN > IPsec Wizard* and configure the following settings for *VPN Setup*:
      i. Enter a VPN name.
      ii. For *Template Type*, select *Site to Site*.
      iii. For *Remote Device Type*, select *FortiGate*.
      iv. For *NAT Configuration*, set *No NAT between sites*.
      v. Click *Next*.
   b. Configure the following settings for *Authentication*:
      i. For *Remote Device*, select *IP Address*.
      ii. In the *IP address* field, enter *172.16.202.1*.
      iii. For *Outgoing Interface*, select port1.
      iv. For *Authentication Method*, select *Pre-shared Key*.
      v. In the *Pre-shared Key* field, enter an example key.
      vi. Click *Next*.
   c. Configure the following settings for *Policy & Routing*:
      i. From the *Local Interface* dropdown menu, select the local interface.
      ii. Configure the *Local Subnets* as *10.1.100.0/24*.
      iii. Configure the *Remote Subnets* as *172.16.101.0/24*.
      iv. Click *Create*.
2. Set up IPsec VPN on HQ2:
   a. Go to *VPN > IPsec Wizard* and configure the following settings for *VPN Setup*:
      i. Enter a VPN name.
      ii. For *Template Type*, select *Site to Site*.
      iii. For *Remote Device Type*, select *FortiGate*.
      iv. For *NAT Configuration*, set *No NAT between sites*.
      v. Click *Next*.
   b. Configure the following settings for *Authentication*:
      i. For *Remote Device*, select *IP Address*.
      ii. In the *IP address* field, enter 172.16.200.1.
      iii. For *Outgoing Interface*, select port13.
      iv. For *Authentication Method*, select *Pre-shared Key*.

v. In the *Pre-shared Key* field, enter an example key.
vi. Click *Next*.

c. Configure the following settings for *Policy & Routing*:
i. From the *Local Interface* dropdown menu, select the desired local interface. In this example, it is port9.
ii. Configure the *Local Subnets* as 172.16.101.0.
iii. Configure the *Remote Subnets* as 10.1.100.0
iv. Click *Create*.

To configure IPsec VPN in an HA environment using the CLI:

1. Configure HA. In this example, two FortiGates work in active-passive mode. The HA heartbeat interfaces are WAN1 and WAN2:

```
config system ha
    set group-name "FGT-HA"
    set mode a-p
    set password sample
    set hbdev "wan1" 50 "wan2" 50
    set session-pickup enable
    set priority 200
    set override-wait-time 10
end
```

2. Configure the WAN interface and default route. The WAN interface is the interface connected to the ISP. It can work in static mode (as shown in this example), DHCP, or PPPoE mode. The IPsec tunnel is established over the WAN interface.
   a. Configure HQ1:

```
config system interface
    edit "port1"
        set vdom "root"
        set ip 172.16.200.1 255.255.255.0
    next
end
config router static
    edit 1
        set gateway 172.16.200.3
        set device "port1"
    next
end
```

   b. Configure HQ2:

```
config system interface
    edit "port25"
        set vdom "root"
        set ip 172.16.202.1 255.255.255.0
    next
end
```

```
config router static
    edit 1
        set gateway 172.16.202.2
        set device "port25"
    next
end
```

3. Configure the internal (protected subnet) interface. The internal interface connects to the corporate internal network. Traffic from this interface routes out the IPsec VPN tunnel.
   a. Configure HQ1:

```
config system interface
    edit "dmz"
        set vdom "root"
        set ip 10.1.100.1 255.255.255.0
    next
end
```

   b. Configure HQ2:

```
config system interface
    edit "port9"
        set vdom "root"
        set ip 172.16.101.1 255.255.255.0
    next
end
```

4. Configure the IPsec phase1-interface. This example uses PSK as the authentication method. You can also use signature authentication.
   a. Configure HQ1:

```
config vpn ipsec phase1-interface
    edit "to_HQ2"
        set interface "port1"
        set peertype any
        set net-device enable
        set ha-sync-esp-seqno  enable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set remote-gw 172.16.202.1
        set psksecret sample
    next
end
```

   b. Configure HQ2:

```
config vpn ipsec phase1-interface
    edit "to_HQ1"
        set interface "port25"
        set peertype any
        set net-device enable
        set ha-sync-esp-seqno  enable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
```

```
        set remote-gw 172.16.200.1
        set psksecret sample
    next
end
```

5. Configure the IPsec phase2-interface:
   a. Configure HQ1:

```
config vpn ipsec phase2-interface
    edit "to_HQ2"
        set phase1name "to_HQ2"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
aes256gcm chacha20poly1305
        set auto-negotiate enable
    next
end
```

   b. Configure HQ2:

```
config vpn ipsec phase2-interface
    edit "to_HQ1"
        set phase1name "to_HQ1"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
aes256gcm chacha20poly1305
        set auto-negotiate enable
    next
end
```

6. Configure static routes. Two static routes are added to reach the remote protected subnet. The blackhole route is important to ensure IPsec traffic does not match the default route when the IPsec tunnel is down.
   a. Configure HQ1:

```
config router static
    edit 2
        set dst 172.16.101.0 255.255.255.0
        set device "to_HQ2"
    next
    edit 3
        set dst 172.16.101.0 255.255.255.0
        set blackhole enable
        set distance 254
    next
end
```

   b. Configure HQ2:

```
config router static
    edit 2
        set dst 10.1.100.0 255.255.255.0
        set device "to_HQ1"
    next
    edit 3
```

```
        set dst 10.1.100.0 255.255.255.0
        set blackhole enable
        set distance 254
    next
end
```

7. Configure two firewall policies to allow bi-directional IPsec traffic flow over the IPsec tunnel:
   a. Configure HQ1:

```
config firewall policy
    edit 1
        set name "inbound"
        set srcintf "to_HQ2"
        set dstintf "dmz"
        set srcaddr "172.16.101.0"
        set dstaddr "10.1.100.0"
        set action accept
        set schedule "always"
        set service "ALL"
    next
    edit 2
        set name "outbound"
        set srcintf "dmz"
        set dstintf "to_HQ2"
        set srcaddr "10.1.100.0"
        set dstaddr "172.16.101.0"
        set action accept
        set schedule "always"
        set service "ALL"
    next
end
```

   b. Configure HQ2:

```
config firewall policy
    edit 1
        set name "inbound"
        set srcintf "to_HQ1"
        set dstintf "port9"
        set srcaddr "10.1.100.0"
        set dstaddr "172.16.101.0"
        set action accept
        set schedule "always"
        set service "ALL"
    next
    edit 2
        set name "outbound"
        set srcintf "port9"
        set dstintf "to_HQ1"
        set srcaddr "172.16.101.0"
        set dstaddr "10.1.100.0"
        set action accept
```

```
        set schedule "always"
        set service "ALL"
    next
end
```

8. Use the following `diagnose` commands to check IPsec phase1/phase2 interface status including the sequence number on the secondary FortiGate. The `diagnose debug application ike -1` command is the key to troubleshoot why the IPsec tunnel failed to establish.
   a. Run the `HQ1 # diagnose vpn ike gateway list` command. The system should return the following:

```
vd: root/0
name: to_HQ2
version: 1
interface: port1 11
addr: 172.16.200.1:500 -> 172.16.202.1:500
created: 5s ago
IKE SA: created 1/1 established 1/1 time 0/0/0 ms
IPsec SA: created 2/2 established 2/2 time 0/0/0 ms
    id/spi: 12 6e8d0532e7fe8d84/3694ac323138a024 direction: responder status: established
5-5s ago = 0ms proposal: aes128-sha256 key: b3efb46d0d385aff-7bb9ee241362ee8d
lifetime/rekey: 86400/86124 DPD sent/recv: 00000000/00000000
```

   b. Run the `HQ1 # diagnose vpn tunnel list` command. The system should return the following:

```
list all ipsec tunnel in vd 0

name=to_HQ2 ver=1 serial=1 172.16.200.1:0->172.16.202.1:0 tun_id=172.16.202.1

    dec:pkts/bytes=0/0, enc:pkts/bytes=0/0
```

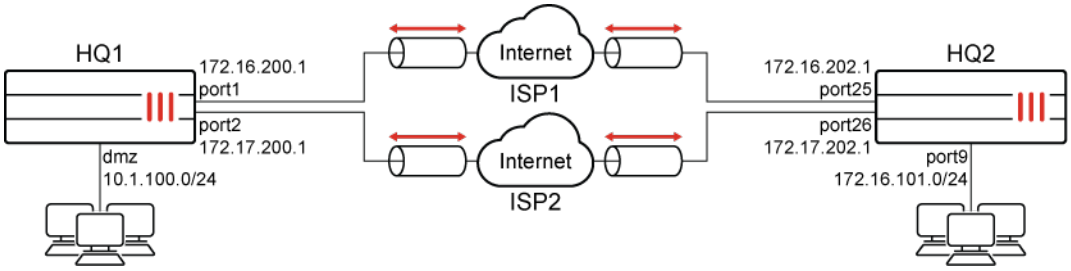
Packet distribution and redundancy for aggregate IPsec tunnels

This is a sample configuration of a multiple site-to-site IPsec VPN that uses an IPsec aggregate interface to set up redundancy and traffic load-balancing. The VPN tunnel interfaces must have `net-device` disabled in order to be members of the IPsec aggregate.

Each FortiGate has two WAN interfaces connected to different ISPs. OSPF runs over the IPsec aggregate in this configuration.

The supported load balancing algorithms are: L3, L4, round-robin (default), weighted round-robin, and redundant. The first four options allow traffic to be load-balanced, while the last option (redundant) uses the first tunnel that is up for all traffic.

Dynamic routing can run on the aggregate interface, and it can be a member interface in SD-WAN (not shown in this configuration).



Configuring the HQ1 FortiGate in the GUI

There are five steps to configure the FortiGate:

1. Create the IPsec tunnels.
2. Create the IPsec aggregate.
3. Configure the firewall policies.
4. Configure the aggregate VPN interface IPs.
5. Configure OSPF.

To create the IPsec tunnels:

1. Go to *VPN* > *IPsec Wizard* and select the *Custom* template.
2. For *Name*, enter pri_HQ2 and click *Next*.
3. Enter the following:

Phase 1	
IP Address	172.16.202.1
Interface	port1
Device creation	Disabled
Aggregate member	Enabled
Authentication Method	Pre-shared Key
Pre-shared Key	Enter the secure key
IKE Mode	Aggressive
Peer Options Accept Types	Any peer ID
Phase 2	
Auto-negotiate	Enable

4. Configure the other settings as needed.
5. Click *OK*.
6. Create another tunnel named sec_HQ2 with the following settings:

Phase 1	
IP Address	172.17.202.1
Interface	port2
Device creation	Disabled
Aggregate member	Enabled
Authentication Method	Pre-shared Key
Pre-shared Key	Enter the secure key
IKE Mode	Aggressive
Peer Options Accept Types	Any peer ID
Phase 2	
Auto-negotiate	Enable

To create the IPsec aggregate:

1. Go to *VPN > IPsec Tunnels* and click *Create New > IPsec Aggregate*.
2. For *Name*, enter agg_HQ2.
3. Select a load balancing algorithm.
4. From the *Tunnel* dropdown, select the tunnels that you created previously (*pri_HQ2* and *sec_HQ2*). If required, enter weights for each tunnel.
5. Click *OK*.

To configure the firewall policies:

1. Go to *Policy & Objects > Firewall Policy*.
2. Create an inbound traffic policy with the following settings:

Name	inbound
Incoming Interface	agg_HQ2
Outgoing Interface	dmz
Source	172.16.101.0
Destination	10.1.100.0
Schedule	always
Action	ACCEPT
Service	ALL

3. Click *OK*.
4. Create an outbound traffic policy with the following settings:

Name	outbound
Incoming Interface	dmz
Outgoing Interface	agg_HQ2
Source	10.1.100.0
Destination	172.16.101.0
Schedule	always
Action	ACCEPT
Service	ALL

To configure the aggregate VPN interface IPs:

1. Go to *Network > Interfaces* and edit agg_HQ2.
2. For *IP*, enter 10.10.10.1.
3. For *Remote IP/Netmask*, enter 10.10.10.2 255.255.255.255.
4. Click *OK*.

To configure OSPF:

1. Go to *Network* > *OSPF*.
2. For *Router ID*, enter 1.1.1.1.
3. In the *Areas* table, click *Create New*.
   a. For *Area ID*, enter 0.0.0.0.
   b. Click *OK*.
4. In the *Networks* table, click *Create New*.
   a. Set the *Area* to *0.0.0.0*.
   b. For *IP/Netmask*, enter 10.1.100.0/24.
   c. Click *OK*.
   d. Click *Create New*.
   e. For *IP/Netmask*, enter 10.10.10.0/24.
   f. Click *OK*.
5. Click *Apply*.

Configuring the HQ2 FortiGate in the GUI

There are five steps to configure the FortiGate:

1. Create the IPsec tunnels.
2. Create the IPsec aggregate.
3. Configure the firewall policies.
4. Configure the aggregate VPN interface IPs.
5. Configure OSPF.

To create the IPsec tunnels:

1. Go to *VPN* > *IPsec Wizard* and select the *Custom* template.
2. For *Name*, enter pri_HQ1 and click *Next*.
3. Enter the following:

Phase 1	
IP Address	172.16.200.1
Interface	port25
Device creation	Disabled
Aggregate member	Enabled
Authentication Method	Pre-shared Key
Pre-shared Key	Enter the secure key
IKE Mode	Aggressive
Peer Options Accept Types	Any peer ID

Phase 2	
Auto-negotiate	Enable

4. Configure the other settings as needed.
5. Click *OK*.
6. Create another tunnel named sec_HQ1 with the following settings:

Phase 1	
IP Address	172.17.200.1
Interface	port26
Device creation	Disabled
Aggregate member	Enabled
Authentication Method	Pre-shared Key
Pre-shared Key	Enter the secure key
IKE Mode	Aggressive
Peer Options Accept Types	Any peer ID
Phase 2	
Auto-negotiate	Enable

To create the IPsec aggregate:

1. Go to *VPN > IPsec Tunnels* and click *Create New > IPsec Aggregate*.
2. For *Name*, enter agg_HQ1.
3. Select a load balancing algorithm.
4. From the *Tunnel* dropdown, select the tunnels that you created previously (*pri_HQ1* and *sec_HQ1*). If required, enter weights for each tunnel.
5. Click *OK*.

To configure the firewall policies:

1. Go to *Policy & Objects > Firewall Policy*.
2. Create an inbound traffic policy with the following settings:

Name	inbound
Incoming Interface	agg_HQ1
Outgoing Interface	port9
Source	10.1.100.0
Destination	172.16.101.0
Schedule	always

Action	ACCEPT
Service	ALL

3. Click *OK*.
4. Create an outbound traffic policy with the following settings:

Name	outbound
Incoming Interface	port9
Outgoing Interface	agg_HQ1
Source	172.16.101.0
Destination	10.1.100.0
Schedule	always
Action	ACCEPT
Service	ALL

To configure the aggregate VPN interface IPs:

1. Go to *Network > Interfaces* and edit agg_HQ1.
2. For *IP*, enter 10.10.10.2.
3. For *Remote IP/Netmask*, enter 10.10.10.1 255.255.255.255.
4. Click *OK*.

To configure OSPF:

1. Go to *Network > OSPF*.
2. For *Router ID*, enter 2.2.2.2.
3. In the *Areas* table, click *Create New*.
   a. For *Area ID*, enter 0.0.0.0.
   b. Click *OK*.
4. In the *Networks* table, click *Create New*.
   a. Set the *Area* to *0.0.0.0*.
   b. For *IP/Netmask*, enter 172.16.101.0/24.
   c. Click *OK*.
   d. Click *Create New*.
   e. For *IP/Netmask*, enter 10.10.10.0/24.
   f. Click *OK*.
5. Click *Apply*.

Monitoring the traffic in the GUI

To monitor the traffic:

1. Go to *Dashboard* > *Network* , hover over the *IPsec* widget, then click *Expand to Full Screen*.
2. Expand the aggregate tunnel in the table to view statistics for each aggregate member.

Configuring the HQ1 FortiGate in the CLI

There are six steps to configure the FortiGate:

1. Configure the interfaces.
2. Configure two IPsec phase 1 and phase 2 interfaces.
3. Configure the IPsec aggregate.
4. Configure the firewall policies.
5. Configure the aggregate VPN interface IPs.
6. Configure OSPF.

To configure the interfaces:

1. Configure port1, port2, and dmz as shown in the topology diagram.

To configure two IPsec phase 1 and phase 2 interfaces:

```
config vpn ipsec phase1-interface
    edit "pri_HQ2"
        set interface "port1"
        set peertype any
        set net-device disable
        set aggregate-member enable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set remote-gw 172.16.202.1
        set psksecret sample1
    next
    edit "sec_HQ2"
        set interface "port2"
        set peertype any
        set net-device disable
        set aggregate-member enable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set remote-gw 172.17.202.1
        set psksecret sample2
    next
end
config vpn ipsec phase2-interface
    edit "pri_HQ2"
        set phase1name "pri_HQ2"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm aes256gcm
chacha20poly1305
```

```
        set auto-negotiate enable
    next
    edit "sec_HQ2"
        set phase1name "sec_HQ2"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm aes256gcm
chacha20poly1305
        set auto-negotiate enable
    next
end
```

To configure the IPsec aggregate:

```
config system ipsec-aggregate
    edit "agg_HQ2"
        set member "pri_HQ2" "sec_HQ2"
    next
end
```

To configure the firewall policies:

```
config firewall policy
    edit 1
        set name "inbound"
        set srcintf "agg_HQ2"
        set dstintf "dmz"
        set srcaddr "172.16.101.0"
        set dstaddr "10.1.100.0"
        set action accept
        set schedule "always"
        set service "ALL"
    next
    edit 2
        set name "outbound"
        set srcintf "dmz"
        set dstintf "agg_HQ2"
        set srcaddr "10.1.100.0"
        set dstaddr "172.16.101.0"
        set action accept
        set schedule "always"
        set service "ALL"
    next
end
```

To configure the aggregate VPN interface IPs:

```
config system interface
    edit "agg_HQ2"
        set ip 10.10.10.1 255.255.255.255
        set remote-ip 10.10.10.2 255.255.255.255
```

```
    next
end
```

To configure OSPF:

```
config router ospf
    set router-id 1.1.1.1
    config area
        edit 0.0.0.0
        next
    end
    config network
        edit 1
            set prefix 10.1.100.0 255.255.255.0
        next
        edit 2
            set prefix 10.10.10.0 255.255.255.0
        next
    end
end
```

Configuring the HQ2 FortiGate in the CLI

There are six steps to configure the FortiGate:

1. Configure the interfaces.
2. Configure two IPsec phase 1 and phase 2 interfaces.
3. Configure the IPsec aggregate.
4. Configure the firewall policies.
5. Configure the aggregate VPN interface IPs.
6. Configure OSPF.

To configure the interfaces:

1. Configure port25, port26, and port9 as shown in the topology diagram.

To configure two IPsec phase 1 and phase 2 interfaces:

```
config vpn ipsec phase1-interface
    edit "pri_HQ1"
        set interface "port25"
        set peertype any
        set net-device disable
        set aggregate-member enable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set remote-gw 172.16.200.1
        set psksecret sample1
    next
```

```
    edit "sec_HQ1"
        set interface "port26"
        set peertype any
        set net-device disable
        set aggregate-member enable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set remote-gw 172.17.200.1
        set psksecret sample2
    next
end
config vpn ipsec phase2-interface
    edit "pri_HQ1"
        set phase1name "pri_HQ1"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm aes256gcm
chacha20poly1305
        set auto-negotiate enable
    next
    edit "sec_HQ1"
        set phase1name "sec_HQ1"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm aes256gcm
chacha20poly1305
        set auto-negotiate enable
    next
end
```

To configure the IPsec aggregate:

```
config system ipsec-aggregate
    edit "agg_HQ1"
        set member "pri_HQ1" "sec_HQ1"
    next
end
```

To configure the firewall policies:

```
config firewall policy
    edit 1
        set name "inbound"
        set srcintf "agg_HQ1"
        set dstintf "port9"
        set srcaddr "10.1.100.0"
        set dstaddr "172.16.101.0"
        set action accept
        set schedule "always"
        set service "ALL"
    next
    edit 2
        set name "outbound"
        set srcintf "port9"
        set dstintf "agg_HQ1"
        set srcaddr "172.16.101.0"
```

```
        set dstaddr "10.1.100.0"
        set action accept
        set schedule "always"
        set service "ALL"
    next
end
```

To configure the aggregate VPN interface IPs:

```
config system interface
    edit "agg_HQ1"
        set ip 10.10.10.2 255.255.255.255
        set remote-ip 10.10.10.1 255.255.255.255
    next
end
```

To configure OSPF:

```
config router ospf
    set router-id 2.2.2.2
    config area
        edit 0.0.0.0
        next
    end
    config network
        edit 1
            set prefix 172.16.101.0 255.255.255.0
        next
        edit 2
            set prefix 10.10.10.0 255.255.255.0
        next
    end
end
```

Monitoring the traffic in the CLI

To view debugging information:

1. Verify the status of the phase 1 IKE SAs:

```
# diagnose vpn ike gateway list
vd: root/0
name: pri_HQ2
version: 1
interface: port1 11
addr: 172.16.200.1:500 -&gt; 172.16.202.1:500
 tun_id: 172.16.202.1
created: 1520s ago
IKE SA: created 1/2 established 1/1 time 10/10/10 ms
```

```
IPsec SA: created 2/2 established 1/1 time 0/0/0 ms
    id/spi: 173 dcdede154681579b/e32f4c48c4349fc0 direction: responder status: established
1498-1498s ago = 10ms proposal: aes128-sha256 key: d7230a68d7b83def-588b94495cfa9d38
lifetime/rekey: 86400/84631 DPD sent/recv: 0000000d/00000006
vd: root/0
name: sec_HQ2
version: 1
interface: port2 12
addr: 172.17.200.1:500 -&gt; 172.17.202.1:500
created: 1520s ago
IKE SA: created 1/2 established 1/1 time 10/10/10 ms
IPsec SA: created 2/2 established 1/1 time 0/0/0 ms
    id/spi: 174 a567bd7bf02a04b5/4251b6254660aee2 direction: responder status: established
1498-1498s ago = 10ms proposal: aes128-sha256 key: 9f44f500c28d8de6-febaae9d1e6a164c
lifetime/rekey: 86400/84631 DPD sent/recv: 00000008/0000000c
```

2. Verify the phase 2 IPsec tunnel SAs:

```
# diagnose vpn tunnel list
list all ipsec tunnel in vd 0
name=sec_HQ2 ver=1 serial=2 172.17.200.1:0-&gt;172.17.202.1:0 tun_id=172.17.202.1
bound_if=5 lgwy=static/1 tun=intf/0 mode=auto/1 encap=none/512 options[0200]=frag-rfc run_
state=1 accept_traffic=1
proxyid_num=1 child_num=0 refcnt=7 ilast=5 olast=5 ad=/0
stat: rxp=39 txp=40 rxb=5448 txb=2732

mtu=1438 expire=41231/0B replaywin=2048
        seqno=28 esn=0 replaywin_lastseq=00000027 itn=0
    life: type=01 bytes=0/0 timeout=42900/43200 dec: spi=1071b4f8 esp=aes key=16
142cce377b3432ba41e64128ade6848c
        ah=sha1 key=20 20e64947e2397123f561584321adc0e7aa0c342d
    enc: spi=ec89b7ed esp=aes key=16 2ec13622fd60dacce3d28ebe5fe7ab14
```

```
        ah=sha1 key=20 c1787497508a87f40c73c0db0e835c70b3c3f42d
    dec:pkts/bytes=38/2568, enc:pkts/bytes=39/5432
```

3. Debug the IPsec aggregation list:

```
# diagnose sys ipsec-aggregate list
agg_HQ2 algo=RR member=2 run_tally=2
members:
    pri_HQ2
    sec_HQ2
```

4. Verify the OSPF neighbor information:

```
# get router info ospf neighbor
OSPF process 0, VRF 0:
Neighbor ID Pri State Dead Time Address Interface
2.2.2.2 1. Full/ - 00:00:34 10.10.10.2 agg1_HQ2
```

5. Verify the OSPF routing table:

```
# get router info routing-table ospf
Routing table for VRF=0
O 172.16.101.0/24 [110/20] via 10.10.10.2, agg1_HQ2 , 00:18:43
```

Packet distribution for aggregate dial-up IPsec tunnels using location ID

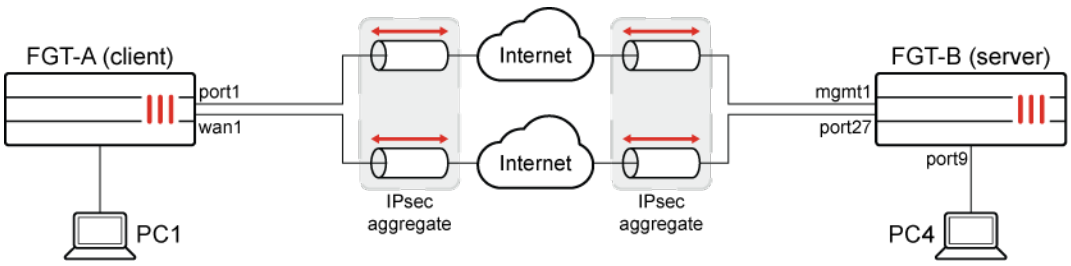
To support per-packet load balancing on aggregate dial-up IPsec tunnels between sites, each spoke must be configured with a location ID. On the hub, per-packet load balancing is performed on the tunnels in the IPsec aggregate that have the same location ID.

Multiple dial-up VPN tunnels from the same location can be aggregated on the VPN hub and load balanced based on the configured load balance algorithm.

IPsec traffic cannot be offloaded to the NPU.

Example

In this example, an IPsec aggregate tunnel is formed between two dial-up IPsec tunnels in order to support per-packet load balancing.



To configure the client FortiGate (FGT-A):

1. Configure the IPsec tunnels:

```
config vpn ipsec phase1-interface
    edit "client1"
        set interface "port1"
        set peertype any
        set net-device disable
        set aggregate-member enable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set remote-gw 172.16.200.4
        set psksecret **********
    next
    edit "client2"
        set interface "wan1"
        set peertype any
        set net-device disable
        set aggregate-member enable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set remote-gw 173.1.1.1
        set psksecret **********
    next
end
```

2. Configure an aggregate of the IPsec tunnels:

```
config system ipsec-aggregate
    edit "agg1"
        set member "client1" "client2"
    next
end
```

3. Configure the location ID:

```
config system settings
    set location-id 1.1.1.1
end
```

To configure the server FortiGate (FGT-B):

1. Configure the IPsec tunnels:

```
config vpn ipsec phase1-interface
    edit "server1"
        set type dynamic
        set interface "mgmt1"
        set peertype any
        set net-device disable
        set aggregate-member enable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set dpd on-idle
```

```
        set psksecret **********
        set dpd-retryinterval 60
    next
    edit "server2"
        set type dynamic
        set interface "port27"
        set peertype any
        set net-device disable
        set aggregate-member enable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set dpd on-idle
        set psksecret **********
        set dpd-retryinterval 60
    next
end
config vpn ipsec phase2-interface
    edit "server1"
        set phase1name "server1"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm aes256gcm
chacha20poly1305
    next
    edit "server2"
        set phase1name "server2"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm aes256gcm
chacha20poly1305
    next
end
```

2. Configure an aggregate of the IPsec tunnels:

```
config system ipsec-aggregate
    edit "server"
        set member "server1" "server2"
    next
end
```

3. Configure a firewall policy:

```
config firewall policy
    edit 1
        set srcintf "server"
        set dstintf "port9"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
    next
end
```

To check the IPsec tunnel and aggregate state:

1. List all of the VPN tunnels:

```
FGDocs # diagnose vpn tunnel list
list all ipsec tunnel in vd 0
------------------------------------------------------
name=server1 ver=1 serial=1 172.16.200.4:500->0.0.0.0:500 tun_id=1.0.0.0 dst_mtu=0 dpd-link=on

```

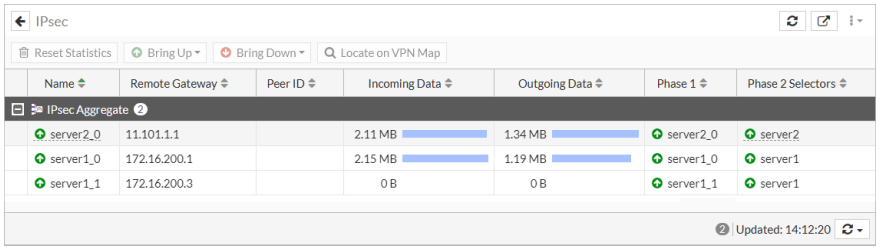
2. List the IPsec aggregate members:

```
# diagnose sys ipsec-aggregate list
server
members(3):
        server1_1
```

```
        server1_0
        server2_0
```

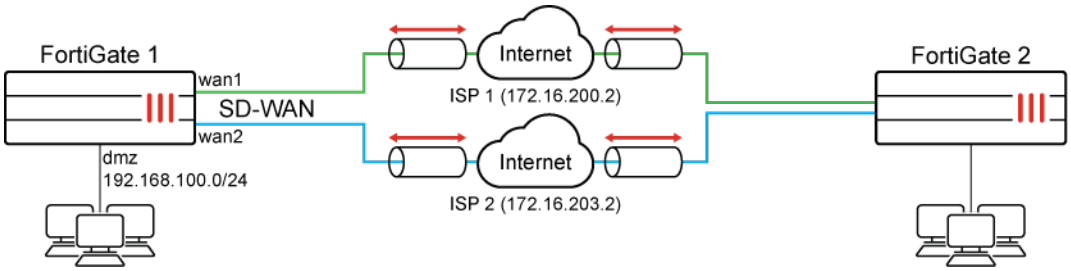
3. In the GUI, go to *Dashboard* > *Network Monitor* > *VPN* to review the traffic distributed over the aggregate members:



Packet distribution for aggregate static IPsec tunnels in SD-WAN

This is a sample configuration of aggregating IPsec tunnels by using per-packet load-balancing.

For example, a customer has two ISP connections, wan1 and wan2. On each FortiGate, two IPsec VPN interfaces are created. Next, an `ipsec-aggregate` interface is created and added as an SD-WAN member.



Configuring FortiGate 1

To create two IPsec VPN interfaces:

```
config vpn ipsec phase1-interface
    edit "vd1-p1"
        set interface "wan1"
        set peertype any
        set net-device disable
        set aggregate-member enable
        set proposal aes256-sha256
        set dhgrp 14
        set remote-gw 172.16.201.2
        set psksecret ftnt1234
    next
    edit "vd1-p2"
        set interface "wan2"
```

```
        set peertype any
        set net-device disable
        set aggregate-member enable
        set proposal aes256-sha256
        set dhgrp 14
        set remote-gw 172.16.202.2
        set psksecret ftnt1234
    next
end
```

```
config vpn ipsec phase2-interface
    edit "vd1-p1"
        set phase1name "vd1-p1"
    next
    edit "vd1-p2"
        set phase1name "vd1-p2"
    next
end
```

To create an IPsec aggregate interface:

```
config system ipsec-aggregate
    edit "agg1"
        set member "vd1-p1" "vd1-p2"
        set algorithm L3
    next
end
```

```
config system interface
    edit "agg1"
        set vdom "root"
        set ip 172.16.11.1 255.255.255.255
        set allowaccess ping
        set remote-ip 172.16.11.2 255.255.255.255
end
```

To configure the firewall policy:

```
config firewall policy
    edit 1
        set name "1"
        set srcintf "dmz"
        set dstintf ""virtual-wan-link""
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
        set nat enable
```

```
    next
end
```

To configure SD-WAN:

```
config system sdwan
    set status enable
    config members
        edit 1
            set interface "agg1"
            set gateway 172.16.11.2
        next
    end
end
```

Configuring FortiGate 2

To create two IPsec VPN interfaces:

```
config vpn ipsec phase1-interface
    edit "vd2-p1"
        set interface "wan1"
        set peertype any
        set net-device disable
        set proposal aes256-sha256
        set dhgrp 14
        set remote-gw 172.16.200.1
        set psksecret ftnt1234
    next
    edit "vd2-p2"
        set interface "wan2"
        set peertype any
        set net-device disable
        set proposal aes256-sha256
        set dhgrp 14
        set remote-gw 172.16.203.1
        set psksecret ftnt1234
    next
end
```

```
config vpn ipsec phase2-interface
    edit "vd2-p1"
        set phase1name "vd2-p1"
    next
    edit "vd2-p2"
        set phase1name "vd2-p2"
    next
end
```

To create an IPsec aggregate interface:

```
config system ipsec-aggregate
    edit "agg2"
        set member "vd2-p1" "vd2-p2"
        set algorithm L3
    next
end
```

```
config system interface
    edit "agg2"
        set vdom "root"
        set ip 172.16.11.2 255.255.255.255
        set allowaccess ping
        set remote-ip 172.16.11.1 255.255.255.255
    next
end
```

To configure the firewall policy:

```
config firewall policy
    edit 1
        set name "1"
        set srcintf "dmz"
        set dstintf ""virtual-wan-link""
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
        set nat enable
    next
end
```

To configure SD-WAN:

```
config system sdwan
    set status enable
    config members
        edit 1
            set interface "agg2"
            set gateway 172.16.11.1
        next
    end
end
```

Related diagnose commands

To display aggregate IPsec members:

```
# diagnose sys ipsec-aggregate list
agg1 algo=L3 member=2 run_tally=2
members:
        vd1-p1
        vd1-p2
```

To check the VPN status:

```
# diagnose vpn tunnel list
list all ipsec tunnel in vd 0
------------------------------------------------------
name=vd1-p1 ver=1 serial=2 172.16.200.1:0->172.16.201.2:0 tun_id=172.16.201.2 dst_mtu=0

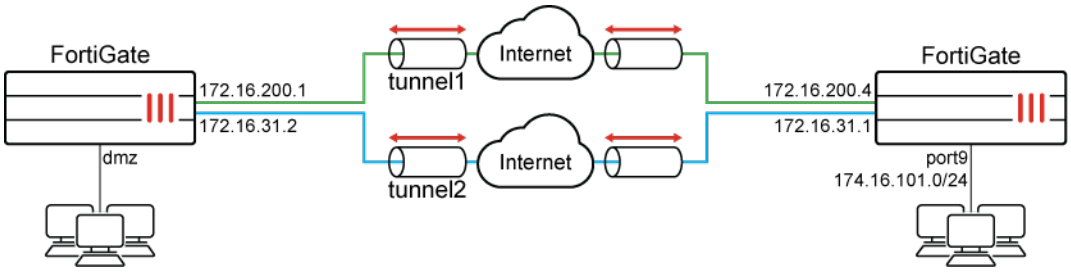
```

Packet distribution for aggregate IPsec tunnels using weighted round robin

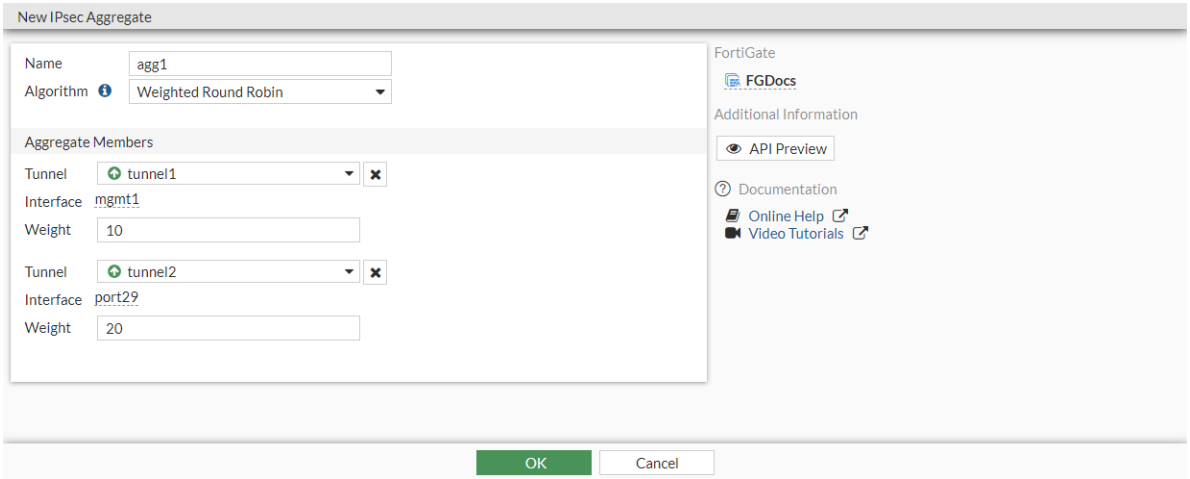
A weighted round robin algorithm can be used for IPsec aggregate tunnels to distribute traffic by the weight of each member tunnel.

In this example, the FortiGate has two IPsec tunnels put into IPsec aggregate. Traffic is distributed among the members, with one third over *tunnel1*, and two thirds over *tunnel2*. To achieve this, the weighted round robin algorithm is selected, *tunnel1* is assigned a weight of 10, and *tunnel2* is assigned a weight of 20.



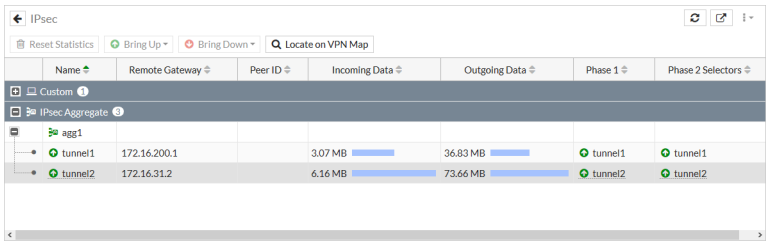
To create the IPsec aggregate in the GUI:

1. Go to *VPN* > *IPsec Tunnels* and click *Create New* > *IPsec Tunnel*.
2. Complete the wizard to create the *tunnel1* and *tunnel2* custom IPsec tunnels. Ensure that *Aggregate member* is *Enabled* for each tunnel under the *Network* > *Advanced* section.
3. Go to *VPN* > *IPsec Tunnels* and click *Create New* > *IPsec Aggregate*.
4. Enter a name for the aggregate, such as *agg1*, and ensure that *Algorithm* is *Weighted Round Robin*.
5. Add *tunnel1* as an aggregate members, and set *Weight* to *10*.
6. Add *tunnel2* as a second aggregate members, and set its *Weight* to *20*.



7. Click *OK*.

8. To view and monitor the aggregate tunnel statistics, go to the *IPsec* widget on the *Network* dashboard.



To create the IPsec aggregate in the CLI:

1. Create the *tunnel1* and *tunnel2* custom IPsec tunnels with aggregate-member enabled and aggregate-weight set for both tunnels:

```
config vpn ipsec phase1-interface
    edit "tunnel1"
        ...
        set aggregate-member enable
        set aggregate-weight 10
        ...
    next
    edit "tunnel2"
        ...
        set aggregate-member enable
        set aggregate-weight 20
        ...
    next
end
```

2. Create the IPsec aggregate:

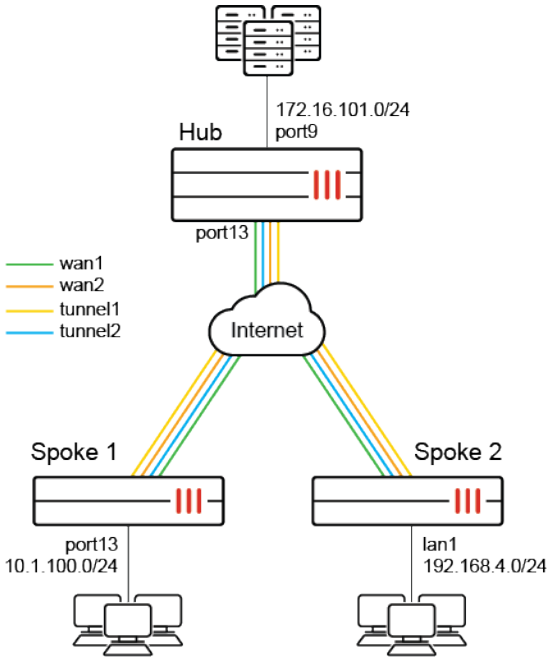
```
config system ipsec-aggregate
    edit "agg1"
        set member "tunnel1" "tunnel2"
        set algorithm weighted-round-robin
    next
end
```

Redundant hub and spoke VPN

A redundant hub and spoke configuration allows VPN connections to radiate from a central FortiGate unit (the hub) to multiple remote peers (the spokes). Traffic can pass between private networks behind the hub and private networks behind the remote peers. Traffic can also pass between remote peer private networks through the hub.

This is a sample configuration of hub and spoke IPsec VPN. The following applies for this scenario:

- The spokes have two WAN interfaces and two IPsec VPN tunnels for redundancy.
- The secondary VPN tunnel is up only when the primary tunnel is down by dead peer detection.



Because the GUI can only complete part of the configuration, we recommend using the CLI.

To configure redundant hub and spoke VPN using the FortiOS CLI:

1. Configure the hub.
   a. Configure the WAN, internal interface, and static route:

```
config system interface
    edit "port13"
        set alias "WAN"
        set ip 172.16.202.1 255.255.255.0
    next
    edit "port9"
        set alias "Internal"
        set ip 172.16.101.1 255.255.255.0
    next
end
config router static
    edit 1
        set gateway 172.16.202.2
        set device "port13"
    next
end
```

   b. Configure the IPsec phase1-interface and phase2-interface:

```
config vpn ipsec phase1-interface
    edit "hub"
        set type dynamic
        set interface "port13"
        set peertype any
```

```
        set net-device enable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set dpd on-idle
        set psksecret sample
        set dpd-retryinterval 60
    next
end
config vpn ipsec phase2-interface
    edit "hub"
        set phase1name "hub"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
aes256gcm chacha20poly1305
    next
end
```

c. Configure the firewall policy:

```
config firewall policy
    edit 1
        set name "spoke-hub"
        set srcintf "hub"
        set dstintf "port9"
        set srcaddr "all"
        set dstaddr "172.16.101.0"
        set action accept
        set schedule "always"
        set service "ALL"
    next
    edit 2
        set name "spoke-spoke"
        set srcintf "hub"
        set dstintf "hub"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
    next
end
```

2. Configure the spokes.

a. Configure the WAN, internal interface, and static route:

i. Configure Spoke1:

```
config system interface
    edit "port1"
        set ip 172.16.200.1 255.255.255.0
    next
    edit "wan1"
        set mode dhcp
        set distance 10
```

```
        set priority 100
    next
    edit "dmz"
        set ip 10.1.100.1 255.255.255.0
    next
end
config router static
    edit 1
        set gateway 172.16.200.2
        set device "port1"
    next
end
```

ii. Configure Spoke2:

```
config system interface
    edit "wan1"
        set ip 172.16.200.3 255.255.255.0
    next
    edit "wan2"
        set mode dhcp
        set distance 10
        set priority 100
    next
    edit "lan1"
        set ip 192.168.4.1 255.255.255.0
    next
end
config router static
    edit 1
        set gateway 172.16.200.2
        set device "wan1"
    next
end
```

b. Configure IPsec phase1-interface and phase2-interface:

i. Configure Spoke1:

```
config vpn ipsec phase1-interface
    edit "primary"
        set interface "port1"
        set peertype any
        set net-device enable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set remote-gw 172.16.202.1
        set psksecret sample
        next
    edit "secondary"
        set interface "wan1"
        set peertype any
        set net-device enable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
```

```
        set remote-gw 172.16.202.1
        set monitor "primary"
        set psksecret sample
    next
end
config vpn ipsec phase2-interface
    edit "primary"
        set phase1name "primary"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
aes256gcm chacha20poly1305
        set auto-negotiate enable
        set src-subnet 10.1.100.0 255.255.255.0
    next
    edit "secondary"
        set phase1name "secondary"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
aes256gcm chacha20poly1305
        set auto-negotiate enable
        set src-subnet 10.1.100.0 255.255.255.0
    next
end
```

ii. Configure Spoke2:

```
config vpn ipsec phase1-interface
    edit "primary"
        set interface "wan1"
        set peertype any
        set net-device enable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set remote-gw 172.16.202.1
        set psksecret sample
        next
    edit "secondary"
        set interface "wan2"
        set peertype any
        set net-device enable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set remote-gw 172.16.202.1
        set monitor "primary"
        set psksecret sample
    next
end
config vpn ipsec phase2-interface
    edit "primary"
        set phase1name "primary"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
aes256gcm chacha20poly1305
        set auto-negotiate enable
        set src-subnet 192.168.4.0 255.255.255.0
    next
    edit "secondary"
```

```
        set phase1name "secondary"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
aes256gcm chacha20poly1305
        set auto-negotiate enable
        set src-subnet 192.168.4.0 255.255.255.0
    next
end
```

c. Configure the firewall policy:

i. Configure Spoke1:

```
config firewall policy
    edit 1
        set srcintf "dmz"
        set dstintf "primary" "secondary"
        set srcaddr "10.1.100.0"
        set dstaddr "172.16.101.0"
        set action accept
        set schedule "always"
        set service "ALL"
    next
end
```

ii. Configure Spoke2:

```
config firewall policy
    edit 1
        set srcintf "lan1"
        set dstintf "primary" "secondary"
        set srcaddr "192.168.4.0"
        set dstaddr "172.16.101.0"
        set action accept
        set schedule "always"
        set service "ALL"
    next
end
```

d. Configure the static route:

i. Configure Spoke1:

```
config router static
    edit 3
        set dst 172.16.101.0 255.255.255.0
        set distance 1
        set device "primary"
    next
    edit 4
        set dst 172.16.101.0 255.255.255.0
        set distance 3
        set device "secondary"
    next
end
```

ii. Configure Spoke2:

```
config router static
    edit 3
        set dst 172.16.101.0 255.255.255.0
        set distance 1
        set device "primary"
    next
    edit 4
        set dst 172.16.101.0 255.255.255.0
        set distance 3
        set device "secondary"
    next
end
```

3. Run `diagnose` and `get` commands.

a. Run the `Spoke1 # diagnose vpn tunnel list` command. The system should return the following:

```
name=primary ver=1 serial=1 172.16.200.1:0-&gt;172.16.202.1:0 tun_id=172.16.202.1
bound_if=11 lgwy=static/1 tun=intf/0 mode=auto/1 encap=none/528 options[0210]=create_dev
frag-rfc accept_traffic=1

```

b. Run the `Spoke1 # get router info routing-table static` command. The system should return the following:

```
Routing table for VRF=0
.................
S 172.16.101.0/24 [1/0] is directly connected, primary
```

ADVPN

Auto-Discovery VPN (ADVPN) allows the central hub to dynamically inform spokes about a better path for traffic between two spokes.

The following topics provide instructions on configuring ADVPN:

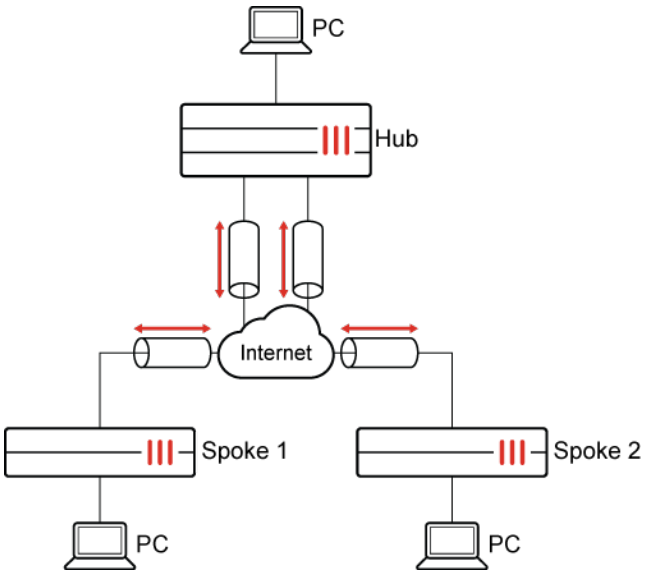
- IPsec VPN wizard hub-and-spoke ADVPN support on page 3099
- ADVPN with BGP as the routing protocol on page 3103
- ADVPN with OSPF as the routing protocol on page 3113
- ADVPN with RIP as the routing protocol on page 3123
- UDP hole punching for spokes behind NAT on page 3133

IPsec VPN wizard hub-and-spoke ADVPN support

When using the IPsec VPN wizard to create a hub and spoke VPN, multiple local interfaces can be selected. At the end of the wizard, changes can be reviewed, real-time updates can be made to the local address group and tunnel interface, and easy configuration keys can be copied for configuring the spokes.

When editing a VPN tunnel, the Hub & Spoke Topology section provides access to the easy configuration keys for the spokes, and allows you to add more spokes.

This example shows the configuration of a hub with two spokes.

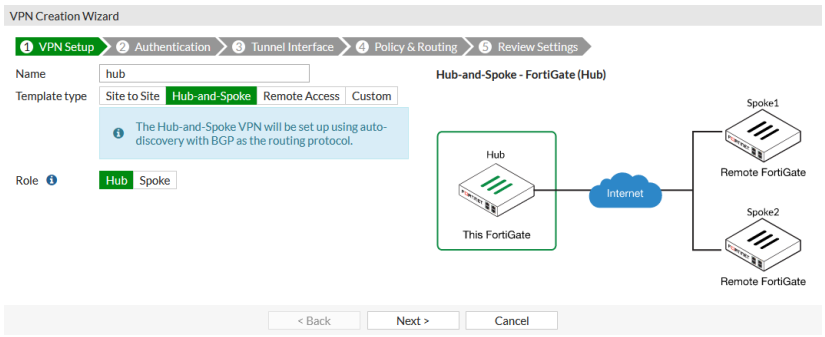


To configure the hub:

1. Go to *VPN > IPsec Wizard*.
2. Go through the steps of the wizard:

a. *VPN Setup*:

Name	hub
Template Type	Hub-and-Spoke
Role	Hub



b. *Authentication*:

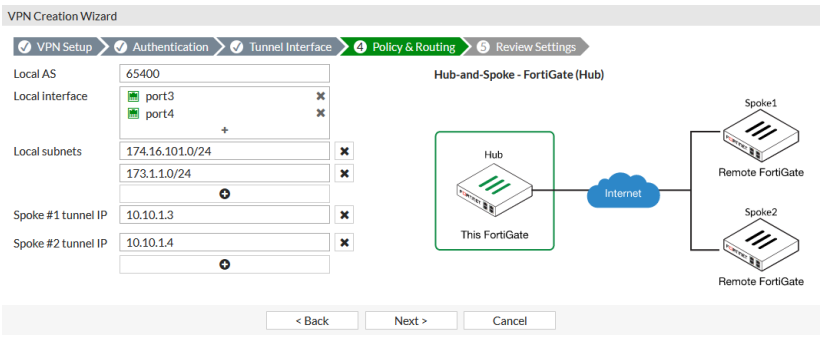
Incoming Interface	port1
Authentication method	Pre-shared Key
Pre-shared key	<key>

c. *Tunnel Interface*:

Tunnel IP	10.10.1.1
Remote IP/netmask	10.10.1.2/24

d. *Policy & Routing*:
Multiple local interfaces and subnets can be configured.

Local AS	65400
Local interface	port3 port4
Local subnets	174.16.101.0/24 173.1.1.0/24
Spoke #1 tunnel IP	10.10.1.3
Spoke #2 tunnel IP	10.10.1.4

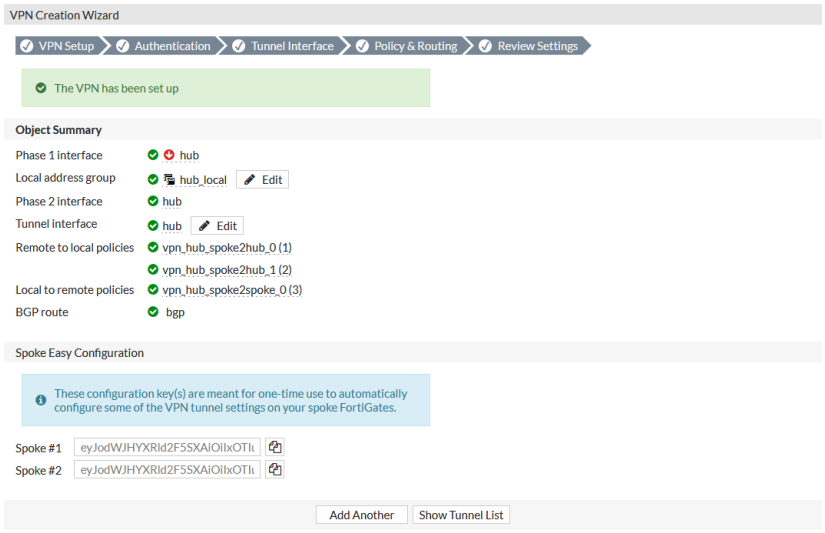


e. *Review Settings*:

Confirm that the settings look correct, then click *Create*.

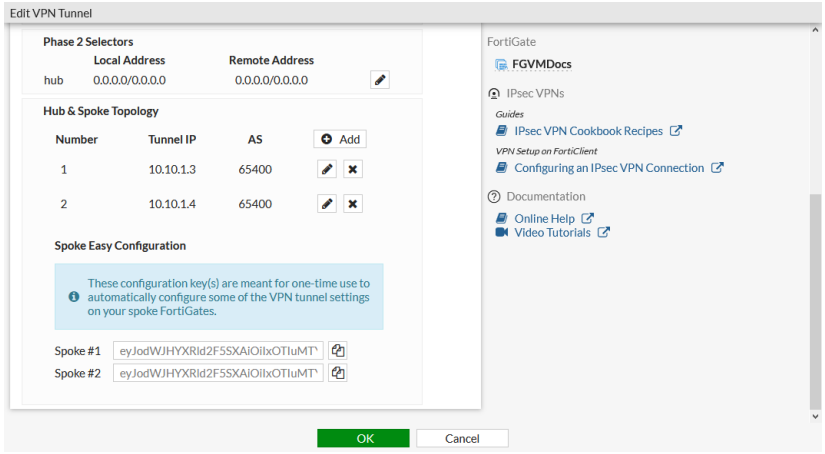
3. The summary shows details about the set up hub:

- The *Local address group* and *Tunnel interface* can be edited directly on this page.
- Spoke easy configuration keys can be used to quickly configure the spokes.



4. Click *Show Tunnel List* to go to *VPN > IPsec Tunnels*.

5. Edit the VPN tunnel to add more spokes and to copy the spokes' easy configuration keys.

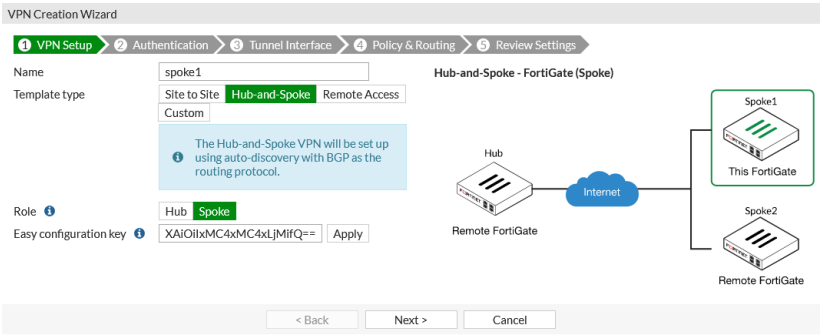


To configure the spokes:

1. Go to *VPN > IPsec Wizard*.
2. On the *VPN Setup* page of the wizard, enter the following:

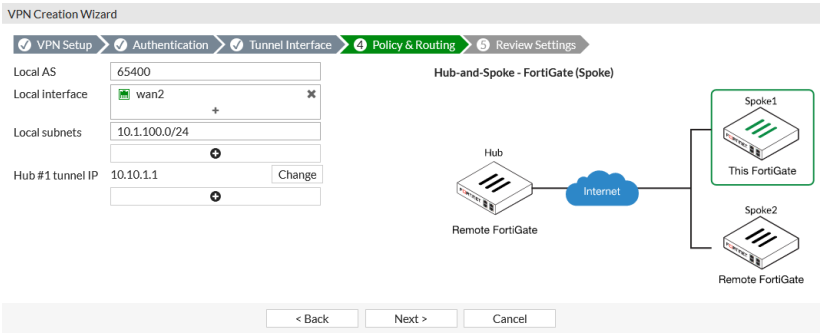
Name	spoke1
Template Type	Hub-and-Spoke
Role	Spoke

3. In the *Easy configuration key* field, paste the *Spoke #1* key from the hub FortiGate, click *Apply*, then click *Next*.



4. Adjust the *Authentication* settings as required, enter the *Pre-shared key*, then click *Next*.
5. Adjust the *Tunnel Interface* settings as required, then click *Next*.
6. Configure the *Policy & Routing* settings, then click *Next*:

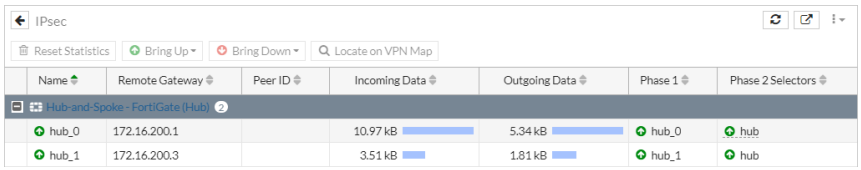
Local interface	wan2
Local subnets	10.1.100.0/24



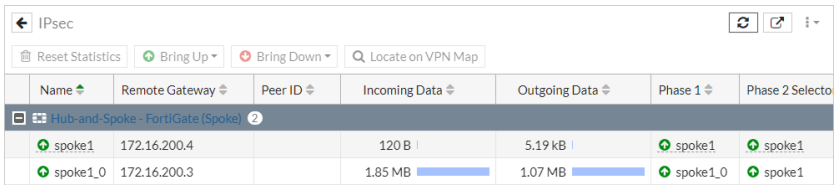
7. Review the settings, then click *Create*.
8. The summary shows details about the set up spoke. The *Local address group* and *Tunnel interface* can be edited directly on this page.
9. Follow the same steps to configure the second spoke.

To check that the tunnels are created and working:

1. On the hub FortiGate, go to *Dashboard > Network > VPN*.
   The tunnels to the spokes are established.



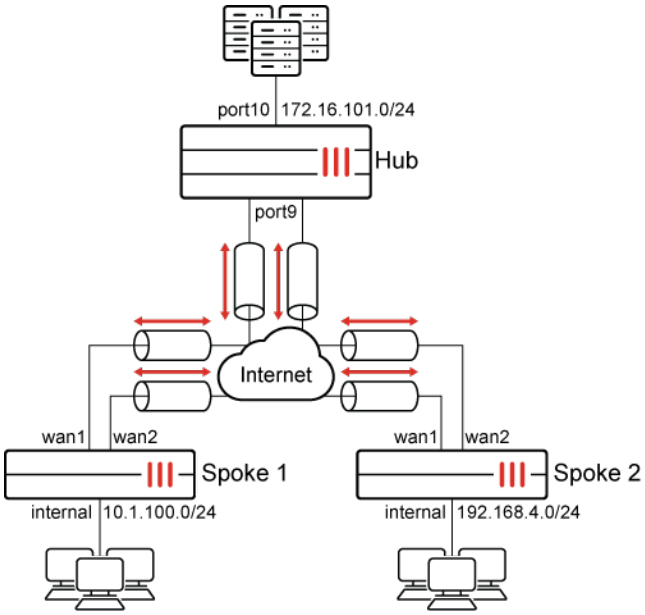
2. On a spoke, go to *Dashboard* > *Network* > *VPN*.
   The tunnel to the hub and the spoke to spoke shortcut are established.



ADVPN with BGP as the routing protocol

This is a sample configuration of ADVPN with BGP as the routing protocol. The following options must be enabled for this configuration:

- On the hub FortiGate, IPsec phase1-interface `net-device disable` must be run.
- IBGP must be used between the hub and spoke FortiGates.
- `bgp neighbor-group/neighbor-range` must be reused.



To configure ADVPN with BGP as the routing protocol using the CLI:

1. Configure hub FortiGate WAN interface, internal interface, and a static route:

```
config system interface
    edit "port9"
```

```
        set alias "WAN"
        set ip 22.1.1.1 255.255.255.0
    next
    edit "port10"
        set alias "Internal"
        set ip 172.16.101.1 255.255.255.0
    next
end
config router static
    edit 1
        set gateway 22.1.1.2
        set device "port9"
    next
end
```

2. Configure the hub FortiGate:
   a. Configure the hub FortiGate IPsec phase1-interface and phase2-interface:

```
config vpn ipsec phase1-interface
    edit "advpn-hub"
        set type dynamic
        set interface "port9"
        set peertype any
        set net-device disable
        set proposal aes128-sha256 aes256-sha256 3des-sha256 aes128-sha1 aes256-sha1 3des-
sha1
        set add-route disable
        set dpd on-idle
        set auto-discovery-sender enable
        set psksecret sample
        set dpd-retryinterval 5
    next
end
config vpn ipsec phase2-interface
    edit "advpn-hub"
        set phase1name "advpn-hub"
        set proposal aes128-sha1 aes256-sha1 3des-sha1 aes128-sha256 aes256-sha256 3des-
sha256
    next
end
```

> When `net-device` is disabled, a tunnel ID is generated for each dynamic tunnel. This ID, in the form of an IP address, is used as the gateway in the route entry to that tunnel. The `tunnel-search` option is removed in FortiOS 7.0.0 and later.

   b. Configure the hub FortiGate firewall policy:

```
config firewall policy
    edit 1
        set name "spoke2hub"
        set srcintf "advpn-hub"
```

```
        set dstintf "port10"
        set srcaddr "all"
        set dstaddr "172.16.101.0"
        set action accept
        set schedule "always"
        set service "ALL"
    next
    edit 2
        set name "spoke2spoke"
        set srcintf "advpn-hub"
        set dstintf "advpn-hub"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
    next
end
```

c. Configure the hub FortiGate's IPsec tunnel interface IP address:

```
config system interface
    edit "advpn-hub1"
        set ip 10.10.10.254 255.255.255.255
        set remote-ip 10.10.10.253 255.255.255.0
    next
end
```

d. Configure the hub FortiGate's BGP:

```
config router bgp
    set as 65412
    config neighbor-group
        edit "advpn"
            set link-down-failover enable
            set remote-as 65412
            set route-reflector-client enable
        next
    end
    config neighbor-range
        edit 1
            set prefix 10.10.10.0 255.255.255.0
            set neighbor-group "advpn"
        next
    end
    config network
        edit 1
            set prefix 172.16.101.0 255.255.255.0
        next
    end
end
```

3. Configure the spoke FortiGates:

a. Configure the spoke FortiGates' WAN, internal interfaces, and static routes:

i. Configure Spoke1:

```
config system interface
    edit "wan1"
        set alias "primary_WAN"
        set ip 15.1.1.2 255.255.255.0
    next
    edit "wan2"
        set alias "secondary_WAN"
        set ip 12.1.1.2 255.255.255.0
    next
    edit "internal"
        set ip 10.1.100.1 255.255.255.0
    next
end
config router static
    edit 1
        set gateway 12.1.1.1
        set device "wan2"
        set distance 15
    next
    edit 2
        set gateway 15.1.1.1
        set device "wan1"
    next
end
```

ii. Configure the Spoke2:

```
config system interface
    edit "wan1"
        set alias "primary_WAN"
        set ip 13.1.1.2 255.255.255.0
    next
    edit "wan2"
        set alias "secondary_WAN"
        set ip 17.1.1.2 255.255.255.0
    next
    edit "internal"
        set ip 192.168.4.1 255.255.255.0
    next
end
config router static
    edit 1
        set gateway 17.1.1.1
        set device "wan2"
        set distance 15
    next
    edit 2
        set gateway 13.1.1.1
        set device "wan1"
```

```
    next
end
```

b. Configure the spoke FortiGates' IPsec phase1-interface and phase2-interface:

i. Configure Spoke1:

```
config vpn ipsec phase1-interface
    edit "spoke1"
        set interface "wan1"
        set peertype any
        set net-device enable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set add-route disable
        set dpd on-idle
        set auto-discovery-receiver enable
        set remote-gw 22.1.1.1
        set psksecret sample
        set dpd-retryinterval 5
    next
    edit "spoke1_backup"
        set interface "wan2"
        set peertype any
        set net-device enable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set add-route disable
        set dpd on-idle
        set auto-discovery-receiver enable
        set remote-gw 22.1.1.1
        set monitor "spoke1"
        set psksecret sample
        set dpd-retryinterval 5
    next
end
config vpn ipsec phase2-interface
    edit "spoke1"
        set phase1name "spoke1"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
aes256gcm chacha20poly1305
        set auto-negotiate enable
    next
    edit "spoke1_backup"
        set phase1name "spoke1_backup"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
aes256gcm chacha20poly1305
        set auto-negotiate enable
    next
end
```

ii. Configure Spoke2:

```
config vpn ipsec phase1-interface
    edit "spoke2"
```

```
        set interface "wan1"
        set peertype any
        set net-device enable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set add-route disable
        set dpd on-idle
        set auto-discovery-receiver enable
        set remote-gw 22.1.1.1
        set psksecret sample
        set dpd-retryinterval 5
    next
    edit "spoke2_backup"
        set interface "wan2"
        set peertype any
        set net-device enable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set add-route disable
        set dpd on-idle
        set auto-discovery-receiver enable
        set remote-gw 22.1.1.1
        set monitor "spoke2"
        set psksecret sample
        set dpd-retryinterval 5
    next
end
config vpn ipsec phase2-interface
    edit "spoke2"
        set phase1name "spoke2"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
aes256gcm chacha20poly1305
        set auto-negotiate enable
    next
    edit "spoke2_backup"
        set phase1name "spoke2_backup"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
aes256gcm chacha20poly1305
        set auto-negotiate enable
    next
end
```

c. Configure the spoke FortiGates' firewall policies:

i. Configure Spoke1:

```
config firewall policy
    edit 1
        set name "outbound_advpn"
        set srcintf "internal"
        set dstintf "spoke1" "spoke1_backup"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
```

```
        set service "ALL"
    next
    edit 2
        set name "inbound_advpn"
        set srcintf "spoke1" "spoke1_backup"
        set dstintf "internal"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
    next
end
```

ii. Configure Spoke2:

```
config firewall policy
    edit 1
        set name "outbound_advpn"
        set srcintf "internal"
        set dstintf "spoke2" "spoke2_backup"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
    next
    edit 2
        set name "inbound_advpn"
        set srcintf "spoke2" "spoke2_backup"
        set dstintf "internal"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
    next
end
```

d. Configure the spoke FortiGates' tunnel interface IP addresses:

i. Configure Spoke1:

```
config system interface
    edit "spoke1"
        set ip 10.10.10.1 255.255.255.255
        set remote-ip 10.10.10.254 255.255.255.0
    next
    edit "spoke1_backup"
        set ip 10.10.10.2 255.255.255.255
        set remote-ip 10.10.10.254 255.255.255.0
    next
end
```

ii. Configure Spoke2:

```
config system interface
    edit "spoke2"
        set ip 10.10.10.3 255.255.255.255
        set remote-ip 10.10.10.254 255.255.255.0
    next
    edit "spoke2_backup"
        set ip 10.10.10.4 255.255.255.255
        set remote-ip 10.10.10.254 255.255.255.0
    next
end
```

e. Configure the spoke FortiGates' BGP:

i. Configure Spoke1:

```
config router bgp
    set as 65412
    config neighbor
        edit "10.10.10.254"
            set advertisement-interval 1
            set link-down-failover enable
            set remote-as 65412
        next
    end
    config network
        edit 1
            set prefix 10.1.100.0 255.255.255.0
        next
    end
end
```

ii. Configure Spoke2:

```
config router bgp
    set as 65412
    config neighbor
        edit "10.10.10.254"
            set advertisement-interval 1
            set link-down-failover enable
            set remote-as 65412
        next
    end
    config network
        edit 1
            set prefix 192.168.4.0 255.255.255.0
        next
    end
end
```

4. Run `diagnose` and `get` commands on Spoke1 to check VPN and BGP states:

a. Run the `diagnose vpn tunnel list` command on Spoke1. The system should return the following:

```
list all ipsec tunnel in vd 0
----
name=spoke1 ver=1 serial=2 15.1.1.2:0->22.1.1.1:0 tun_id=22.1.1.1
bound_if=7 lgwy=static/1 tun=intf/0 mode=auto/1 encap=none/536 options[0218]=npu create_
dev frag-rfc  accept_traffic=1

proxyid_num=1 child_num=1 refcnt=19 ilast=1 olast=1 ad=r/2

  src: 0:0.0.0.0/0.0.0.0:0
  dst: 0:0.0.0.0/0.0.0.0:0
```

b. Run the `get router info bgp summary` command on Spoke1. The system should return the following:

```
BGP router identifier 7.7.7.7, local AS number 65412
BGP table version is 2
1 BGP AS-PATH entries
0 BGP community entries

Neighbor             V         AS [[QualityAssurance62/MsgRcvd]]
[[QualityAssurance62/MsgSent]]   [[QualityAssurance62/TblVer]]  InQ OutQ Up/Down
State/PfxRcd
10.10.10.254       1.          65412     143     142         1.     1.     1. 00:24:45
               2

Total number of neighbors 1
```

c. Run the `get router info routing-table bgp` command on Spoke1. The system should return the following:

```
Routing table for VRF=0
B       172.16.101.0/24 [200/0] via 10.10.10.254, spoke1, 00:23:57
B       192.168.4.0/24 [200/0] via 10.10.10.254, spoke1, 00:22:03
```

d. Generate traffic between the spokes and check the shortcut tunnel and routing table. Run the `diagnose vpn tunnel list` command on Spoke1. The system should return the following:

```
list all ipsec tunnel in vd 0
----
name=spoke1 ver=1 serial=2 15.1.1.2:0->22.1.1.1:0 tun_id=22.1.1.1

```

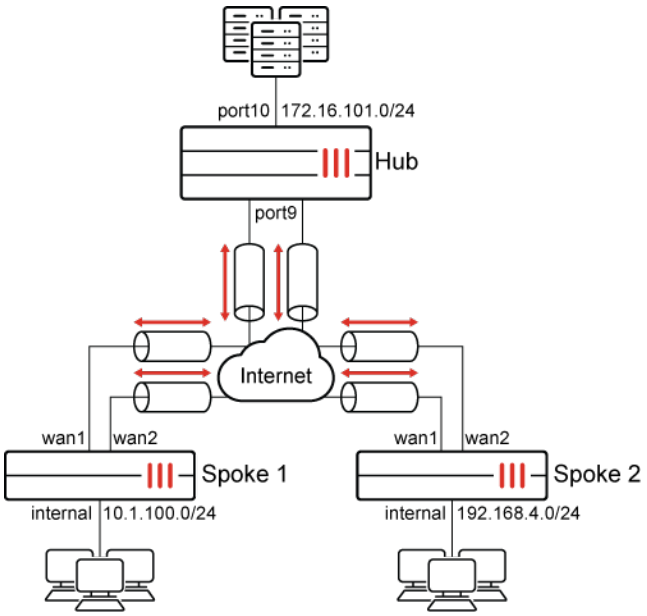
e. Run the `get router info routing-tale bgp` command. The system should return the following:

```
Routing table for VRF=0
B       172.16.101.0/24 [200/0] via 10.10.10.254, spoke1, 00:23:57
B       192.168.4.0/24 [200/0] via 10.10.10.3, spoke1_0 , 00:22:03
```

ADVPN with OSPF as the routing protocol

This is a sample configuration of ADVPN with OSPF as the routing protocol. The following options must be enabled for this configuration:

- On the hub FortiGate, IPsec phase1-interface `net-device enable` must be run.
- OSPF must be used between the hub and spoke FortiGates.



To configure ADVPN with OSPF as the routing protocol using the CLI:

1. Configure hub FortiGate's WAN, internal interface, and static route:

```
config system interface
    edit "port9"
        set alias "WAN"
        set ip 22.1.1.1 255.255.255.0
    next
    edit "port10"
        set alias "Internal"
        set ip 172.16.101.1 255.255.255.0
    next
end
config router static
    edit 1
        set gateway 22.1.1.2
        set device "port9"
    next
end
```

2. Configure the hub FortiGate:
   a. Configure the hub FortiGate IPsec phase1-interface and phase2-interface:

```
config vpn ipsec phase1-interface
    edit "advpn-hub"
        set type dynamic
        set interface "port9"
        set peertype any
        set net-device enable
        set proposal aes128-sha256 aes256-sha256 3des-sha256 aes128-sha1 aes256-sha1 3des-
sha1
        set add-route disable
        set dpd on-idle
        set auto-discovery-sender enable
        set psksecret sample
        set dpd-retryinterval 5
    next
end
config vpn ipsec phase2-interface
    edit "advpn-hub"
        set phase1name "advpn-hub"
        set proposal aes128-sha1 aes256-sha1 3des-sha1 aes128-sha256 aes256-sha256 3des-
sha256
    next
end
```

   When `net-device` is disabled, a tunnel ID is generated for each dynamic tunnel. This ID, in the form of an IP address, is used as the gateway in the route entry to that tunnel. The `tunnel-search` option is removed in FortiOS 7.0.0 and later.

   b. Configure the hub FortiGate firewall policy:

```
config firewall policy
    edit 1
        set name "spoke2hub"
        set srcintf "advpn-hub"
        set dstintf "port10"
        set srcaddr "all"
        set dstaddr "172.16.101.0"
        set action accept
        set schedule "always"
        set service "ALL"
    next
    edit 2
        set name "spoke2spoke"
        set srcintf "advpn-hub"
        set dstintf "advpn-hub"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
    next
end
```

c. Configure the hub FortiGate's IPsec tunnel interface IP address:

```
config system interface
    edit "advpn-hub1"
        set ip 10.10.10.254 255.255.255.255
        set remote-ip 10.10.10.253 255.255.255.0
    next
end
```

d. Configure the hub FortiGate's OSPF:

```
config router ospf
    set router-id 1.1.1.1
    config area
        edit 0.0.0.0
        next
    end
    config network
        edit 1
            set prefix 10.10.10.0 255.255.255.0
        next
        edit 2
            set prefix 172.16.101.0 255.255.255.0
        next
    end
end
```

3. Configure the spoke FortiGates:

a. Configure the spoke FortiGates' WAN, internal interfaces, and static routes:

i. Configure Spoke1:

```
config system interface
    edit "wan1"
        set alias "primary_WAN"
        set ip 15.1.1.2 255.255.255.0
    next
    edit "wan2"
        set alias "secondary_WAN"
        set ip 12.1.1.2 255.255.255.0
    next
    edit "internal"
        set ip 10.1.100.1 255.255.255.0
    next
end
config router static
    edit 1
        set gateway 12.1.1.1
        set device "wan2"
        set distance 15
    next
    edit 2
        set gateway 15.1.1.1
        set device "wan1"
    next
end
```

ii. Configure the Spoke2:

```
config system interface
    edit "wan1"
        set alias "primary_WAN"
        set ip 13.1.1.2 255.255.255.0
    next
    edit "wan2"
        set alias "secondary_WAN"
        set ip 17.1.1.2 255.255.255.0
    next
    edit "internal"
        set ip 192.168.4.1 255.255.255.0
    next
end
config router static
    edit 1
        set gateway 17.1.1.1
        set device "wan2"
        set distance 15
    next
    edit 2
        set gateway 13.1.1.1
        set device "wan1"
```

```
    next
end
```

b. Configure the spoke FortiGates' IPsec phase1-interface and phase2-interface:

i. Configure Spoke1:

```
config vpn ipsec phase1-interface
    edit "spoke1"
        set interface "wan1"
        set peertype any
        set net-device enable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set add-route disable
        set dpd on-idle
        set auto-discovery-receiver enable
        set remote-gw 22.1.1.1
        set psksecret sample
        set dpd-retryinterval 5
    next
    edit "spoke1_backup"
        set interface "wan2"
        set peertype any
        set net-device enable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set add-route disable
        set dpd on-idle
        set auto-discovery-receiver enable
        set remote-gw 22.1.1.1
        set monitor "spoke1"
        set psksecret sample
        set dpd-retryinterval 5
    next
end
config vpn ipsec phase2-interface
    edit "spoke1"
        set phase1name "spoke1"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
aes256gcm chacha20poly1305
        set auto-negotiate enable
    next
    edit "spoke1_backup"
        set phase1name "spoke1_backup"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
aes256gcm chacha20poly1305
        set auto-negotiate enable
    next
end
```

ii. Configure Spoke2:

```
config vpn ipsec phase1-interface
    edit "spoke2"
```

```
        set interface "wan1"
        set peertype any
        set net-device enable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set add-route disable
        set dpd on-idle
        set auto-discovery-receiver enable
        set remote-gw 22.1.1.1
        set psksecret sample
        set dpd-retryinterval 5
    next
    edit "spoke2_backup"
        set interface "wan2"
        set peertype any
        set net-device enable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set add-route disable
        set dpd on-idle
        set auto-discovery-receiver enable
        set remote-gw 22.1.1.1
        set monitor "spoke2"
        set psksecret sample
        set dpd-retryinterval 5
    next
end
config vpn ipsec phase2-interface
    edit "spoke2"
        set phase1name "spoke2"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
aes256gcm chacha20poly1305
        set auto-negotiate enable
    next
    edit "spoke2_backup"
        set phase1name "spoke2_backup"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
aes256gcm chacha20poly1305
        set auto-negotiate enable
    next
end
```

c. Configure the spoke FortiGates' firewall policies:

i. Configure Spoke1:

```
config firewall policy
    edit 1
        set name "outbound_advpn"
        set srcintf "internal"
        set dstintf "spoke1" "spoke1_backup"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
```

```
        set service "ALL"
    next
    edit 2
        set name "inbound_advpn"
        set srcintf "spoke1" "spoke1_backup"
        set dstintf "internal"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
    next
end
```

ii. Configure Spoke2:

```
config firewall policy
    edit 1
        set name "outbound_advpn"
        set srcintf "internal"
        set dstintf "spoke2" "spoke2_backup"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
    next
    edit 2
        set name "inbound_advpn"
        set srcintf "spoke2" "spoke2_backup"
        set dstintf "internal"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
    next
end
```

d. Configure the spoke FortiGates' tunnel interface IP addresses:

i. Configure Spoke1:

```
config system interface
    edit "spoke1"
        set ip 10.10.10.1 255.255.255.255
        set remote-ip 10.10.10.254 255.255.255.0
    next
    edit "spoke1_backup"
        set ip 10.10.10.2 255.255.255.255
        set remote-ip 10.10.10.254 255.255.255.0
    next
end
```

ii. Configure Spoke2:

```
config system interface
    edit "spoke2"
        set ip 10.10.10.3 255.255.255.255
        set remote-ip 10.10.10.254 255.255.255.0
    next
    edit "spoke2_backup"
        set ip 10.10.10.4 255.255.255.255
        set remote-ip 10.10.10.254 255.255.255.0
    next
end
```

e. Configure the spoke FortiGates' OSPF:

i. Configure Spoke1:

```
config router ospf
    set router-id 7.7.7.7
    config area
        edit 0.0.0.0
        next
    end
    config network
        edit 1
            set prefix 10.10.10.0 255.255.255.0
        next
        edit 2
            set prefix 10.1.100.0 255.255.255.0
        next
    end
end
```

ii. Configure Spoke2:

```
config router ospf
    set router-id 8.8.8.8
    config area
        edit 0.0.0.0
        next
    end
    config network
        edit 1
            set prefix 10.10.10.0 255.255.255.0
        next
        edit 2
            set prefix 192.168.4.0 255.255.255.0
        next
    end
end
```

4. Run `diagnose` and `get` commands on Spoke1 to check VPN and OSPF states:

a. Run the `diagnose vpn tunnel list` command on Spoke1. The system should return the following:

```
list all ipsec tunnel in vd 0
----
name=spoke1 ver=1 serial=2 15.1.1.2:0->22.1.1.1:0 tun_id=22.1.1.1
bound_if=7 lgwy=static/1 tun=intf/0 mode=auto/1 encap=none/536 options[0218]=npu create_
dev frag-rfc  accept_traffic=1

proxyid_num=1 child_num=1 refcnt=19 ilast=5 olast=2 ad=r/2

proxyid=spoke1_backup proto=0 sa=0 ref=2 serial=1 auto-negotiate adr
  src: 0:0.0.0.0/0.0.0.0:0
  dst: 0:0.0.0.0/0.0.0.0:0
```

b. Run the `get router info ospf neighbor` command on Spoke1. The system should return the following:

```
OSPF process 0, VRF 0: Neighbor ID Pri State Dead Time Address Interface 8.8.8.8 1. Full/
- 00:00:35 10.10.10.254 spoke1 1.1.1.1 1. Full/ - 00:00:35 10.10.10.254 spoke1
```

c. Run the `get router info routing-table ospf` command on Spoke1. The system should return the following:

```
Routing table for VRF=0
O       172.16.101.0/24 [110/110] via 10.10.10.254, spoke1, 00:23:23
O       192.168.4.0/24   [110/110] via 10.10.10.254, spoke1, 00:22:35
```

d. Generate traffic between the spokes, then check the shortcut tunnel and routing table. Run the `diagnose vpn tunnel list` command on Spoke1. The system should return the following:

```
list all ipsec tunnel in vd 0
----
----
name=spoke1 ver=1 serial=2 15.1.1.2:0->22.1.1.1:0 tun_id=22.1.1.1

```

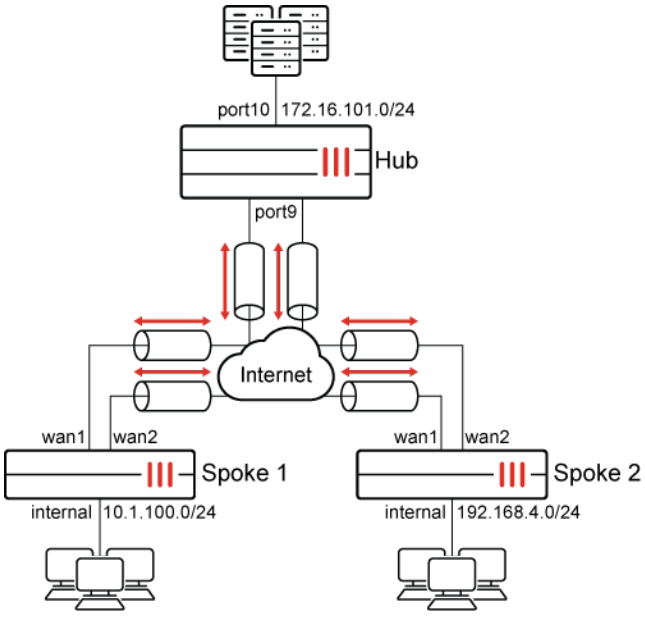
e. Run the `get router info routing-tale ospf` command. The system should return the following:

```
Routing table for VRF=0
O       172.16.101.0/24 [110/110] via 10.10.10.254, spoke1, 00:27:14
O       192.168.4.0/24  [110/110] via  10.10.10.3, spoke1_0, 00:26:26
```

ADVPN with RIP as the routing protocol

This is a sample configuration of ADVPN with RIP as routing protocol. The following options must be enabled for this configuration:

- On the hub FortiGate, IPsec phase1-interface `net-device disable` must be run.
- RIP must be used between the hub and spoke FortiGates.
- `split-horizon-status enable` must be run on the hub FortiGate.



To configure ADVPN with RIP as the routing protocol using the CLI:

1. In the CLI, configure hub FortiGate's WAN, internal interface, and static route:

```
config system interface
    edit "port9"
        set alias "WAN"
        set ip 22.1.1.1 255.255.255.0
    next
```

```
    edit "port10"
        set alias "Internal"
        set ip 172.16.101.1 255.255.255.0
    next
end
config router static
    edit 1
        set gateway 22.1.1.2
        set device "port9"
    next
end
```

2. Configure the hub FortiGate:
   a. Configure the hub FortiGate IPsec phase1-interface and phase2-interface:

```
config vpn ipsec phase1-interface
    edit "advpn-hub"
        set type dynamic
        set interface "port9"
        set peertype any
        set net-device disable
        set proposal aes128-sha256 aes256-sha256 3des-sha256 aes128-sha1 aes256-sha1 3des-
sha1
        set add-route disable
        set dpd on-idle
        set auto-discovery-sender enable
        set psksecret sample
        set dpd-retryinterval 5
    next
end
config vpn ipsec phase2-interface
    edit "advpn-hub"
        set phase1name "advpn-hub"
        set proposal aes128-sha1 aes256-sha1 3des-sha1 aes128-sha256 aes256-sha256 3des-
sha256
    next
end
```

> When `net-device` is disabled, a tunnel ID is generated for each dynamic tunnel. This ID, in the form of an IP address, is used as the gateway in the route entry to that tunnel. The `tunnel-search` option is removed in FortiOS 7.0.0 and later.

   b. Configure the hub FortiGate firewall policy:

```
config firewall policy
    edit 1
        set name "spoke2hub"
        set srcintf "advpn-hub"
        set dstintf "port10"
        set srcaddr "all"
        set dstaddr "172.16.101.0"
```

```
        set action accept
        set schedule "always"
        set service "ALL"
    next
    edit 2
        set name "spoke2spoke"
        set srcintf "advpn-hub"
        set dstintf "advpn-hub"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
    next
end
```

c. Configure the hub FortiGate's IPsec tunnel interface IP address:

```
config system interface
    edit "advpn-hub1"
        set ip 10.10.10.254 255.255.255.255
        set remote-ip 10.10.10.253 255.255.255.0
    next
end
```

d. Configure the hub FortiGate's RIP:

```
config router rip
    set default-information-originate enable
    config network
        edit 1
            set prefix 10.10.10.0 255.255.255.0
        next
        edit 2
            set prefix 172.16.101.0 255.255.255.0
        next
    end
    config interface
        edit "advpn-hub"
            set split-horizon-status disable
        next
    end
end
```

3. Configure the spoke FortiGates:

a. Configure the spoke FortiGates' WAN, internal interfaces, and static routes:

i. Configure Spoke1:

```
config system interface
    edit "wan1"
        set alias "primary_WAN"
        set ip 15.1.1.2 255.255.255.0
```

```
    next
    edit "wan2"
        set alias "secondary_WAN"
        set ip 12.1.1.2 255.255.255.0
    next
    edit "internal"
        set ip 10.1.100.1 255.255.255.0
    next
end
config router static
    edit 1
        set gateway 12.1.1.1
        set device "wan2"
        set distance 15
    next
    edit 2
        set gateway 15.1.1.1
        set device "wan1"
    next
end
```

ii. Configure the Spoke2:

```
config system interface
    edit "wan1"
        set alias "primary_WAN"
        set ip 13.1.1.2 255.255.255.0
    next
    edit "wan2"
        set alias "secondary_WAN"
        set ip 17.1.1.2 255.255.255.0
    next
    edit "internal"
        set ip 192.168.4.1 255.255.255.0
    next
end
config router static
    edit 1
        set gateway 17.1.1.1
        set device "wan2"
        set distance 15
    next
    edit 2
        set gateway 13.1.1.1
        set device "wan1"
    next
end
```

b. Configure the spoke FortiGates' IPsec phase1-interface and phase2-interface:

i. Configure Spoke1:

```
config vpn ipsec phase1-interface
    edit "spoke1"
        set interface "wan1"
        set peertype any
        set net-device enable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set add-route disable
        set dpd on-idle
        set auto-discovery-receiver enable
        set remote-gw 22.1.1.1
        set psksecret sample
        set dpd-retryinterval 5
    next
    edit "spoke1_backup"
        set interface "wan2"
        set peertype any
        set net-device enable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set add-route disable
        set dpd on-idle
        set auto-discovery-receiver enable
        set remote-gw 22.1.1.1
        set monitor "spoke1"
        set psksecret sample
        set dpd-retryinterval 5
    next
end
config vpn ipsec phase2-interface
    edit "spoke1"
        set phase1name "spoke1"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
aes256gcm chacha20poly1305
        set auto-negotiate enable
    next
    edit "spoke1_backup"
        set phase1name "spoke1_backup"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
aes256gcm chacha20poly1305
        set auto-negotiate enable
    next
end
```

ii. Configure Spoke2:

```
config vpn ipsec phase1-interface
    edit "spoke2"
        set interface "wan1"
        set peertype any
        set net-device enable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set add-route disable
```

```
        set dpd on-idle
        set auto-discovery-receiver enable
        set remote-gw 22.1.1.1
        set psksecret sample
        set dpd-retryinterval 5
    next
    edit "spoke2_backup"
        set interface "wan2"
        set peertype any
        set net-device enable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set add-route disable
        set dpd on-idle
        set auto-discovery-receiver enable
        set remote-gw 22.1.1.1
        set monitor "spoke2"
        set psksecret sample
        set dpd-retryinterval 5
    next
end
config vpn ipsec phase2-interface
    edit "spoke2"
        set phase1name "spoke2"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
aes256gcm chacha20poly1305
        set auto-negotiate enable
    next
    edit "spoke2_backup"
        set phase1name "spoke2_backup"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
aes256gcm chacha20poly1305
        set auto-negotiate enable
    next
end
```

c. Configure the spoke FortiGates' firewall policies:

i. Configure Spoke1:

```
config firewall policy
    edit 1
        set name "outbound_advpn"
        set srcintf "internal"
        set dstintf "spoke1" "spoke1_backup"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
    next
    edit 2
        set name "inbound_advpn"
        set srcintf "spoke1" "spoke1_backup"
```

```
        set dstintf "internal"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
    next
end
```

ii. Configure Spoke2:

```
config firewall policy
    edit 1
        set name "outbound_advpn"
        set srcintf "internal"
        set dstintf "spoke2" "spoke2_backup"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
    next
    edit 2
        set name "inbound_advpn"
        set srcintf "spoke2" "spoke2_backup"
        set dstintf "internal"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
    next
end
```

d. Configure the spoke FortiGates' tunnel interface IP addresses:

i. Configure Spoke1:

```
config system interface
    edit "spoke1"
        set ip 10.10.10.1 255.255.255.255
        set remote-ip 10.10.10.254 255.255.255.0
    next
    edit "spoke1_backup"
        set ip 10.10.10.2 255.255.255.255
        set remote-ip 10.10.10.254 255.255.255.0
    next
end
```

ii. Configure Spoke2:

```
config system interface
    edit "spoke2"
```

```
        set ip 10.10.10.3 255.255.255.255
        set remote-ip 10.10.10.254 255.255.255.0
    next
    edit "spoke2_backup"
        set ip 10.10.10.4 255.255.255.255
        set remote-ip 10.10.10.254 255.255.255.0
    next
end
```

e. Configure the spoke FortiGates' RIP:

i. Configure Spoke1:

```
config router rip
    config network
        edit 1
            set prefix 10.10.10.0 255.255.255.0
        next
        edit 2
            set prefix 10.1.100.0 255.255.255.0
        next
    end
end
```

ii. Configure Spoke2:

```
config router rip
    config network
        edit 1
            set prefix 10.10.10.0 255.255.255.0
        next
        edit 2
            set prefix 192.168.4.0 255.255.255.0
        next
    end
end
```

4. Run `diagnose` and `get` commands on Spoke1:

a. Run the `diagnose vpn tunnel list` command on Spoke1. The system should return the following:

```
list all ipsec tunnel in vd 0
----
name=spoke1 ver=1 serial=2 15.1.1.2:0->22.1.1.1:0 tun_id=22.1.1.1

```

c. Run the `get router info routing-table rip` command on Spoke1. The system should return the following:

```
Routing table for VRF=0
R       172.16.101.0/24 [120/2] via 10.10.10.254, spoke1, 00:08:38
R       192.168.4.0/24 [120/3] via 10.10.10.254, spoke1, 00:08:38
```

d. Generate traffic between the spokes, then check the shortcut tunnel and routing table. Run the `diagnose vpn tunnel list` command on Spoke1. The system should return the following:

```
list all ipsec tunnel in vd 0
----
name=spoke1 ver=1 serial=2 15.1.1.2:0->22.1.1.1:0 tun_id=22.1.1.1

```

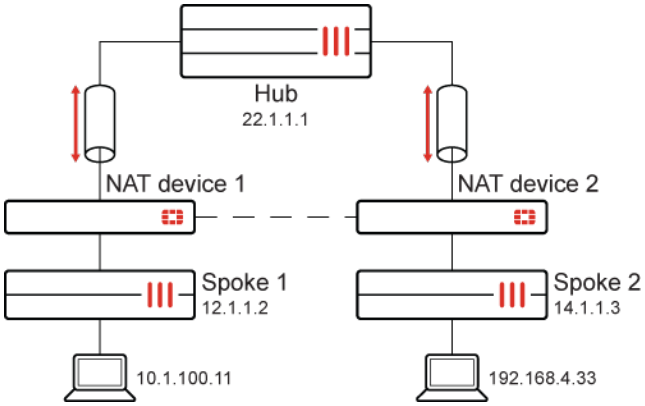
e. Run the `get router info routing-tale rip` command. The system should return the following:

```
Routing table for VRF=0
R       172.16.101.0/24 [120/2] via 10.10.10.254, spoke1, 00:09:04
R       192.168.4.0/24 [120/2] via 10.10.10.3, spoke1_0, 00:00:02
```

UDP hole punching for spokes behind NAT

UDP hole punching allows ADVPN shortcuts to be established through a UDP hole on a NAT device. The NAT device must support RFC 4787 Endpoint-Independent Mapping.

In the following example, device 10.1.100.11 behind Spoke1 needs to reach device 192.168.4.33 behind Spoke2. Spoke1 and Spoke2 are behind NAT devices and have established IPsec tunnels to the Hub. The hole punching creates a shortcut between Spoke1 and Spoke2 that bypasses the Hub.



To verify the ADVPN shortcut is established between both spokes behind NAT:

```

Fabric Overlay Orchestrator

The Fabric Overlay Orchestrator feature is an easy-to-use GUI wizard that simplifies the process of configuring a self-orchestrated SD-WAN overlay within a single Security Fabric. This feature is self-orchestrated since no additional tool or device, aside from the FortiGates themselves, is required to orchestrate this configuration. An SD-WAN overlay configuration consists of IPsec and BGP configuration settings.

Currently, the Fabric Overlay Orchestrator supports a single hub architecture and builds upon an existing Security Fabric configuration. This feature configures the root FortiGate as the SD-WAN overlay hub and the downstream first-level FortiGates as the spokes.

After configuring the Fabric Overlay, you can complete the SD-WAN deployment by configuring SD-WAN rules.

If you cannot view the *VPN > Fabric Overlay Orchestrator* tree menu, configure the FortiGate as a root or a downstream device in the Security Fabric. See Configuring the root FortiGate and downstream FortiGates on page 4162 for more details.

The Fabric Overlay Orchestrator does not work when VDOM mode is enabled.

This section contains the following topics:

- Prerequisites on page 3136
- Network topology on page 3137
- Using the Fabric Overlay Orchestrator on page 3137
- SPA easy configuration key for FortiSASE on page 3155
- Fabric Overlay Orchestrator Topology dashboard widget for hub FortiGates on page 3157

Prerequisites

Create a single Fortinet Security Fabric with the following components:

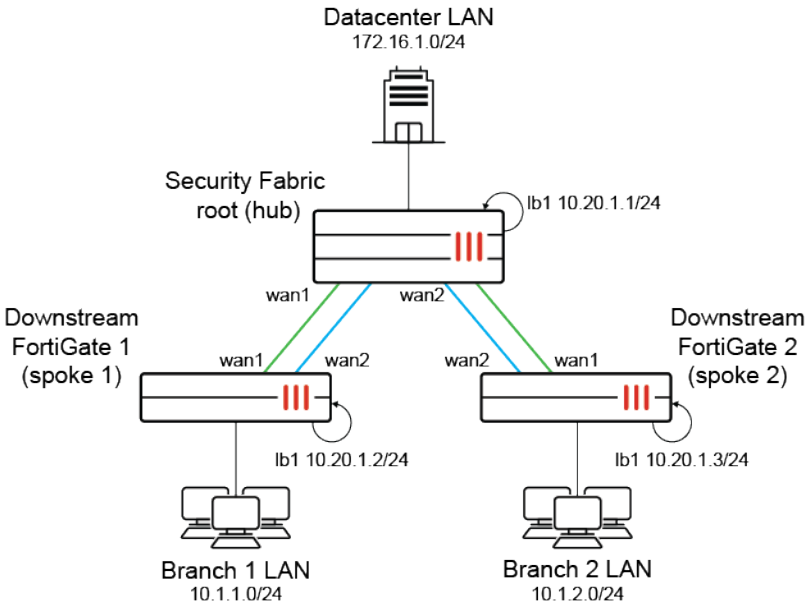
- A root FortiGate and one or more downstream FortiGates all running FortiOS 7.2.4 or later
- A FortiAnalyzer, or cloud logging using FortiAnalyzer Cloud or FortiGate Cloud
  - For FortiGate Cloud, all downstream devices must belong to the same FortiCloud account

  For more information about configuring these components, see Configuring the root FortiGate and downstream FortiGates on page 4162, Configuring FortiAnalyzer on page 4171, and Configuring cloud logging on page 4174 in the Security Fabric chapter.

The Fabric Overlay Orchestrator does not work when VDOM mode is enabled.

Network topology

The Fabric Overlay Orchestrator supports configuring an overlay for the following example hub and spoke topology using ADVPN and a single hub.



This topology corresponds to the single datacenter (active-passive gateway) design using the IPsec overlay design of one-to-one overlay mapping per underlay. For more details on these topics, see the SD-WAN Architectures for Enterprise guide.

In this topology, the datacenter FortiGate (Security Fabric root FortiGate) is the hub, and the branch FortiGates (Security Fabric downstream FortiGates) are the spokes. Each FortiGate has a distinctly defined LAN subnet and loopback interface (lb1) with an IP address within the 10.20.1.0/24 subnet.

The Fabric Overlay Orchestrator creates loopbacks to act as health check servers that are always up, and they can be accessed by adjacent Fabric devices. When configuring the policy creation option of either automatic or health check on the hub, the Fabric Overlay Orchestrator configures performance SLAs from the hub to the health check servers on 10.20.1.2 and 10.20.1.3 corresponding to the spoke 1 and spoke 2 FortiGates respectively. Likewise, when the Fabric Overlay Orchestrator runs on each spoke, it creates a performance SLA to the hub using its loopback address of 10.20.1.1.

Instead of using loopbacks, any business-critical applications and resources connected to the LAN of each device can be used as health check servers for performance SLAs.

Using the Fabric Overlay Orchestrator

If you cannot view the *VPN > Fabric Overlay Orchestrator* tree menu, configure the FortiGate as a root or a downstream device in the Security Fabric. See Configuring the root FortiGate and downstream FortiGates on page 4162 for more details.

The Fabric Overlay Orchestrator does not work when VDOM mode is enabled.

The following steps should be used to configure a self-orchestrated SD-WAN overlay within a single Security Fabric. These steps must be followed in order, and assume that the prerequisites and network topology are in place.

1. Configure the root FortiGate using the Fabric Overlay Orchestrator.
2. Configure one or more downstream FortiGates using the Fabric Overlay Orchestrator.
3. Configure an overlay on the spoke for an additional incoming interface on the hub (if applicable).
4. Verify the firewall policies on the hub FortiGate.
5. Verify the Fabric Overlay created by the Fabric Overlay Orchestrator:
   a. Verify the IPsec VPN tunnels on the hub FortiGate.
   b. Verify BGP routing on the hub FortiGate.
   c. Verify the performance SLAs on the hub FortiGate.
   d. Verify the firewall policies on a spoke FortiGate.
   e. Verify the IPsec VPN tunnels on a spoke FortiGate.
   f. Verify BGP routing on a spoke FortiGate.
   g. Verify the performance SLAs on a spoke FortiGate.
   h. Verify the spoke-to-spoke ADVPN communication.
6. Configure SD-WAN rules on the hub FortiGate.
7. Configure SD-WAN rules on the spoke FortiGates.

When configuring the root and downstream FortiGates, the Fabric Overlay Orchestrator configures the following settings in the background:

- IPsec overlay configuration (hub and spoke ADVPN tunnels)
- BGP configuration
- Policy routing
- SD-WAN zones
- SD-WAN performance SLAs

The FortiGate's role in the SD-WAN overlay is automatically determined by its role in the Security Fabric. The Fabric root will be the hub, and any first-level downstream devices from the Fabric root will be spokes.

After using the Fabric Overlay Orchestrator on all FortiGates and verifying the overlay settings, complete the SD-WAN deployment configuration using steps 3 (if applicable), and steps 6 and 7. See SD-WAN rules on page 1053 for more information.

Creating firewall policies

The Fabric Overlay Orchestrator can create firewall policies to allow all traffic through the SD-WAN overlay, or firewall policies to just allow health check traffic through it instead. When the Fabric Overlay Orchestrator is enabled on the root FortiGate, there are three *Policy creation* options:

- *Automatic*: automatically create policies for the loopback interface and tunnel overlays.
- *Health check*: automatically create a policy for the loopback interface so the SD-WAN health checks are functional.
- *Manual*: no policies are automatically created.

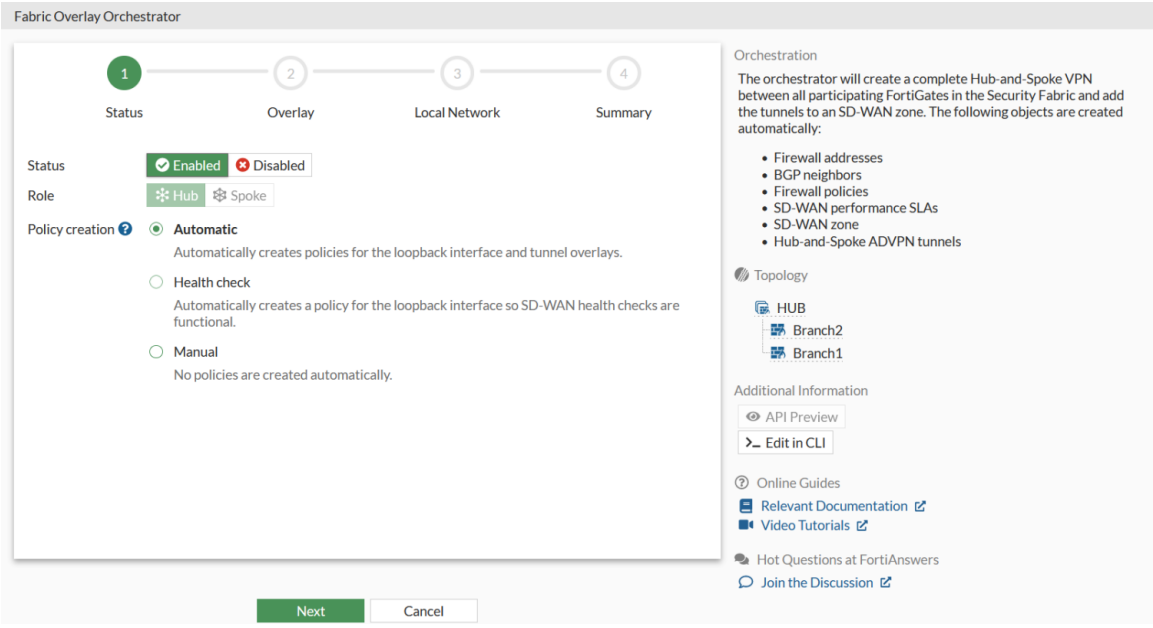
The *Automatic* policy creation option creates wildcard allow policies for the tunnel overlays. For some cases, these policies do not provide the necessary granularity to restrict overlay traffic to specific subnets or hosts.

When the Fabric Overlay Orchestrator is configured on a device, changing the policy creation rule will create new policies based on the rule, but it will not delete existing policies. Deleting existing policies must be performed manually.

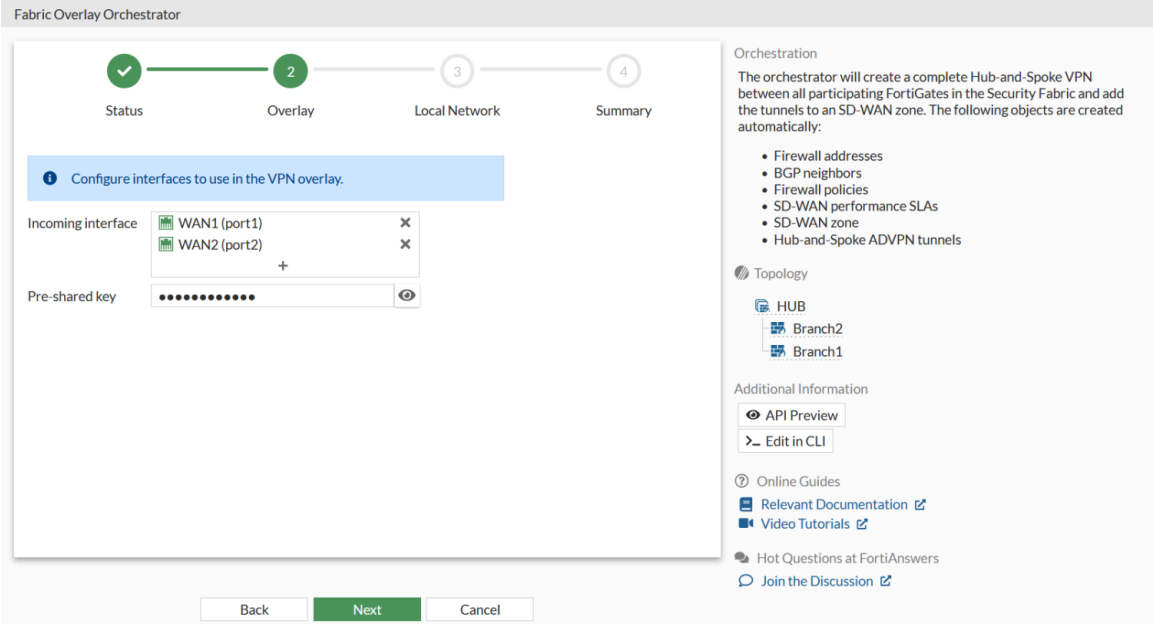
Configuring the root FortiGate using the Fabric Overlay Orchestrator

To configure the root FortiGate using the Fabric Overlay Orchestrator:

1. Go to *VPN* > *Fabric Overlay Orchestrator*.
2. Set the *Status* to *Enabled*. The *Role* is automatically selected based on the FortiGate's role in the Security Fabric. Ensure that *Hub* is selected. The Fabric root must always be the hub.
3. Set *Policy creation* to *Automatic*.

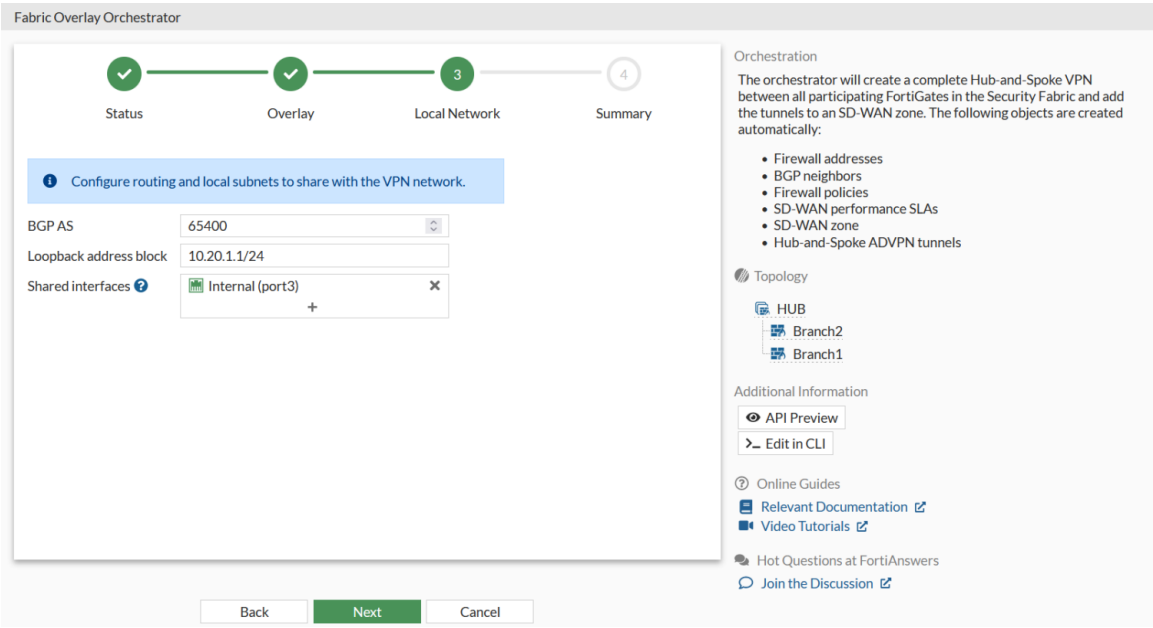


4. Click *Next*. The *Overlay* settings appear.
5. Select one or more interfaces as the *Incoming interface* or the underlay link over which the VPN overlay will be built (two incoming interfaces are selected in this example).
6. Enter the *Pre-shared key*.

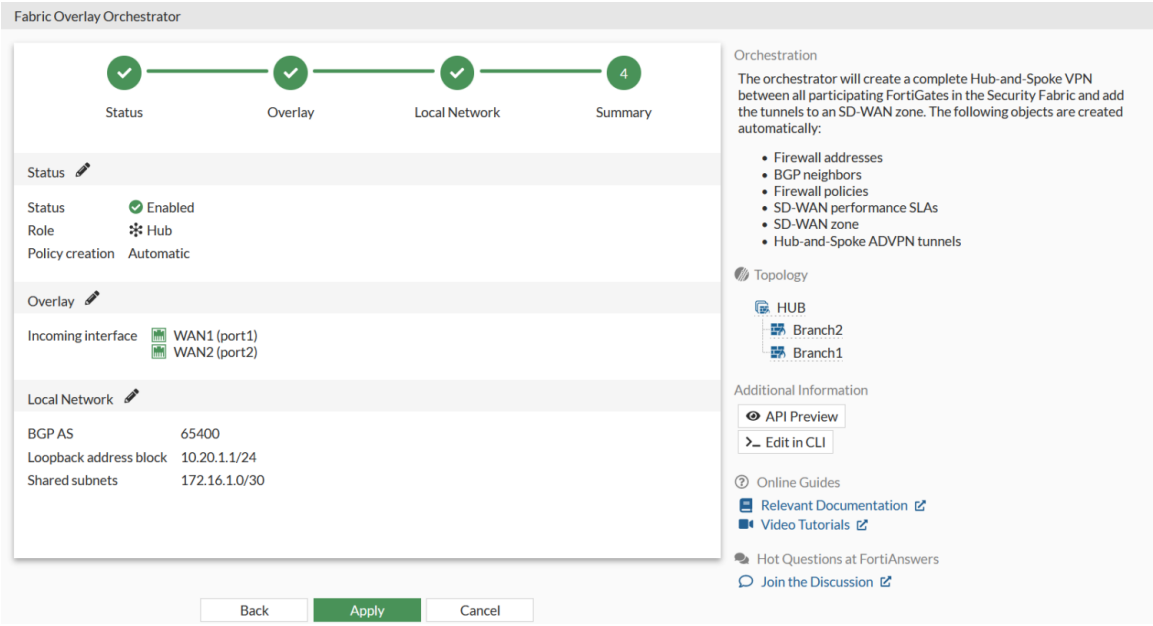


7. Click *Next*. The *Local Network* settings appear.
8. Configure routing and local subnets to share the following with the VPN network:

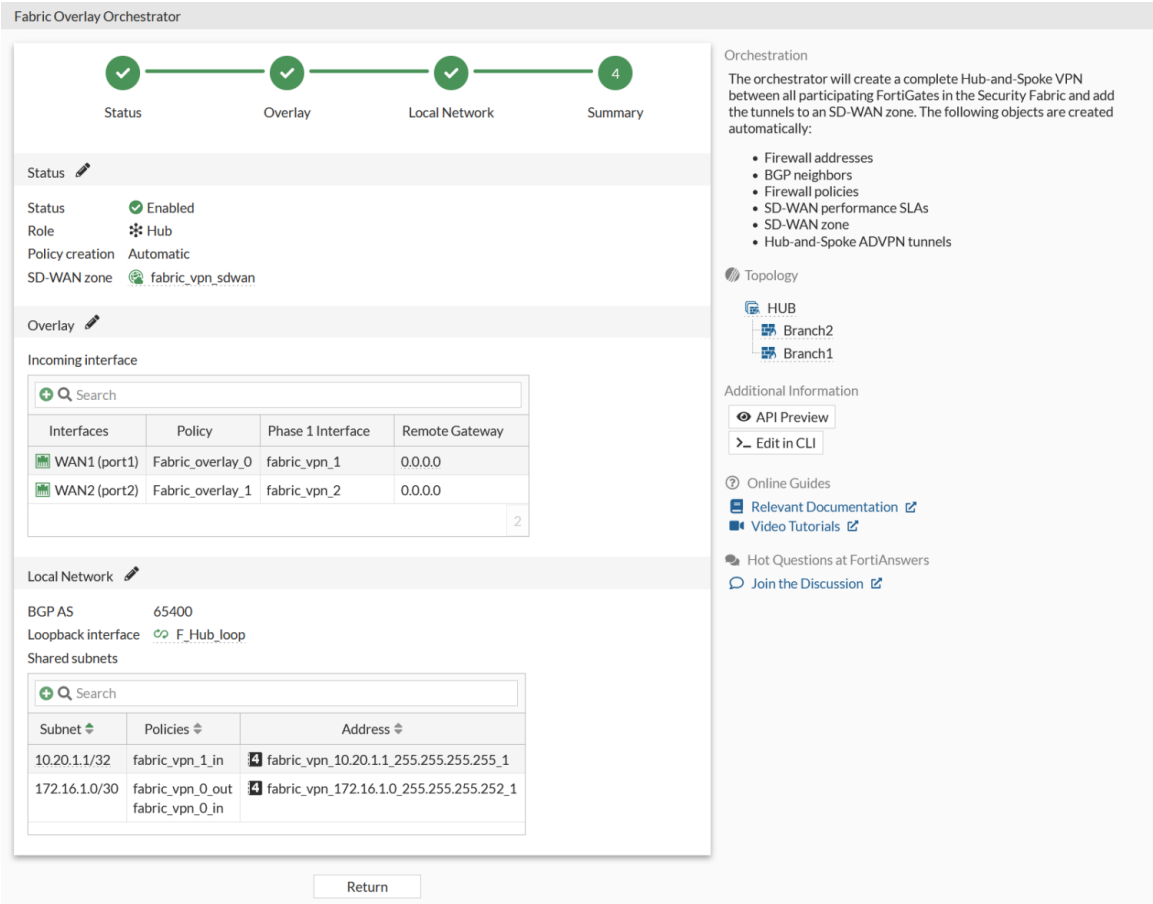
BGP AS	Optional setting to configure the BGP AS number. By default, this is set to *65400*.
Loopback address block	Optional setting to configure the loopback IP address. By default, this is set to *10.20.1.1/255.255.255.0*.
Shared interfaces	Select the interface of the local network to share with the VPN network.



9. Click *Next*. The *Summary* page appears.
10. Review the settings, then click *Apply*.



An updated *Summary* page appears with all the settings.



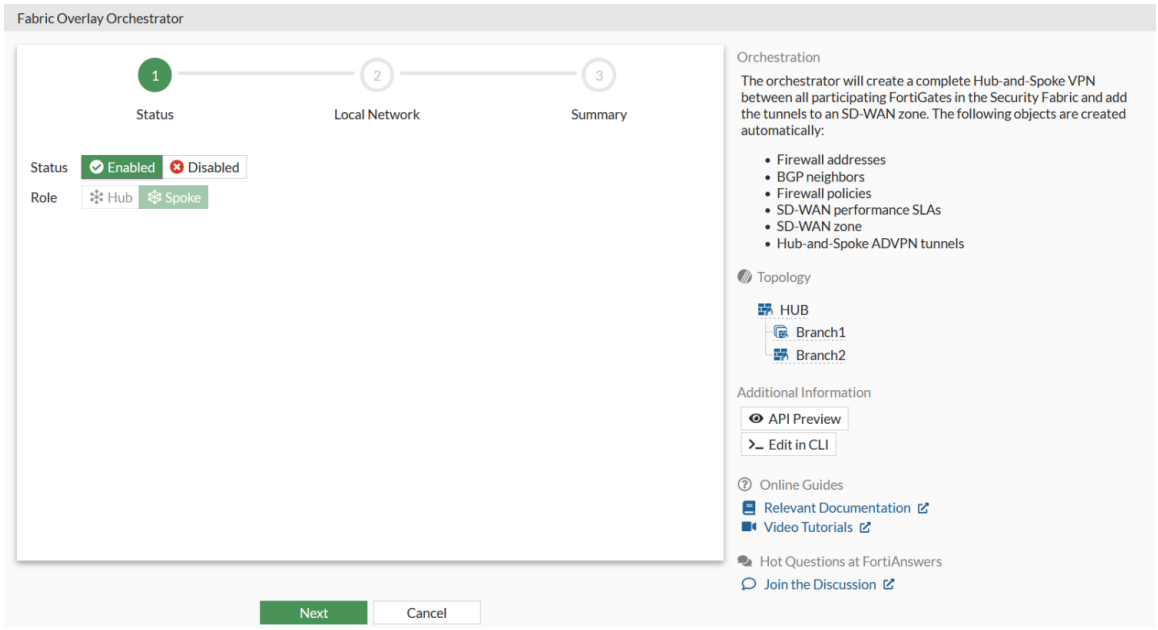
Note the following settings in this example:

SD-WAN zone	Located in the *Status* section: *fabric_vpn_sdwan*.
VPN tunnels	Located in the *Overlay* section in the *Incoming interface* table under the *Phase 1 Interface* column: *fabric_vpn1* and *fabric_vpn2*.
BGP	Located in the *Local Network* section. The *BGP AS* is *65400*. The *Shared subnets* are *10.20.1.1/32* and *172.16.1.0/30*.
Loopback interface	Located in the *Local Network* section: *F_Hub_loop*.
Firewall policies	Located in two sections: • *Overlay* section in the *Incoming interface* table under the *Policy* column: *Fabric_overlay_0* and *Fabric_overlay_1* • *Local Network* section in the *Shared subnets* table under the *Policies* column: *fabric_vpn_1_in*, *fabric_vpn_0_out*, and *fabric_vpn_0_in*

Configuring a downstream FortiGate using the Fabric Overlay Orchestrator

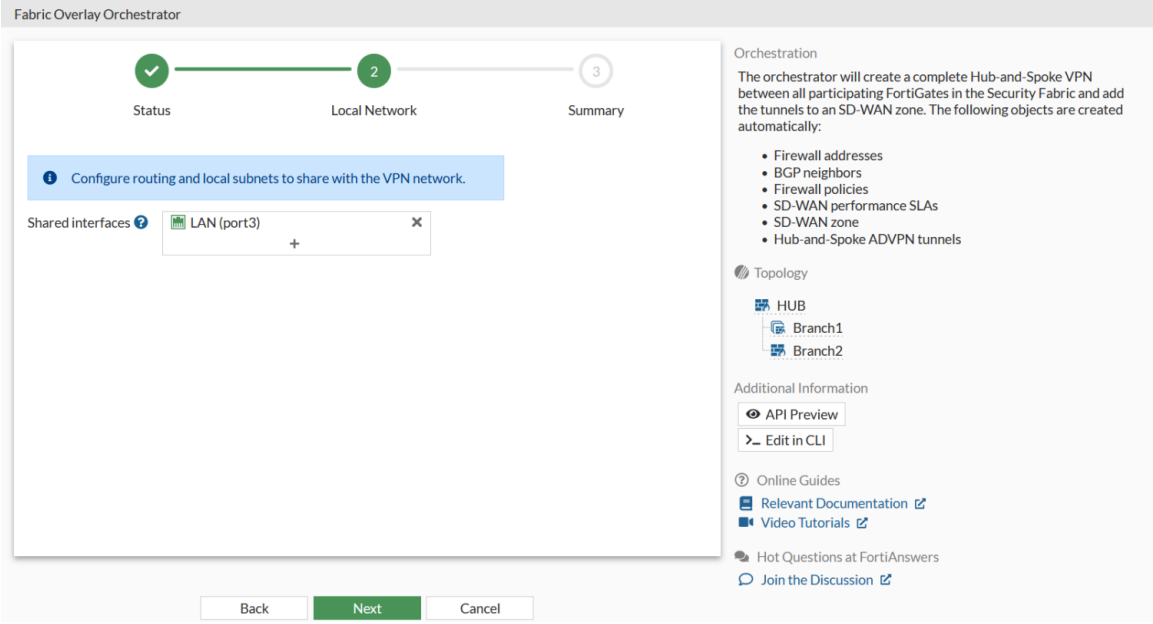
To configure a downstream FortiGate using the Fabric Overlay Orchestrator:

1. Go to *VPN* > *Fabric Overlay Orchestrator*.
2. Set the *Status* to *Enabled*. The *Role* is automatically selected based on the FortiGate's role in the Security Fabric. Ensure that *Spoke* is selected. Only downstream first-level FortiGates can be spokes.

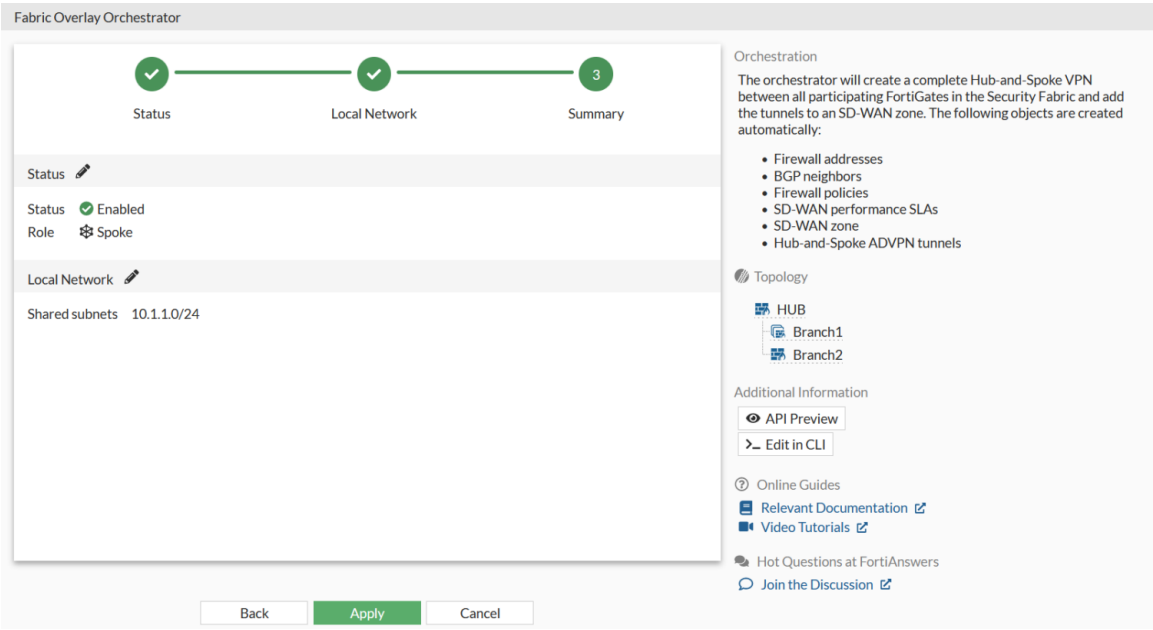


3. Click *Next*. The *Local Network* settings appear.
4. Configure the routing and local subnets to share with the VPN network in the following fields:

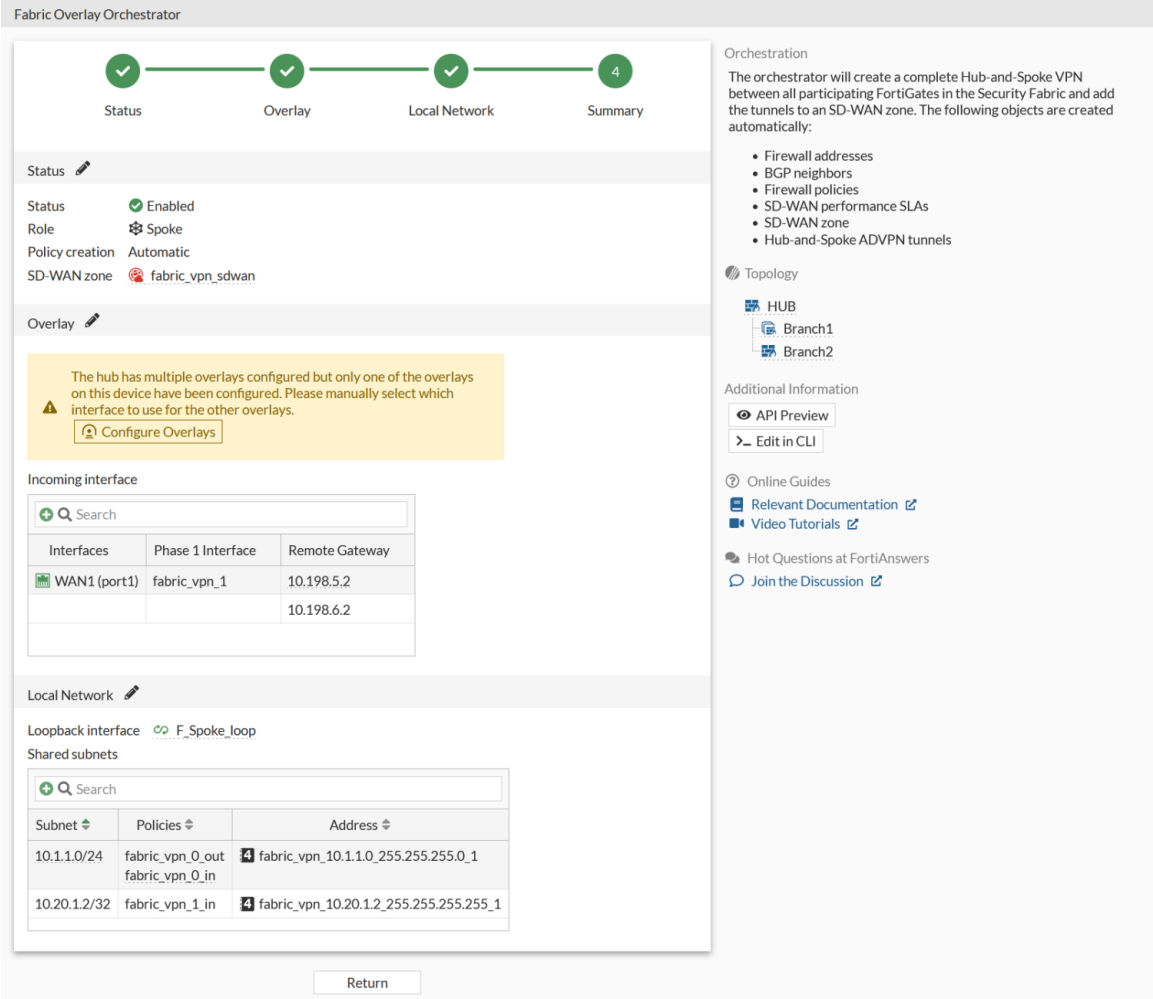
Shared interfaces	Select the interface of the local network to share with the VPN network.



5. Click *Next*. As the downstream FortiGate updates, a *Configuring spoke Fabric VPN from root FortiGate* message appears The *Summary* page appears once the update is complete.



6. Review the settings, then click *Apply*.
   An updated *Summary* page appears with all the settings.



Note the following settings in this example:

SD-WAN zone	Located in the *Status* section: *fabric_vpn_sdwan*.
VPN tunnels	Located in the *Overlay* section in the *Incoming interface* table under the *Phase 1 Interface* column: *fabric_vpn1*.
BGP	Located in the *Local Network* section. The *BGP AS* is *65400*. The *Shared subnets* are *10.1.1.0/24* and *10.20.1.2/32*.
Loopback interface	Located in the *Local Network* section: *F_Hub_loop*.
Firewall policies	Located in the *Local Network* section in the *Shared subnets* table under the *Policies* column: *fabric_vpn_0_out*, *fabric_vpn_0_in*, and *fabric_vpn_1_in*.

The loopback IP addresses for the branches are generated based on the index number of the trusted device in the root FortiGate's Security Fabric (HUB) configuration.

```
config system csf
    set status enable
    set group-name "fabric"
```

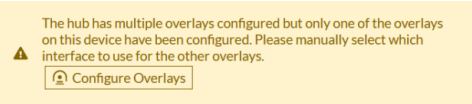
```
    config trusted-list
        edit "FGVM02TM22000001"
            set serial "FGVM02TM22000001"
            set index 1
        next
        edit "FGVM02TM22000002"
            set serial "FGVM02TM22000002"
            set index 2
        next
    end
end
```

For example, if Branch1 (index 1) is the first FortiGate and Branch2 (index 2) is the second FortiGate authorized on the root FortiGate, the loopback addresses are generated as follows:

- Branch1 loopback IP: 10.20.1.2
- Branch2 loopback IP: 10.20.1.3

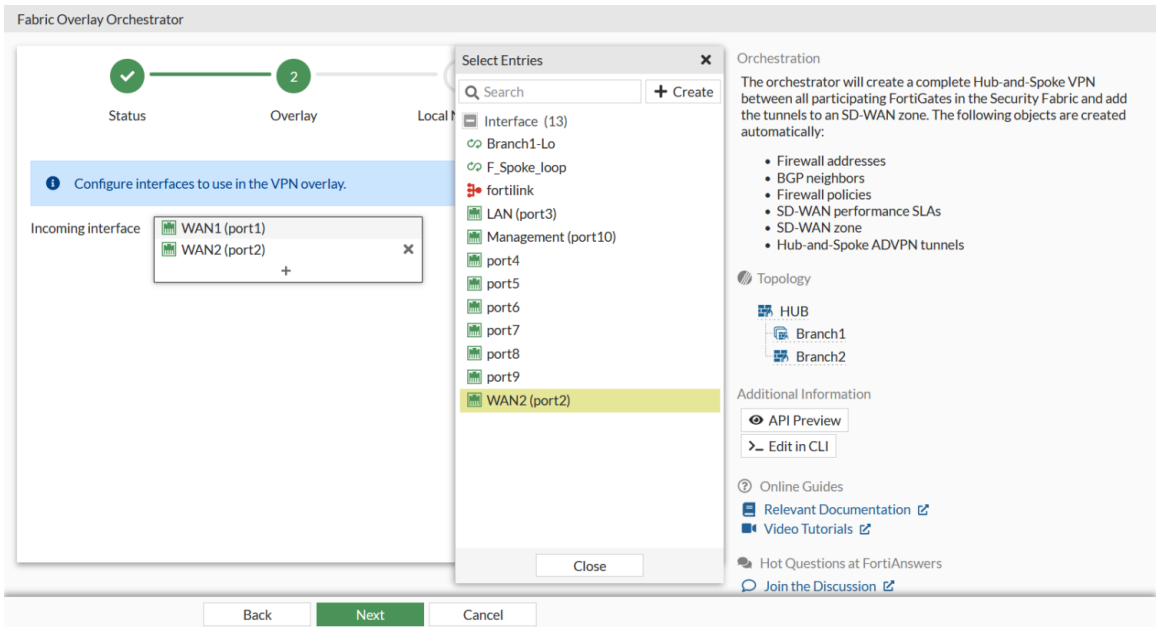
Configuring an overlay on the spoke for an additional incoming interface on the hub

A hub typically includes two incoming interfaces, but additional interfaces can be configured if needed. On downstream devices, the following warning is displayed on the *Fabric Overlay Orchestrator* page that *The hub has multiple overlays configured but only one of the overlays on this device have been configured. Please manually select which interface to use for the other overlays.*

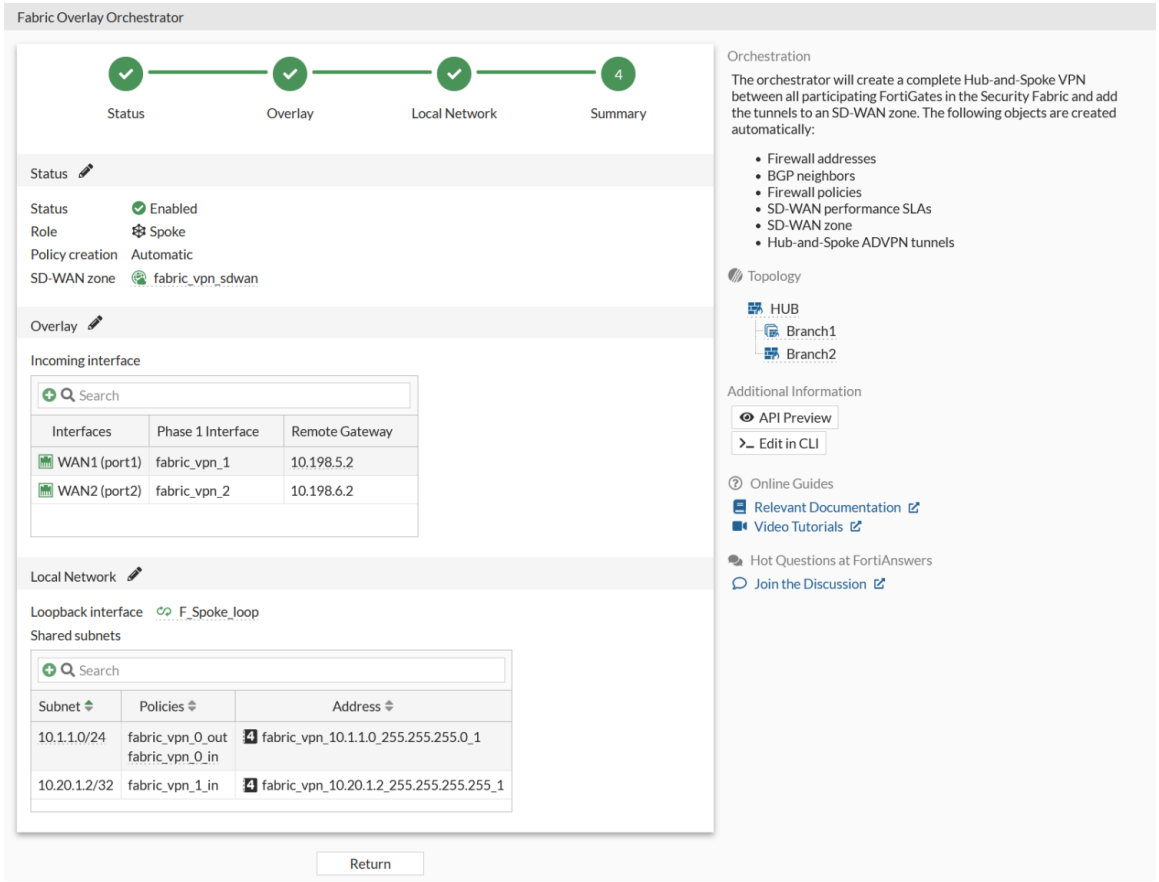


To configure an additional incoming interface on a spoke:

1. Go to *VPN > Fabric Overlay Orchestrator*.
2. Click *Configure Overlays* in the warning box.
3. Navigate to the *Overlay* section, click the *+* in the *Incoming interface* field, and select *WAN2 (port2)* to add it to the overlay.



4. Click *Next*, then complete the remaining steps in the GUI wizard. On the *Summary* page, the additional interface *WAN2 (port2)* appears in the *Incoming interfaces* table.

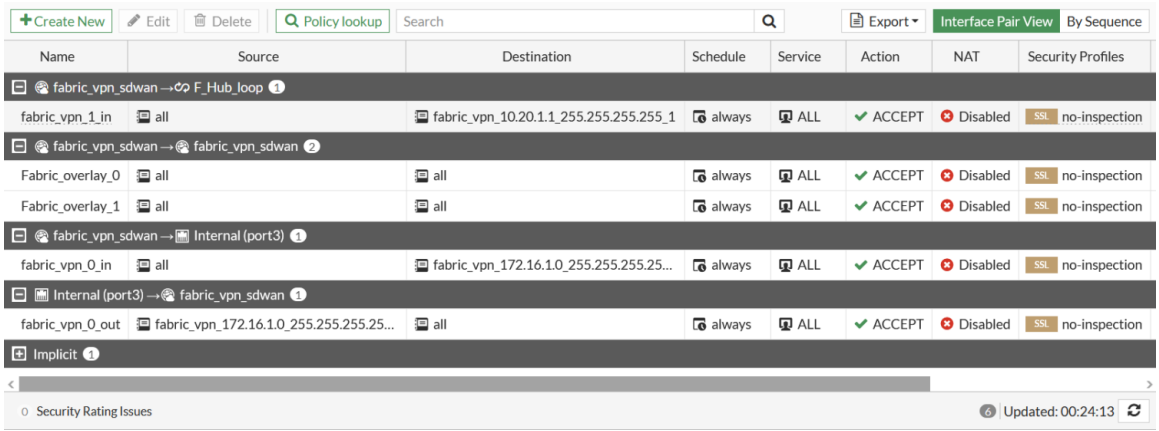


Verifying the firewall policies on the hub FortiGate

Different policies are created on the hub FortiGate based on the *Policy creation* setting in the Fabric Overlay Orchestrator configuration (*Automatic*, *Health check*, or *Manual*).

Automatic

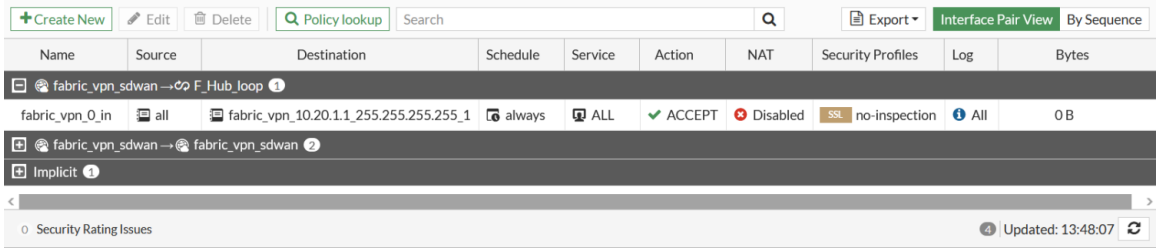
Go to *Policy & Objects* > *Firewall Policy* to verify that wildcard firewall policies have been configured on the hub FortiGate. This Fabric Overlay Orchestrator configuration example uses automatic policy creation, and the following firewall policies are configured:



> The *Automatic* policy creation option creates wildcard allow policies for the tunnel overlays. For some cases, these policies do not provide the necessary granularity to restrict overlay traffic to specific subnets or hosts.

Health check

Go to *Policy & Objects* > *Firewall Policy* to verify that a single firewall policy allowing health check traffic to the hub's loopback has been configured on the hub FortiGate. For example:



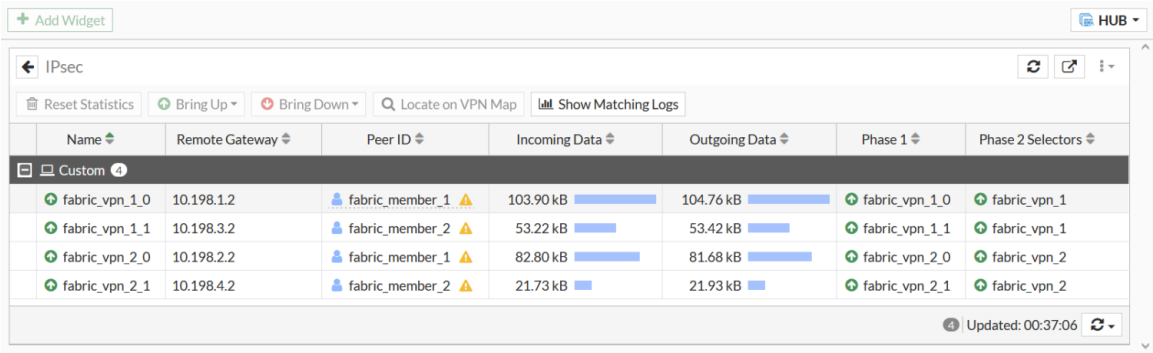
Manual

Go to *Policy & Objects* > *Firewall Policy* to verify that no firewall policies have been created by the Fabric Overlay Orchestrator. If desired, firewall policies must be manually configured on the hub FortiGate to allow traffic to the loopback interface for health checks and the overlays.

Verifying the Fabric Overlay created by the Fabric Overlay Orchestrator

To verify the IPsec VPN tunnels on the hub:

1. Go to *Dashboard* > *Network Monitor* > *VPN*.
2. Verify that there are two tunnels established for each phase 1 interface.



The naming convention <tunnel_name>_<number> indicates the relative order in which the tunnels were established:

fabric_vpn_1_0	VPN tunnel listening on the hub's WAN1 incoming interface; established with spoke 1 using its WAN1 interface
fabric_vpn_1_1	VPN tunnel listening on the hub's WAN1 incoming interface; established with spoke 2 using its WAN1 interface
fabric_vpn_2_0	VPN tunnel listening on the hub's WAN2 incoming interface; established with spoke 1 using its WAN2 interface
fabric_vpn_2_1	VPN tunnel listening on the hub's WAN2 incoming interface; established with spoke 2 using its WAN2 interface

Verify the BGP routing on the hub:

1. In the CLI, check the BGP peering status:

```
HUB # get router info bgp summary

VRF 0 BGP router identifier 10.20.1.1, local AS number 65400
BGP table version is 11
1 BGP AS-PATH entries
0 BGP community entries
Next peer check timer due in 43 seconds

Neighbor    V         AS MsgRcvd MsgSent   TblVer  InQ OutQ Up/Down  State/PfxRcd
10.10.10.1  4      65400      23      27       11    0    0 00:09:28        2
10.10.10.2  4      65400      16      16       11    0    0 00:06:36        2
10.10.11.1  4      65400      14      20       11    0    0 00:09:22        2
10.10.11.2  4      65400       7      11       11    0    0 00:03:22        2
```

```
Total number of neighbors 4
```

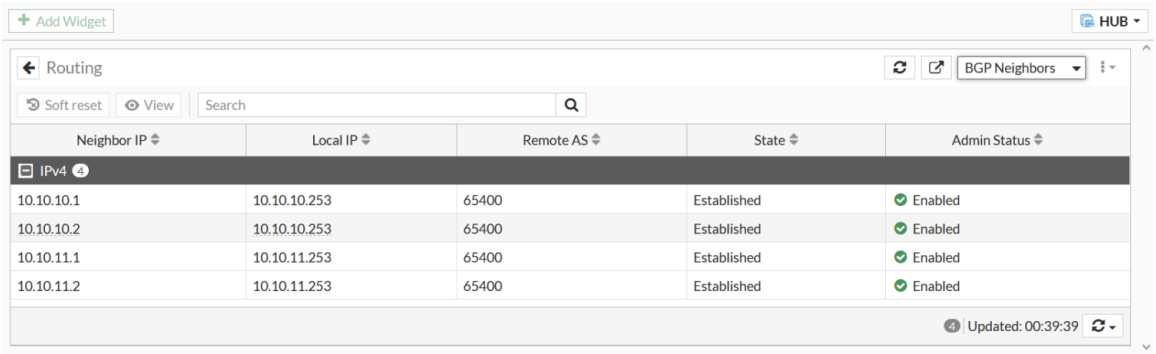
2. Check the BGP advertised routes:

```
HUB # get router info bgp neighbors 10.10.10.1 advertised-routes
VRF 0 BGP table version is 11, local router ID is 10.20.1.1
Status codes: s suppressed, d damped, h history, * valid, > best, i - internal
Origin codes: i - IGP, e - EGP, ? - incomplete

   Network          Next Hop            Metric     LocPrf Weight RouteTag Path
*>i10.1.1.0/24      10.10.11.1                       100      0        0 i <-/2>
*>i10.1.2.0/24      10.10.11.2                       100      0        0 i <-/2>
*>i10.1.2.0/24      10.10.10.2                       100      0        0 i <-/1>
*>i10.10.10.0/24    10.10.10.253                     100  32768        0 i <-/1>
*>i10.10.11.0/24    10.10.10.253                     100  32768        0 i <-/1>
*>i10.20.1.1/32     10.10.10.253                     100  32768        0 i <-/1>
*>i10.20.1.2/32     10.10.11.1                       100      0        0 i <-/2>
*>i10.20.1.3/32     10.10.11.2                       100      0        0 i <-/2>
*>i10.20.1.3/32     10.10.10.2                       100      0        0 i <-/1>
*>i172.16.1.0/30    10.10.10.253                     100  32768        0 i <-/1>

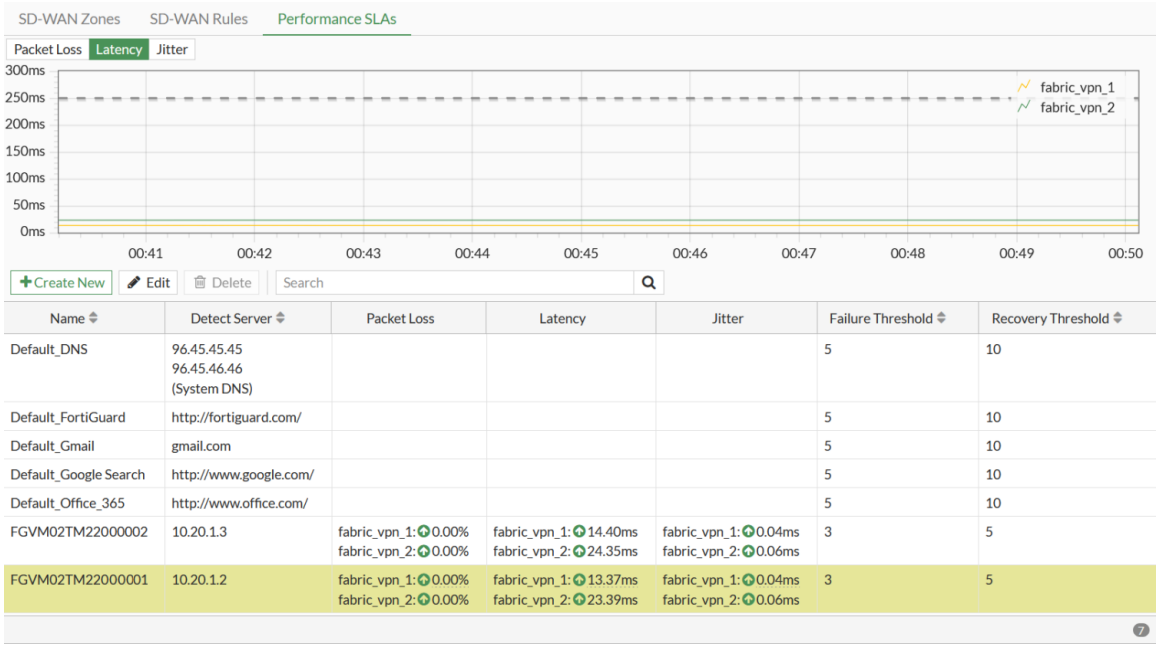
Total number of prefixes 10
```

3. In the GUI, go to *Dashboard > Network Monitor > Routing*.
4. In the dropdown, select *BGP Neighbors*.



To verify the performance SLAs on the hub:

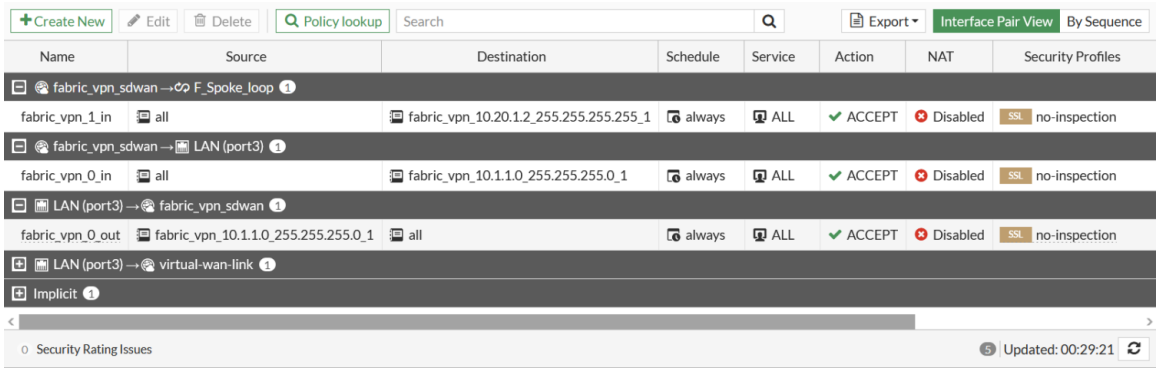
1. Go to *Network > SD-WAN* and select the *Performance SLAs* tab.
2. Verify that the performance SLAs are automatically created for each spoke. The performance SLA naming uses the serial number of the spoke FortiGate. There are two new entries.



To verify the firewall policies on a spoke FortiGate:

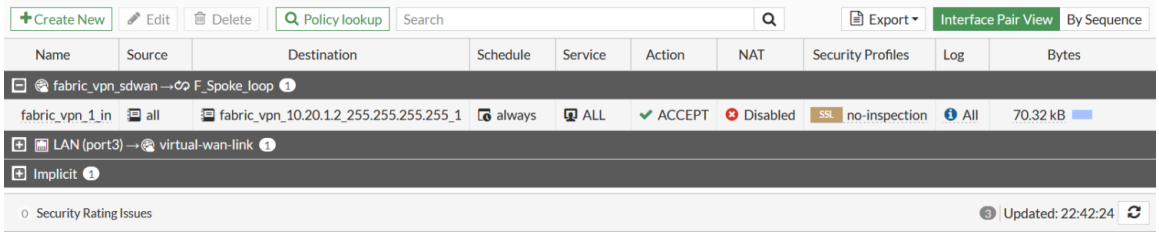
Different policies are created on the spoke FortiGates based on the hub's *Policy creation* setting in the Fabric Overlay Orchestrator configuration (*Automatic*, *Health check*, or *Manual*). The *Automatic* setting is used in this example.

1. Go to *Policy & Objects* > *Firewall Policy*.
2. Verify that wildcard firewall policies have been configured.



The *Automatic* policy creation option creates wildcard allow policies for the tunnel overlays. For some cases, these policies do not provide the necessary granularity to restrict overlay traffic to specific subnets or hosts.

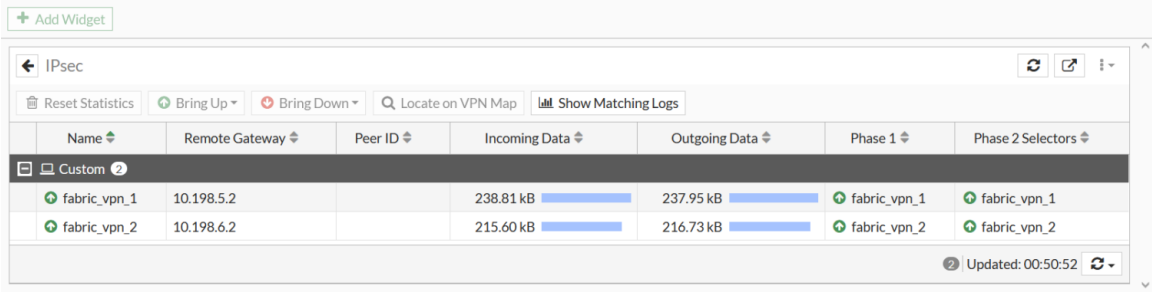
If the hub's *Policy creation*setting is *Health Check*, a single firewall policy that allows health check traffic to the spoke's loopback should be configured on the spoke FortiGates:



If the hub's *Policy creation*setting is *Manual*, there should be no new policies created by the Fabric Overlay Orchestrator. If desired, firewall policies must be manually configured on the spoke FortiGates to allow traffic to the loopback interface for health checks and the overlays.

To verify the IPsec VPN tunnels on a spoke:

1. Go to *Dashboard* > *Network Monitor* > *VPN*.
2. Verify the IPsec tunnels that go back to the hub.



To verify BGP routing on a spoke:

1. In the CLI, check the BGP peering status:

```
Branch1 # get router info bgp summary

VRF 0 BGP router identifier 10.20.1.2, local AS number 65400
BGP table version is 5
1 BGP AS-PATH entries
0 BGP community entries

Neighbor     V         AS MsgRcvd MsgSent   TblVer  InQ OutQ Up/Down  State/PfxRcd
10.10.10.253 4      65400      41      37        4    0    0 00:23:39        8
10.10.11.253 4      65400      38      34        4    0    0 00:23:33        8

Total number of neighbors 2
```

2. Check the BGP advertised routes:

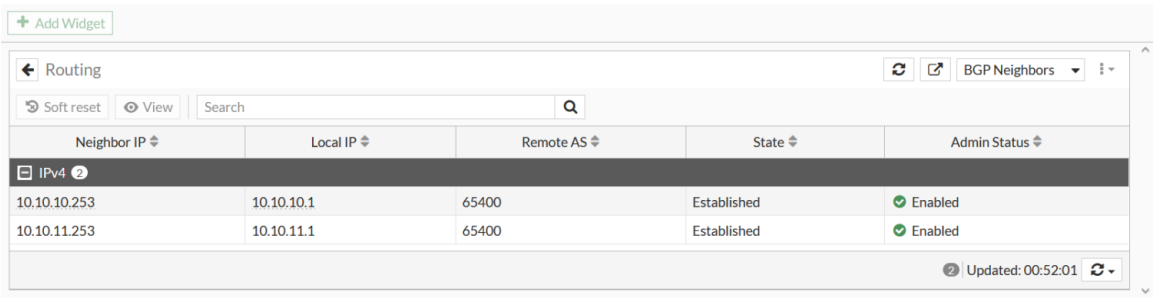
```
Branch1 # get router info bgp neighbors 10.10.10.253 advertised-routes
VRF 0 BGP table version is 5, local router ID is 10.20.1.2
Status codes: s suppressed, d damped, h history, * valid, > best, i - internal
Origin codes: i - IGP, e - EGP, ? - incomplete

   Network          Next Hop            Metric     LocPrf Weight RouteTag Path
```

```
*>i10.1.1.0/24      10.10.10.1                100  32768        0 i <0/->
*>i10.20.1.2/32     10.10.10.1                100  32768        0 i <0/->

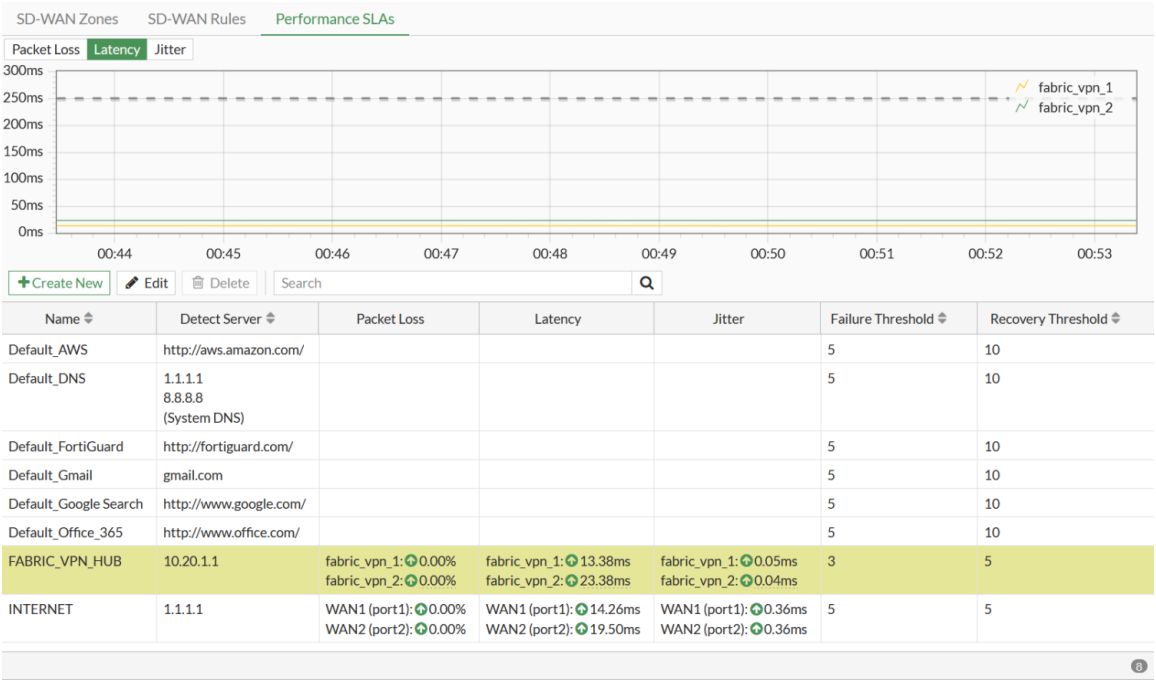
Total number of prefixes 2
```

3. In the GUI, go to *Dashboard* > *Network Monitor* > *Routing*.
4. In the dropdown, select *BGP Neighbors*.



To verify the performance SLAs on a spoke:

1. Go to *Network* > *SD-WAN* and select the *Performance SLAs* tab.
2. Verify that the performance SLA is automatically created for the hub FortiGate. There is a new entry (*FABRIC_VPN_HUB*).



To verify the spoke-to-spoke ADVPN communication:

1. From Branch1, ping Branch2 (10.20.1.3):

```
Branch1 # exec ping-options source 10.20.1.2
Branch1 # exec ping 10.20.1.3
```

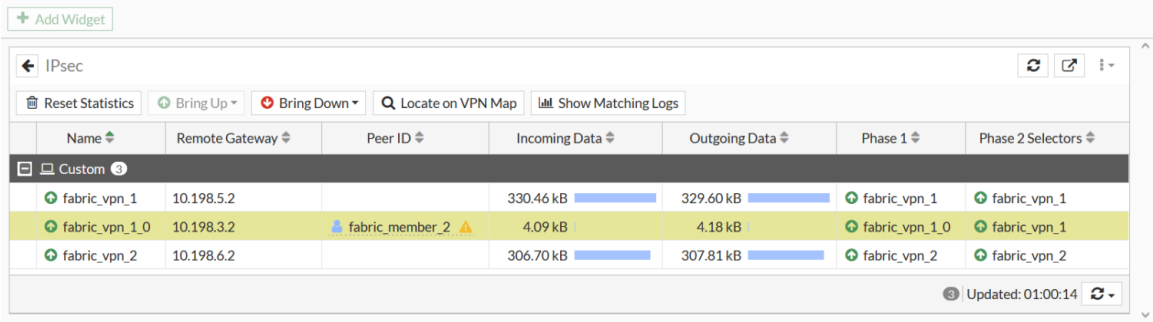
```
PING 10.20.1.3 (10.20.1.3): 56 data bytes
64 bytes from 10.20.1.3: icmp_seq=0 ttl=254 time=27.7 ms
64 bytes from 10.20.1.3: icmp_seq=2 ttl=255 time=17.4 ms
64 bytes from 10.20.1.3: icmp_seq=3 ttl=255 time=17.5 ms
64 bytes from 10.20.1.3: icmp_seq=4 ttl=255 time=17.4 ms

--- 10.20.1.3 ping statistics ---
5 packets transmitted, 4 packets received, 20% packet loss
round-trip min/avg/max = 17.4/20.0/27.7 ms
```

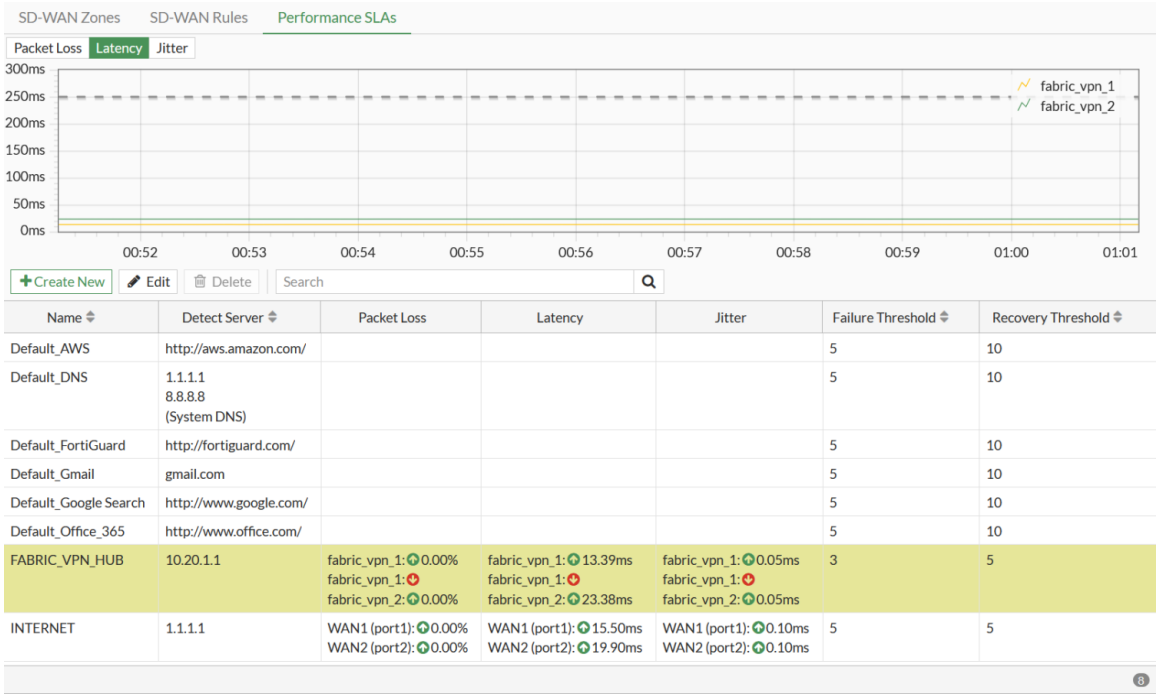
2. Verify the IPsec tunnel summary.
   - In the CLI, enter the following:

     ```
     Branch1 # get vpn ipsec tunnel summary
     'fabric_vpn_1_0' 10.198.3.2:0  selectors(total,up): 1/1  rx(pkt,err): 25/0  tx(pkt,err):
     26/2
     'fabric_vpn_1' 10.198.5.2:0  selectors(total,up): 1/1  rx(pkt,err): 8032/0  tx(pkt,err):
     8022/2
     'fabric_vpn_2' 10.198.6.2:0  selectors(total,up): 1/1  rx(pkt,err): 7462/0  tx(pkt,err):
     7478/1
     ```

     The `fabric_vpn_1_0` tunnel was created for spoke 1-to-spoke 2 communication.
   - In the GUI, go to *Dashboard > Network Monitor > VPN*.



3. Verify that the performance SLA was updated. Go to *Network > SD-WAN* and select the *Performance SLAs* tab.



Name	Detect Server	Packet Loss	Latency	Jitter	Failure Threshold	Recovery Threshold
Default_AWS	http://aws.amazon.com/				5	10
Default_DNS	1.1.1.1 8.8.8.8 (System DNS)				5	10
Default_FortiGuard	http://fortiguard.com/				5	10
Default_Gmail	gmail.com				5	10
Default_Google Search	http://www.google.com/				5	10
Default_Office_365	http://www.office.com/				5	10
FABRIC_VPN_HUB	10.20.1.1	fabric_vpn_1: 0.00% fabric_vpn_1: fabric_vpn_2: 0.00%	fabric_vpn_1: 13.39ms fabric_vpn_1: fabric_vpn_2: 23.38ms	fabric_vpn_1: 0.05ms fabric_vpn_1: fabric_vpn_2: 0.05ms	3	5
INTERNET	1.1.1.1	WAN1 (port1): 0.00% WAN2 (port2): 0.00%	WAN1 (port1): 15.50ms WAN2 (port2): 19.90ms	WAN1 (port1): 0.10ms WAN2 (port2): 0.10ms	5	5

The first performance SLA, *fabric_vpn_1*, that corresponds to the spoke-to-hub VPN tunnel is shown as up. The second one, *fabric_vpn_1* that corresponds to the spoke-to-spoke VPN tunnel (*fabric_vpn_1_0*) is shown as down since 10.20.1.1 is the IP address corresponding to the hub's loopback interface that is not present on another spoke.

Configuring SD-WAN rules on the hub FortiGate

On the hub, the Fabric Overlay Orchestrator automatically creates a performance SLA that corresponds to each spoke FortiGate using the serial number as the name of the performance SLA. SD-WAN rules must be configured on the hub FortiGate to direct traffic to each of the spokes using these performance SLAs.

To configure SD-WAN rules on the hub FortiGate:

1. Go to *Network* > *SD-WAN*, select the *SD-WAN Rules* tab, and click *Create New*.
2. Enter a name (such as *Hub-To-Br1*).
3. In the *Source* section, set the *Address* to the local subnet of the hub.
4. Configure the following in the *Destination* section:
   a. Set the *Address* to the local subnet of the spoke. If an address object does not exist yet, click *Create* in the slide-out pane and configure the address.
   b. Set the *Protocol number* as needed (default = *ANY*).
5. Configure the following in the *Outgoing Interfaces* section:
   a. Set the *Interface selection strategy* to *Lowest cost (SLA)*.
   b. Set the *Interface preference* to the SD-WAN members.
   c. Set *Required SLA target* to the corresponding performance SLA created by the Fabric Overlay Orchestrator for this the spoke. The name is based on the spoke FortiGate's serial number (*FGVM0XXX00000000 #1*).

6. Click *OK*.
7. Repeat these steps for the other spoke. Ensure the *Name* is unique, and that the *Destination* address corresponds to the local subnet behind the spoke.

If you need to disable the Fabric Overlay Orchestrator on the hub FortiGate by setting the *Status* to *Disabled*, you must first delete any SD-WAN rules on the hub FortiGate created using this procedure to ensure the added configuration does not block the clean-up process.

Configuring SD-WAN rules on the spoke FortiGates

On each spoke, the Fabric Overlay Orchestrator automatically creates a performance SLA that corresponds to the hub FortiGate. An SD-WAN rule must be configured on the spoke FortiGates to direct traffic to the hub FortiGate using this performance SLA.

To configure an SD-WAN rule on a spoke FortiGate:

1. Go to *Network* > *SD-WAN*, select the *SD-WAN Rules* tab, and click *Create New*.
2. Enter a name (such as *LAN-to-HUB*).
3. In the *Source* section, set the *Address* to the local subnet of the spoke.
4. Configure the following in the *Destination* section:
   a. Set the *Address* to the local subnet of the hub. If an address object does not exist yet, click *Create* in the slide-out pane and configure the address.
   b. Set the *Protocol number* as needed (default = *ANY*).
5. Configure the following in the *Outgoing Interfaces* section:
   a. Set the *Interface selection strategy* to *Lowest cost (SLA)*.
   b. Set the *Interface preference* to the SD-WAN members.
   c. Set *Required SLA target* to the corresponding performance SLA created by the Fabric Overlay Orchestrator, which is named *FABRIC_VPN_HUB#1* by default.
6. Click *OK*.

If you need to disable the Fabric Overlay Orchestrator on a spoke FortiGate by setting the *Status* to *Disabled*, you must first delete any SD-WAN rules on the spoke FortiGate created using this procedure to ensure the added configuration does not block the clean-up process.

SPA easy configuration key for FortiSASE

A gutter section is available in the *Fabric Overlay Orchestrator* page if the FortiSASE SPA license is active. From this section, the user can open a pane that will generate a FortiSASE SPA easy configuration key based on the current Fabric Overlay Orchestrator configuration which can be used in the SPA setup of FortiSASE.

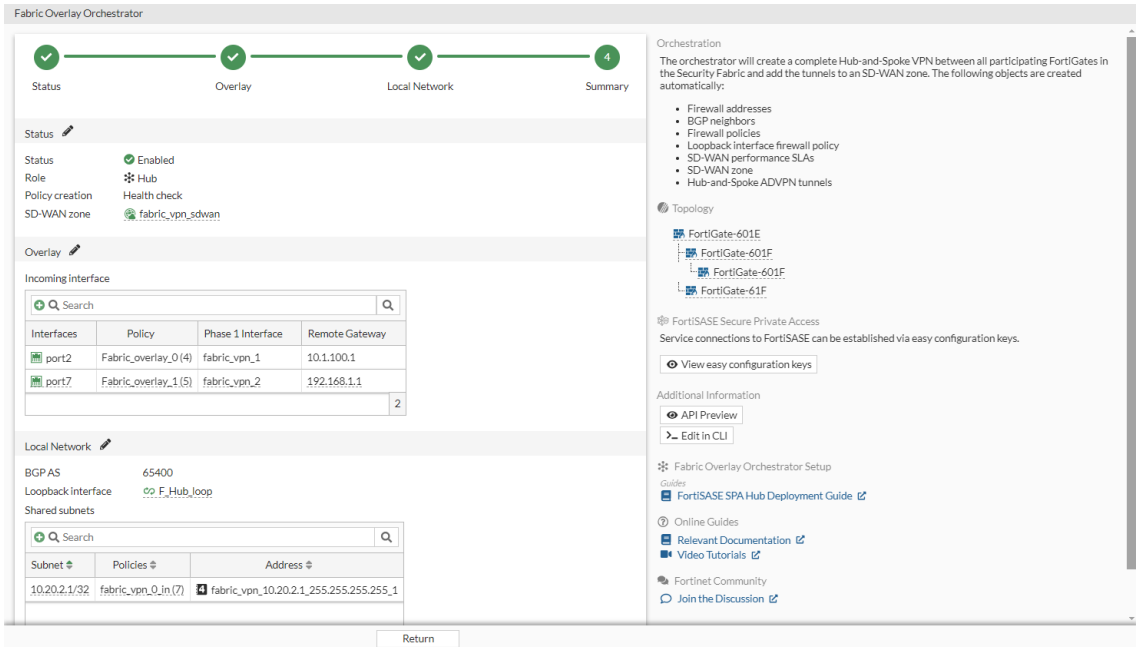
The easy configuration key is an encode of Base64 of a JSON object. It includes the FortiOS version, gateway, peer IP address, BGP Autonomous Systems (AS), BGP method, and the FortiSASE BGP router subnet.

To access the easy configuration key:

1. Prepare the two FortiGates:
   a. Go to *System* > *FortiGuard* and confirm that the FortiGates have a FortiSASE SPA license.

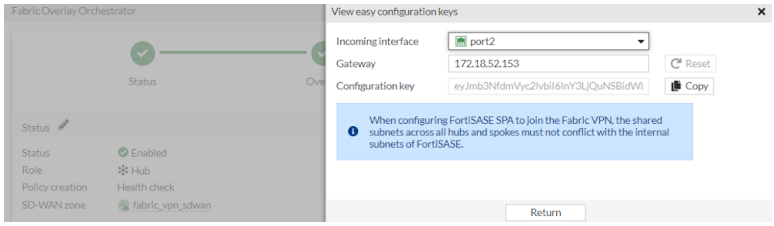
   b. Configure the Security Fabric in both FortiGates.
   c. Go to *VPN* > *Fabric Overlay Orchestrator* and enable it on both FortiGates. See Using the Fabric Overlay Orchestrator on page 3137.

   The *FortiSASE Secure Private Access* section will be included in the gutter.



2. Access the easy configuration key:

a. In *VPN* > *Fabric Overlay Orchestrator*, click *View easy configuration keys* in the gutter.
The *View easy configuration keys* pane is displayed.



b. Select the *Incoming interface*.

c. Enter the *Gateway*.

> Shared subnets cannot conflict with FortiSASE's internal subnets.

d. Click *Copy* beside the *Configuration key*.
This easy configuration key can be pasted into FortiSASE when setting up SPA.

> If the FortiOS administrator makes any changes to BGP or to their IPsec, the configuration key is auto-updated on FortiOS. However, the FortiSASE administrator needs to know to re-copy and paste the configuration into FortiSASE.
>
> Currently, there is no way to detect the above and throw a warning on either FortiSASE nor FortiOS GUI.

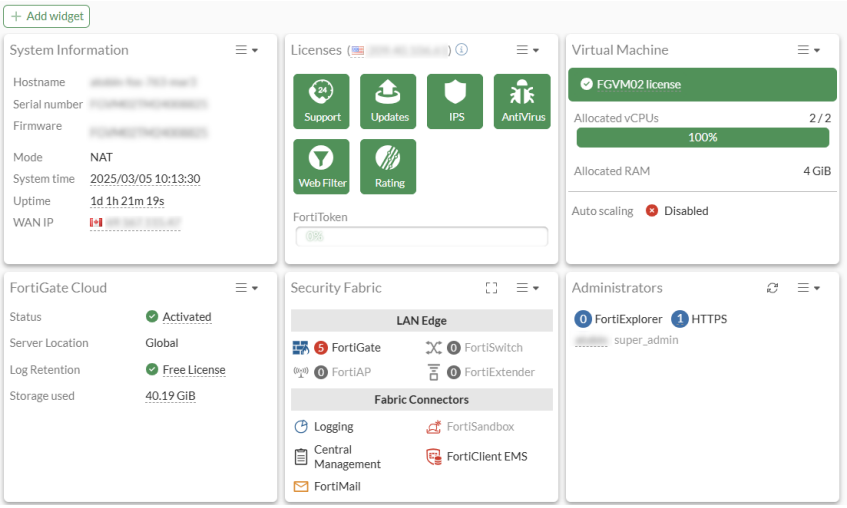
Fabric Overlay Orchestrator Topology dashboard widget for hub FortiGates

The *Fabric Overlay Orchestrator Topology* dashboard widget provides an interactive view of hub and spoke devices previously configured using the Fabric Overlay Orchestrator feature. It can display health-check status, multiple tunnels, resource usage, shortcuts, and so on.

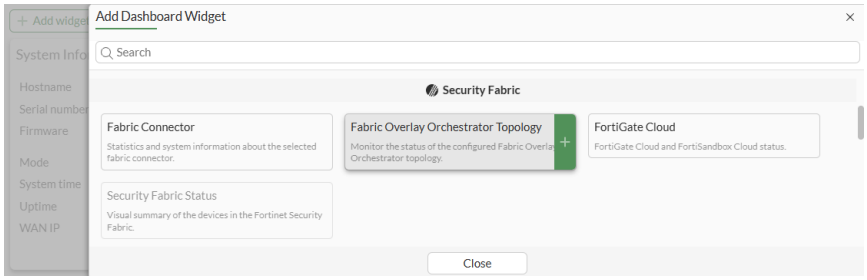
> This dashboard widget is only available on the hub or root FortiGate device.

To enable the Fabric Overlay Orchestrator Topology widget:

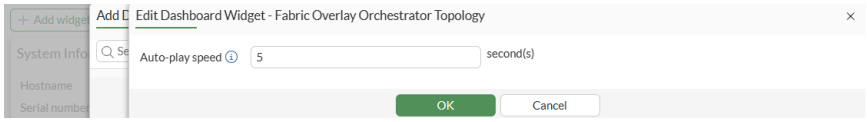
1. Go to *Dashboard* > *Status*.



2. Click *Add widget*.
3. Select *Fabric Overlay Orchestrator Topology* under *Security Fabric*.



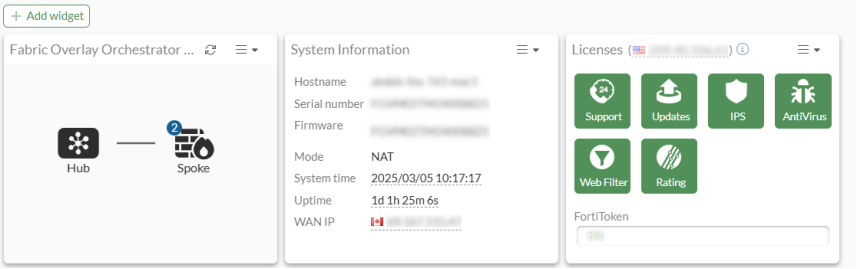
4. Enter the *Auto-play speed*.



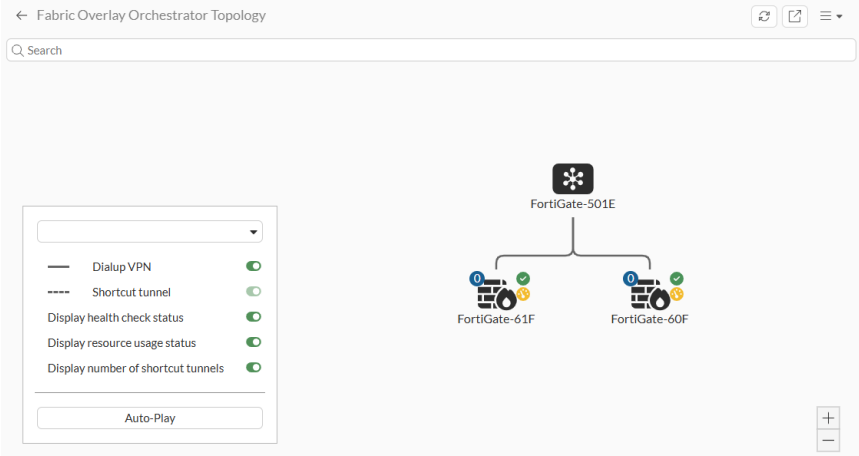
5. Click *OK*.
6. Click *Close*.

To review hub and spoke details in the Fabric Overlay Orchestrator Topology widget:

1. Go to *Dashboard* > *Status*.



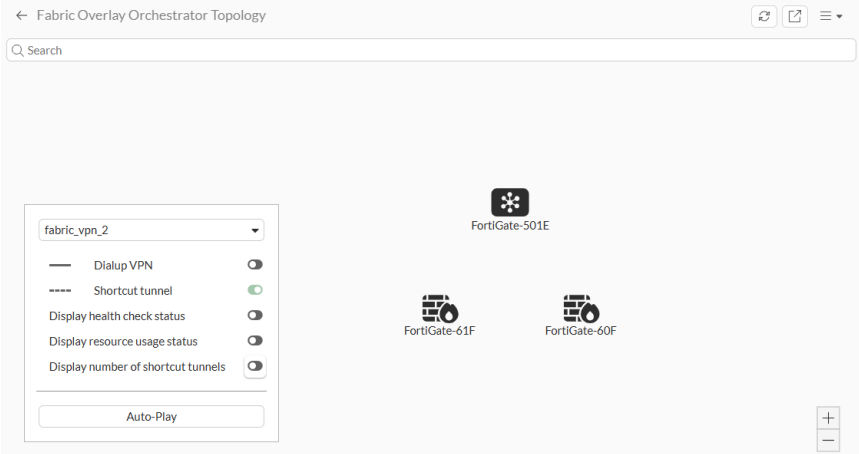
2. Click the *Fabric Overlay Orchestrator Topology* widget to expand it.



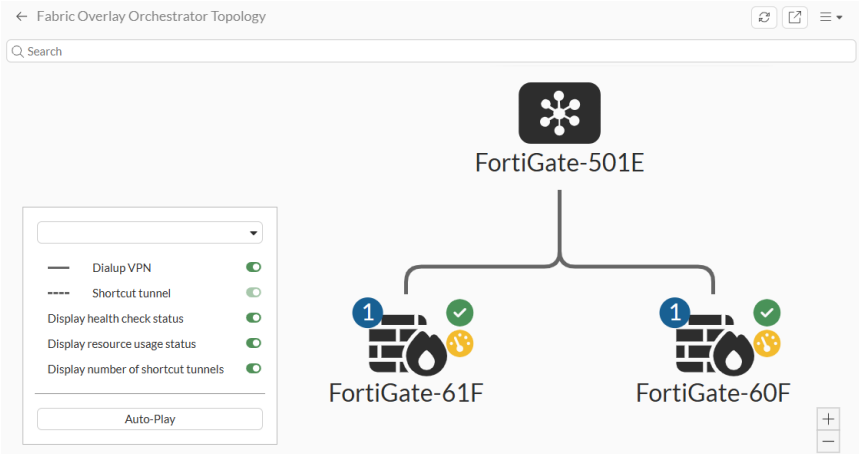
3. Review the topology:
   - Select a hub or spoke in the topology to view *Details*, such as *Latency*, *Jitter*, and usage information.

   - Hover over a hub or spoke in the topology to view device information, such as *Serial Number*, *Model*, and *Version* information.

   - Toggle the display options to define what is displayed.



- Use the + and - to zoom in and out of the topology.



Other VPN topics

The following topics provide instructions on configuring other VPN topics.

- VPN and ASIC offload on page 3160
- Encryption algorithms on page 2766
- Configure DSCP for IPsec tunnels on page 3171
- Windows IKEv2 native VPN with user certificate on page 3173
- IPsec IKE load balancing based on FortiSASE account information on page 3187
- IPsec SA key retrieval from a KMS server using KMIP on page 3189
- Multiple interface monitoring for IPsec on page 3201

VPN and ASIC offload

This topic provides a brief introduction to VPN traffic offloading.

IPsec traffic processed by NPU

1. Check the device ASIC information. For example, a FortiGate 900D has an NP6 and a CP8.

```
# get hardware status
Model name: [[QualityAssurance62/FortiGate]]-900D
ASIC version: CP8
ASIC SRAM: 64M
CPU: Intel(R) Xeon(R) CPU E3-1225 v3 @ 3.20GHz
Number of CPUs: 4
RAM: 16065 MB
Compact Flash: 1925 MB /dev/sda
Hard disk: 244198 MB /dev/sdb
USB Flash: not available
Network Card chipset: [[QualityAssurance62/FortiASIC]] NP6 Adapter (rev.)
```

2. Check port to NPU mapping.

```
# diagnose npu np6 port-list
Chip   XAUI Ports            Max   Cross-chip
                             Speed offloading
----
np6_0  0
        1.    port17           1G    Yes
        1.    port18           1G    Yes
        1.    port19           1G    Yes
        1.    port20           1G    Yes

----
```

3. Configure the option in IPsec phase1 settings to control NPU encrypt/decrypt IPsec packets (enabled by default).

```
config vpn ipsec phase1/phase1-interface
    edit "vpn_name"
        set npu-offload enable/disable
    next
end
```

4. Check NPU offloading. The NPU encrypted/decrypted counter should tick. The `npu_flag 03` flag means that the traffic processed by the NPU is bi-directional.

```

        sha512           : 0                1.
```

2. Two options are used to control if the CP processes packets. If disabled, packets are processed by the CPU.

```
config system global
    set ipsec-asic-offload disable
    set ipsec-hmac-offload disable
end
```

IPsec traffic processed by CPU

IPsec traffic might be processed by the CPU for the following reasons:

- Some entry-level models do not have NPUs.
- NPU offloading and CP IPsec traffic processing manually disabled.
- Some types of proposals - SEED, ARIA, chacha20poly1305 - are not supported by the NPU or CP.
- NPU flag set to 00 and software encrypt/decrypt counter ticked.

```

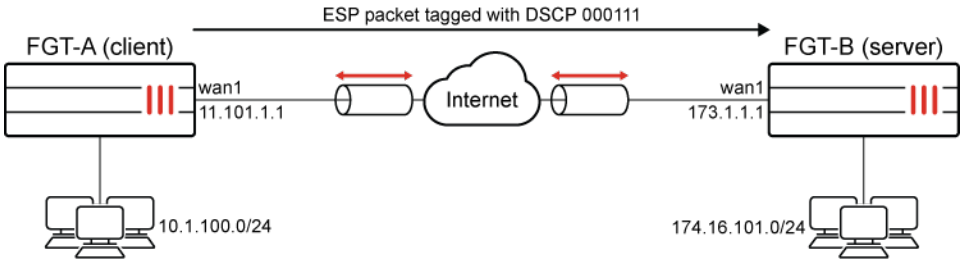
Configure DSCP for IPsec tunnels

Configuring the differentiated services (DiffServ) code in phase2 of an IPsec tunnel allows the tag to be applied to the outer IP header of the Encapsulating Security Payload (ESP) packet. This allows more control over the DSCP value of the ESP packet that can be used by the ISP for QoS controls.

This may be helpful when there is already a DSCP tag within the inner IP header of encapsulated payload. When the inner IP header has a DSCP tag:

- If `diffserv` is disabled in the IPsec phase2 configuration, then the ESP packets' DSCP value is copied from the DSCP value of the inner IP header.
- If `diffserv` is enabled in the IPsec phase2 configuration, then ESP packets' DSCP value is set to the configured value.

Offloading traffic to the NPU must be disabled for the tunnel in order for the configured DSCP value to be applied to the outer IP header of the ESP packet. If NPU offloading is enabled, and diffserv is enabled on the IPsec phase2 settings, then the DSCP value is copied from the inner IP header to the outer IP header.



In this example, NPU offloading is disabled, diffserv is enabled, and the diffserv code is set to 000111 on FGT-A. ESP packets egressing from FGT-A will have the DSCP tag which can be used by the ISP for QoS purpose. Only one side of the tunnel needs to have diffserv enabled.

To configure IPsec on FGT-A:

1. Configure the phase1-interface:

```
config vpn ipsec phase1-interface
    edit "s2s"
        set interface "wan1"
        set peertype any
        set net-device disable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set npu-offload disable
        set dhgrp 14 5
        set wizard-type static-fortigate
        set remote-gw 173.1.1.1
        set psksecret **********
    next
end
```

2. Configure the phase2-interface:

```
config vpn ipsec phase2-interface
    edit "s2s"
        set phase1name "s2s"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm aes256gcm
chacha20poly1305
        set dhgrp 14 5
        set diffserv enable
        set diffservcode 000111
        set src-addr-type name
        set dst-addr-type name
        set src-name "s2s_local"
        set dst-name "s2s_remote"
    next
end
```

3. Check the state of the IPsec tunnel:

```
FGT-A # diagnose vpn tunnel list
list all ipsec tunnel in vd 0
------------------------------------------------------
name=s2s ver=1 serial=1 11.101.1.1:0->173.1.1.1:0 tun_id=173.1.1.1 dst_mtu=1500
bound_if=17 lgwy=static/1 tun=intf/0 mode=auto/1 encap=none/512 options[0200]=frag-rfc  run_
state=0 accept_traffic=1 overlay_id=0

```

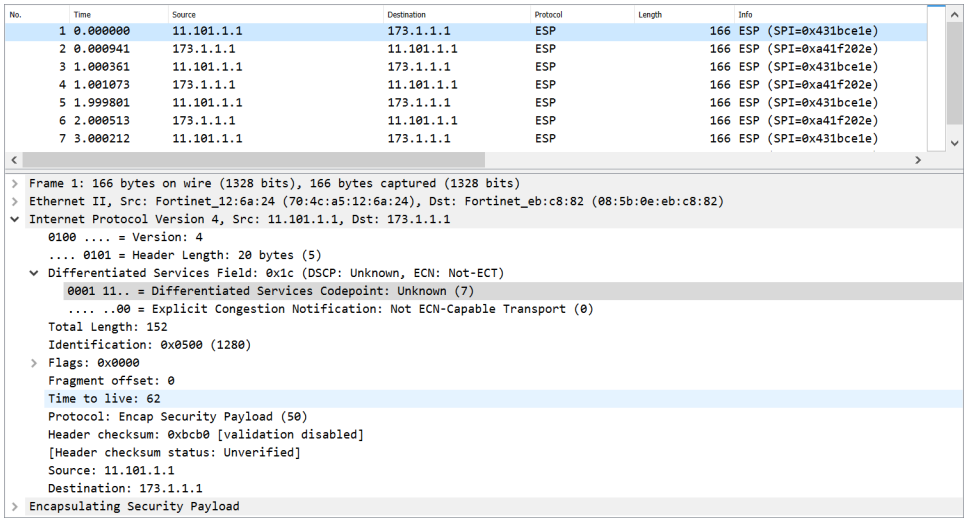
4. Use a packet analyzer, or sniffer, to check the ESP packets:



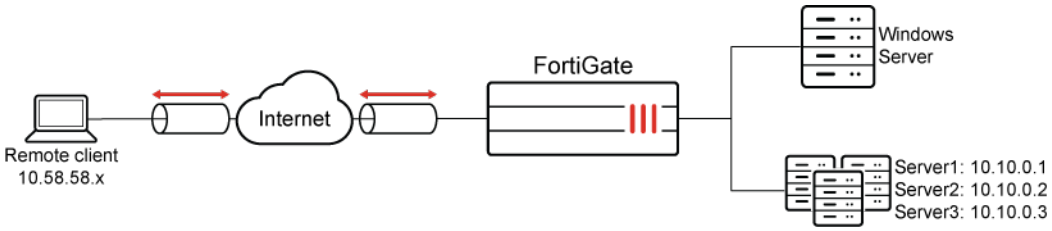
Windows IKEv2 native VPN with user certificate

In this example, IKEv2 with Extensible Authentication Protocol – Transport Layer Security (EAP-TLS) using mutual certificate authentication is configured. Mutual certificate authentication means that both the client and server use certificates to identify themselves. EAP uses RADIUS, which is handled by the Network Policy Server (NPS) on the Windows server. Certificates are generated and distributed through Active Directory Certificate Services (AD CS). An additional certificate is used to identify the IPsec gateway.

This example assumes that the following Windows server roles are installed and available:

- NPS (RADIUS)
- AD CS with a generated CA
- Group Policy Management
- DNS server

It is also assumed that a connection is established between the NPS and FortiGate, and a DNS entry exists for the NPS that the FortiGate can resolve.



Certificates

The following certificates are required:

- CA certificate for EAP-TLS to sign the client and server certificates.

  The CA certificate must be able to sign other certificates. It is created after AD CSs CA role installation. It is named lab-local-CA, as lab.local is the domain that is used in this example. The CA certificate is automatically installed on the server that is hosting the AD CS role. In this example, that server is also hosting the NPS and DNS server.

  The *Key Usage* specifies *Certificate Signing*.
- Client certificate for EAP-TLS used by the windows client.

  The client certificate is stored in the personal user certificate store and is used to authenticate the user. The certificate has *Client Authentication* and a SAN of the user's FQDN, and is signed by the CA. The CA is stored in *Current User > Trusted Root Certification Authorities*.
- Server certificate for EAP-TLS used by the server providing RADIUS authentication.

  The NPS certificate must be in the hosting server's certificate store so that the NPS can access it. It has *Server Authentication* and a SAN DNS name to match the server's IP address. The user must use the FQDN to connect to the VPN. If the IP address that the name resolves to is used, the certificate will not be considered valid.
- VPN certificate used to identify the FortiGate dialup gateway.

  The VPN certificate and private key are installed to the FortiGate using a CSR generated by the FortiGate

Configure the Windows server

The Windows server includes AD-CS, a RADIUS server, and a DNS server.

After the AD CS role has been installed and configured, the CA is ready to sign certificates.

Users and groups are defined first. The groups are configured to automatically receive certificates and relay membership to the FortiGate for granular access control through group matching in policies.

RADIUS is used to authorize connecting users. The RADIUS server returns users' groups with the access-accept response, to indicate to the FortiGate what groups the users belong to.

To create security groups and users:

1. Open *Active Directory Users and Computers*.
2. Create two groups, *Group1* and *Group2*.
3. Create two users, *User1* and *User2*.

   a. To ensure that the automatic enrollment process succeeds in subsequent steps, ensure that each users has an email address configured in the *Email* field under *Properties* > *General*.
4. Add *User1* to *Group1* and *User2* to *Group2*.

To create a certificate template to enable automatic enrollment for the user groups:

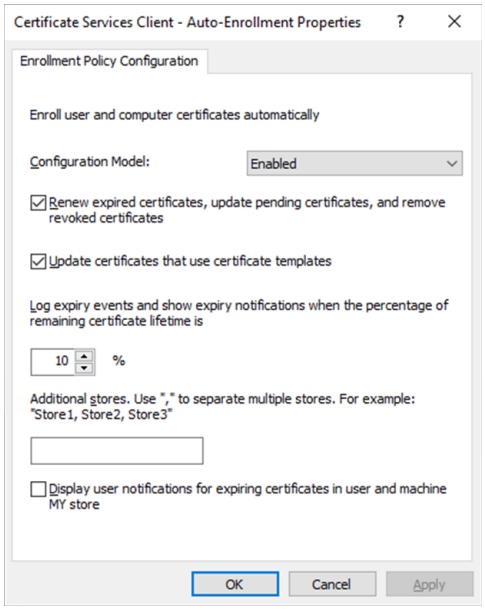
1. Open *Certification Authority*.
2. In the navigation pane, expand the new CA, right-click *Certificate Template* and click *Manage*.
3. Configure a new certificate template:
   a. Right-click the *User* template and click *Duplicate Template*.
   b. On the *General* tab, enter a *Template display name*, such as *User Auto Enroll*.
   c. Enable *Publish certificate in Active Directory* and *Do not automatically reenroll...*.

   d. Configure the remaining settings as required, then go to the *Request Handling* tab.
   e. Disable *Allow private key to be exported* and select *Enroll subject without requiring any user input*.
   f. On the *Security* tab, in *Group or user name*, click *Add*.
   g. Add *Group1* and *Group2*.
   h. Select each group and, under *Permissions*, enable *Read*, *Enroll*, and *Autoenroll*.
   i. On the *Extensions* tab, click *Application Policies* then click *Edit*.
   j. Remove all of the policies expect for *Client Authentication*.
   k. Click *OK* then close the *Certificate Templates* console.
4. In the navigation pane, right-click *Certificate Template* and click *New* > *Certificate Template to Issue*.
5. Select the new certificate template, *User Auto Enroll*, then click *OK*.

To create a group policy to enable automatic enrollment:

1. Open the *Group Policy Management* console.
2. In the navigation pane, go to *Forest:lab.local* > *Domains* > *lab.local*, and then click *Group Policy Objects*.

3. Click *Action*, and then click *New*.
4. Set a *Name* for the new GPO then click *OK*.
5. Right-click the new GPO and click *Edit*.
6. In the *Group Policy Management Editor* navigation pane, go to *User configuration* > *Policies* > *Windows Settings* > *Security Settings* > *Public Key Policies*.
7. In the content pane, double-click *Certificate Services Client - Auto-Enrollment*.
8. Set *Configuration Model* to *Enabled*.
9. Enable *Renew expired certificates...* and *Update certificates...*.



10. Click *OK*.

To verify that users are receiving certificates:

1. Log into an endpoint with a domain user.
2. On the server, open Certification Authority.
3. Expand the CA and select *Issued Certificates*.
4. Verify that the user logged into the endpoint is listed under *Requested Name*. You can also check the local user certificate store on the endpoint.

To generate and sign a CSR and import the signed certificate to the FortiGate:

1. On the FortiGate and go to *System* > *Certificates* and click *Create/Import* > *Generate CSR*.
2. Configure the CSR:

Certificate Name	vpn.lab.local
ID Type	Domain Name
Domain Name	vpn.lab.local
Subject Alternative Name	DNS:vpn.lab.local

3. Configure the remaining settings as required, then click *OK*.

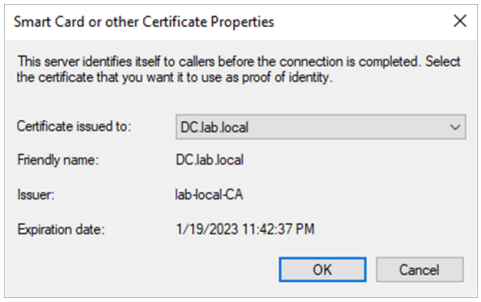
4. Download the CSR to a location that is accessible to the CA server, in this example: C:\CSR\
5. Sign the CSR with the previously created CA:
   a. Open the command prompt as an administrator and enter the following:

      ```
      certreq -submit -attrib "CertificateTemplate:WebServer" C:\CSR\vpn.lab.local.csr
      ```

      The *Certification Authority List* window opens.
   b. Select the CA and click *OK*.
   c. Save the signed certificate with a .cer file extension to a location that is accessible from the FortiGate.
6. Import the signed certificate to the FortiGate:
   a. On the FortiGate, go to *System* > *Certificates* and click *Create/Import* > *Certificate*.
   b. Click *Import Certificate*.
   c. Set *Type* to *Local Certificate*.
   d. Click *Upload* and locate and select the signed certificate
   e. Click *Create* then click *OK*.

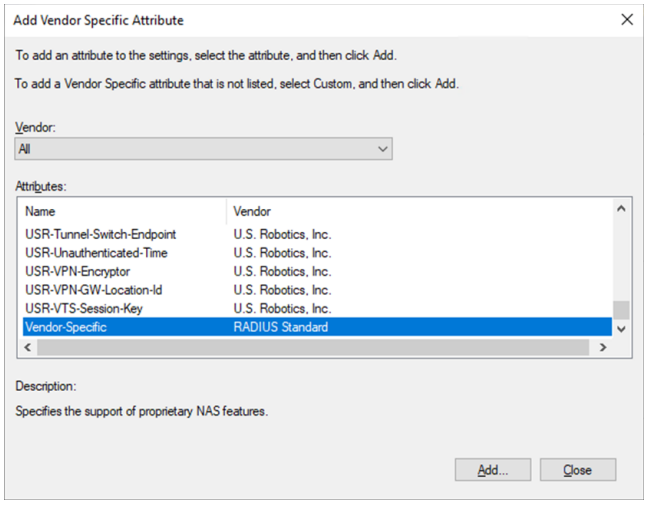
To configure network policies on the RADIUS server:

1. Open the *Network Policy Server* and, in the console tree, expand *Policies*.
2. Right-click on *Network Policies* and click *New*.
3. Enter a *Policy name*, such as *VPN-Group1*, then click *Next*.
4. Under *Condition description* click *Add*:
   a. Select *User Groups*, then click *Add*.
   b. Click *Add Groups*.
   c. Enter the group name, *Group1*, click *Check Names* to confirm the group.
   d. Click *OK* in both windows.
5. Click *Next*.
6. Make sure that *Access granted* is selected, then click *Next*.
7. On the *Configure Authentication Methods* page, click *Add* and add the EAP type *Microsoft: Smart Care or other certificate*.
8. Edit the EAP type, select the previously generated certificate, then click *OK*.



9. Deselect all of the *Less secure authentication methods* then click *Next*.
10. Configure constraints as needed, then click *Next*.
11. On the *Configure Settings* page, under *RADIUS Attributes*, select *Vendor Specific*, then click *Add*:

a. In the *Attributes* list, select *Vendor-Specific*, then click *Add*.

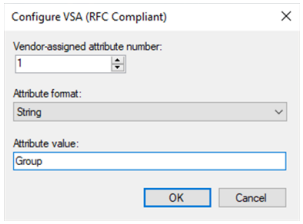


b. In the *Attribute Information* window, click *Add*.

c. In the *Vendor-Specific Attribute Information* window, enter the *Vendor Code*, *12356*, and select *Yes. It conforms*.

d. Click *Configure Attribute* and configure the following:

Vendor-assigned attribute number	1
Attribute format	String
Attribute value	Group



e. Click *OK* on all three windows and on the *Add Vendor Specific Attribute* window click *Close*.

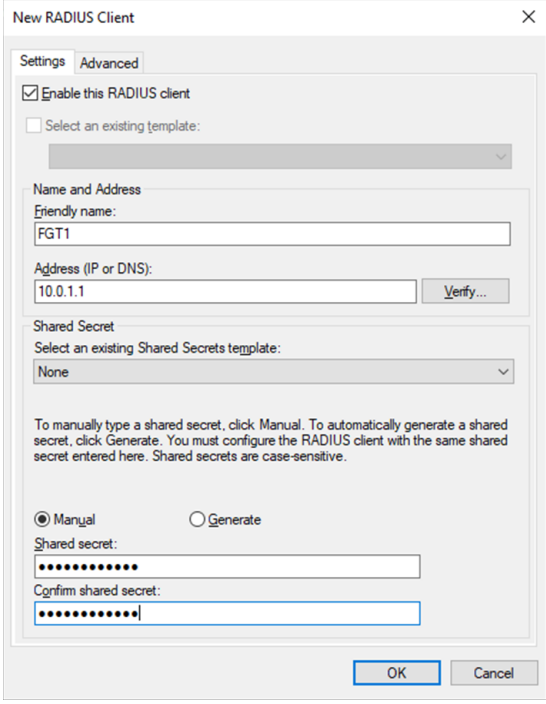
12. Click *Next*.
13. On the *Completing New Network Policy* page, review the configuration, then click *Finish*.
14. Duplicate the policy for *Group2*, and call the new policy *VPN-Group2*.
15. Reorder the policies so that *VPN-Group1* and *VPN-Group2* are one and two in the processing order.

To add the FortiGate as a RADIUS client:

1. Open the *Network Policy Server* and, in the console tree, expand *RADIUS Clients and Servers*.
2. Right-click on *RADIUS Clients* and click *New*.
3. Add the FortiGate as a RADIUS client:

Friendly name	FGT1

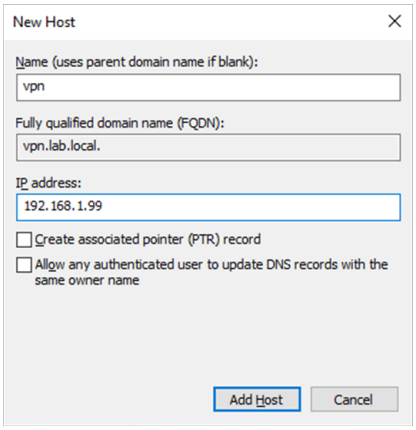
Address	10.0.1.1
Shared Secret	Manually enter the shared secret.



4. Click *OK*.

To create a DNS entry for the VPN connection:

1. Open the *DNS Manager*.
2. Go to *DC > Forward Lookup Zones* and select *lab.local*.
3. Right click in the content pane and select *New Host (A or AAAA)*.
4. Enter the VPN name. The FQDN should be auto-filled with *vpn.lab.local*.



5. Enter an IP address.
6. Click *Add Host*.

Configure the FortiGate

An IPsec VPN tunnel is configured to connect to the NPS (RADIUS) server for EAP authentication. For information about IPsec VPN, see IPsec VPN on page 2684.

A RADIUS server is added to relay VPN authentication requests to the NPS server. For information about RADIUS servers, see RADIUS servers on page 3399.

Three groups are created that point to the RADIUS server for authentication: one group each for user group *Group1*, user group *Group2*, and the remote server. For information about groups, see User groups on page 3359.

Three firewall policies are created to test the functionality of the three user groups (see Policies on page 1776):

- Policy 1 allows VPN clients to communicate with each other.
- Policy 2 allows VPN clients in the *Group1* user group to communicate with *Server1* and *Server3*.
- Policy 3 allows VPN clients in the *Group2* user group to communicate with *Server1* and *Server2*.

To configure IPsec VPN in the GUI:

1. Go to *VPN* > *IPsec Wizard*.
2. Enter a name for the VPN, such as *VPN1*.
3. Set *Template type* to *Custom*, then click *Next*.
4. In the *Network* section, configure the following:

Remote Gateway	Dialup User
Interface	port1
Mode Config	Enable
Assign IP From	Range
Client Address Range	10.58.58.1-10.58.58.10
DNS Server	192.168.1.100
Enable IPv4 Split Tunnel	Enable
Accessible Networks	Select the networks that VPN users will have access to.

5. In the *Authentication* section, configure the following:

Method	Signature
Certificate Name	vpn.lab.local
Version	2
Accept Types	Any peer ID

6. In the *Phase 1 Proposal* section, configure the following:

Encryption / Authentication	AES128 / SHA256
Encryption / Authentication	AES256 / SHA256

Encryption / Authentication	AES128 / SHA1
Diffie-Hellman Groups	14, 5, 2
Local ID	vpn.lab.local

7. In the *Phase 2 Selectors* section, configure the following:

Local Address	Named Address - all
Remote Address	Named Address - all
Encryption / Authentication	AES128 / SHA256
Encryption / Authentication	AES256 / SHA256
Encryption / Authentication	AES128 / SHA1
Enable Perfect Forward Secrecy (PFS)	Disable
Autokey Keep Alive	Enable

8. Enable EAP settings in the CLI:

```
config vpn ipsec phase1-interface
    edit VPN1
        set eap enable
        set eap-identity send-request
    next
end
```

To configure IPsec VPN in the CLI:

```
config vpn ipsec phase1-interface
    edit "VPN1"
        set type dynamic
        set interface "port1"
        set ike-version 2
        set authmethod signature
        set peertype any
        set net-device disable
        set mode-cfg enable
        set ipv4-dns-server1 192.168.1.100
        set proposal aes128-sha256 aes256-sha256 aes128-sha1
        set localid "vpn.lab.local"
        set dpd on-idle
        set dhgrp 14 5 2
        set eap enable
        set eap-identity send-request
        set certificate "vpn.lab.local"
        set ipv4-start-ip 10.58.58.1
        set ipv4-end-ip 10.58.58.10
        set ipv4-split-include "10/8_net"
        set dpd-retryinterval 60
```

```
    next
end
config vpn ipsec phase2-interface
    edit "VPN1"
        set phase1name "VPN1"
        set proposal aes128-sha256 aes256-sha256 aes128-sha1
        set pfs disable
        set keepalive enable
        set src-addr-type name
        set dst-addr-type name
        set src-name "all"
        set dst-name "all"
    next
end
```

To add the RADIUS server in the GUI:

1. Go to *User & Authentication > RADIUS Servers* and click *Create New*.
2. Enter a name for the server, such as *NPS*.
3. Enter the *Primary Server IP/Name* and *Secret*.
   The *Test User Credentials* option will not work, as it does not use certificates for the test.
4. Click *OK*.

To add the RADIUS server in the CLI:

```
config user radius
    edit "NPS"
        set server <ip>
        set secret **********
    next
end
```

To configure the user groups in the GUI:

1. Go to *User & Authentication > User Groups* and click *Create New*.
2. Enter a name for the group, such as *Group1*.
3. In the *Remote Groups* table, click *Add*:
   a. Set *Remote Server* to the just created RADIUS server, *NPS*.
   b. Set *Groups* to *Specify* and enter *Group1*.
   c. Click *OK*.
4. Click *OK*.
5. Create a second group called *Group2* with the same *Remote Server* and *Group Name* set to *Group2*.
6. Create a third group called RADIUS with the same *Remote Server* but no *Group Name*.

To configure the user groups in the CLI:

```
config user group
    edit "Group1"
        set member "NPS"
        config match
            edit 1
                set server-name "NPS"
                set group-name "Group1"
            next
        end
    next
    edit "Group2"
        set member "NPS"
        config match
            edit 1
                set server-name "NPS"
                set group-name "Group2"
            next
        end
    next
    edit "RADIUS"
        set member "NPS"
    next
end
```

To configure the policies in the GUI:

1. Go to *Policy & Objects* > *Firewall Policy* and click *Create New*.
2. Configure policy 1:

Name	VPN-VPN
Incoming Interface	VPN1
Outgoing Interface	VPN1
Source	all, RADIUS
Destination	all
Schedule	always
Service	ALL
NAT	Disable

3. Click *OK*.
4. Click *Create New* again and configure policy 2:

Name	VPN Group1
Incoming Interface	VPN1

Outgoing Interface	Server1, Server3
Source	all, Group1
Destination	10.10.0.1, 10.10.0.3
Schedule	always
Service	ALL
NAT	Disable

5. Click *OK*.
6. Click *Create New* again and configure policy 3:

Name	VPN Group2
Incoming Interface	VPN1
Outgoing Interface	Server1, Server2
Source	all, Group2
Destination	10.10.0.1, 10.10.0.2
Schedule	always
Service	ALL
NAT	Disable

7. Click *OK*.

To configure the policies in the CLI:

```
config firewall policy
    edit 1
        set name "VPN-VPN"
        set srcintf "VPN1"
        set dstintf "VPN1"
        set action accept
        set srcaddr "all" "RADIUS"
        set dstaddr "all"
        set schedule "always"
        set service "ALL"
        set nat disable
    next
    edit 2
        set name "VPN Group1"
        set srcintf "VPN1"
        set dstintf "Server1" "Server3"
        set action accept
        set srcaddr "all" "Group1"
        set dstaddr "10.10.0.1" "10.10.0.3"
        set schedule "always"
        set service "ALL"
```

```
        set nat disable
    next
    edit 3
        set name "VPN Group2"
        set srcintf "VPN1"
        set dstintf "Server1" "Server2"
        set action accept
        set srcaddr "all" "Group2"
        set dstaddr "10.10.0.1" "10.10.0.2"
        set schedule "always"
        set service "ALL"
        set nat disable
    next
end
```

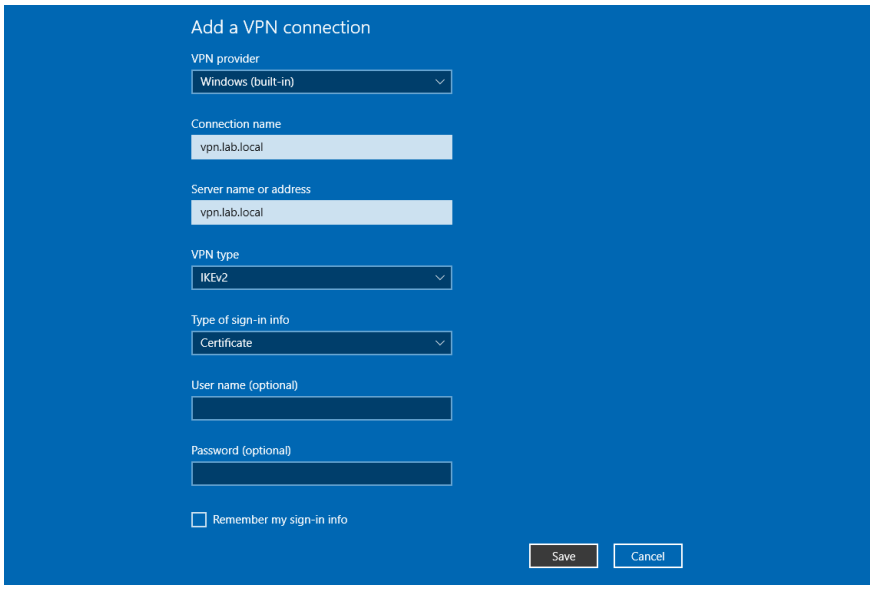
Configure the Windows client

The configuration is done on a Windows 10 Enterprise endpoint.

To add VPN connection and configure a VPN interface:

1. Open the *Settings* page and go to *Network & Internet > VPN*.
2. Click *Add a VPN connection*.
3. Configure the following:

VPN provider	Windows (built-in)
Connection name	vpn.lab.local
Server name or address	vpn.lab.local
VPN type	IKEv2
Type of sign-in info	Certificate



4. Click *Save*.
5. Go to *Network & Internet* > *Status* and, under *Advanced network settings*, click *Change adapter options*.
6. Select the VPN connection then click *Change settings of this connection*, or right-click on the connection and select *Properties*:
   a. Go to the *Security* tab and, in the *Authentication* section, click *Properties*.
   b. Select *Use a certificate on this computer* and enable *Use simple certification selection*.
   c. Enable *Verify the server's identity by validating the certificate*.
   d. Optionally, enable *Connect to these servers* and enter your NPS server's FQDN, in this case *DC.lab.local*.
   e. In the *Trusted Root Certificate Authorities* list, select the CA *lab-local-CA*.

   f. Click *OK*, then click *OK* again.

To test the connection:

1. Log in to the Windows endpoint as user1.
2. Open the network settings and connect to the *vpn.lab.local* VPN.
3. Ping each of the three servers to confirm that you can connect to server1 (10.10.0.1) and server3 (10.10.0.3), but not server2 (10.10.0.2).
4. Log out of the Windows endpoint, then log back in as user2.
5. Open the network settings and connect to the *vpn.lab.local* VPN.
6. Ping each of the three servers to confirm that you can connect to server1 (10.10.0.1) and server2 (10.10.0.2), but not server3 (10.10.0.3).

IPsec IKE load balancing based on FortiSASE account information

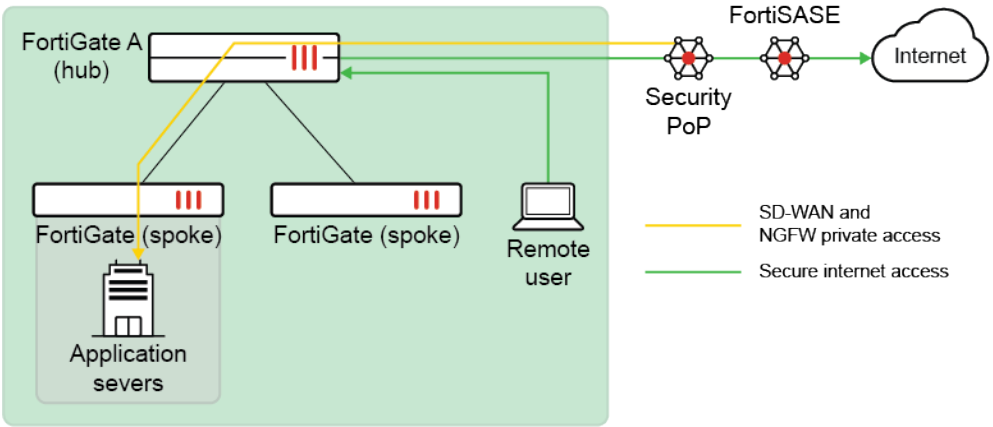
The FortiGate device ID is carried by the IKEv2 message NOTIFY payload when it is configured.

```
config vpn ipsec phase1-interface
    edit <name>
        set dev-id-notification enable
        set dev-id <string>
    next
end
```

This device ID configuration is required when the FortiGate is configured as a secure edge LAN extension for FortiSASE. It allows FortiSASE to distribute IKE/IPsec traffic according to the FortiGate device ID to achieve load balancing.

Example

In this example, a FortiGate SD-WAN is configured, which acts as a secure edge. FortiSASE ensures secure internet access for users in the local network behind the FortiGate and allows other FortiSASE remote users with secure private access to private resources behind the FortiGate.



To configure FortiGate A (FGT-A):

1. Configure the IPsec phase 1 settings:

```
config vpn ipsec phase1-interface
    edit "ul-port1"
        set interface "port1"
        set ike-version 2
        set peertype any
        set net-device disable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set localid "peerid-UNshTWcLQ22UNWqk0UwYtCQNtVhujrxAdyMG0qRsGVkx9mM8ksdaRZOF"
        set dpd on-idle
        set comments "[FGCONN] Do NOT edit. Automatically generated by extension controller."
        set dev-id-notification enable
        set dev-id "FGT_A"
        set remote-gw 172.16.200.2
        set psksecret ********
    next
end
```

2. Verify that the IPsec tunnel is established:

```
# diagnose vpn tunnel list
list all ipsec tunnel in vd 3
------------------------------------------------------
name=ul-port1 ver=2 serial=3 172.16.200.1:0->172.16.200.2:0 tun_id=172.16.200.2 tun_
id6=::172.16.200.2 dst_mtu=1500 dpd-link=on weight=1

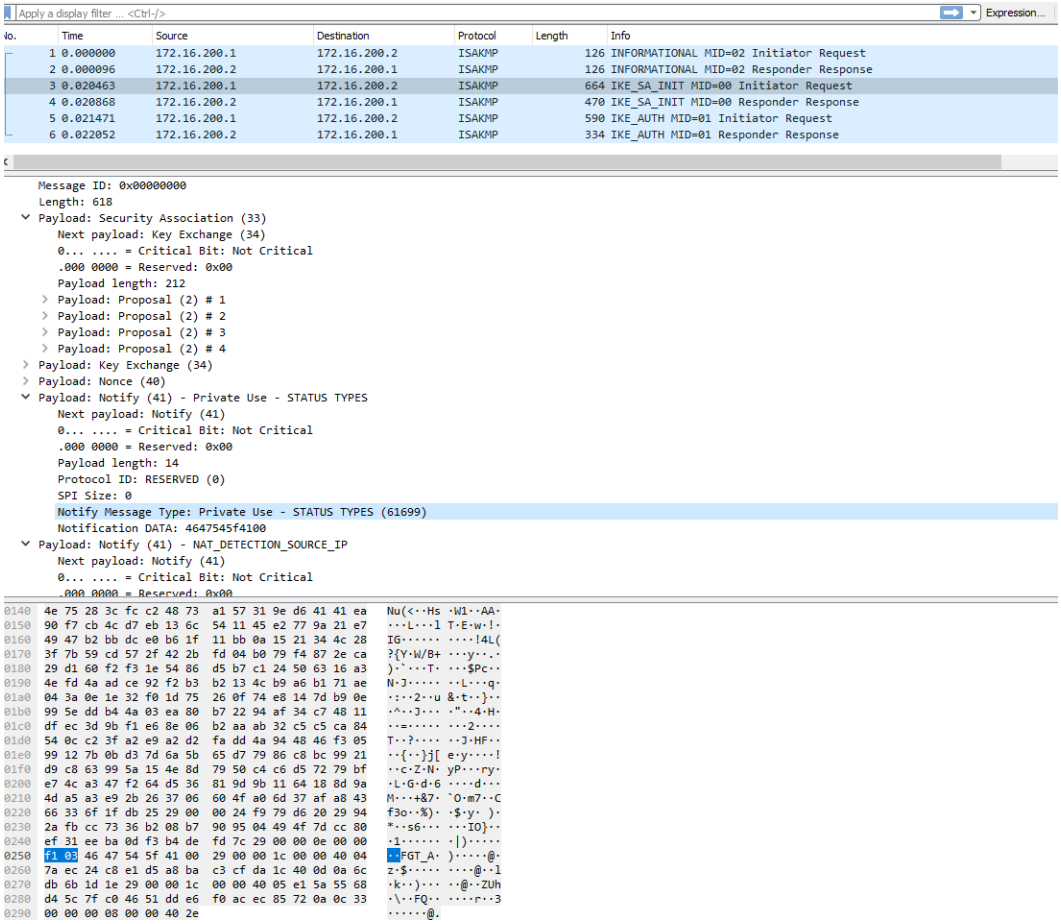
```

3. Perform a packet capture of IPsec traffic (Wireshark is used in this example) and locate the initiator request IKE packet's NOTIFY message (type 61699).



IPsec SA key retrieval from a KMS server using KMIP

In environments that require centralized management of cryptographic keys where no key derivations or algorithmic operations are allowed on edge devices (such as the FortiGate), they will deploy a Key Management Services (KMS) server cluster to generate and manage all cryptographic keys. Then, the Key Management Interoperability Protocol (KMIP) is used on the edge devices to locate the KMS server, create keys if they do not exist, and retrieve keys to be used for securing these edge devices.

FortiGates have a KMIP client that sends KMIP requests to locate the Key Management Services (KMS) server, creates keys if they do not exist on the KMS server, and retrieves keys from the KMS server to use as IPsec security association (SA) keys for IKEv2 only.

This feature allows the FortiGate to offload the task of generating IPsec SA keys to a KMS server, regardless of specific IPsec VPN topologies with a FortiGate, when the administrator has the requirement to centralize cryptographic keys management in a KMS server.

The FortiGate's integrated KMIP client also supports the following:

- If the KMS server is unavailable, then the FortiGate continues to use the previous keys to avoid a network blackout.
- ADVPN configurations for the hub and spoke, so that shortcuts between two spokes will use their own encryption keys retrieved from the KMS server.

- Multiple tunnels between the same tunnel endpoints using multiple VRFs.

To configure the KMIP server:

```
config vpn kmip-server
    edit <KMS_server_ID>
        config server-list
            edit <ID>
                set server <server_IP>
                set cert <string>
            next
        end
        set username <username_defined_on_KMS_server>
        set password <password>
    next
end
```

To apply the KMS server in the phase 1 interface settings:

```
config vpn ipsec phase1-interface
    edit <name>
        set kms <KMS_server_ID>
    next
end
```

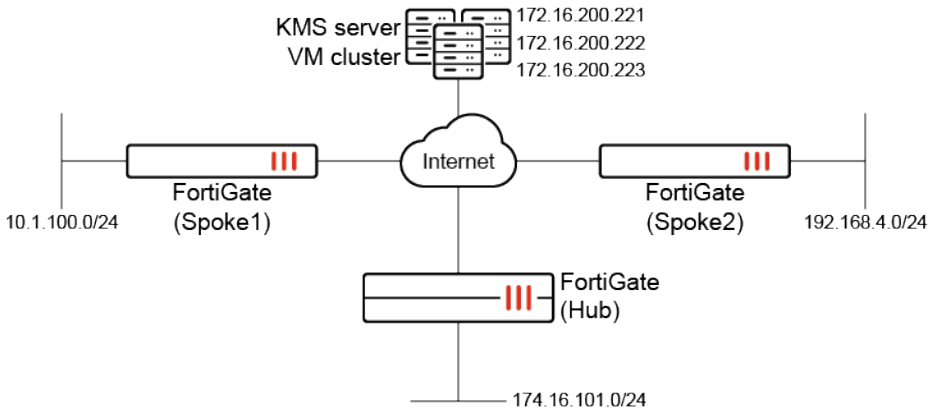
IPsec tunnels will not be established if a FortiGate VPN peer does not support KMS, or has not configured `kms <KMS_server_ID>` in `config vpn ipsec phase1-interface`.

The following diagnostic commands have been added:

- `get vpn ike kms-keys`
- `diagnose debug application kmipd -1`
- `execute kmip {create | destroy | get | locate | rekey} <parameter>`

Example

In this example, there is a topology with an ADVPN hub FortiGate and two spoke FortiGates. There is a cluster or three KMS server VMs (172.16.200.221, 172.16.200.222, and 172.16.200.223) that operates in round-robin mode. The `testuser1_Cert` certificate is issued by the KMS server, and the `testuser1` user is defined on the KMS server. Authentication to the KMS server by the KMIP client requires both a certificate and a password.



The Hub FortiGate acting as the responder will try to locate keys on the KMS server first. If they do not exist, the FortiGate requests to create new keys on KMS server. The responder sends the keys' names to the Spoke1 and Spoke2 FortiGates acting as the initiators using IKE messages, and these initiators locate and retrieve keys from KMS server using the keys' names. The `keylifeseconds` parameter in phase 2 defines how often the FortiGate will try to synchronize local keys to those on the KMS server.

The keys are retrieved from the KMS server and used as IPsec SA keys in IPsec tunnels. The key format used is: [IDi/r]-[IDr/i]-[phase2name]-ENC/AUTH-[keyalg]-[keylen].

First, this example focuses on the Hub FortiGate and the IPsec VPN connection between the Spoke1 and Hub FortiGate. Second, this example focuses on the spoke-to-spoke tunnel, also known as a shortcut tunnel or shortcut, which is established when traffic flows between the Spoke1 and Spoke2 FortiGates.

To configure IPsec SA key retrieval from a KMS server on the Hub FortiGate:

1. Configure the KMIP server:

```
config vpn kmip-server
    edit "KMS_server"
        config server-list
            edit 1
                set server "172.16.200.221"
                set cert "testuser1_Cert"
            next
            edit 2
                set server "172.16.200.222"
                set cert "testuser1_Cert"
            next
            edit 3
                set server "172.16.200.223"
                set cert "testuser1_Cert"
            next
        end
        set username "testuser1"
        set password **********
    next
end
```

2. Configure the IPsec VPN phase 1 settings:

```
config vpn ipsec phase1-interface
    edit "hub"
        set type dynamic
        set interface "port2"
        set ike-version 2
        set authmethod signature
        set peertype any
        set net-device disable
        set proposal aes128-sha256 aes256-sha256 aes128gcm-prfsha256 aes256gcm-prfsha384
chacha20poly1305-prfsha256
        set add-route disable
        set dpd on-idle
        set auto-discovery-sender enable
        set kms "KMS_server"
        set certificate "Fortinet_Factory_Backup"
        set dpd-retryinterval 60
    next
end
```

This feature is only supported in IKEv2. The `localid` is required in the phase 1 settings when using the PSK authentication method.

3. Configure the IPsec VPN phase 2 settings:

```
config vpn ipsec phase2-interface
    edit "hub"
        set phase1name "hub"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm aes256gcm
chacha20poly1305
        set keylifeseconds 7200
    next
end
```

To verify the IPsec configuration and tunnel between the Hub and Spoke1 FortiGates:

1. Verify the tunnel state on the Hub:

```
Hub # diagnose vpn tunnel list
list all ipsec tunnel in vd 0
------------------------------------------------------
name=hub ver=2 serial=1 172.16.200.4:0->0.0.0.0:0 tun_id=10.0.0.1 tun_id6=::10.0.0.1 dst_mtu=0

To verify the IPsec configuration and tunnel between the Spoke1 and Spoke2 FortiGates:

1. Verify the tunnel state on Spoke1:

```
Spoke1 # diagnose vpn tunnel list
list all ipsec tunnel in vd 0
------------------------------------------------------
name=spoke1 ver=2 serial=1 172.16.200.1:0->172.16.200.4:0 tun_id=172.16.200.4 tun_
id6=::172.16.200.4 dst_mtu=1500 dpd-link=on weight=1
bound_if=19 lgwy=static/1 tun=intf mode=auto/1 encap=none/552 options[0228]=npu frag-rfc  run_
state=0 role=primary accept_traffic=1 overlay_id=0 proxyid_num=1 child_num=1 refcnt=5 ilast=35
olast=35 ad=r/2
stat: rxp=1 txp=11 rxb=71 txb=699
dpd: mode=on-demand on=1 idle=20000ms retry=3 count=0 seqno=5
```

```
natt: mode=none draft=0 interval=0 remote_port=0

```

2. Verify the KMS keys for the VPN tunnel between Spoke1 and Spoke2:

```
Spoke1 # get vpn ike kms-keys

vd: root/0
name: spoke1
addr: 172.16.200.1:500 -> 172.16.200.4:500

  phase2
  name: spoke1
  server: "KMS_server"
  spi: 628d1814
    enc
      keyname: "Spoke1-hub-hub-ENC-AES-16"
```

```
      key: 5dad0d8d3568eab7c3f259349dc64039
    auth
      keyname: "Spoke1-hub-hub-AUTH-SHA1-20"
      key: e660f491b80b2cfdcdb0d737942bea2e853dac8d
  spi: 471dfe2e
    enc
      keyname: "hub-Spoke1-hub-ENC-AES-16"
      key: 1de4b8e8accaa792e0934fbd9f933a6a
    auth
      keyname: "hub-Spoke1-hub-AUTH-SHA1-20"
      key: 1fa244d3971b4d4df59b8d7b3655a1b77f8e65af

vd: root/0
name: spoke1_0
addr: 172.16.200.1:500 -> 172.16.200.3:500

  phase2
  name: spoke1
  server: "KMS_server"
  spi: 8d568114
    enc
      keyname: "Spoke1-Spoke2-spoke2-ENC-AES-16"
      key: b01c534b11792b856c1b95c78c4cad91
    auth
      keyname: "Spoke1-Spoke2-spoke2-AUTH-SHA1-20"
      key: fe6a82177db6911b3203d1306969e5ddec8fd039
  spi: 471dfe2f
    enc
      keyname: "Spoke2-Spoke1-spoke2-ENC-AES-16"
      key: a6d6a25cd986860bcc502d58f32e99de
    auth
      keyname: "Spoke2-Spoke1-spoke2-AUTH-SHA1-20"
      key: 07d712156eaca28439fbe944e3a8c9af4c45166a
```

3. Verify the FortiGate (KMIP client) connection to the KMS server:

```
Spoke1 # execute kmip locate KMS_server hub-Spoke1-hub-AUTH-SHA1-20
Locating key 'hub-Spoke1-hub-AUTH-SHA1-20', jobid=1935521133
Ret=0, jobid=1935521133
        Key ID: 2ba130bff7174ba7a237d7ea53611121383b132cf18a4fd183890ca196296cb4
```

4. Verify the IKE and KMIP debug messages on Spoke1 to confirm that when the KMS server is down during IPsec rekey, IPsec tunnel does not go down:

```
Spoke1 # diagnose debug application ike -1
Spoke1 # diagnose debug application kmipd -1

ike 0:spoke1:543:580 rekey in progress for SPI 471dfe32

```

Multiple interface monitoring for IPsec

IPsec can monitor multiple interfaces per tunnel, and activate a backup link only when all of the primary links are down. This can be useful if you have multiple WAN links and want to optimize your WAN link selection and performance while limiting the use of more expensive and bandwidth intensive interfaces, like 5G or LTE.

In cases where multiple primary overlays are deployed and the backup overlay is on an LTE connection, avoiding IPsec keep alive messages, BGP hellos, and SD-WAN health checks on the backup connection is required when the primary overlays are working. The backup overlay can monitor all of the primary overlays, and is not activated until the number of unhealthy primary overlays equals or surpasses the predefined threshold.

```
config vpn ipsec phase1-interface
    edit <phase-1 name>
        set monitor <overlay> <overlay> ... <overlay>
        set monitor-min <integer>
    next
end
```

`monitor`	The IPsec interfaces to monitor.
`monitor-min`	The minimum number of monitored interfaces that must become degraded before this interface is activated (0 = all interfaces, default = 0).

In this example, four primary overlays are configured, T1 - T4, on fixed broadband connections and one backup overlay, T5, is configured on an LTE connection.

The backup overlay stays down as long as the primary overlays are working normally. When all four of the primary overlays go down, the backup overlay is activated and used to forward traffic. If any of the primary overlays recover, then the backup overlay goes down.

SD-WAN can also be configured to steer traffic.

To configure the overlays:

1. Configure the VPN remote gateways:

```
config vpn ipsec phase1-interface
    edit "T1"
        set interface "dmz"
        set ike-version 2
        set peertype any
        set net-device disable
        set proposal aes128-sha256
        set remote-gw 172.16.208.2
        set psksecret **********
    next
    edit "T2"
        set interface "agg1"
        set ike-version 2
        set peertype any
        set net-device disable
```

```
        set proposal aes128-sha256
        set remote-gw 172.16.203.2
        set psksecret **********
    next
    edit "T3"
        set interface "vlan100"
        set ike-version 2
        set peertype any
        set net-device disable
        set proposal aes128-sha256
        set remote-gw 172.16.206.2
        set psksecret **********
    next
    edit "T4"
        set interface "port15"
        set ike-version 2
        set peertype any
        set net-device disable
        set proposal aes128-sha256
        set remote-gw 172.16.209.2
        set psksecret **********
    next
    edit "T5"
        set interface "vlan200"
        set ike-version 2
        set peertype any
        set monitor "T1" "T2" "T3" "T4"
        set monitor-min 4
        set net-device disable
        set proposal aes128-sha256
        set remote-gw 172.16.210.2
        set psksecret **********
    next
end
```

2. Configure the VPN tunnels:

```
config vpn ipsec phase2-interface
    edit "T1_P2"
        set phase1name "T1"
        set proposal aes256-sha256
        set auto-negotiate enable
    next
    edit "T2_P2"
        set phase1name "T2"
        set proposal aes256-sha256
        set auto-negotiate enable
    next
    edit "T3_P2"
        set phase1name "T3"
        set proposal aes256-sha256
        set auto-negotiate enable
```

```
    next
    edit "T4_P2"
        set phase1name "T4"
        set proposal aes256-sha256
        set auto-negotiate enable
    next
    edit "T5_P2"
        set phase1name "T5"
        set proposal aes256-sha256
        set auto-negotiate enable
    next
end
```

3. Configure the interfaces:

```
config system interface
    edit "T1"
        set vdom "root"
        set ip 100.1.1.1 255.255.255.255
        set allowaccess ping
        set type tunnel
        set remote-ip 100.1.1.2 255.255.255.0
        set snmp-index 113
        set interface "dmz"
    next
    edit "T2"
        set vdom "root"
        set ip 100.1.2.1 255.255.255.255
        set allowaccess ping
        set type tunnel
        set remote-ip 100.1.2.2 255.255.255.0
        set snmp-index 114
        set interface "agg1"
    next
    edit "T3"
        set vdom "root"
        set ip 100.1.3.1 255.255.255.255
        set allowaccess ping
        set type tunnel
        set remote-ip 100.1.3.2 255.255.255.0
        set snmp-index 115
        set interface "vlan100"
    next
    edit "T4"
        set vdom "root"
        set ip 100.1.4.1 255.255.255.255
        set allowaccess ping
        set type tunnel
        set remote-ip 100.1.4.2 255.255.255.0
        set snmp-index 65
        set interface "port15"
    next
```

```
    edit "T5"
        set vdom "root"
        set ip 100.1.5.1 255.255.255.255
        set allowaccess ping
        set type tunnel
        set remote-ip 100.1.5.2 255.255.255.0
        set snmp-index 117
        set interface "vlan200"
    next
end
```

4. Check the IPsec tunnel summary:

```
# get vpn ipsec tunnel summary
'T2' 172.16.203.2:0  selectors(total,up): 1/1  rx(pkt,err): 0/0  tx(pkt,err): 0/4
'T3' 172.16.206.2:0  selectors(total,up): 1/1  rx(pkt,err): 0/0  tx(pkt,err): 0/4
'T4' 172.16.209.2:0  selectors(total,up): 1/1  rx(pkt,err): 0/0  tx(pkt,err): 0/4
'T5' 172.16.210.2:0  selectors(total,up): 1/0  rx(pkt,err): 0/0  tx(pkt,err): 0/4
'T1' 172.16.208.2:0  selectors(total,up): 1/1  rx(pkt,err): 0/0  tx(pkt,err): 0/4
```

The backup overlay, T5, is down.

To configure steering traffic with SD-WAN:

1. Configure the SD-WAN:

```
config system sdwan
    set status enable
    config zone
        edit "virtual-wan-link"
        next
    end
    config members
        edit 1
            set interface "T1"
        next
        edit 2
            set interface "T2"
        next
        edit 3
            set interface "T3"
        next
        edit 4
            set interface "T4"
        next
        edit 5
            set interface "T5"
        next
    end
    config service
        edit 1
            set name "1"
```

```
            set load-balance enable
            set dst "all"
            set src "172.16.205.0"
            set priority-members 1 2 3 4 5
        next
    end
end
```

2. Configure a static route:

```
config router static
    edit 5
        set dst 8.0.0.0 255.0.0.0
        set distance 1
        set sdwan-zone "virtual-wan-link"
    next
end
```

3. Check the routing table:

```
# get router info routing-table static
Routing table for VRF=0
S       8.0.0.0/8 [1/0] via T2 tunnel 172.16.203.2, [1/0]
                  [1/0] via T3 tunnel 172.16.206.2, [1/0]
                  [1/0] via T1 tunnel 172.16.208.2, [1/0]
                  [1/0] via T4 tunnel 172.16.209.2, [1/0]
```

Check the results:

- When both the T1 and T2 connections are down, T5 stays down as well, and traffic is load-balanced on T3 and T4 by the SD-WAN configuration:

```
 # get vpn ipsec tunnel summary
'T2' 172.16.203.2:0  selectors(total,up): 1/0  rx(pkt,err): 0/0  tx(pkt,err): 0/0
'T3' 172.16.206.2:0  selectors(total,up): 1/1  rx(pkt,err): 0/0  tx(pkt,err): 0/0
'T4' 172.16.209.2:0  selectors(total,up): 1/1  rx(pkt,err): 0/0  tx(pkt,err): 0/4
'T5' 172.16.210.2:0  selectors(total,up): 1/0  rx(pkt,err): 0/0  tx(pkt,err): 0/4
'T1' 172.16.208.2:0  selectors(total,up): 1/0  rx(pkt,err): 0/0  tx(pkt,err): 0/0
```

```
# get router info routing-table static
Routing table for VRF=0
S       8.0.0.0/8 [1/0] via T3 tunnel 172.16.206.2, [1/0]
                  [1/0] via T4 tunnel 172.16.209.2, [1/0]
```

Traffic is load-balanced between the remaining tunnels:

```
# diagnose sniffer packet any 'host 8.8.8.8' 4
interfaces=[any]
filters=[host 8.8.8.8]
3.027055 port5 in 172.16.205.100 -> 8.8.8.8: icmp: echo request
3.027154 T4 out 172.16.205.100 -> 8.8.8.8: icmp: echo request
3.031434 T4 in 8.8.8.8 -> 172.16.205.100: icmp: echo reply
```

```
3.031485 port5 out 8.8.8.8 -> 172.16.205.100: icmp: echo reply
3.612818 port5 in 172.16.205.100 -> 8.8.8.8: icmp: echo request
3.612902 T3 out 172.16.205.100 -> 8.8.8.8: icmp: echo request
3.617107 T3 in 8.8.8.8 -> 172.16.205.100: icmp: echo reply
3.617159 port5 out 8.8.8.8 -> 172.16.205.100: icmp: echo reply
4.168845 port5 in 172.16.205.100 -> 8.8.8.8: icmp: echo request
4.168907 T4 out 172.16.205.100 -> 8.8.8.8: icmp: echo request
4.173150 T4 in 8.8.8.8 -> 172.16.205.100: icmp: echo reply
4.173174 port5 out 8.8.8.8 -> 172.16.205.100: icmp: echo reply
4.710907 port5 in 172.16.205.100 -> 8.8.8.8: icmp: echo request
4.710991 T3 out 172.16.205.100 -> 8.8.8.8: icmp: echo request
4.715933 T3 in 8.8.8.8 -> 172.16.205.100: icmp: echo reply
4.715958 port5 out 8.8.8.8 -> 172.16.205.100: icmp: echo reply
```

- When all of the primary overlays are down, T5 is activated and used for traffic

```
# get vpn ipsec tunnel summary
'T2' 172.16.203.2:0  selectors(total,up): 1/0  rx(pkt,err): 0/0  tx(pkt,err): 0/0
'T3' 172.16.206.2:0  selectors(total,up): 1/0  rx(pkt,err): 0/0  tx(pkt,err): 0/0
'T4' 172.16.209.2:0  selectors(total,up): 1/0  rx(pkt,err): 0/0  tx(pkt,err): 0/0
'T5' 172.16.210.2:0  selectors(total,up): 1/1  rx(pkt,err): 0/0  tx(pkt,err): 0/4
'T1' 172.16.208.2:0  selectors(total,up): 1/0  rx(pkt,err): 0/0  tx(pkt,err): 0/0
```

```
# get router info routing-table static
Routing table for VRF=0
S       8.0.0.0/8 [1/0] via T5 tunnel 172.16.210.2, [1/0]
```

Traffic is using the backup overlay, T5:

```
# diagnose sniffer packet any 'host 8.8.8.8' 4
interfaces=[any]
filters=[host 8.8.8.8]
1.907944 port5 in 172.16.205.100 -> 8.8.8.8: icmp: echo request
1.908045 T5 out 172.16.205.100 -> 8.8.8.8: icmp: echo request
1.912283 T5 in 8.8.8.8 -> 172.16.205.100: icmp: echo reply
1.912351 port5 out 8.8.8.8 -> 172.16.205.100: icmp: echo reply
2.665921 port5 in 172.16.205.100 -> 8.8.8.8: icmp: echo request
2.665999 T5 out 172.16.205.100 -> 8.8.8.8: icmp: echo request
2.670209 T5 in 8.8.8.8 -> 172.16.205.100: icmp: echo reply
2.670235 port5 out 8.8.8.8 -> 172.16.205.100: icmp: echo reply
5.269997 port5 in 172.16.205.100 -> 8.8.8.8: icmp: echo request
5.270090 T5 out 172.16.205.100 -> 8.8.8.8: icmp: echo request
5.274275 T5 in 8.8.8.8 -> 172.16.205.100: icmp: echo reply
5.274300 port5 out 8.8.8.8 -> 172.16.205.100: icmp: echo reply
5.781848 port5 in 172.16.205.100 -> 8.8.8.8: icmp: echo request
5.781920 T5 out 172.16.205.100 -> 8.8.8.8: icmp: echo request
5.786334 T5 in 8.8.8.8 -> 172.16.205.100: icmp: echo reply
5.786363 port5 out 8.8.8.8 -> 172.16.205.100: icmp: echo reply
```

- If T4 recovers, T5 is deactivated and traffic switches to T4:

```
# get vpn ipsec tunnel summary
'T2' 172.16.203.2:0  selectors(total,up): 2/0  rx(pkt,err): 0/0  tx(pkt,err): 0/0
'T3' 172.16.206.2:0  selectors(total,up): 2/0  rx(pkt,err): 0/0  tx(pkt,err): 0/0
'T4' 172.16.209.2:0  selectors(total,up): 2/2  rx(pkt,err): 0/0  tx(pkt,err): 0/0
'T5' 172.16.210.2:0  selectors(total,up): 2/0  rx(pkt,err): 0/0  tx(pkt,err): 0/0
'T1' 172.16.208.2:0  selectors(total,up): 2/0  rx(pkt,err): 0/0  tx(pkt,err): 0/0
```

```
# get router info routing-table static
Routing table for VRF=0
S       8.0.0.0/8 [1/0] via T4 tunnel 172.16.209.2, [1/0]
```

The primary overlay T4 has recovered, and the backup overlay is down again:

```
# diagnose sniffer packet any 'host 8.8.8.8' 4
interfaces=[any]
filters=[host 8.8.8.8]
4.555685 port5 in 172.16.205.100 -> 8.8.8.8: icmp: echo request
4.555790 T4 out 172.16.205.100 -> 8.8.8.8: icmp: echo request

  - `diagnose vpn ike gateway filter loc-addr4 203.0.113.2 203.0.113.8`
  - `diagnose vpn ike gateway clear`

Agentless VPN

A Virtual Private Network (VPN) allows remote users to securely access private networks over the Internet, protecting data from unauthorized access. Employees working remotely can use a VPN to connect securely to their office network. VPNs also enable secure interconnectivity between multiple office locations.

Agentless VPN uses the Secure Socket Layer (SSL) protocol to establish a secure tunnel through a web browser, eliminating the need for a dedicated VPN client. Operating at the application layer of the OSI model, it provides clientless access to specific network resources without additional software installation.

Users authenticate to FortiGate's Agentless VPN web portal, which provides access to network services and resources, including HTTP/HTTPS, Telnet, FTP, SMB/CIFS, VNC, RDP, and SSH. When a user starts a connection to a server from the web portal, FortiOS proxies the communication with the server. All communication between the FortiGate and the user continues over HTTPS, regardless of the service being accessed.

Agentless VPN security restricts and validates HTTP messages sent from clients to FortiGate. With advanced checks and binary code verification, FortiGate automatically detects and blocks certain HTTP methods that could be exploited for unauthorized access attempts. By implementing this proactive defense, FortiGate enhances the security of its Agentless VPN feature, ensuring a safer environment for users.

Agentless VPN can be used when you require:

- A clientless solution in which all remote services are accessed through a web portal
- Tight control over the contents of the web portal
- Limited services to be provided to the remote users

Considerations to use Agentless VPN:

- Multiple applications and protocols are not supported.
- VNC and RDP access might have limitations, such as unsupported shortcut keys.
- In some configurations, RDP can consume a significant amount of memory and CPU resources.
- Firewall performance might decrease as remote usage increases.
- Highly customized web pages might render incorrectly.

Alternative remote-access solutions in FortiOS are IPsec VPN on page 2684 and Zero Trust Network Access on page 1543.

To overcome the limitations of Agentless VPN, consider using IPsec VPN, which requires the FortiClient VPN agent to be installed on the remote endpoint. The FortiClient VPN client is available in both free and paid tiers, offering enhanced security and performance. For supported operating systems, refer to the FortiClient Technical Specifications.

For the highest VPN throughput and reliability, configure a dial-up IPsec VPN, which provides superior performance compared to SSL-based VPN solutions. See FortiClient as dialup client on page 2909.

By default, the *VPN > Agentless VPN* and *VPN > Agentless VPN Settings* menus are hidden from the GUI and the CLI.

To enable Agentless VPN, enter:

```
config system global
    set sslvpn-web-mode enable
end
```

To enable Agentless VPN feature visibility in the CLI, enter:

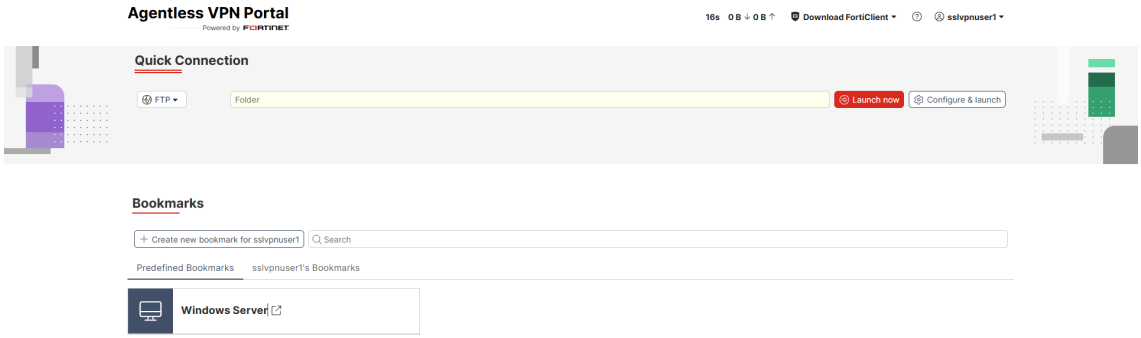
```
config system settings
    set gui-sslvpn enable
end
```

To enable Agentless VPN feature visibility in the GUI, go to *System > Feature Visibility*, enable *Agentless VPN*, and click *Apply*.

When `sslvpn-web-mode` is disabled, an error message appears when users access the Agentless VPN web portal by navigating to the listening IP address, domain, or port.

A user must have valid username and password credentials to log in to an Agentless VPN web portal. Other multi-factor authentication components may also be configured and required, such as FortiTokens.

After logging in, the Agentless VPN web portal page appears:



An Agentless VPN web portal includes the following features:

- The session information is displayed in the right corner of the top banner. This includes the elapsed time since logging in and the volume of inbound and outbound HTTP and HTTPS traffic.
- The *Launch FortiClient* button appears if FortiClient is installed. Click the button to open the *FortiClient Remote Access* tab. FortiClient does not automatically create a VPN connection based on the web-mode connection information.
- The *Download FortiClient* button downloads the FortiClient application for various operating systems.
- The *Bookmarks* widget includes links to network resources (administrator-defined bookmarks), and users can create their own bookmarks.
- The *Quick Connection* dropdown menu enables a connection to network resources without using or creating a bookmark.

The following topics provide information about Agentless VPN in FortiOS:

- Agentless VPN portal configurations on page 3223
- Quick Connection tool on page 3224

- Agentless VPN troubleshooting on page 3353

Agentless VPN portal configurations

An Agentless VPN portal enables users to access network resources through a secure channel using a web browser. System administrators can configure login privileges and available network resources for users. The portal configuration determines what displays for users logged in to the portal. Both system administrators and users can customize the Agentless VPN portal.

The following predefined, default Agentless VPN portal configurations are available with specific settings for Agentless VPN:

- full-access: Agentless VPN is enabled.
- tunnel-access: Agentless VPN is disabled.
- web-access: Agentless VPN is enabled.

Custom Agentless VPN portals can also be configured.

To configure a custom Agentless VPN portal:

1. Go to *VPN* > *Agentless VPN Portals* and click *Create New*.
2. Configure the following settings as needed:

GUI option	Description
Name	Enter the portal name.
Limit Users to One Agentless VPN Connection at a Time	This option is disabled by default. When enabled, once a user logs in to the portal, they cannot go to another system and log in with the same credentials again.
Web Mode	This option enables or disables Agentless VPN. By default, this option is enabled for new Agentless VPN portals and hidden from the GUI. The option is visible in the GUI after being disabled using the CLI.
Portal Message	Enter a message that appears at the top of the web portal screen (default = *Agentless VPN Portal*).

GUI option		Description
	Theme	Select a color theme from the dropdown.
	Default protocol	Select the default protocol to be visible under *Quick Connection*.
	Show Session Information	Enable to display session information in the top banner of the Agentless portal (username, amount of time logged in, and traffic statistics).
	Show Connection Launcher	Enable to display the *Quick Connection* button.
	Show Login History	Enable to display the user's login history (*History*).
	User Bookmarks	Enable to allow users to add their own bookmarks (*New Bookmark*).
	Predefined Bookmarks	Use the table to create and edit predefined bookmarks. See To create a predefined administrator bookmark in FortiOS: on page 3228 for more details.
	Rewrite Content IP/UI/	Enable contents rewrite for URIs containing `IP-address/ui/`.
	RDP/VNC clipboard	Enable to support RDP/VPC clipboard functionality.
FortiClient Download		Enable this option to display the *Download FortiClient* button.
	Download Method	Select either *Direct* or *Agentless VPN Proxy* as the method to download FortiClient.
	Customize Download Location	Enable to configure a custom download location for *Windows* or *Mac*.

3. Click *OK*.

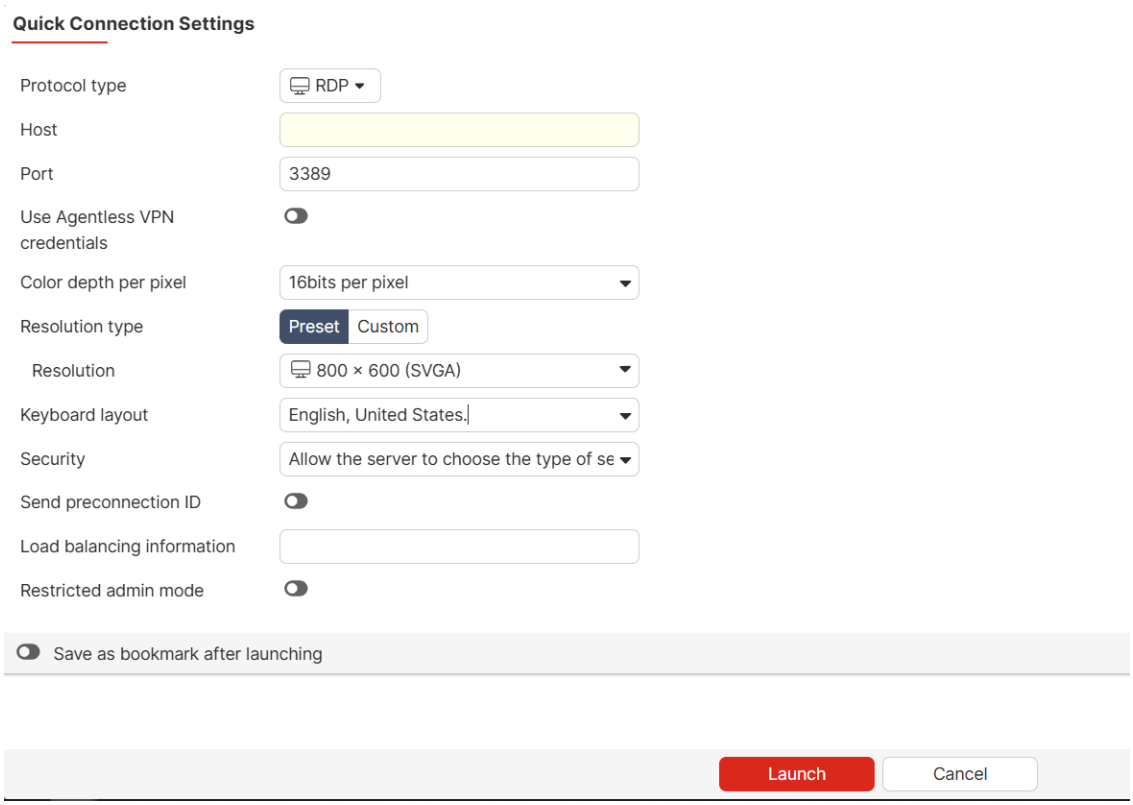
By default, the browser's language preference is automatically detected and used by the Agentless VPN web portal login page. The system language can still be used by changing the settings on the *Agentless VPN Settings* page of the GUI, or disabling browser-language detection in the CLI. See Showing the Agentless VPN web portal login page in the browser's language on page 3237 for more details.

Quick Connection tool

The *Quick Connection* tool allows a user to connect to a resource when it is not a predefined bookmark. The tool allows the user to specify the type of server and the URL or IP address of the host.

To connect to a resource:

1. After logging in to Agentless VPN web portal, under *Quick Connection*, click *Configure & launch*.
2. Select the desired *Protocol type*, and enter the required information, such as the IP address or URL of the host.
3. Click *Launch*.



In a VNC session, to send Ctrl+Alt+Del, press *F8* then select *Send Ctrl-Alt-Delete*.

RDP sessions

Some Windows servers require that a specific security be set for RDP sessions, as opposed to the standard RDP encryption security. For example, Windows 10 requires that TLS be used.

You can specify a location option if the remote computer does not use the same keyboard layout as your computer by appending it to the *Host* field using the following format: `<IP address> -m <locale>`

The available options are:

ar	Arabic	fr-be	Belgian French	no	Norwegian
da	Danish	fr-ca	Canadian French	pl	Polish

de	German	fr-ch	Swiss French	pt	Portuguese
de-ch	Swiss German	hr	Croatian	pt-br	Brazilian Portuguese
en-gb	British English	hu	Hungarian	ru	Russian
en-uk	UK English	it	Italian	sl	Slovenian
en-us	US English	ja	Japanese	sv	Sudanese
es	Spanish	lt	Lithuanian	tk	Turkmen
fi	Finnish	lv	Latvian	tr	Turkish
fr	French	mk	Macedonian		

Agentless VPN bookmarks

The *Bookmarks* widget displays bookmarks configured by administrators and users. Administrator bookmarks cannot be edited, and they are configured in FortiOS. Users can add, edit, and delete their own bookmarks within the web portal.

The FortiGate forwards client requests to servers on the internet or internal network. To use the web portal applications, add the URL, IP address, or name of the server application to the *Bookmarks* list. Once a bookmark is created, click the bookmark icon to initiate a session.

To access a destination without adding a bookmark to the *Your Bookmarks* list, use the Quick Connection tool. See Quick Connection tool on page 3224 for more details.

Configuring bookmarks

The following table summarizes which options can be configured based on the bookmark type in the Agentless VPN web portal:

Setting	HTTP/ HTTPS	FTP	SMB	SFTP	RDP	VNC	SSH	Telnet
URL	✓							
Folder		✓	✓	✓				
Host					✓	✓	✓	✓
Domain			✓					
Port					✓	✓		
Description	✓	✓	✓	✓	✓	✓	✓	✓
Password						✓		
SSO Credentials	✓	✓	✓	✓				
Agentless VPN Login	✓	✓	✓	✓				
SSO Form Data	✓							
Form Key	✓							
Form Value	✓							
Alternative	✓	✓	✓	✓				
Username	✓	✓	✓	✓				
Password	✓	✓	✓	✓				
Use Agentless VPN Credentials					✓			
Username					✓			
Password					✓			
*Color Depth Per Pixel**					✓			
*Screen Width**					✓			
*Screen Height**					✓			
Keyboard Layout					✓			
Security					✓			
Preconnection ID					✓			
Preconnection Blob					✓			
Load Balancing Information					✓			
Restricted Admin Mode					✓			

* = This setting can only be configured by an administrator.

To create a user bookmark in the web portal:

1. Log in to the Agentless VPN web portal.
2. Under *Bookmarks*, click *Create new bookmark for <username>*.
3. Enter a *Name*.
4. Select a *Protocol* type, and configure the type-based settings using the table above.
5. Click *OK*.

To create a predefined administrator bookmark in FortiOS:

1. Go to *VPN > Agentless VPN Portals*, and double-click a portal to edit it.
2. In the *Predefined Bookmarks* table, click *Create New*. The *New Bookmark* pane appears.
3. Enter a *Name*.
4. Select a protocol *Type*, and configure the settings based on its type.
5. Click *OK* to save the bookmark settings.
6. Click *OK* to save the portal settings.

Configuring group-based Agentless VPN bookmarks

Administrators can add bookmarks for users in the same user group. Agentless VPN will only output the matched group name entry to the client. This setting can only be configured in the CLI.

To add bookmarks for users in the same user group:

1. Enable group bookmarks in the web portal settings:

```
config vpn ssl web portal
    edit <name>
        set user-group-bookmark enable
    next
end
```

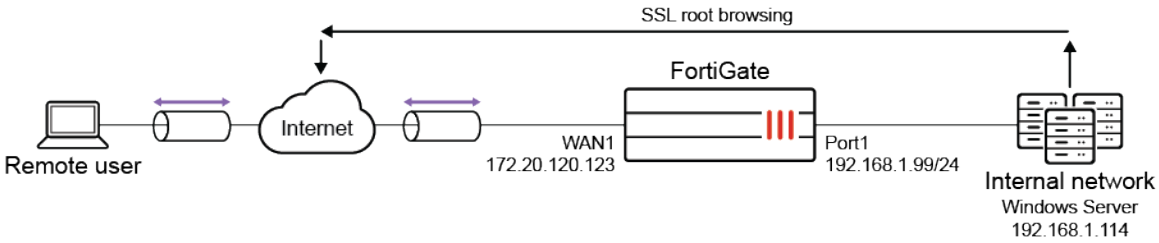
2. Configure the user group bookmark:

```
config vpn ssl web user-group-bookmark
    edit <name>
        config bookmarks
            edit <name>
                ...
            next
        end
    next
end
```

Agentless VPN for remote users

This is a sample configuration of remote users accessing the corporate network through an Agentless VPN web portal.

Sample topology



Sample configuration

WAN interface is the interface connected to ISP using a static IP. You can also use DHCP or PPPoE mode on WAN1 interface. The Agentless VPN's SSL tunnel is established over the WAN interface. By default, Agentless VPN settings are disabled and hidden from the GUI and CLI.

To enable Agentless VPN feature and Agentless VPN feature visibility in FortiOS:

1. Enable Agentless VPN using the CLI:

```
config system global
    set sslvpn-web-mode enable
end
```

2. Enable Agentless VPN feature visibility.
   a. In the GUI:
      i. Go to *System* > *Feature Visibility*.
      ii. In the *Core Features* section, enable *Agentless VPN*.
      iii. Click *Apply*.
   b. In the CLI:

```
config system settings
    set gui-sslvpn enable
end
```

To configure Agentless VPN using the GUI:

1. Configure the interface and firewall address. The port1 interface connects to the internal network.
   a. Go to *Network* > *Interfaces* and edit the *wan1* interface.
   b. Set *IP/Network Mask* to *172.20.120.123/255.255.255.0*.
   c. Edit *port1* interface and set *IP/Network Mask* to *192.168.1.99/255.255.255.0*.
   d. Click *OK*.
   e. Go to *Policy & Objects* > *Address* and create an address for internet subnet *192.168.1.0*.
2. Configure user and user group.
   a. Go to *User & Authentication* > *User Definition* to create a local user *agentlessvpnuser1*.
   b. Go to *User & Authentication* > *User Groups* to create a group *agentlessvpngroup* with the member *agentlessvpnuser1*.
3. Configure Agentless VPN portals.
   a. Go to *VPN* > *Agentless VPN Portals*, and click *Create New*.
   b. Enter a name, such as *agentless-portal*.
   c. Under *Predefined Bookmarks*, click *Create New*, and enter the following details:

Field	Value
Name	Windows Server
Type	RDP
Host	192.168.1.114
Port	3389
Single Sign-On	Disable
Username	Set the username to log in to Windows Server.
Password	Set the password to log in to Windows Server.
Port	3389

   d. Click *OK* to save the predefined bookmark.
   e. Click *OK* to save the portal settings.
   f. Create another Agentless VPN portal and name it *portal-access-disabled*.
   g. Click *OK* to save the portal settings.
   h. Disable Agentless VPN for the newly created portal (that is, *portal-access-disabled*) using CLI:

```
config vpn ssl web portal
    edit "portal-access-disabled"
        set web-mode disable
    next
end
```

4. Configure Agentless VPN settings.
   a. Go to *VPN* > *Agentless VPN Settings*.
   b. Set *Agentless VPN* status to *Enable*.
   c. Set *Listen on Interface(s)* to *wan1*.

d. Set *Listen on Port* to *10443*.
e. Choose a certificate for *Server Certificate*. The default is *Fortinet_Factory*.
f. In *Authentication/Portal Mapping*, select *All Other Users/Groups*, and click *Edit*.
g. Use *Portal* dropdown to select *portal-access-disabled*.
h. Click *OK*.
i. In *Authentication/Portal Mapping*, click *Create New*.
    i. Set *Users/Groups* to *agentlessvpngroup*.
    ii. Set *Portal* to *agentless-portal*.
    iii. Click *OK*.
j. Click *Apply* to save the Agentless VPN settings.

5. Configure Agentless VPN firewall policy.
a. Go to *Policy & Objects > Firewall Policy*, and click *Create New*.
b. Set *Name* to *Agentless VPN firewall policy*.
c. Set *Schedule* to *always* and *Action* to *Accept*.
d. Set *Incoming interface* to *Agentless VPN interface (ssl.root)*.
e. Choose an *Outgoing Interface*. This example uses *port1*.
f. Set the *Source* to *all* and *User/group* to *agentlessvpngroup*.
g. In this example, the *Destination* is the internal, protected subnet *192.168.1.0*.
h. Set *Service* to *ALL*.
i. Click *OK*.

To configure Agentless VPN using the CLI:

1. Configure the interface and firewall address.

```
config system interface
    edit "wan1"
        set vdom "root"
        set ip 172.20.120.123 255.255.255.0
    next
end
```

2. Configure the internal interface and protected subnet, then connect the port1 interface to the internal network.

```
config system interface
    edit "port1"
        set vdom "root"
        set ip 192.168.1.99 255.255.255.0
    next
end
```

```
config firewall address
    edit "192.168.1.0"
        set subnet 192.168.1.0 255.255.255.0
    next
end
```

3. Configure user and user group.

```
config user local
    edit "agentlessvpnuser1"
        set type password
        set passwd your-password
    next
end
```

```
config user group
    edit "agentlessvpngroup"
        set member "vpnuser1"
    next
end
```

4. Configure Agentless VPN portal and predefine RDP bookmark for windows server.

```
config vpn ssl web portal
    edit "agentless-portal"
        set web-mode enable
        config bookmark-group
            edit "gui-bookmarks"
                config bookmarks
                    edit "Windows Server"
                        set apptype rdp
                        set host "192.168.1.114"
                        set port 3389
                        set logon-user "your-windows-server-user-name"
                        set logon-password your-windows-server-password
                    next
                end
            next
        end
    next
end
```

5. Configure another Agentless VPN portal and disable Agentless VPN on it.

```
config vpn ssl web portal
    edit "portal-access-disabled"
        set web-mode disable
    next
end
```

6. Configure one Agentless VPN firewall policy to allow remote users to access the internal network. This policy does not allow traffic initiated from internal network to remote client.

```
config firewall policy
    edit 1
        set name "Agentless VPN firewall policy"
        set srcintf "ssl.root"
        set dstintf "port1"
        set action accept
```

```
        set srcaddr "all"
        set dstaddr "192.168.1.0"
        set service "ALL"
        set nat enable
        set groups "agentlessvpngroup"
    next
end
```

Do not set the virtual IP addresses as the destination address in a firewall policy when using Agentless VPN, as it will result in no destination address being accessible. Please note that the FortiOS Agentless VPN does not support mapping the virtual IP to the actual one.

To see the results:

1. In a web browser, log in to the portal *https://172.20.120.123:10443* using the credentials you've set up.
2. In the portal with the predefined bookmark, select the bookmark to begin an RDP session. If there are no predefined bookmarks, the Quick Connection tool can be used; see Quick Connection tool on page 3224 for more information.
3. On FortiGate, go to *Dashboard* > *Agentless VPN Monitor* to verify the list of Agentless VPN users.
   If the Agentless VPN Monitor is hidden, click *+* under the *Dashboard*, search for *Agentless VPN Monitor*, and add it to the display.
4. Go to *Log & Report* > *System Events*, and use the dropdown to select *VPN Events* to view VPN logs.

Customizing the RDP display size

The RDP display size (width and height settings) can be customized for Agentless VPN when creating a new connection or bookmark. Administrators can also specify the display size when preconfiguring bookmarks.

To configure the default window dimensions in an RDP Agentless VPN portal:

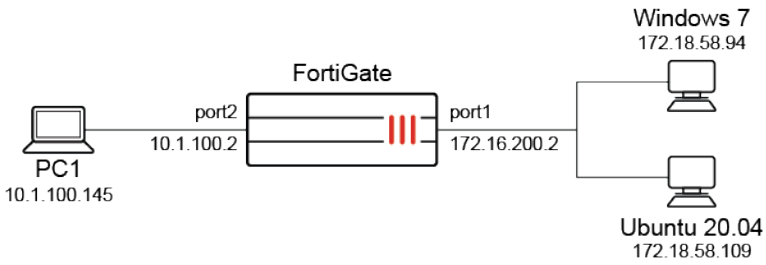
```
config vpn ssl web portal
    edit <name>
        set default-window-width <integer>
        set default-window-height <integer>
    next
end
```

`default-window-width <integer>`	Set the default RDP screen width, in pixels (0 - 65535, default = 1024).
`default-window-height <integer>`	Set the default RDP screen height, in pixels (0 - 65535, default = 768).

Example

In this example, a user has a monitor with a resolution of 1920 × 1080. The user creates two bookmarks for RDP servers with different resolutions:

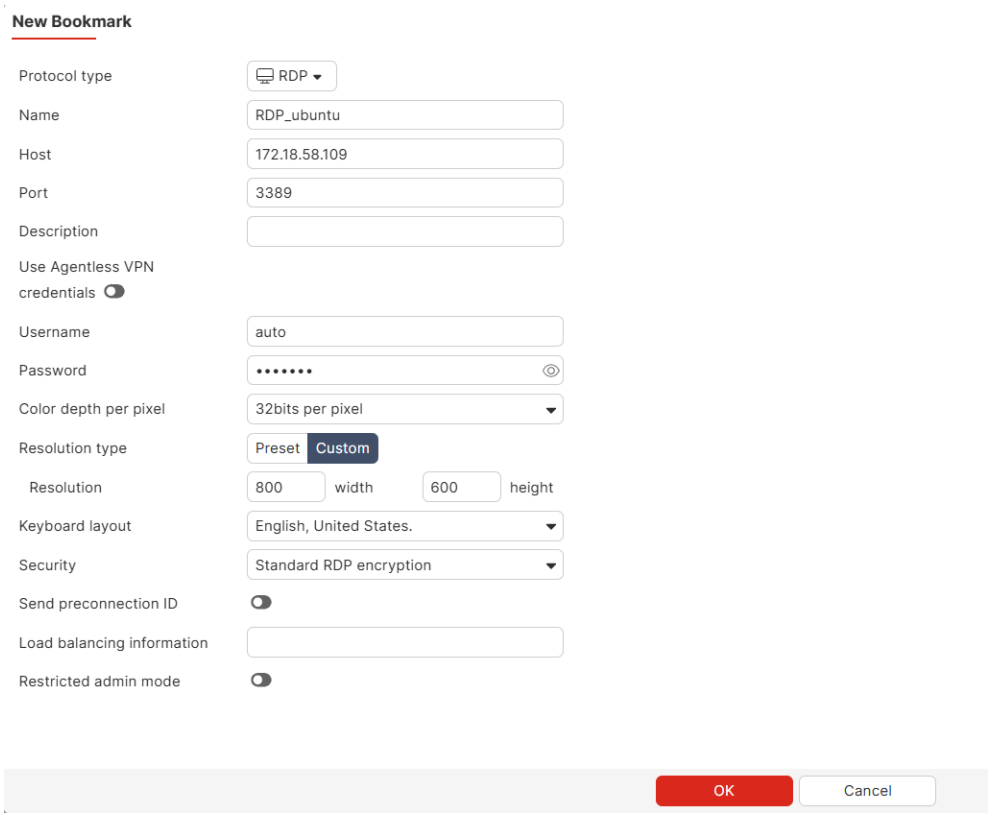
- Windows 7: 1360 × 768
- Ubuntu 20.04: 800 × 600



To customize the RDP bookmark display size:

1. Log in to the Agentless VPN web portal.
2. Under *Bookmarks*, click *Create new bookmark for <user>*.
3. Set *Protocol type* to *RDP*, and enter a suitable *Name*, *Host*, and *Port*.
4. Set the *Resolution width* and *height* fields as required.
   a. Windows 7: 1360 width and 768 height.

   b. Ubuntu 20.04: 800 width and 600 height.

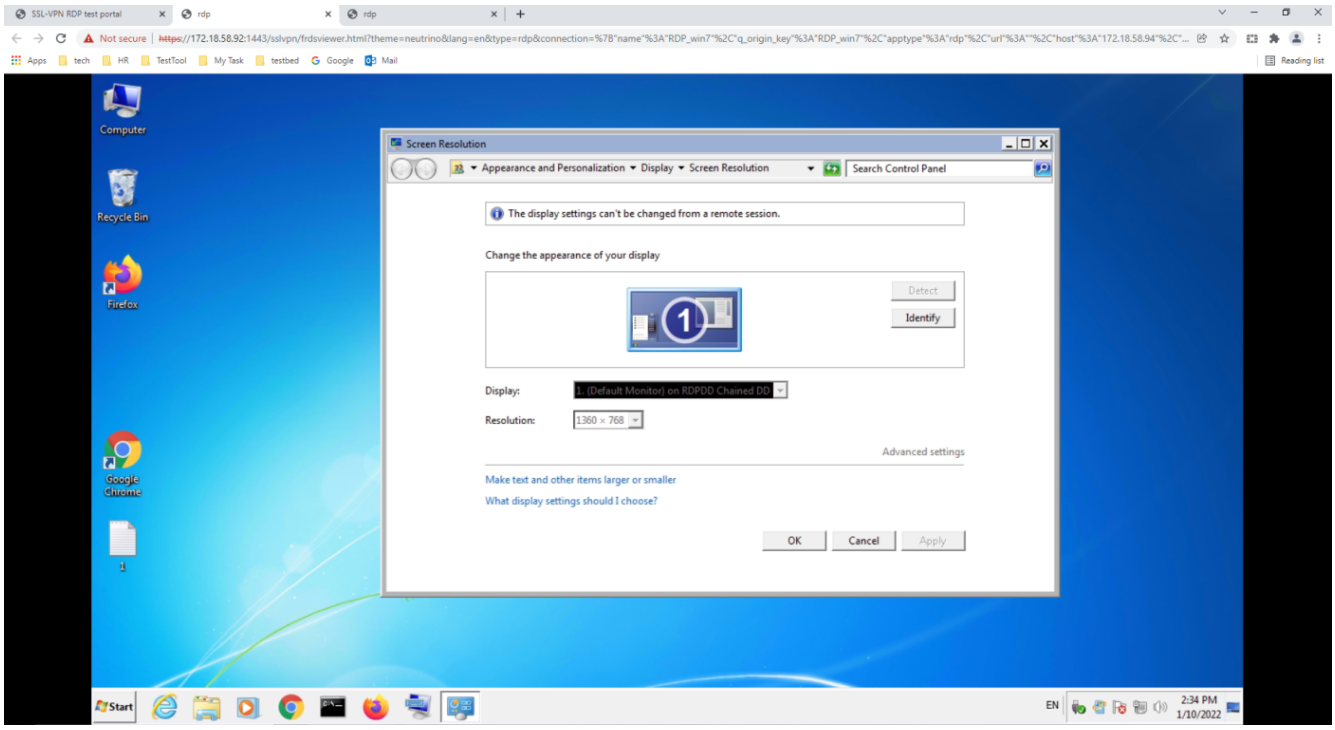


5. Click *OK*.

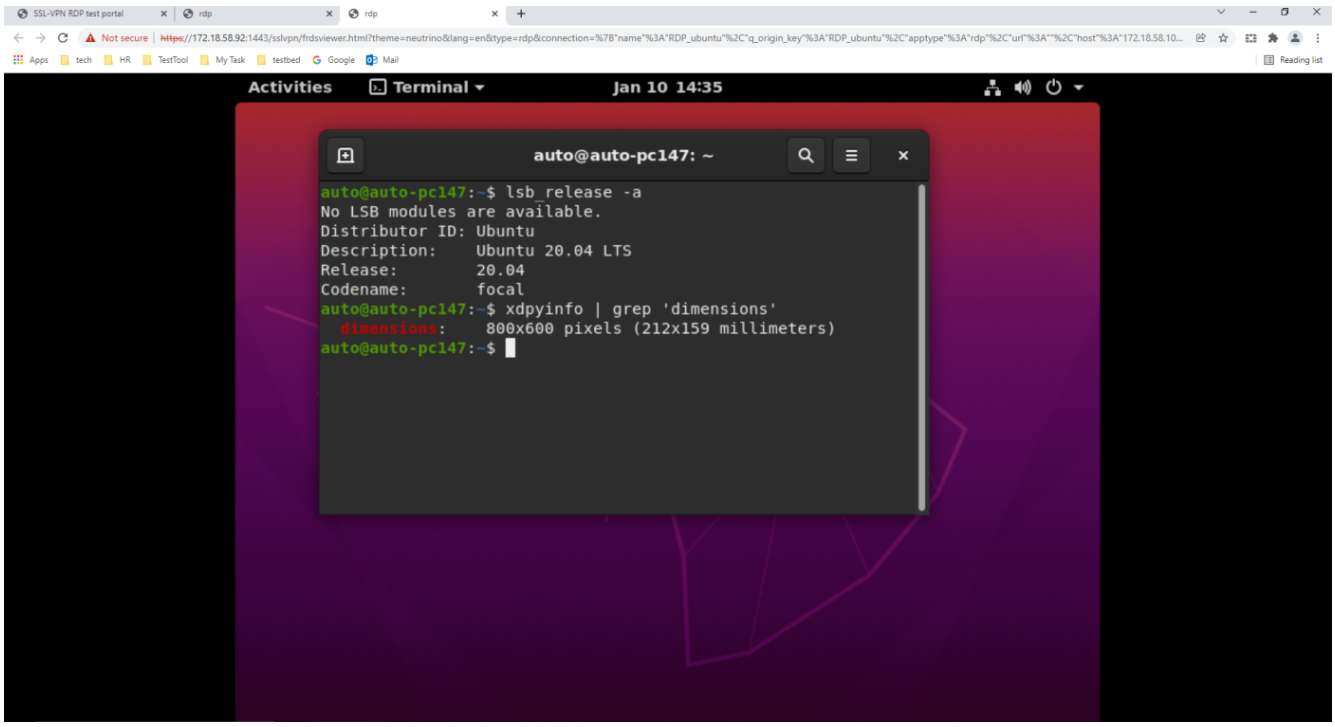
Verification:

When the user connects to the RDP servers using the bookmarks, the customized screen resolutions are applied regardless of the client PC's screen resolution (1920 × 1080).

Windows 7:



Ubuntu 20.04:



To view the bookmarks created by the user:

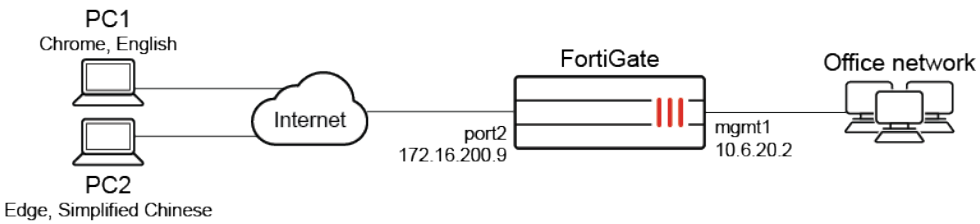
```
show vpn ssl web user-bookmark
config vpn ssl web user-bookmark
```

```
    edit "rdp_user#"
        config bookmarks
            edit "RDP_win7"
                set apptype rdp
                set host "172.18.58.94"
                set port 3389
                set logon-user "fosqa"
                set logon-password ********
                set color-depth 32
                set width 1360
                set height 768
            next
            edit "RDP_ubuntu"
                set apptype rdp
                set host "172.18.58.109"
                set port 3389
                set logon-user "auto"
                set logon-password ********
                set color-depth 32
                set width 800
                set height 600
            next
        end
    next
end
```

Showing the Agentless VPN web portal login page in the browser's language

By default, the browser's language preference is automatically detected and used by the Agentless VPN web portal login page. The system language can be used by changing the settings on the *Agentless VPN Settings* page of the GUI or disabling `browser-language-detection` in the CLI:

```
config vpn ssl settings
    set browser-language-detection disable
end
```



In this example, the *agentlessvpnadmin* user account is used for Agentless VPN connections on the *testportal1* Agentless VPN portal. The account is shared by users from different countries that use different browsers and different languages in their browsers. The user on PC1 uses Chrome in English, and the user on PC2 uses Edge

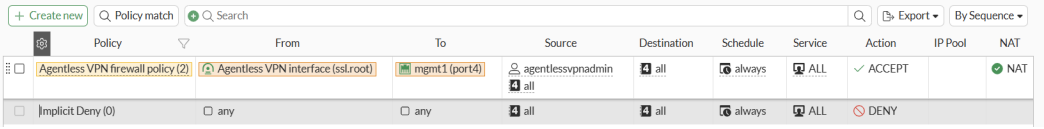
in Simplified Chinese. When a user logs in to the Agentless VPN portal, all pages are shown in the same language as their browser.

To configure the Agentless VPN portal to use the client's browser language:

1. Ensure Agentless VPN is enabled on *testportal1* portal.

```
config vpn ssl web portal
    edit "testportal1"
        set web-mode enable
    next
end
```

2. Set the language preference:
   a. Go to *VPN* > *Agentless VPN Settings*.
   b. Set *Language* to *Browser Preference*.
   c. Click *Apply*.
3. Add the *agentlessvpnadmin* user to the policy used by the Agentless VPN portal.



4. Confirm that the configuration works:
   - When the user on PC1 logs in to the Agentless VPN portal using Chrome in English, all of the pages are shown in English.
   - When the user on PC2 logs in to the Agentless VPN portal using Edge in Simplified Chinese, all of the pages are shown in Simplified Chinese.

Agentless VPN custom landing page

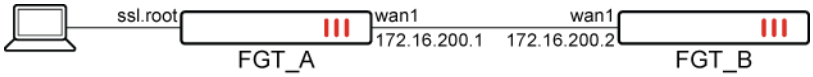
An Agentless VPN user can log in to the Agentless VPN portal and be redirected to a custom landing page. The custom landing page can be configured in *VPN* > *Agentless VPN Portals* by setting the portal *Landing page* to *Custom* or by using the command `config landing-page`.

The landing page can accept SSO credentials as well as SSO from form data. This allows administrators to streamline web application access for their users. The custom redirected portal has a logout button so that when users log out from the web application, they are also logged out from the Agentless VPN connection.

Example

In the following example, the Agentless VPN portal settings are configured so that the URL of the custom landing page of FGT_A is set to the FGT_B login page. Therefore, when a web user is logging into FGT_A's Agentless VPN portal, they will automatically be redirected to FGT_B, where the SSO username and password

are passed into the username and password input fields. This allows for single sign on of the connecting user into FGT_B through the Agentless VPN.



To configure a custom landing page from the CLI:

1. Configure the user and user group:

```
config user local
    edit "custom_landing_user"
        set type password
        set passwd ********
    next
end
config user group
    edit "ssl-web-group"
        set member "custom_landing_user"
    next
end
```

2. Configure the Agentless VPN portal:

```
config vpn ssl web portal
    edit "custom_landing"
        set web-mode enable
        set landing-page-mode enable
        config landing-page
            set url "https://172.16.200.2/login"
            set sso static
            config form-data
                edit "username"
                    set value "admin"
                next
                edit "secretkey"
                    set value "1"
                next
            end
            set sso-credential alternative
            set sso-username "admin"
            set sso-password ********
        end
    next
end
```

3. Configure the Agentless VPN settings:

```
config vpn ssl settings
    set banned-cipher SHA1 SHA256 SHA384
    set servercert "fgt_gui_automation"
    set port 1443
```

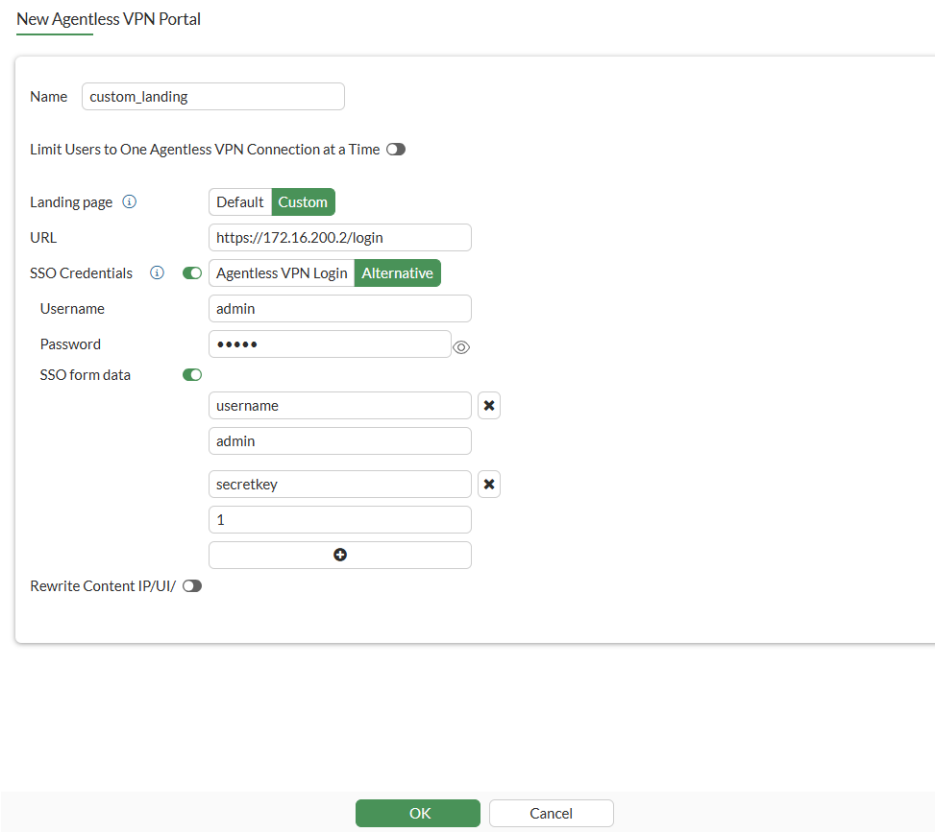
```
    set source-interface "port1"
    set source-address "all"
    set source-address6 "all"
    set default-portal "portal-access-disabled"
    config authentication-rule
        edit 1
            set groups "ssl-web-group"
            set portal "custom_landing"
        next
    end
    set encrypt-and-store-password enable
end
```

4. Configure the firewall policy:

```
config firewall policy
    edit 1
        set name "testpolicy"
        set srcintf "ssl.root"
        set dstintf "wan1"
        set action accept
        set srcaddr "all"
        set dstaddr "all"
        set srcaddr6 "all"
        set dstaddr6 "all"
        set schedule "always"
        set service "ALL"
        set logtraffic all
        set nat enable
        set groups "ssl-web-group"
    next
end
```

To configure a custom landing page from the GUI:

1. Configure the user and user group:
   a. Go to *User & Authentication > User Definition* to create the `custom_landing_user` user.
   b. Go to *User & Authentication > User Groups* to create the `ssl-web-group` user group with the member `custom_landing_user`.
2. Configure the Agentless VPN portal:
   a. Go to *VPN > Agentless VPN Portals*.
   b. Click *Create New*.
   c. Enter `custom_landing` as the *Name*.
   d. Set *Landing Page* to *Custom*.
   e. Enter the FGT_B login page *URL*.
   f. Enable *SSO Credentials* and select *Alternative*.
   g. Enable *SSO form data* and enter the form keys and values.



h. Click *OK*.

3. Configure the Agentless VPN settings:
   a. Go to *VPN > Agentless VPN Settings*.
   b. Set *Listen on Interface(s)* to *port1*.
   c. Set *Listen on Port* to *1443*.
   d. Set *Server Certificate* to *fgt_gui_automation*.
   e. Create a new *Authentication/Portal Mapping* for group *ssl-web-group* mapping the portal *custom-landing*.
   f. Click *Apply*.
4. Configure the firewall policy:
   a. Go to *Policy & Objects > Firewall Policy* and click *Create New*.
   b. Configure the following settings:

Name	testpolicy
Incoming Interface	ssl.root
Outgoing Interface	wan1
Source	all
User/group	ssl-web-group
Destination	all

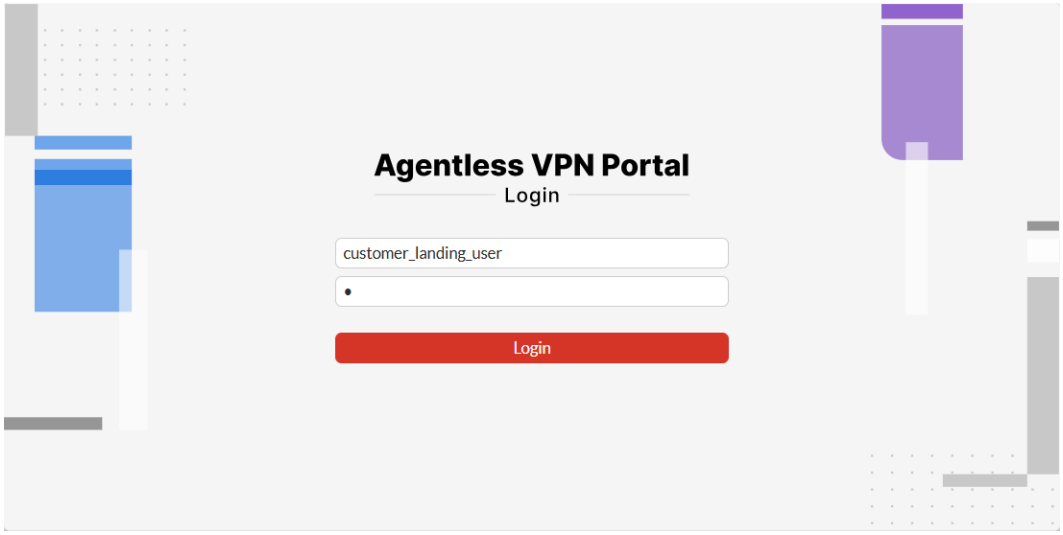
Schedule	always
Service	ALL
Action	ACCEPT

c. Enable *NAT*.
d. Enable *Log Allowed Traffic* and set it to *All Sessions*.
e. Click *OK*.

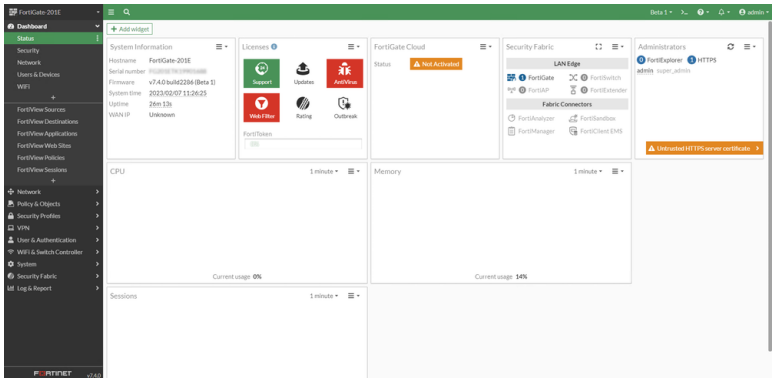
Once the Agentless VPN portal is configured, the connected user can access FGT_B through the FGT_A Agentless VPN portal.

To access FGT_B through the FGT_A Agentless VPN portal:

1. Enter your SSO credentials in the Agentless VPN login fields.



The landing page is redirected to the FGT_B GUI automatically.



Agentless VPN protocols

The following topics provide information about Agentless VPN protocols:

- TLS 1.3 support on page 3243
- SMBv2 support on page 3244

TLS 1.3 support

FortiOS supports TLS 1.3 for Agentless VPN.

TLS 1.3 support requires IPS engine 4.205 or later and browsers that support TLS 1.3.

To establish a TLS 1.3 connection to Agentless VPN:

1. Enable TLS 1.3 support using the CLI:

```
config vpn ssl setting
    set ssl-max-proto-ver tls1-3
    set ssl-min-proto-ver tls1-3
end
```

2. Configure the Agentless VPN settings. See Agentless VPN for remote users on page 3229.
3. Configure the firewall policy. See Firewall policy on page 1777.
4. For Linux clients, ensure OpenSSL 1.1.1a is installed:
   a. Run the following commands in the Linux client terminal:

```
root@PC1:~/tools# openssl
OpenSSL> version
```

   If OpenSSL 1.1.1a is installed, the system displays a response like the following:

```
OpenSSL 1.1.1a  20 Nov 2018
```

5. For Linux clients, use OpenSSL with the TLS 1.3 option to connect to Agentless VPN:
   a. Run the following command in the Linux client terminal:

```
#openssl s_client -connect 10.1.100.10:10443 -tls1_3
```

6. Ensure the Agentless VPN connection is established with TLS 1.3 using the CLI:

```
# diagnose debug application sslvpn -1
# diagnose debug enable
```

   The system displays a response like the following:

```
[207:root:1d]SSL established: TLSv1.3 TLS_AES_256_GCM_SHA384
```

SMBv2 support

On all FortiGate models, SMBv2 is enabled by default for Agentless VPN.

To configure SMBv2:

1. Set the minimum and maximum SMB versions.

```
config vpn ssl web portal
    edit portal-name
       set smb-min-version smbv2
       set smb-max-version smbv3
    next
end
```

2. Configure the Agentless VPN settings. See Agentless VPN for remote users on page 3229.
3. Configure the firewall policy. See Firewall policy on page 1777.
4. Connect to the Agentless VPN web portal, and create an SMB bookmark for the SMBv2 server.
5. Click the bookmark to connect to the SMBv2 server.
6. On the FortiGate, use package capture to verify that SMBv2 works:

Agentless VPN security best practices

Securing remote access to network resources is a critical part of security operations. Agentless VPN allows administrators to configure, administer, and deploy a remote access strategy for their remote workers. Applying the proper levels of security are integral to providing optimal performance and user experience and keeping user data safe.

The guidelines in this topic outline how to employ security best practices to protect your data.

Information about Agentless VPN throughput and maximum concurrent users is available on your device's datasheet; see Next-Generation Firewalls Models and Specifications.

Do not set the virtual IP addresses as the destination address in a firewall policy when using Agentless VPN, as it will result in no destination address being accessible. Please note that the FortiOS Agentless VPN does not support mapping the virtual IP to the actual one.

Ensure you always upgrade your FortiGate to the latest FortiOS firmware version. This ensures you are running the latest Agentless VPN security enhancements to protect your VPN deployment.

Agentless VPN settings on page 3245

- Define your minimum supported TLS version and cipher suites on page 3245
- Limit log in attempts and block duration on page 3245

- Limit users to one Agentless VPN session at a time on page 3246
- Use a custom listening port for Agentless VPN on page 3246
- Disable Agentless VPN on page 3246
- Enable server hostname on page 3247

Authentication on page 3247

- Integrate with authentication servers on page 3247
- Use a non-factory SSL certificate for the Agentless VPN portal on page 3247
- Use multi-factor authentication on page 3247
- Use multi-factor authentication with authentication servers on page 3248
- Disable case sensitivity for remote users using authentication servers and MFA on page 3248
- Deploy user certificates for remote Agentless VPN users on page 3248

Authorization on page 3248

- Properly administer firewall policies and profiles against only the access level required for the remote user on page 3248
- Set the default portal to a custom VPN portal with Agentless VPN disabled on page 3249
- Limit incoming access to specific hosts or geography based addresses on page 3249
- Limit incoming access using local-in policies with specific hosts, geography based addresses, or schedules on page 3250
- Limit incoming access using a virtual IP, loopback interface, and firewall policy with Internet Services or an external feed or schedule on page 3251

Agentless VPN settings

Define your minimum supported TLS version and cipher suites

Minimum and maximum supported TLS version can be configured in the FortiGate CLI. The cipher algorithm can also be customized.

See How to control the SSL version and cipher suite for Agentless VPN for more information.

Limit log in attempts and block duration

To prevent brute force attacks, limit log in attempts and configure the block duration:

```
config vpn ssl settings
   set login-attempt-limit 2
   set login-block-time 60
   set login-timeout 30
end
```

These are the default values. The FortiGate will block attempts to connect to Agentless VPN for 60 seconds after two unsuccessful log in attempts.

This configuration enhances Agentless VPN security by limiting failed login attempts (`login-attempt-limit 2`), temporarily blocking an IP for 60 seconds after two consecutive failed attempts (`login-block-time 60`), and defining a 30-second window for consecutive login attempts (`login-timeout 30`). If two failed attempts occur within 30 seconds of each other, they are considered consecutive and trigger a block. However, if the second attempt occurs after 30 seconds, it resets the login attempt count. These settings help mitigate brute-force attacks by restricting repeated login attempts within a short period.

Modify the values as needed for your requirements.

Limit users to one Agentless VPN session at a time

To prevent attacks from a compromised user, you can limit a user to one Agentless VPN session at a time by going to *VPN > Agentless VPN Portals*, editing a portal, and enabling *Limit Users to One Agentless VPN Connection at a Time*. This option can also be configured in the CLI:

```
config vpn ssl web portal
    edit < portal name >
        set limit-user-logins enable
    end
end
```

Use a custom listening port for Agentless VPN

To prevent external attacks targeting the default Agentless VPN port 443, use a custom port for Agentless VPN.

The Agentless VPN listening port can be configured from the GUI on the *VPN > Agentless VPN Settings* page by changing the *Listen on Port* field from the default 443 to any other port. To change the listening port in the CLI:

```
config vpn ssl settings
    set port <port number>
end
```

After changing the Agentless VPN listening port, ensure that end users are informed of the new port. Users must update the Agentless VPN web portal URL in their browsers, replacing 443 with the newly assigned port.

Make sure that the selected port is not in use by other services on the firewall.

Disable Agentless VPN

After the Agentless VPN settings have been configured, Agentless VPN can be disabled when not in use.

To disable Agentless VPN in the GUI:

1. Go to *VPN > Agentless VPN Settings*.
2. Set *Agentless VPN status* to *Disable*.
3. Click *Apply*.

If the FortiGate has VDOMs configured, select the appropriate VDOM, and repeat the steps to disable Agentless VPN for that specific VDOM.

See How to disable Agentless VPN functionality on FortiGate for more information.

Enable server hostname

Enabling server hostname ensures that if a page redirection occurs, the FortiGate server hostname is used in the host field of the HTTP header instead of a client-provided host field.

```
config vpn ssl settings
    set server-hostname <redirect host name>
end
```

Authentication

Integrate with authentication servers

For networks with many users, integrate your user configuration with existing authentication servers through LDAP, RADIUS, or FortiAuthenticator. When integrating with existing authentication servers, these users are referred to as remote users.

By integrating with existing authentication servers, such as Windows AD, there is a lower chance of making mistakes when configuring remote users and remote user groups, reducing your administration effort. Also, credentials for remote users are kept on the authentication servers themselves and are not stored on the FortiGate, unlike credentials for local users.

See Agentless VPN with LDAP user authentication on page 3252 and Agentless VPN with RADIUS on Windows NPS on page 3307 for more information.

It is best practice to integrate with encrypted protocols on authentication servers such as LDAPS instead of LDAP, and RADSEC over TLS instead of RADIUS. See Configuring client certificate authentication on the LDAP server on page 3396 and Configuring a RADSEC client on page 3438 for more information.

Use a non-factory SSL certificate for the Agentless VPN portal

Your certificate should identify your domain so that a remote user can recognize the identity of the server or portal that they are accessing through a trusted CA.

The default Fortinet factory self-signed certificates are provided to simplify initial installation and testing. If you use these certificates you are vulnerable to man-in-the-middle attacks, where an attacker spoofs your certificate, compromises your connection, and steals your personal information. It is highly recommended that you purchase a server certificate from a trusted CA to allow remote users to connect to Agentless VPN with confidence. See Procuring and importing a signed SSL certificate on page 3842 for more information.

Use multi-factor authentication

Multi-factor authentication (MFA) ensures that the end-user is who they claim to be by requiring at least two factors - a piece of information that the user knows (password), and an asset that the user has (OTP). A third

factor, something a user is (fingerprint or face), may be enabled as well. FortiToken Mobile is typically used for MFA.

FortiGate comes with two free FortiTokens, and more can be purchased from the FortiToken Mobile iOS app or through Fortinet partners.

See Agentless VPN with FortiToken mobile push authentication on page 3285 for more information.

2FA, a subset of MFA, can also be set up with email tokens. See Email Two-Factor Authentication on FortiGate for information.

Use multi-factor authentication with authentication servers

Users configured with MFA, such as FortiToken Mobile tokens and email tokens on the FortiGate, are still essentially local users with user credentials stored on the FortiGate.

You should therefore consider using a combination of MFA and authentication servers for optimal security. See Agentless VPN with LDAP-integrated certificate authentication on page 3270, Agentless VPN with RADIUS and FortiToken mobile push on FortiAuthenticator on page 3297, and RADIUS integrated certificate authentication for Agentless VPN on page 3443 for more information.

Disable case sensitivity for remote users using authentication servers and MFA

When using remote users with authentication servers and MFA, it is possible for MFA to be bypassed if the case of the entered username is not an exact match. To prevent this, ensure case sensitivity is disabled for each remote user that has been configured on the FortiGate with authentication server and MFA settings. See Agentless VPN for remote users with MFA and user sensitivity on page 3277 for more information.

Deploy user certificates for remote Agentless VPN users

This method of 2FA uses a user certificate as the second authentication factor. This is more secure, as it identifies the end user using a certificate. The configuration and administration of this solution is significantly more complicated, and requires administrators with advanced knowledge of the FortiGate and certificate deployment.

See Agentless VPN with certificate authentication on page 3264 for more information.

Authorization

Properly administer firewall policies and profiles against only the access level required for the remote user

Users do not all require the same access. Access should only be granted after careful considerations. Typically, users are placed in groups, and each group is allowed access to limited resources.

Using Agentless VPN simplifies defining the control structure for mapping users and groups to the appropriate resources.

See Agentless VPN multi-realm on page 3330 for more information.

Set the default portal to a custom VPN portal with Agentless VPN disabled

In the Agentless VPN settings, it is mandatory in the *Authentication/Portal Mapping* section to configure a portal for *All Other Users/Groups* or what can be considered a default portal for other users who are not specifically mapped to access Agentless VPN portals.

When the *Authentication/Portal Mapping* does not match users or groups that you have specifically mapped to access Agentless VPN portals, you can create a custom Agentless VPN portal and disable `web-mode` using the CLI, and then set default portal to that custom portal. This configuration is analogous to the implicit deny policy in firewall policies, in that this custom portal can deny all other users and groups.

For a default portal with `web-mode` disabled, users deemed part of *All Other Users/Groups* can still access the Agentless VPN portal. Once these users try to log in to the portal, access will be denied. Users deemed part of *All Other Users/Groups* should be unable to successfully establish Agentless VPN connection in this case.

To disable web-mode in custom Agentless VPN portal and apply it in Agentless VPN settings:

1. Using CLI, edit the Agentless VPN web portal and disable web mode.

```
config vpn ssl web portal
    edit "custom-web-portal"
        set web-mode disable
    next
end
```

2. Apply the custom web portal to Agentless VPN:
   - Using the GUI:
     i. Go to *VPN* > *Agentless VPN Settings*.
     ii. Under *Authentication/Portal Mapping*, click *All Other Users/Groups* > *Edit*.
     iii. Under *Portal* dropdown, select *custom-web-portal*.
     iv. Click *OK*.
     v. Click *Apply*.
   - Using the CLI:

```
config vpn ssl settings
    set default-portal "custom-web-portal"
end
```

Limit incoming access to specific hosts or geography based addresses

The simplest method for limiting incoming access is specifying source addresses in the Agentless VPN settings.

- If you require schedules and geography based addresses, and are comfortable using the CLI, then consider configuring local-in policies as described in To limit incoming access to specific hosts based on their source IP addresses in the CLI.
- If you require Internet Services using ISDB or external feeds, or schedules and geography based addresses, and are more comfortable using the GUI, then consider configuring a VIP, loopback, and firewall policy as described in To limit incoming access to specific hosts based on their source IP addresses in the GUI.

To limit incoming access to specific hosts based on their source IP addresses in the GUI:

1. Create address objects or groups with the source IP addresses you need to allow access to Agentless VPN.
2. In *VPN > Agentless VPN Settings* under *Restrict Access*, select *Limit access to specific hosts* and in the *Hosts* field select address objects or groups corresponding to specific source IP addresses for hosts that you need to allow.
3. To block specific source IPs while allowing all others, enable *Negate Source*, and select the address objects or groups representing the restricted hosts.

To limit incoming access to specific hosts based on their source IP addresses in the CLI:

```
config vpn ssl settings
    set source-address <source address 1> ... <source address n>
    set source-address-negate {disable | enable}
end
```

With this CLI, you can limit incoming access to hosts from specific countries by specifying geography-based addresses as the source addresses. See Geography based addresses on page 1974 for more information.

Limit incoming access using local-in policies with specific hosts, geography based addresses, or schedules

As an alternative to configuring source addresses in the Agentless VPN settings, you can configure local-in policies to allow and deny specific source addresses.

The configuration workflow is:

1. Create a new custom service corresponding to the Agentless VPN listening TCP port.
2. (Optional) Create new geography based addresses that can be specified as the source addresses for the allow and deny local-in policies that are created.
3. (Optional) Configure new schedules that can be specified as the schedule for the allow and deny local-in policies that are created.
4. Create a local-in policy using the Agentless VPN custom service to allow specific source addresses.
5. Create a local-in policy using the Agentless VPN custom service to deny specific source addresses. This is required since there is no implicit deny local-in policy defined by default.

Note that extra care should be taken when configuring a local-in policy, as an incorrect configuration could inadvertently deny traffic for IPsec VPN, dynamic routing protocols, HA, and other FortiGate features.

The source IP address objects that are used can be address objects or groups, or geography based address objects. New schedules can be created and applied to the local-in policies to impose schedule-based access restrictions.

You can also deny all access to Agentless VPN by creating a deny local-in policy using source address `all` and Agentless VPN custom service without creating a corresponding local-in policy to allow the Agentless VPN custom service.

Limit incoming access using a virtual IP, loopback interface, and firewall policy with Internet Services or an external feed or schedule

Agentless VPN access can be moved to a secondary IP address or any other WAN IP address defined on a FortiGate interface by using a virtual IP (VIP), loopback interface, and WAN-to-loopback firewall policy.

The configuration workflow is as follows:

1. Configure the Agentless VPN firewall policy from the `ssl.<VDOM>` interface to the internal interface or interfaces, ensuring that you specify the users and groups (required), and addresses or address groups (optional) in the policy's *Source* field. See Agentless VPN for remote users on page 3229.
2. Create a new loopback interface and specify an IP address that is not being used by any other interface on the FortiGate. This IP address can be a private IP address within the RFC 1918 range.
3. Create a new VIP with the following settings:
   - *External IP address/range* configured as the secondary WAN IP address, or any other WAN IP address that is available for the WAN interface.
   - *IPv4 address/range* configured as the IP address assigned to the loopback interface.
   - *Port forwarding* enabled with *External service port* and *Map to IPv4 port* with the Agentless VPN listening port.
4. Create a new WAN interface to loopback interface firewall policy with the VIP as the destination address.
5. Under *VPN > Agentless VPN Settings*, set *Listen on Interface(s)* to the newly created loopback interface.
6. (Optional) Create a new deny firewall policy, configure Internet Services as source addresses in the new policy, and place it above the WAN-to-loopback firewall policy.
7. (Optional) Create a new deny firewall policy, configure an IP address external feed, configure the external feed as a source address in the new policy, and place it above the WAN-to-loopback firewall policy.
8. (Optional) Configure a new schedule and apply it to the WAN-to-loopback firewall policy.

This configuration gives you the option to deny access to Agentless VPN from specified hosts. You can create a new deny firewall policy, apply Internet Services using the ISDB or external feed objects as source addresses and place the deny policy above the WAN-to-loopback firewall policy.

You also have the option of creating a new schedule and applying it to the WAN-to-loopback firewall policy to allow Agentless VPN access during a specified time or days of the week.

Finally, you can disable all Agentless VPN access by disabling the WAN-to-loopback firewall policy.

Agentless VPN authentication

The following topics provide instructions on configuring Agentless VPN authentication:

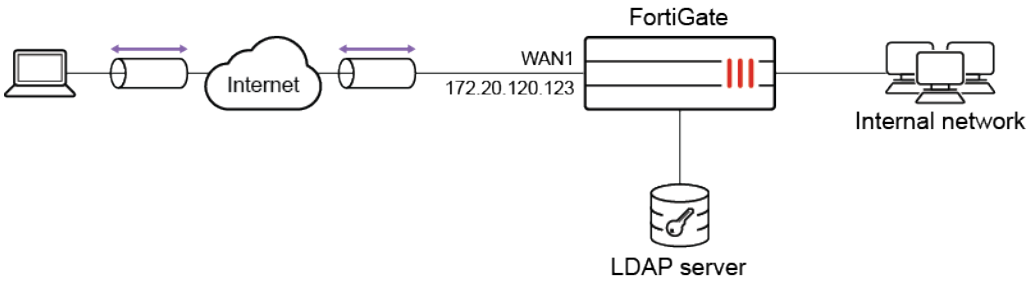
- Agentless VPN with LDAP user authentication on page 3252
- Agentless VPN with LDAP user password renew on page 3258
- Agentless VPN with certificate authentication on page 3264
- Agentless VPN with LDAP-integrated certificate authentication on page 3270
- Agentless VPN for remote users with MFA and user sensitivity on page 3277
- Agentless VPN with FortiToken mobile push authentication on page 3285
- Agentless VPN with RADIUS on FortiAuthenticator on page 3291
- Agentless VPN with RADIUS and FortiToken mobile push on FortiAuthenticator on page 3297
- Agentless VPN with RADIUS password renew on FortiAuthenticator on page 3302
- Agentless VPN with RADIUS on Windows NPS on page 3307
- Agentless VPN with multiple RADIUS servers on page 3313
- Agentless VPN with local user password policy on page 3324
- Agentless VPN multi-realm on page 3330
- NAS-IP support per Agentless VPN realm on page 3336
- Agentless VPN with Okta as SAML IdP on page 3338
- Agentless VPN with Microsoft Entra SSO integration on page 3344

Agentless VPN with LDAP user authentication

This is a sample configuration of Agentless VPN for LDAP users. In this example, the LDAP server is a Windows 2012 AD server. A user *ldu1* is configured on Windows 2012 AD server.

You must have generated and exported a CA certificate from the AD server and then have imported it as an external CA certificate into the FortiGate.

Sample topology



Sample configuration

WAN interface is the interface connected to ISP. This example shows static mode. You can also use DHCP or PPPoE mode. The Agentless VPN connection is established over the WAN interface.

To configure Agentless VPN using the GUI:

1. Configure the interface and firewall address. The port1 interface connects to the internal network:
   a. Go to *Network* > *Interfaces* and edit the *wan1* interface.
   b. Set *IP/Network Mask* to *172.20.120.123/255.255.255.0*.
   c. Edit *port1* interface and set *IP/Network Mask* to *192.168.1.99/255.255.255.0*.
   d. Click *OK*.
   e. Go to *Policy & Objects* > *Address* and create an address for internet subnet *192.168.1.0*.
2. Import CA certificate into FortiGate:
   a. Go to *System* > *Features Visibility* and ensure *Certificates* is enabled.
   b. Go to *System* > *Certificates* and select *Import* > *CA Certificate*.
   c. Select *Local PC* and then select the certificate file.
      The CA certificate now appears in the list of *External CA Certificates*. In this example, it is called *CA_Cert_1*.
   d. If you want, you can use CLI commands to rename the system-generated *CA_Cert_1* to be more descriptive:

```
config vpn certificate ca
    rename CA_Cert_1 to LDAPS-CA
end
```

3. Configure the LDAP user:
   a. Go to *User & Authentication* > *LDAP Servers* and click *Create New*.
   b. Specify *Name* and *Server IP/Name*.
   c. Specify *Common Name Identifier* and *Distinguished Name*.
   d. Set *Bind Type* to *Regular*.
   e. Specify *Username* and *Password*.
   f. Set *Protocol* to *LDAPS*.
   g. Enable *Certificate* and select *LDAPS-CA* from the list.
4. Configure user group:
   a. Go to *User & Authentication* > *User Groups* to create a user group.
   b. Enter a *Name*.
   c. In *Remote Groups*, click *Add* to add *ldaps-server*.
5. Configure Agentless VPN portals.
   a. Go to *VPN* > *Agentless VPN Portals*, and click *Create New*.
   b. Enter a name, such as *agentless-portal*.
   c. Under *Predefined Bookmarks*, click *Create New*, and enter the following details:

Field	Value
Name	Windows Server
Type	RDP
Host	192.168.1.114

Field	Value
Port	3389
Single Sign-On	Disable
Username	Set the username to log in to Windows Server.
Password	Set the password to log in to Windows Server.
Port	3389

d. Click *OK* to save the predefined bookmark.
e. Click *OK* to save the portal settings.
f. Create another Agentless VPN portal and name it *portal-access-disabled*.
g. Click *OK* to save the portal settings.
h. Disable Agentless VPN for the newly created portal (that is, *portal-access-disabled*) using CLI:

```
config vpn ssl web portal
    edit "portal-access-disabled"
        set web-mode disable
    next
end
```

6. Configure Agentless VPN settings.
   a. Go to *VPN > Agentless VPN Settings*.
   b. Set *Agentless VPN* status to *Enable*.
   c. Set *Listen on Interface(s)* to *wan1*.
   d. Set *Listen on Port* to *10443*.
   e. Choose a certificate for *Server Certificate*. The default is *Fortinet_Factory*.
   f. In *Authentication/Portal Mapping*, select *All Other Users/Groups*, and click *Edit*.
   g. Use *Portal* dropdown to select *portal-access-disabled*.
   h. Click *OK*.
   i. In *Authentication/Portal Mapping*, click *Create New*.
      i. Set *Users/Groups* to *ldaps-server*.
      ii. Set *Portal* to *agentless-portal*.
      iii. Click *OK*.
   j. Click *Apply* to save the Agentless VPN settings.
7. Configure Agentless VPN firewall policy.
   a. Go to *Policy & Objects > Firewall Policy*, and click *Create New*.
   b. Set *Name* to *Agentless VPN firewall policy*.
   c. Set *Schedule* to *always* and *Action* to *Accept*.
   d. Set *Incoming interface* to *Agentless VPN interface (ssl.root)*.
   e. Choose an *Outgoing Interface*. This example uses *port1*.
   f. Set the *Source* to *all* and *User/group* to *ldaps-group*.
   g. In this example, the *Destination* is the internal, protected subnet *192.168.1.0*.
   h. Set *Service* to *ALL*.
   i. Enable *NAT*.

j. Configure any remaining firewall and security options as desired.
k. Click *OK*.

To configure Agentless VPN using the CLI:

1. Configure the interface and firewall address:

```
config system interface
    edit "wan1"
        set vdom "root"
        set ip 172.20.120.123 255.255.255.0
    next
end
```

2. Configure internal interface and protected subnet, then connect the port1 interface to the internal network:

```
config system interface
    edit "port1"
        set vdom "root"
        set ip 192.168.1.99 255.255.255.0
    next
end
```

```
config firewall address
    edit "192.168.1.0"
        set subnet 192.168.1.0 255.255.255.0
    next
end
```

3. Import CA certificate into FortiGate:
   a. Go to *System* > *Features Visibility* and ensure *Certificates* is enabled.
   b. Go to *System* > *Certificates* and select *Import* > *CA Certificate*.
   c. Select *Local PC* and then select the certificate file.
      The CA certificate now appears in the list of *External CA Certificates*. In the example, it is called *CA_Cert_1*.
   d. If you want, you can use CLI commands to rename the system-generated *CA_Cert_1* to be more descriptive:

```
config vpn certificate ca
    rename CA_Cert_1 to LDAPS-CA
end
```

4. Configure the LDAP server:

```
config user ldap
    edit "ldaps-server"
        set server "172.20.120.161"
        set cnid "cn"
        set dn "cn=Users,dc=qa,dc=fortinet,dc=com"
        set type regular
        set username "CN=Administrator,cn=users,DC=qa,DC=fortinet,DC=com"
```

```
        set password **********
        set group-member-check group-object
        set secure ldaps
        set ca-cert "LDAPS-CA"
        set port 636
    next
end
```

5. Configure user group:

```
config user group
    edit "ldaps-group"
        set member "ldaps-server"
    next
end
```

6. Configure Agentless VPN portal and predefine RDP bookmark for windows server.

```
config vpn ssl web portal
    edit "agentless-portal"
        set web-mode enable
        config bookmark-group
            edit "gui-bookmarks"
                config bookmarks
                    edit "Windows Server"
                        set apptype rdp
                        set host "192.168.1.114"
                        set port 3389
                        set logon-user "your-windows-server-user-name"
                        set logon-password your-windows-server-password
                    next
                end
            next
        end
    next
end
```

7. Configure another Agentless VPN portal and disable Agentless VPN on it.

```
config vpn ssl web portal
    edit "portal-access-disabled"
        set web-mode disable
    next
end
```

8. Configure Agentless VPN settings:

```
config vpn ssl settings
    set banned-cipher SHA1 SHA256 SHA384
    set servercert "server_certificate"
    set port 1443
    set source-interface "wan1"
```

```
    set source-address "all"
    set default-portal "portal-access-disabled"
    config authentication-rule
        edit 1
            set groups "ldaps-group"
            set portal "agentless-portal"
        next
    end
end
```

9. Configure one Agentless VPN firewall policy to allow remote user to access the internal network. The policy does not allow traffic initiated from internal network to remote client:

```
config firewall policy
    edit 1
        set name "Agentless VPN firewall policy"
        set srcintf "ssl.root"
        set dstintf "port1"
        set srcaddr "all"
        set dstaddr "192.168.1.0"
        set action accept
        set schedule "always"
        set service "ALL"
        set nat enable
        set groups "ldaps-group"
    next
end
```

To see the results of Agentless VPN portal access:

1. From a remote device, use a web browser to log into the Agentless VPN portal *http://172.20.120.123:10443*.
2. Enter the *ldu1* user credentials, then click *Login*.
3. On FortiGate, go to *Dashboard > Agentless VPN Monitor* to verify the list of Agentless VPN users.
   If the Agentless VPN Monitor is hidden, click *+* under the *Dashboard*, search for *Agentless VPN Monitor*, and add it to the display.
4. Go to *Log & Report > System Events*, and use the dropdown to select *VPN Events* to view VPN logs.

To check the Agentless VPN portal login using the FortiOS CLI:

```
# get vpn ssl monitor
Agentless VPN Login Users:
 Index   User    Auth Type    Timeout    From           HTTP in/out  HTTPS in/out
 0       ldu1    1(1)         229        10.1.100.254   0/0          0/0

Agentless VPN sessions:
 Index   User    Source IP      Duration        I/O Bytes       Tunnel/Dest IP
```

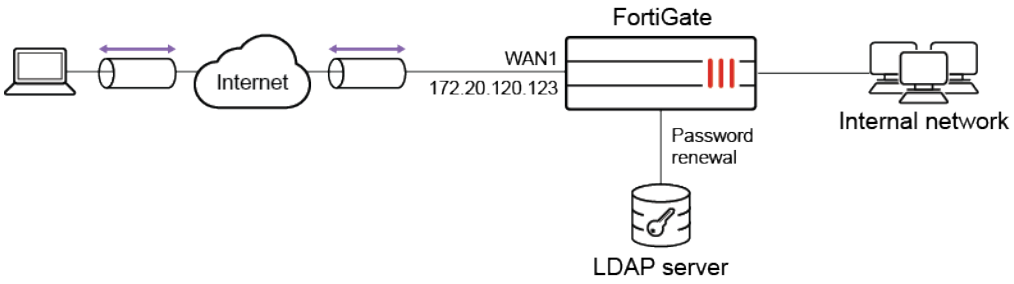
Agentless VPN with LDAP user password renew

This is a sample configuration of Agentless VPN for LDAP users with *Force Password Change on next logon*. In this example, the LDAP server is a Windows 2012 AD server. A user *ldu1* is configured on Windows 2012 AD server with *Force password change on next logon*.

> The LDAP renewal method is designed to replace (reset) the user password, meaning that the Active Directory password policy will not be enforced. For example, users can reuse the same password or use old ones.

You must have generated and exported a CA certificate from the AD server and then have imported it as an external CA certificate into the FortiGate.

Sample topology



Sample configuration

WAN interface is the interface connected to ISP. This example shows static mode. You can also use DHCP or PPPoE mode. The Agentless VPN connection is established over the WAN interface.

To configure Agentless VPN using the GUI:

1. Configure the interface and firewall address. The port1 interface connects to the internal network.
   a. Go to *Network* > *Interfaces* and edit the *wan1* interface.
   b. Set *IP/Network Mask* to *172.20.120.123/255.255.255.0*.
   c. Edit *port1* interface and set *IP/Network Mask* to *192.168.1.99/255.255.255.0*.
   d. Click *OK*.
   e. Go to *Policy & Objects* > *Address* and create an address for internet subnet *192.168.1.0*.
2. Import CA certificate into FortiGate:
   a. Go to *System* > *Features Visibility* and ensure *Certificates* is enabled.
   b. Go to *System* > *Certificates* and select *Import* > *CA Certificate*.
   c. Select *Local PC* and then select the certificate file.
      The CA certificate now appears in the list of *External CA Certificates*. In this example, it is called *CA_Cert_1*.

d. If you want, you can use CLI commands to rename the system-generated *CA_Cert_1* to be more descriptive:

```
config vpn certificate ca
    rename CA_Cert_1 to LDAPS-CA
end
```

3. Configure the LDAP user:

> The LDAP user must either be an administrator, or have the proper permissions delegated to it, to be able to change passwords of other registered users on the LDAP server.

a. Go to *User & Authentication* > *LDAP Servers* and click *Create New*.
b. Specify *Name* and *Server IP/Name*.
c. Specify *Common Name Identifier* and *Distinguished Name*.
d. Set *Bind Type* to *Regular*.
e. Specify *Username* and *Password*.
f. Set *Protocol* to *LDAPS*.
g. Enable *Certificate* and select *LDAPS-CA* from the list.
h. To enable the `password-renew` option, use these CLI commands.

```
config user ldap
    edit "ldaps-server"
        set password-expiry-warning enable
        set password-renewal enable
    next
end
```

4. Configure user group:
a. Go to *User & Authentication* > *User Groups* to create a user group.
b. Enter a *Name*.
c. In *Remote Groups*, click *Add* to add *ldaps-server*.
5. Configure Agentless VPN portals.
a. Go to *VPN* > *Agentless VPN Portals*, and click *Create New*.
b. Enter a name, such as *agentless-portal*.
c. Under *Predefined Bookmarks*, click *Create New*, and enter the following details:

Field	Value
Name	Windows Server
Type	RDP
Host	192.168.1.114
Port	3389
Single Sign-On	Disable
Username	Set the username to log in to Windows Server.

Field	Value
Password	Set the password to log in to Windows Server.
Port	3389

d. Click *OK* to save the predefined bookmark.
e. Click *OK* to save the portal settings.
f. Create another Agentless VPN portal and name it *portal-access-disabled*.
g. Click *OK* to save the portal settings.
h. Disable Agentless VPN for the newly created portal (that is, *portal-access-disabled*) using CLI:

```
config vpn ssl web portal
    edit "portal-access-disabled"
        set web-mode disable
    next
end
```

6. Configure Agentless VPN settings.
   a. Go to *VPN > Agentless VPN Settings*.
   b. Set *Agentless VPN* status to *Enable*.
   c. Set *Listen on Interface(s)* to *wan1*.
   d. Set *Listen on Port* to *10443*.
   e. Choose a certificate for *Server Certificate*. The default is *Fortinet_Factory*.
   f. In *Authentication/Portal Mapping*, select *All Other Users/Groups*, and click *Edit*.
   g. Use *Portal* dropdown to select *portal-access-disabled*.
   h. Click *OK*.
   i. In *Authentication/Portal Mapping*, click *Create New*.
      i. Set *Users/Groups* to *ldaps-group*.
      ii. Set *Portal* to *agentless-portal*.
      iii. Click *OK*.
   j. Click *Apply* to save the Agentless VPN settings.
7. Configure Agentless VPN firewall policy:
   a. Go to *Policy & Objects > Firewall Policy*, and click *Create New*.
   b. Set *Name* to *Agentless VPN firewall policy*.
   c. Set *Schedule* to *always* and *Action* to *Accept*.
   d. Set *Incoming interface* to *Agentless VPN interface (ssl.root)*.
   e. Choose an *Outgoing Interface*. This example uses *port1*.
   f. Set the *Source* to *all* and *User/group* to *ldaps-group*.
   g. Set *Destination Address*. In this example, the destination is the internal, protected subnet *192.168.1.0*.
   h. Set *Service* to *ALL*.
   i. Click *OK*.

To configure Agentless VPN using the CLI:

1. Configure the interface and firewall address:

```
config system interface
    edit "wan1"
        set vdom "root"
        set ip 172.20.120.123 255.255.255.0
    next
end
```

2. Configure internal interface and protected subnet, then connect the port1 interface to the internal network:

```
config system interface
    edit "port1"
        set vdom "root"
        set ip 192.168.1.99 255.255.255.0
    next
end
```

```
config firewall address
    edit "192.168.1.0"
        set subnet 192.168.1.0 255.255.255.0
    next
end
```

3. Import CA certificate into FortiGate:
   a. Go to *System* > *Features Visibility* and ensure *Certificates* is enabled.
   b. Go to *System* > *Certificates* and select *Import* > *CA Certificate*.
   c. Select *Local PC* and then select the certificate file.
      The CA certificate now appears in the list of *External CA Certificates*. In the example, it is called *CA_Cert_1*.
   d. If you want, you can use CLI commands to rename the system-generated *CA_Cert_1* to be more descriptive:

```
config vpn certificate ca
    rename CA_Cert_1 to LDAPS-CA
end
```

4. Configure the LDAP server:

> The LDAP user must either be an administrator, or have the proper permissions delegated to it, to be able to change passwords of other registered users on the LDAP server.

```
config user ldap
    edit "ldaps-server"
        set server "172.20.120.161"
        set cnid "cn"
        set dn "cn=Users,dc=qa,dc=fortinet,dc=com"
        set type regular
```

```
        set username "CN=Administrator,cn=users,DC=qa,DC=fortinet,DC=com"
        set password **********
        set group-member-check group-object
        set secure ldaps
        set ca-cert "LDAPS-CA"
        set port 636
        set password-expiry-warning enable
        set password-renewal enable
    next
end
```

5. Configure user group:

```
config user group
    edit "ldaps-group"
        set member "ldaps-server"
    next
end
```

6. Configure Agentless VPN portal and predefine RDP bookmark for windows server.

```
config vpn ssl web portal
    edit "agentless-portal"
        set web-mode enable
        config bookmark-group
            edit "gui-bookmarks"
                config bookmarks
                    edit "Windows Server"
                        set apptype rdp
                        set host "192.168.1.114"
                        set port 3389
                        set logon-user "your-windows-server-user-name"
                        set logon-password your-windows-server-password
                    next
                end
            next
        end
    next
end
```

7. Configure another Agentless VPN portal and disable Agentless VPN on it.

```
config vpn ssl web portal
    edit "portal-access-disabled"
        set web-mode disable
    next
end
```

8. Configure Agentless VPN settings:

```
config vpn ssl settings
    set servercert "server_certificate"
```

```
    set source-interface "wan1"
    set source-address "all"
    set default-portal "portal-access-disable"
    config authentication-rule
        edit 1
            set groups "ldaps-group"
            set portal "agentless-portal"
        next
    end
end
```

9. Configure one Agentless VPN firewall policy to allow remote user to access the internal network. This policy does not allow traffic initiated from internal network to remote client.

```
config firewall policy
    edit 1
        set name "Agentless VPN firewall policy"
        set srcintf "ssl.root"
        set dstintf "port1"
        set srcaddr "all"
        set dstaddr "192.168.1.0"
        set action accept
        set schedule "always"
        set service "ALL"
        set nat enable
        set groups "ldaps-group"
    next
end
```

To see the results of web portal:

1. From a remote device, use a web browser to log into the Agentless VPN web portal *http://172.20.120.123:10443*.
2. Log in using the *ldu1* credentials.
   Use a user that is configured on FortiAuthenticator with *Force password change on next logon*.
3. Click *Login*. You are prompted to enter a new password. The prompt will timeout after 90 seconds.
4. On FortiGate, go to *Dashboard > Agentless VPN Monitor* to verify the list of Agentless VPN users.
   If the Agentless VPN Monitor is hidden, click *+* under the *Dashboard*, search for *Agentless VPN Monitor*, and add it to the display.
5. Go to *Log & Report > System Events*, and use the dropdown to select *VPN Events* to view VPN logs.

To check the web portal login using the FortiOS CLI:

```
# get vpn ssl monitor
Agentless VPN Login Users:
 Index   User    Auth Type    Timeout    From           HTTP in/out  HTTPS in/out
 0       ldu1    1(1)         229        10.1.100.254   0/0          0/0

Agentless VPN sessions:
 Index   User    Source IP      Duration        I/O Bytes       Tunnel/Dest IP
```

Agentless VPN with certificate authentication

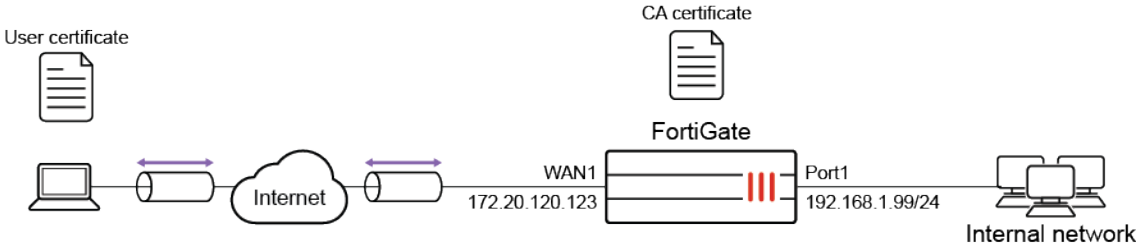
This is an example configuration of Agentless VPN that requires users to authenticate using a client certificate. The client certificate is issued by the company Certificate Authority (CA). Each user is issued a certificate with their username in the subject.

There are two ways to configure certificate authentication:

1. Using PKI users
2. Configuring Agentless VPN settings to require a client certificate

In this example, the server and client certificates are signed by the same Certificate Authority (CA).

> ⚠ Self-signed certificates are provided by default to simplify initial installation and testing. It is **HIGHLY** recommended that you acquire a signed certificate for your installation.
>
> Continuing to use these certificates can result in your connection being compromised, allowing attackers to steal your information, such as credit card details.
>
> For more information, please review the Use a non-factory SSL certificate for the Agentless VPN portal on page 3247 and learn how to Procuring and importing a signed SSL certificate on page 3842.



Using PKI users

When using PKI users, the FortiGate authenticates the user based on there identity in the subject or the common name on the certificate. The certificate must be signed by a CA that is known by the FortiGate, either through the default CA certificates or through importing a CA certificate.

The user can either match a static subject or common name defined in the PKI user settings, or match an LDAP user in the LDAP server defined in the PKI user settings. Multi-factor authentication can also be enabled with the password as the second factor.

Configuring Agentless VPN settings to require a client certificate

Using this method, the user is authenticated based on their regular username and password, but Agentless VPN will still require an additional certificate check. The client certificate only needs to be signed by a known CA in order to pass authentication.

This method can be configured by enabling *Require Client Certificate* (`reqclientcert`) in the Agentless VPN settings.

Configuration

In the following example, Agentless VPN users are authenticated using the first method. A PKI user is configured with multi-factor authentication

Pre-requisites:

- The CA has already issued a client certificate to the user.
- The CA has issued a server certificate for the FortiGate's Agentless VPN portal.
- The CA certificate is available to be imported on the FortiGate.

To configure Agentless VPN in the GUI:

1. Install the server certificate. The server certificate allows the clients to authenticate the server and to encrypt the Agentless VPN traffic.
   a. Go to *System* > *Feature Visibility* and ensure *Certificates* is enabled.
   b. Go to *System* > *Certificates* and select *Import* > *Local Certificate*.
      - Set *Type* to *Certificate*.
      - Choose the *Certificate file* and the *Key file* for your certificate, and enter the *Password*.
      - If required, you can change the *Certificate Name*.

   The server certificate now appears in the list of *Certificates*.
2. Install the CA certificate.
   The CA certificate is the certificate that signed both the server certificate and the user certificate. In this example, it is used to authenticate Agentless VPN users.
   a. Go to *System* > *Certificates* and select *Import* > *CA Certificate*.
   b. Select *Local PC* and then select the certificate file.

   The CA certificate now appears in the list of *External CA Certificates*. In this example, it is called *CA_Cert_1*.
3. Configure PKI users and a user group.
   To use certificate authentication, use the CLI to create PKI users.

```
config user peer
    edit pki01
        set ca CA_Cert_1
        set subject "CN=User01"
    next
end
```

   Ensure that the subject matches the name of the user certificate. In this example, *User01*.
4. After you have create a PKI user, a new menu is added to the GUI:
   a. Go to *User & Authentication* > *PKI* to see the new user.
   b. Edit the user account.
   c. Enable *Two-factor authentication* and set a password for the account.
   d. Go to *User & Authentication* > *User Groups* and create a group called *agentlessvpngroup*.
   e. Add the PKI user *pki01* to the group.
5. Configure Agentless VPN portals.
   a. Go to *VPN* > *Agentless VPN Portals*, and click *Create New*.
   b. Enter a name, such as *agentless-portal*.

c. Under *Predefined Bookmarks*, click *Create New*, and enter the following details:

Field	Value
Name	Windows Server
Type	RDP
Host	192.168.1.114
Port	3389
Single Sign-On	Disable
Username	Set the username to log in to Windows Server.
Password	Set the password to log in to Windows Server.
Port	3389

d. Click *OK* to save the predefined bookmark.
e. Click *OK* to save the portal settings.
f. Create another Agentless VPN portal and name it *portal-access-disabled*.
g. Click *OK* to save the portal settings.
h. Disable Agentless VPN for the newly created portal (that is, *portal-access-disabled*) using CLI:

```
config vpn ssl web portal
    edit "portal-access-disabled"
        set web-mode disable
    next
end
```

6. Configure Agentless VPN settings.
   a. Go to *VPN > Agentless VPN Settings* and enable Agentless VPN.
   b. Set the *Listen on Interface(s)* to *wan1*.
   c. Set *Listen on Port* to *10443*.
   d. Set *Server Certificate* to the local certificate that was imported.
   e. Enable *Require Client Certificate*.
   f. Under *Authentication/Portal Mapping*, set select *All Other Users/Groups*, and click *Edit*.
   g. Use *Portal* dropdown to select *portal-access-disabled*.
   h. Click *OK*.
   i. In *Authentication/Portal Mapping*, click *Create New*.
      i. Set *Users/Groups* to *agentlessvpngroup*.
      ii. Set *Portal* to *agentless-portal*.
      iii. Click *OK*.
   j. Click *Apply* to save the Agentless VPN settings.
7. Configure Agentless VPN firewall policy.
   a. Go to *Policy & Objects > Firewall Policy*, and click *Create New*.
   b. Set *Name* to *Agentless VPN firewall policy*.
   c. Set *Schedule* to *always* and *Action* to *Accept*.
   d. Set *Incoming interface* to *Agentless VPN interface (ssl.root)*.

e. Choose an *Outgoing Interface*. This example uses *port1*.
f. Set the *Source* to *all* and *User/group* to *agentlessvpngroup*.
g. In this example, the *Destination* is the internal, protected subnet *192.168.1.0*.
h. Set *Service* to *ALL*.
i. Click *OK*.

To configure Agentless VPN in the CLI:

1. Configure the protected subnet:

```
config firewall address
    edit "192.168.1.0"
        set subnet 192.168.1.0 255.255.255.0
    next
end
```

2. Install the server certificate:

   The server certificate allows the clients to authenticate the server and to encrypt the Agentless VPN traffic. While it is easier to install the server certificate in the GUI, the CLI can be used to import a p12 certificate from a TFTP server.

   To import a p12 certificate, put the certificate *server_certificate.p12* on your TFTP server, then run following command on the FortiGate:

```
execute vpn certificate local import tftp server_certificate.p12 <your tftp_server> p12 <your
password for PKCS12 file>
```

   To check that the server certificate is installed:

```
show vpn certificate local server_certificate
```

3. Install the CA certificate:

   The CA certificate is the certificate that signed both the server certificate and the user certificate. In this example, it is used to authenticate Agentless VPN users. While it is easier to install the CA certificate from GUI, the CLI can be used to import a CA certificates from a TFTP server.

   To import a CA certificate, put the CA certificate on your TFTP server, then run following command on the FortiGate:

```
execute vpn certificate ca import tftp <your CA certificate name> <your tftp server>
```

   To check that a new CA certificate is installed:

```
show vpn certificate ca
```

4. Configure PKI users and a user group:

```
config user peer
    edit pki01
        set ca CA_Cert_1
        set subject "CN=User01"
        set two-factor enable
        set passwd **********
```

```
    next
end
```

```
config user group
    edit "agentlessvpngroup"
        set member "pki01"
    next
end
```

5. Configure Agentless VPN portal and predefine RDP bookmark for windows server.

```
config vpn ssl web portal
    edit "agentless-portal"
        set web-mode enable
        config bookmark-group
            edit "gui-bookmarks"
                config bookmarks
                    edit "Windows Server"
                        set apptype rdp
                        set host "192.168.1.114"
                        set port 3389
                        set logon-user "your-windows-server-user-name"
                        set logon-password your-windows-server-password
                    next
                end
            next
        end
    next
end
```

6. Configure another Agentless VPN portal and disable Agentless VPN on it.

```
config vpn ssl web portal
    edit "portal-access-disabled"
        set web-mode disable
    next
end
```

7. Configure Agentless VPN settings:

```
config vpn ssl settings
    set reqclientcert enable
    set banned-cipher SHA1 SHA256 SHA384
    set servercert "server_certificate"
    set source-interface "wan1"
    set source-address "all"
    set default-portal "portal-access-disabled"
    config authentication-rule
        edit 1
            set groups "agentlessvpngroup"
            set portal "agentless-portal"
        next
```

```
    end
end
```

8. Configure one Agentless VPN firewall policy to allow remote user to access the internal network. This policy does not allow traffic initiated from internal network to remote client.

```
config firewall policy
    edit 1
        set name "Agentless VPN firewall policy"
        set srcintf "ssl.root"
        set dstintf "port1"
        set srcaddr "all"
        set dstaddr "192.168.1.0"
        set action accept
        set schedule "always"
        set service "ALL"
        set nat enable
        set groups "agentlessvpngroup"
    next
end
```

Installation

To use the user certificate, you must first install it on the user's PC. When the user tries to authenticate, the user certificate is checked against the CA certificate to verify that they match.

Every user should have a unique user certificate. This allows you to distinguish each user and revoke a specific user's certificate, such as if a user no longer has VPN access.

To install the user certificate on Windows 7, 8, and 10:

1. Double-click the certificate file to open the *Import Wizard*.
2. Use the *Import Wizard* to import the certificate into the *Personal store* of the current user.

To install the user certificate on Mac OS X:

1. Open the certificate file, to open *Keychain Access*.
2. Double-click the certificate.
3. Expand *Trust* and select *Always Trust*.

To see the results of Agentless VPN web portal:

1. In a web browser, log into the portal *http://172.20.120.123:10443*.
   A message requests a certificate for authentication.
2. Select the user certificate.
3. Enter your user credentials.
   If the certificate is correct, you can connect to the Agentless VPN web portal.

To check the Agentless VPN connection using the GUI:

1. On FortiGate, go to *Dashboard* > *Agentless VPN Monitor* to verify the list of Agentless VPN users.
   If the Agentless VPN Monitor is hidden, click + under the *Dashboard*, search for *Agentless VPN Monitor*, and add it to the display.
2. Go to *Log & Report* > *System Events*, and use the dropdown to select *VPN Events* to view VPN logs.

To check the Agentless VPN connection using the CLI:

```
get vpn ssl monitor
Agentless VPN Login Users:
 Index   User    Auth Type      Timeout         From     HTTP in/out    HTTPS in/out
 0       pki01,cn=User01          1(1)            229     10.1.100.254   0/0     0/0
 1       pki01,cn=User01          1(1)            291     10.1.100.254   0/0     0/0

Agentless VPN sessions:
 Index   User    Source IP      Duration        I/O Bytes       Tunnel/Dest IP
 0       pki01,cn=User01          10.1.100.254    9       22099/43228    10.212.134.200
```

Agentless VPN with LDAP-integrated certificate authentication

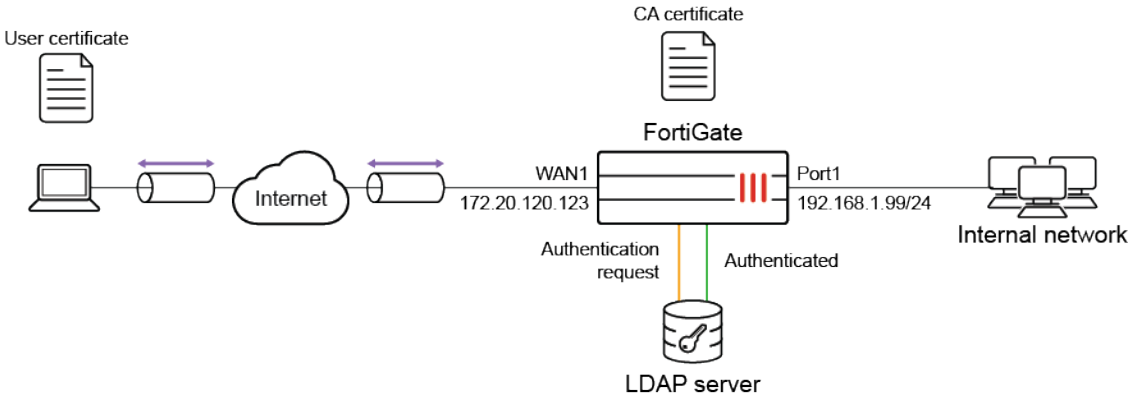
This is a sample configuration of Agentless VPN that requires users to authenticate using a certificate with LDAP `UserPrincipalName` checking.

This sample uses Windows 2012R2 Active Directory acting as both the user certificate issuer, the certificate authority, and the LDAP server.

⚠ When configuring an LDAP connection to an Active Directory server, an administrator must provide Active Directory user credentials.

- To secure this connection, use LDAPS on both the Active Directory server and FortiGate. See Configuring an LDAP server on page 3381 and Configuring client certificate authentication on the LDAP server on page 3396.
- Apply the principle of least privilege. For the LDAP regular bind operation, do not use credentials that provide full administrative access to the Windows server when using credentials. See Configuring least privileges for LDAP admin account authentication in Active Directory on page 3389.

Sample topology



Sample configuration

WAN interface is the interface connected to ISP. This example shows static mode. You can also use DHCP or PPPoE mode. The Agentless VPN connection is established over the WAN interface.

In this sample, the *User Principal Name* is included in the subject name of the issued certificate. This is the user field we use to search LDAP in the connection attempt.

To use the user certificate, you must first install it on the user's PC. When the user tries to authenticate, the user certificate is checked against the CA certificate to verify that they match.

Every user should have a unique user certificate. This allows you to distinguish each user and revoke a specific user's certificate, such as if a user no longer has VPN access.

To install the server certificate:

The server certificate is used for authentication and for encrypting Agentless VPN traffic.

1. Go to *System* > *Feature Visibility* and ensure *Certificates* is enabled.
2. Go to *System* > *Certificates* and select *Import* > *Local Certificate*.
3. Set *Type* to *Certificate*.
4. Choose the *Certificate file* and the *Key file* for your certificate, and enter the *Password*.
5. If required, change the *Certificate Name*.
   The server certificate now appears in the list of *Certificates*.

To install the CA certificate:

The CA certificate is the certificate that signed both the server certificate and the user certificate. In this example, it is used to authenticate Agentless VPN users.

1. Go to *System* > *Certificates* and select *Import* > *CA Certificate*.
2. Select *Local PC* and then select the certificate file.
   The CA certificate now appears in the list of *External CA Certificates*. In this example, it is called *CA_Cert_1*.

To configure Agentless VPN using the GUI:

1. Configure the interface and firewall address. The port1 interface connects to the internal network.
   a. Go to *Network* > *Interfaces* and edit the *wan1* interface.
   b. Set *IP/Network Mask* to *172.20.120.123/255.255.255.0*.
   c. Edit *port1* interface and set *IP/Network Mask* to *192.168.1.99/255.255.255.0*.
   d. Click *OK*.
   e. Go to *Policy & Objects* > *Address* and create an address for internet subnet *192.168.1.0*.
2. Configure the LDAP server:
   a. Go to *User & Authentication* > *LDAP Servers* and click *Create New*.
   b. Specify *Name* and *Server IP/Name*.
   c. Set *Distinguished Name* to *dc=fortinet-fsso,dc=com*.
   d. Set *Bind Type* to *Regular*.
   e. Set *Username* to *cn=admin,ou=testing,dc=fortinet-fsso,dc=com*.
   f. Set *Password*.
   g. Click *OK*.
3. Configure PKI users and a user group:
   To use certificate authentication, use the CLI to create PKI users.

```
config user peer
    edit user1
        set ca CA_Cert_1
        set mfa-server "ldap-AD"
        set mfa-mode subject-identity
    next
end
```

   When you have create a PKI user, a new menu is added to the GUI:
   a. Go to *User & Authentication* > *PKI* to see the new user.
   b. Go to *User & Authentication* > *User* > *User Groups* and create a group *agentlessvpn-group*.
   c. Add the PKI peer object you created as a local member of the group.
   d. Add a remote group on the LDAP server and select the group of interest.
      You need these users to be members using the LDAP browser window.
4. Configure Agentless VPN portals.
   a. Go to *VPN* > *Agentless VPN Portals*, and click *Create New*.
   b. Enter a name, such as *agentless-portal*.
   c. Under *Predefined Bookmarks*, click *Create New*, and enter the following details:

Field	Value
Name	Windows Server
Type	RDP
Host	192.168.1.114
Port	3389

Field	Value
Single Sign-On	Disable
Username	Set the username to log in to Windows Server.
Password	Set the password to log in to Windows Server.
Port	3389

d. Click *OK* to save the predefined bookmark.
e. Click *OK* to save the portal settings.
f. Create another Agentless VPN portal and name it *portal-access-disabled*.
g. Click *OK* to save the portal settings.
h. Disable Agentless VPN for the newly created portal (that is, *portal-access-disabled*) using CLI:

```
config vpn ssl web portal
    edit "portal-access-disabled"
        set web-mode disable
    next
end
```

5. Configure Agentless VPN settings:
   a. Go to *VPN > Agentless VPN Settings*.
   b. Select the *Listen on Interface(s)*, in this example, *wan1*.
   c. Set *Listen on Port* to *10443*.
   d. Set *Server Certificate* to the authentication certificate.
      i. In *Authentication/Portal Mapping*, select *All Other Users/Groups*, and click *Edit*.
      ii. Use *Portal* dropdown to select *portal-access-disabled*.
      iii. Click *OK*.
   e. In *Authentication/Portal Mapping*, click *Create New*.
      i. Set *Users/Groups* to *agentlessvpn-group*.
      ii. Set *Portal* to *agentless-portal*.
      iii. Click *OK*.
   f. Click *Apply* to save the Agentless VPN settings.
6. Configure Agentless VPN firewall policy.
   a. Go to *Policy & Objects > Firewall Policy*, and click *Create New*.
   b. Set *Name* to *Agentless VPN firewall policy*.
   c. Set *Schedule* to *always* and *Action* to *Accept*.
   d. Set *Incoming interface* to *Agentless VPN interface (ssl.root)*.
   e. Choose an *Outgoing Interface*. This example uses *port1*.
   f. Set the *Source* to *all* and *User/group* to *agentlessvpngroup*.
   g. In this example, the *Destination* is the internal, protected subnet *192.168.1.0*.
   h. Set *Service* to *ALL*.
   i. Click *OK*.

To configure Agentless VPN using the CLI:

1. Configure the interface and firewall address:

```
config system interface
    edit "wan1"
        set vdom "root"
        set ip 172.20.120.123 255.255.255.0
    next
end
```

2. Configure internal interface and protected subnet, then connect the port1 interface to the internal network:

```
config system interface
    edit "port1"
        set vdom "root"
        set ip 192.168.1.99 255.255.255.0
    next
end
```

```
config firewall address
    edit "192.168.1.0"
        set subnet 192.168.1.0 255.255.255.0
    next
end
```

3. Configure the LDAP server:

```
config user ldap
    edit "ldap-AD"
        set server "172.18.60.206"
        set cnid "cn"
        set dn "dc=fortinet-fsso,dc=com"
        set type regular
        set username "cn=admin,ou=testing,dc=fortinet-fsso,dc=com"
        set password ldap-server-password
    next
end
```

4. Configure PKI users and a user group:

```
config user peer
    edit user1
        set ca CA_Cert_1
        set mfa-server "ldap-AD"
        set mfa-mode subject-identity
    next
end
```

```
config user group
    edit "agentlessvpn-group"
        set member "ldap-AD" "user1"
        config match
```

```
            edit 1
                set server-name "ldap-AD"
                set group-name "CN=group3,OU=Testing,DC=Fortinet-FSSO,DC=COM"
            next
        end
    next
end
```

5. Configure Agentless VPN portal and predefine RDP bookmark for windows server.

```
config vpn ssl web portal
    edit "agentless-portal"
        set web-mode enable
        config bookmark-group
            edit "gui-bookmarks"
                config bookmarks
                    edit "Windows Server"
                        set apptype rdp
                        set host "192.168.1.114"
                        set port 3389
                        set logon-user "your-windows-server-user-name"
                        set logon-password your-windows-server-password
                    next
                end
            next
        end
    next
end
```

6. Configure another Agentless VPN portal and disable Agentless VPN on it.

```
config vpn ssl web portal
    edit "portal-access-disabled"
        set web-mode disable
    next
end
```

7. Configure Agentless VPN settings:

```
config vpn ssl settings
    set servercert "server_certificate"
    set source-interface "wan1"
    set source-address "all"
    set default-portal "agentless-portal"
    config authentication-rule
        edit 1
            set groups "agentlessvpn-group"
            set portal "agentless-portal"
        next
    end
end
```

8. Configure one Agentless VPN firewall policy to allow remote user to access the internal network. This policy does not allow traffic initiated from internal network to remote client.

```
config firewall policy
    edit 1
        set name "Agentless VPN firewall policy"
        set srcintf "ssl.root"
        set dstintf "port1"
        set srcaddr "all"
        set dstaddr "192.168.1.0"
        set action accept
        set schedule "always"
        set service "ALL"
        set nat enable
        set groups "agentlessvpngroup"
    next
end
```

To see the results of Agentless VPN portal:

1. In a web browser, log into the portal *http://172.20.120.123:10443*.
   A message requests a certificate for authentication.
2. Select the user certificate. It does not require username and password.
   You can connect to the Agentless VPN web portal.

To check the Agentless VPN connection using the GUI:

1. On FortiGate, go to *Dashboard > Agentless VPN Monitor* to verify the list of Agentless VPN users.
   If the Agentless VPN Monitor is hidden, click *+* under the *Dashboard*, search for *Agentless VPN Monitor*, and add it to the display.
2. Go to *Log & Report > System Events*, and use the dropdown to select *VPN Events* to view VPN logs.

To check the Agentless VPN connection using the CLI:

```
get vpn ssl monitor
Agentless VPN Login Users:
 Index   User    Auth Type      Timeout         From     HTTP in/out    HTTPS in/out
 0       test3          1(1)            229     10.1.100.254   0/0     0/0

Agentless VPN sessions:
 Index   User    Source IP      Duration        I/O Bytes       Tunnel/Dest IP
```

To check the real-time authentication debug logs using the CLI:

Below is a sample output of `diagnose debug application fnbamd -1` while the user connects. This is a shortened output sample of a few locations to show the important parts. This sample shows lookups to find the group memberships (three groups total) of the user and that the correct group being found results in a match.

```
[1148] fnbamd_ldap_recv-Response len: 16, svr: 172.18.60.206
[829] fnbamd_ldap_parse_response-Got one MESSAGE. ID:4, type:search-result
```

```
[864] fnbamd_ldap_parse_response-ret=0
[1386] __fnbamd_ldap_primary_grp_next-Auth accepted
[910] __ldap_rxtx-Change state to 'Done'
[843] __ldap_rxtx-state 23(Done)
[925] fnbamd_ldap_send-sending 7 bytes to 172.18.60.206
[937] fnbamd_ldap_send-Request is sent. ID 5
[753] __ldap_stop-svr 'ldap-AD'

[2120] fnbamd_auth_cert_result-Result for ldap svr[0] 'ldap-AD' is SUCCESS
[2126] fnbamd_auth_cert_result-matched user 'test3', matched group 'agentlessvpn-group'
```

You can also use `diagnose firewall auth list` to validate that a firewall user entry exists for the Agentless VPN user and is part of the right groups.

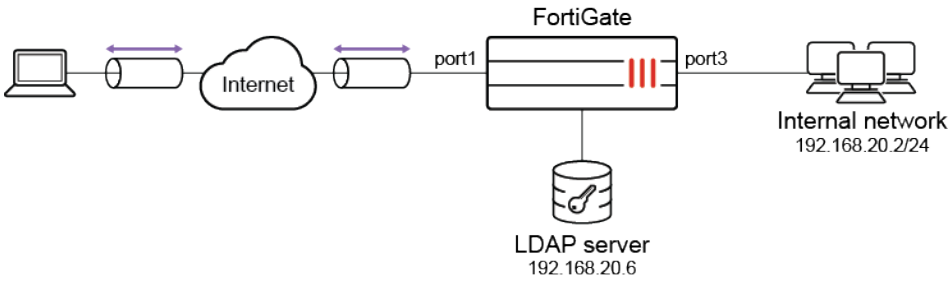
Agentless VPN for remote users with MFA and user sensitivity

By default, remote LDAP and RADIUS user names are case sensitive. When a remote user object is applied to Agentless VPN authentication, the user must type the exact case that is used in the user definition on the FortiGate.

Case sensitivity and accents can be ignored by disabling the `username-sensitivity` CLI command, allowing the remote user object to match any case or accents that the end user types in.

In this example, a remote user is configured with multi-factor authentication (MFA). The user group includes the LDAP user and server and is applied to Agentless VPN authentication and the policy.

Topology



Example configuration

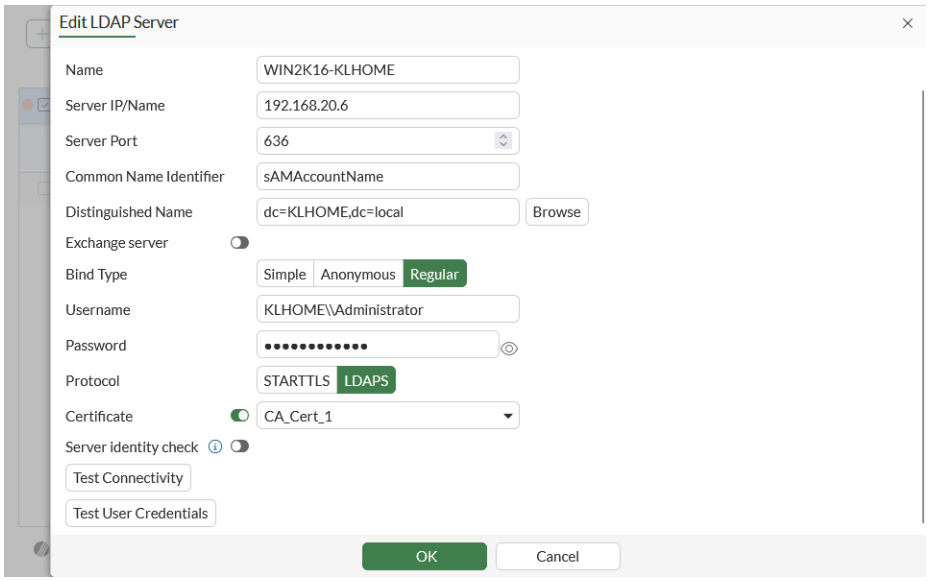
To configure the LDAP server:

1. Generate and export a CA certificate from the AD server .
2. Import the CA certificate into FortiGate:
   a. Go to *System > Features Visibility* and ensure *Certificates* is enabled.
   b. Go to *System > Certificates* and select *Import > CA Certificate*.
   c. Select *Local PC* and then select the certificate file.
      The CA certificate now appears in the list of *External CA Certificates*. In this example, it is called *CA_Cert_1*.
   d. If you want, you can use CLI commands to rename the system-generated *CA_Cert_1* to be more descriptive:

```
config vpn certificate ca
    rename CA_Cert_1 to LDAPS-CA
end
```

3. Configure the LDAP user:
   a. Go to *User & Authentication > LDAP Servers* and click *Create New*.
   b. Configure the following options for this example:

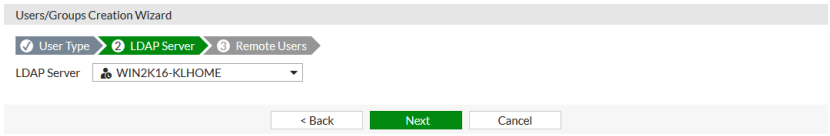
Name	WIN2K16-KLHOME
Server IP/Name	192.168.20.6
Server Port	636
Common Name Identifier	sAMAccountName
Distinguished Name	dc=KLHOME,dc=local
Bind Type	Regular
Username	KLHOME\\Administrator
Password	*********
Protocol	LDAPS
Certificate	CA_Cert_1 This is the CA certificate that you imported in step 2.



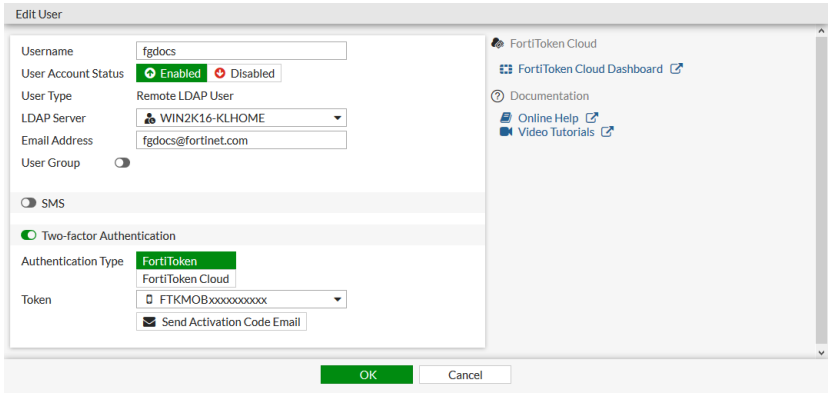
c. Click *OK*.

To configure an LDAP user with MFA:

1. Go to *User & Authentication* > *User Definition* and click *Create New*.
2. Select *Remote LDAP User*, then click *Next*.
3. Select the just created LDAP server, then click *Next*.



4. Right click to add the selected user, then click *Submit*.
5. Edit the user that you just created.
   The username will be pulled from the LDAP server with the same case as it has on the server.
6. Set the *Email Address* to the address that FortiGate will send the FortiToken to.
7. Enable *Two-factor Authentication*.
8. Set *Authentication Type* to *FortiToken*.
9. Set *Token* to a FortiToken device. See for more information.



10. Click *OK*.

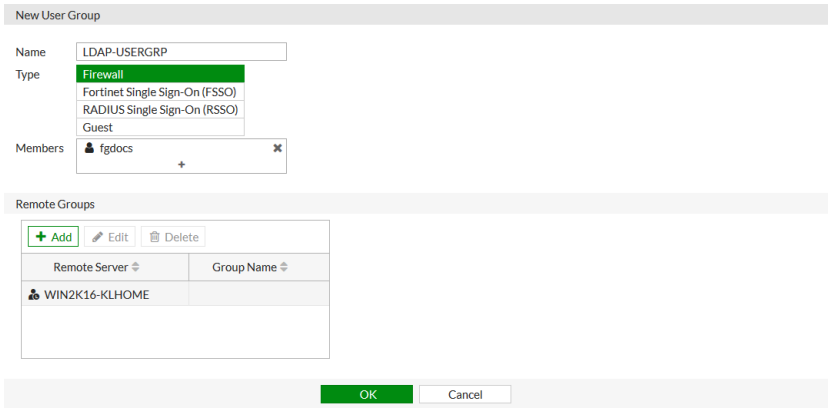
To disable case and accent sensitivity on the remote user:

This can only be configured in the CLI.

```
config user local
    edit "fgdocs"
        set type ldap
        set two-factor fortitoken
        set fortitoken "FTKMOBxxxxxxxxxx"
        set email-to "fgdocs@fortinet.com"
        set username-sensitivity disable
        set ldap-server "WIN2K16-KLHOME"
    next
end
```

To configure a user group with the remote user and the LDAP server:

1. Go to *User & Authentication* > *User Groups* and click *Create New*.
2. Set the *Name* to *LDAP-USERGRP*.
3. Set *Members* to the just created remote user.
4. In the *Remote Groups* table, click *Add*:
   a. Set *Remote Server* to the LDAP server.
   b. Set the group or groups that apply, and right click to add them.
   c. Click *OK*.



5. Click *OK*.

To configure Agentless VPN Portal:

1. Go to *VPN* > *Agentless VPN Portals*, and click *Create New*.
2. Enter a *Name*, such as *agentless-portal*.
3. Under *Predefined Bookmarks*, click *Create New*, and enter following details:

Field	Value
Name	Windows Server
Type	RDP

Field	Value
Host	192.168.1.114
Port	3389
Single Sign-On	Disable
Username	Set the username to login to Windows Server
Password	Set the password to login to Windows Server
Port	3389

4. Click *OK* to save the predefined bookmark.
5. Click *OK* to save the portal settings.
6. Create another Agentless VPN Portal and name it as *portal-access-disabled*.
7. Click *OK* to save the portal settings.
8. Disable Agentless VPN for the newly created portal (that is, `portal-access-disabled`) using CLI:

```
config vpn ssl web portal
    edit "portal-access-disabled"
        set web-mode disable
    next
end
```

To configure Agentless VPN settings and apply the user group to the Agentless VPN portal:

1. Go to *VPN > Agentless VPN Settings*.
2. Set *Agentless VPN* status to *Enable*.
3. For *Listen on Interface(s)*, select *wan1*.
4. Set *Listen on Port* to *10443*.
5. Choose a certificate for *Server Certificate*. The default is *Fortinet_Factory*.
6. In *Authentication/Portal Mapping*, select *All Other Users/Groups*, and click *Edit*.
7. Use *Portal* dropdown to select *portal-access-disabled*.
8. Click *OK*.
9. In *Authentication/Portal Mapping*, click *Create New*.
   a. Set *Users/Groups* to *LDAP-USERGRP*.
   b. Set *Portal* to *agentless-portal*.
   c. Click *OK*.
10. Click *Apply* to save the Agentless VPN settings.

To apply the user group to Agentless VPN firewall policy:

1. Go to *Policy & Objects > Firewall Policy*, and click *Create New*.
2. Set *Name* as *Agentless VPN firewall policy*.
3. Set *Schedule* to *always* and *Action* to *Accept*.
4. Set *Incoming interface* to *Agentless VPN interface (ssl.root)*.
5. Choose an *Outgoing Interface*. This example uses *port1*.

6. Set the *Source* to *all* and *User/group* to *LDAP-USERGRP*.
7. In this example, the *Destination* is the internal, protected subnet 192.168.1.0.
8. Set *Service* to *ALL*.
9. Click *OK*.

To configure this example in the CLI:

1. Configure the LDAP server:

```
config user ldap
    edit "WIN2K16-KLHOME"
        set server "192.168.20.6"
        set cnid "sAMAccountName"
        set dn "dc=KLHOME,dc=local"
        set type regular
        set username "KLHOME\\Administrator"
        set password *********
        set secure ldaps
        set ca-cert "CA_Cert_1"
        set port 636
    next
end
```

2. Configure an LDAP user with MFA and disable case and accent sensitivity on the remote user:

```
config user local
    edit "fgdocs"
        set type ldap
        set two-factor fortitoken
        set fortitoken "FTKMOBxxxxxxxxxx"
        set email-to "fgdocs@fortinet.com"
        set username-sensitivity disable
        set ldap-server "WIN2K16-KLHOME"
    next
end
```

3. Configure a user group with the remote user and the LDAP server:

```
config user group
    edit "LDAP-USERGRP"
        set member "fgdocs" "WIN2K16-KLHOME"
    next
end
```

4. Configure Agentless VPN portal and predefine RDP bookmark for windows server.

```
config vpn ssl web portal
    edit "agentless-portal"
        set web-mode enable
        config bookmark-group
            edit "gui-bookmarks"
                config bookmarks
```

```
                    edit "Windows Server"
                        set apptype rdp
                        set host "192.168.1.114"
                        set port 3389
                        set logon-user "your-windows-server-user-name"
                        set logon-password your-windows-server-password
                    next
                end
            next
        end
    next
end
```

5. Configure another Agentless VPN portal and disable Agentless VPN on it.

```
config vpn ssl web portal
    edit "portal-access-disabled"
        set web-mode disable
    next
end
```

6. Apply the user group to the Agentless VPN portal:

```
config vpn ssl settings
    set servercert "Fortinet_Factory"
    set source-interface "wan1"
    set source-address "all"
    set default-portal "portal-access-disabled"
    config authentication-rule
        edit 1
            set groups "LDAP-USERGRP"
            set portal "agentless-portal"
        next
    end
end
```

7. Configure one Agentless VPN firewall policy to allow the remote user to access the internal network. This policy does not allow traffic initiated from internal network to remote client:

```
config firewall policy
    edit 1
        set name "Agentless VPN firewall policy"
        set srcintf "ssl.root"
        set dstintf "port1"
        set action accept
        set srcaddr "all"
        set dstaddr "192.168.1.0"
        set schedule "always"
        set service "ALL"
        set nat enable
        set groups "LDAP-USERGRP"
```

```
    next
end
```

Verification

To test the connection with case sensitivity disabled:

1. From a remote device, use a web browser to log in to the Agentless VPN web portal *https://172.20.120.123:10443*.
2. Connect to the Agentless VPN:
   a. Log in to the tunnel with the username, using the same case that it is on the FortiGate.
   b. When prompted, enter your FortiToken code.
   You should now be connected.
3. Check the web portal log in using the CLI:

```
# get vpn ssl monitor
Agentless VPN Login Users:
 Index   User    Group   Auth Type      Timeout         From     HTTP in/out   HTTPS in/out
 0       fgdocs          LDAP-USERGRP    16(1)           289     192.168.2.202 0/0      0/0

Agentless VPN sessions:
 Index   User    Group   Source IP      Duration        I/O Bytes       Tunnel/Dest IP
```

4. Log out from the Agentless VPN portal.
5. Reconnect to the Agentless VPN portal:
   a. Log in to the Agentless VPN portal with the username, using a different case than on the FortiGate.
   b. When prompted, enter your FortiToken code.
   You should now be connected.
6. Check the web portal log in using the CLI:

```
# get vpn ssl monitor
Agentless VPN Login Users:
 Index   User    Group   Auth Type      Timeout         From     HTTP in/out   HTTPS in/out
 0       FGDOCS          LDAP-USERGRP    16(1)           289     192.168.2.202 0/0      0/0

Agentless VPN sessions:
 Index   User    Group   Source IP      Duration        I/O Bytes       Tunnel/Dest IP
```

In both cases, the remote user is matched against the remote LDAP user object and prompted for multi-factor authentication.

To test the connection with case and accent sensitivity enabled:

1. Enable case and accent sensitivity for the user:

```
config user local
    edit "fgdocs"
        set username-sensitivity enable
```

```
    next
end
```

2. Connect to the Agentless VPN portal:
   a. Log in to the Agentless VPN portal with the username, using the same case that it is on the FortiGate.
   b. When prompted, enter your FortiToken code.
      You should now be connected.
3. Check the web portal log in using the CLI:

```
# get vpn ssl monitor
Agentless VPN Login Users:
 Index   User    Group   Auth Type      Timeout         From     HTTP in/out   HTTPS in/out
 0       fgdocs          LDAP-USERGRP    16(1)           289     192.168.2.202 0/0      0/0

Agentless VPN sessions:
 Index   User    Group   Source IP      Duration        I/O Bytes       Tunnel/Dest IP
 0       fgdocs          LDAP-USERGRP    192.168.2.202   45      99883/5572    10.212.134.200
```

4. Log out from Agentless VPN portal.
5. Reconnect to the Agentless VPN portal:
   a. Log in to the Agentless VPN portal with the username, using a different case than on the FortiGate.
      You will not be prompted for your FortiToken code. You should now be connected.
6. Check the web portal log in using the CLI:

```
# get vpn ssl monitor
Agentless VPN Login Users:
 Index   User    Group   Auth Type      Timeout         From     HTTP in/out   HTTPS in/out
 0       FGdocs          LDAP-USERGRP    16(1)           289     192.168.2.202 0/0      0/0

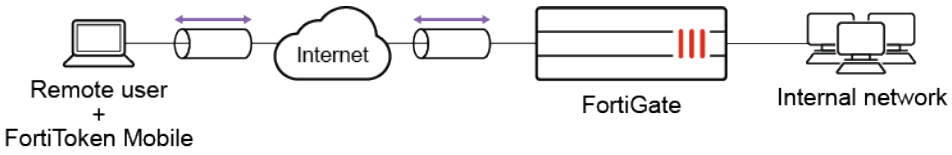
Agentless VPN sessions:
 Index   User    Group   Source IP      Duration        I/O Bytes       Tunnel/Dest IP
```

In this case, the user is allowed to log in without a FortiToken code because the entered user name did not match the name defined on the remote LDAP user object. Authentication continues to be evaluated against the LDAP server though, which is not case sensitive.

Agentless VPN with FortiToken mobile push authentication

This is a sample configuration of Agentless VPN that uses FortiToken mobile push two-factor authentication. If you enable push notifications, users can accept or deny the authentication request.

Sample topology



Sample configuration

WAN interface is the interface connected to ISP. This example shows static mode. You can also use DHCP or PPPoE mode. The Agentless VPN connection is established over the WAN interface.

To configure Agentless VPN using the GUI:

1. Configure the interface and firewall address. The port1 interface connects to the internal network.
   a. Go to *Network* > *Interfaces* and edit the *wan1* interface.
   b. Set *IP/Network Mask* to *172.20.120.123/255.255.255.0*.
   c. Edit *port1* interface and set *IP/Network Mask* to *192.168.1.99/255.255.255.0*.
   d. Click *OK*.
   e. Go to *Policy & Objects* > *Address* and create an address for internet subnet *192.168.1.0*.
2. Register FortiGate for FortiCare Support:
   To add or download a mobile token on FortiGate, FortiGate must be registered for FortiCare Support. If your FortiGate is registered, skip this step.
   a. Go to *Dashboard* > *Licenses*.
   b. Hover the pointer on *Support* to check if FortiCare registered. If not, click it and select *Register*.
3. Add FortiToken mobile to FortiGate:
   If your FortiGate has FortiToken installed, skip this step.
   a. Go to *User & Authentication* > *FortiTokens* and click *Create New*.
   b. Select *Mobile Token* and type in *Activation Code*.
   c. Every FortiGate has two free mobile tokens. Go to *User & Authentication* > *FortiTokens* and click *Import Free Trial Tokens*.
4. Enable FortiToken mobile push:
   To use FTM-push authentication, use CLI to enable FTM-Push on the FortiGate.
   a. Ensure `server` is reachable from the Internet and enter the following CLI commands:

```
config system ftm-push
    set server 172.20.120.123
    set status enable
end
```

   b. Go to *Network* > *Interfaces*.
   c. Edit the *wan1* interface.
   d. Under *Administrative Access* > *IPv4*, select *FTM*.
   e. Click *OK*.
5. Configure user and user group:

a. Go to *User & Authentication > User Definition* to create a local user *agentlessvpnuser1*.
b. Enter the user's *Email Address*.
c. Enable *Two-factor Authentication* and select one mobile *Token* from the list,
d. Enable *Send Activation Code* and select *Email*.
e. Click *Next* and click *Submit*.
f. Go to *User & Authentication > User Groups* to create a group *agentlessvpngroup* with the member *agentlessvpnuser1*.

6. Activate the mobile token:
   a. When the user *agentlessvpnuser1* is created, an email is sent to the user's email address. Follow the instructions to install your FortiToken mobile application on your device and activate your token.
7. Configure Agentless VPN portals.
   a. Go to *VPN > Agentless VPN Portals*, and click *Create New*.
   b. Enter a name, such as *agentless-portal*.
   c. Under *Predefined Bookmarks*, click *Create New*, and enter the following details:

Field	Value
Name	Windows Server
Type	RDP
Host	192.168.1.114
Port	3389
Single Sign-On	Disable
Username	Set the username to log in to Windows Server.
Password	Set the password to log in to Windows Server.
Port	3389

   d. Click *OK* to save the predefined bookmark.
   e. Click *OK* to save the portal settings.
   f. Create another Agentless VPN portal and name it *portal-access-disabled*.
   g. Click *OK* to save the portal settings.
   h. Disable Agentless VPN for the newly created portal (that is, *portal-access-disabled*) using CLI:

```
config vpn ssl web portal
    edit "portal-access-disabled"
        set web-mode disable
    next
end
```

8. Configure Agentless VPN settings.
   a. Go to *VPN > Agentless VPN Settings*.
   b. Set Agentless VPN to *Enable*.
   c. Set the *Listen on Interface(s)* to *wan1*.
   d. Set *Listen on Port* to *10443*.
   e. Choose a certificate for *Server Certificate*. The default is *Fortinet_Factory*.

f. Under *Authentication/Portal Mapping*, set select *All Other Users/Groups*, and click *Edit*.
g. Use *Portal* dropdown to select *portal-access-disabled*.
h. Click *OK*.
i. In *Authentication/Portal Mapping*, click *Create New*.
   i. Set *Users/Groups* to *agentlessvpngroup*.
   ii. Set *Portal* to *agentless-portal*.
   iii. Click *OK*.
j. Click *Apply* to save the Agentless VPN settings.

9. Configure Agentless VPN firewall policy:
   a. Go to *Policy & Objects > Firewall Policy*, and click *Create New*.
   b. Set *Name* to *Agentless VPN firewall policy*.
   c. Set *Schedule* to *always* and *Action* to *Accept*.
   d. Set *Incoming interface* to *Agentless VPN tunnel interface(ssl.root)*.
   e. Choose an *Outgoing Interface*. This example uses *port1*.
   f. Set the *Source* to *all* and *User/group* to *agentlessvpngroup*.
   g. Set *Destination Address*. In this example, the destination is the internal, protected subnet *192.168.1.0*.
   h. Set *Service* to *ALL*.
   i. Click *OK*.

To configure Agentless VPN using the CLI:

1. Configure the interface and firewall address.

```
config system interface
    edit "wan1"
        set vdom "root"
        set ip 172.20.120.123 255.255.255.0
    next
end
```

2. Configure internal interface and protected subnet, then connect the port1 interface to the internal network.

```
config system interface
    edit "port1"
        set vdom "root"
        set ip 192.168.1.99 255.255.255.0
    next
end
```

```
config firewall address
    edit "192.168.1.0"
        set subnet 192.168.1.0 255.255.255.0
    next
end
```

3. Register FortiGate for FortiCare Support.
   To add or download a mobile token on FortiGate, FortiGate must be registered for FortiCare Support. If your FortiGate is registered, skip this step.

```
diagnose forticare direct-registration product-registration -a "your account@xxx.com" -p "your
password" -T "Your Country/Region" -R "Your Reseller" -e 1
```

4. Add FortiToken mobile to FortiGate:

```
execute fortitoken-mobile import <your FTM code>
```

If your FortiGate has FortiToken installed, skip this step.
Every FortiGate has two free mobile Tokens. You can download the free token.

```
execute fortitoken-mobile import 0000-0000-0000-0000-0000
```

5. Enable FortiToken mobile push:
   a. To use FTM-push authentication, ensure `server` is reachable from the Internet and enable FTM-push in the FortiGate:

```
config system ftm-push
    set server 172.20.120.123
    set status enable
end
```

   b. Enable FTM service on WAN interface:

```
config system interface
    edit "wan1"
        append allowaccess ftm
    next
end
```

6. Configure user and user group:

```
config user local
    edit "agentlessvpnuser1"
        set type password
        set two-factor fortitoken
        set fortitoken <select mobile token for the option list>
        set email-to <user's email address>
        set passwd <user's password>
    next
end
config user group
    edit "agentlessvpngroup"
        set member "agentlessvpnuser1"
    next
end
```

7. Activate the mobile token.
   When the user *agentlessvpnuser1* is created, an email is sent to the user's email address. Follow the instructions to install your FortiToken mobile application on your device and activate your token.
8. Configure Agentless VPN portal and predefine RDP bookmark for windows server.

```
config vpn ssl web portal
    edit "agentless-portal"
        set web-mode enable
        config bookmark-group
            edit "gui-bookmarks"
                config bookmarks
                    edit "Windows Server"
                        set apptype rdp
                        set host "192.168.1.114"
                        set port 3389
                        set logon-user "your-windows-server-user-name"
                        set logon-password your-windows-server-password
                    next
                end
            next
        end
    next
end
```

9. Configure another Agentless VPN portal and disable Agentless VPN on it.

```
config vpn ssl web portal
    edit "portal-access-disabled"
        set web-mode disable
    next
end
```

10. Configure Agentless VPN settings:

```
config vpn ssl settings
    set servercert "Fortinet_Factory"
    set source-interface "wan1"
    set source-address "all"
    set default-portal "portal-access-disabled"
    config authentication-rule
        edit 1
            set groups "agentlessvpngroup"
            set portal "agentless-portal"
        next
    end
end
```

11. Configure one Agentless VPN firewall policy to allow remote user to access the internal network. This policy does not allow traffic initiated from internal network to remote client.

```
config firewall policy
    edit 1
        set name "sslvpn web mode access"
        set srcintf "ssl.root"
        set dstintf "port1"
        set srcaddr "all"
        set dstaddr "192.168.1.0"
```

```
        set groups “sslvpngroup”
        set action accept
        set schedule "always"
        set service "ALL"
        set nat enable
    next
end
```

To see the results of web portal:

1. From a remote device, use a web browser to log into the Agentless VPN web portal *http://172.20.120.123:10443*.
2. Log in using the *agentlessvpnuser1* credentials.
   The FortiGate pushes a login request notification through the FortiToken mobile application.
3. Check your mobile device and select *Approve*.
   When the authentication is approved, *agentlessvpnuser1* is logged into the Agentless VPN portal.

To check the Agentless VPN connection using the GUI:

1. On FortiGate, go to *Dashboard > Agentless VPN Monitor* to verify the list of Agentless VPN users.
   If the Agentless VPN Monitor is hidden, click *+* under the *Dashboard*, search for *Agentless VPN Monitor*, and add it to the display.
2. Go to *Log & Report > System Events*, and use the dropdown to select *VPN Events* to view VPN logs.

To check the web portal login using the CLI:

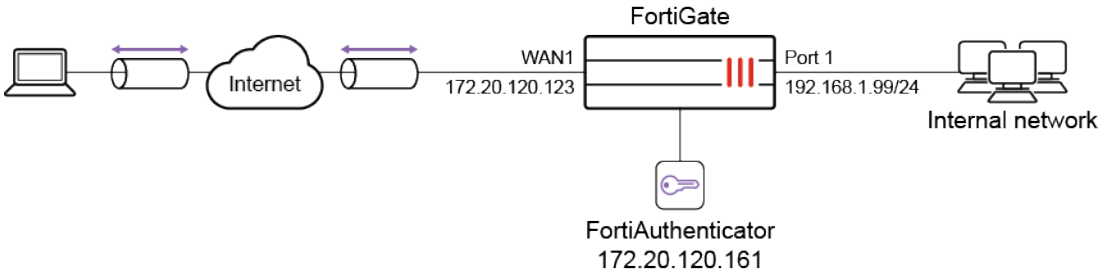
```
get vpn ssl monitor
Agentless VPN Login Users:
 Index   User           Auth Type    Timeout   From           HTTP in/out   HTTPS in/out
 0       agentlessvpnuser1    1(1)         229       10.1.100.254   0/0           0/0

Agentless VPN sessions:
 Index   User    Source IP      Duration        I/O Bytes       Tunnel/Dest IP
```

Agentless VPN with RADIUS on FortiAuthenticator

This is a sample configuration of Agentless VPN that uses FortiAuthenticator as a RADIUS authentication server.

Sample topology



Sample configuration

WAN interface is the interface connected to ISP. This example shows static mode. You can also use DHCP or PPPoE mode. The Agentless VPN connection is established over the WAN interface.

To configure FortiAuthenticator using the GUI:

1. Create a user on the FortiAuthenticator.
   a. On the FortiAuthenticator, go to *Authentication* > *User Management* > *Local Users* to create a user *agentlessvpnuser1*.
   b. Enable *Allow RADIUS authentication* and click *OK* to access additional settings.
   c. Go to *Authentication* > *User Management* > *User Groups* to create a group *agentlessvpngroup*.
   d. Add *agentlessvpnuser1* to the group by moving the user from *Available users* to *Selected users*.
2. Create the RADIUS client (FortiGate) on the FortiAuthenticator.
   a. On the FortiAuthenticator, go to *Authentication* > *RADIUS Service* > *Clients* to add the FortiGate as a RADIUS client *OfficeServer*).
   b. Enter the FortiGate IP address and set a *Secret*.
      The secret is a pre-shared secure password that the FortiGate uses to authenticate to the FortiAuthenticator.
   c. Set *Realms* to *local | Local users*.

To configure Agentless VPN using the GUI:

1. Configure the interface and firewall address. The port1 interface connects to the internal network.
   a. Go to *Network* > *Interfaces* and edit the *wan1* interface.
   b. Set *IP/Network Mask* to *172.20.120.123/255.255.255.0*.
   c. Edit *port1* interface and set *IP/Network Mask* to *192.168.1.99/255.255.255.0*.
   d. Click *OK*.
   e. Go to *Policy & Objects* > *Addresses* and create an address for internal subnet *192.168.1.0*.
2. Create a RADIUS user and user group .
   a. On the FortiGate, go to *User & Authentication* > *RADIUS Servers* to create a user to connect to the RADIUS server (FortiAuthenticator).
   b. For *Name*, use *FAC-RADIUS*.
   c. Enter the IP address of the FortiAuthenticator, and enter the *Secret* created above.

d. Click *Test Connectivity* to ensure you can connect to the RADIUS server.
e. Select *Test User Credentials* and enter the credentials for *sslvpnuser1*.
   The FortiGate can now connect to the FortiAuthenticator as the RADIUS client.
f. Go to *User & Authentication > User Groups* and click *Create New* to map authenticated remote users to a user group on the FortiGate.
g. For *Name*, use *AgentlessVPNGroup*.
h. In *Remote Groups*, click *Add*.
i. In the *Remote Server* dropdown list, select *FAC-RADIUS*.
j. Leave the *Groups* field blank.

3. Configure Agentless VPN portals.
   a. Go to *VPN > Agentless VPN Portals*, and click *Create New*.
   b. Enter a name, such as *agentless-portal*.
   c. Under *Predefined Bookmarks*, click *Create New*, and enter the following details:

Field	Value
Name	Windows Server
Type	RDP
Host	192.168.1.114
Port	3389
Single Sign-On	Disable
Username	Set the username to log in to Windows Server.
Password	Set the password to log in to Windows Server.
Port	3389

   d. Click *OK* to save the predefined bookmark.
   e. Click *OK* to save the portal settings.
   f. Create another Agentless VPN portal and name it *portal-access-disabled*.
   g. Click *OK* to save the portal settings.
   h. Disable Agentless VPN for the newly created portal (that is, *portal-access-disabled*) using CLI:

```
config vpn ssl web portal
    edit "portal-access-disabled"
        set web-mode disable
    next
end
```

4. Configure Agentless VPN settings.
   a. Go to *VPN > Agentless VPN Settings*.
   b. Set *Agentless VPN* status to *Enable*.
   c. Set *Listen on Interface(s)* to *wan1*.
   d. Set *Listen on Port* to *10443*.
   e. Choose a certificate for *Server Certificate*. The default is *Fortinet_Factory*.
   f. In *Authentication/Portal Mapping*, select *All Other Users/Groups*, and click *Edit*.

g. Use *Portal* dropdown to select *portal-access-disabled*.
h. Click *OK*.
i. In *Authentication/Portal Mapping*, click *Create New*.
    i. Set *Users/Groups* to *AgentlessvpnGroup*.
    ii. Set *Portal* to *agentless-portal*.
    iii. Click *OK*.
j. Click *Apply* to save the Agentless VPN settings.

5. Configure Agentless VPN firewall policy.
a. Go to *Policy & Objects > Firewall Policy*, and click *Create New*.
b. Set *Name* to *Agentless VPN firewall policy*.
c. Set *Schedule* to *always* and *Action* to *Accept*.
d. Set *Incoming interface* to *Agentless VPN interface (ssl.root)*.
e. Choose an *Outgoing Interface*. This example uses *port1*.
f. Set the *Source* to *all* and *User/group* to *AgentlessVPNGroup*.
g. In this example, the *Destination* is the internal, protected subnet *192.168.1.0*.
h. Set *Service* to *ALL*.
i. Enable *NAT*.
j. Configure the remaining options as required.
k. Click *OK*.

To configure Agentless VPN using the CLI:

1. Configure the interface and firewall address.

```
config system interface
    edit "wan1"
        set vdom "root"
        set ip 172.20.120.123 255.255.255.0
    next
end
```

2. Configure internal interface and protected subnet, then connect the port1 interface to the internal network.

```
config system interface
    edit "port1"
        set vdom "root"
        set ip 192.168.1.99 255.255.255.0
    next
end
```

```
config firewall address
    edit "192.168.1.0"
        set subnet 192.168.1.0 255.255.255.0
    next
end
```

3. Create a RADIUS user and user group.

```
config user radius
    edit "FAC-RADIUS"
        set server "172.20.120.161"
        set secret <FAC client secret>
    next
end
```

```
config user group
    edit "sslvpngroup"
        set member "FAC-RADIUS"
    next
end
```

4. Configure Agentless VPN portal and predefine RDP bookmark for windows server.

```
config vpn ssl web portal
    edit "agentless-portal"
        set web-mode enable
        config bookmark-group
            edit "gui-bookmarks"
                config bookmarks
                    edit "Windows Server"
                        set apptype rdp
                        set host "192.168.1.114"
                        set port 3389
                        set logon-user "your-windows-server-user-name"
                        set logon-password your-windows-server-password
                    next
                end
            next
        end
    next
end
```

5. Configure another Agentless VPN portal and disable Agentless VPN on it.

```
config vpn ssl web portal
    edit "portal-access-disabled"
        set web-mode disable
    next
end
```

6. Configure Agentless VPN settings.

```
config vpn ssl settings
    set banned-cipher SHA1 SHA256 SHA384
    set servercert "server_certificate"
    set port 1443
    set source-interface "wan1"
    set source-address "all"
    set default-portal "portal-access-disabled"
    config authentication-rule
```

```
        edit 1
            set groups "agentlessvpngroup"
            set portal "agentless-portal"
        next
    end
end
```

7. Configure one Agentless VPN firewall policy to allow remote users to access the internal network. This policy does not allow traffic initiated from internal network to remote client.

```
config firewall policy
    edit 1
        set name "Agentless VPN firewall policy"
        set srcintf "ssl.root"
        set dstintf "port1"
        set srcaddr "all"
        set dstaddr "192.168.1.0"
        set action accept
        seet schedule "always"
        set service "ALL"
        set nat enable
        set groups "agentlessvpngroup"
    next
end
```

To see the results of web portal:

1. From a remote device, use a web browser to log into the Agentless VPN web portal *http://172.20.120.123:10443*.
2. Log in using the *agentlessvpnuser1* credentials.

To check the Agentless VPN connection using the GUI:

1. On FortiGate, go to *Dashboard > Agentless VPN Monitor* to verify the list of Agentless VPN users.
   If the Agentless VPN Monitor is hidden, click *+* under the *Dashboard*, search for *Agentless VPN Monitor*, and add it to the display.
2. Go to *Log & Report > System Events*, and use the dropdown to select *VPN Events* to view VPN logs.

To check the web portal login using the CLI:

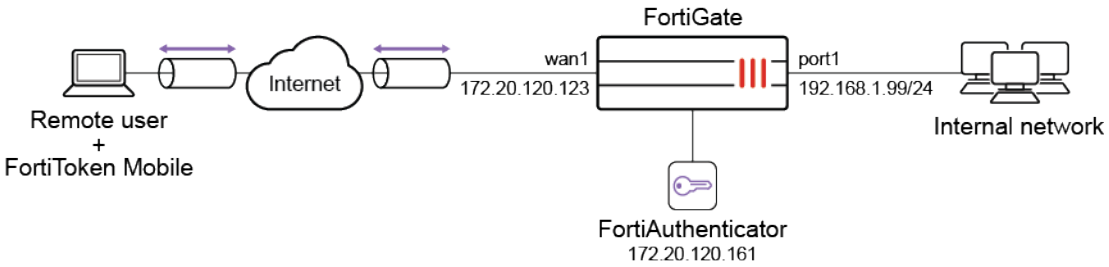
```
get vpn ssl monitor
Agentless VPN Login Users:
 Index   User          Auth Type    Timeout    From           HTTP in/out  HTTPS in/out
 0       agentlessvpnuser1   1(1)         229        10.1.100.254   0/0          0/0

Agentless VPN sessions:
 Index   User    Source IP      Duration        I/O Bytes       Tunnel/Dest IP
```

Agentless VPN with RADIUS and FortiToken mobile push on FortiAuthenticator

This is a sample configuration of Agentless VPN that uses FortiAuthenticator as a RADIUS authentication server and FortiToken mobile push two-factor authentication. If you enable push notifications, users can accept or deny the authentication request.

Sample topology



Sample configuration

WAN interface is the interface connected to ISP. This example shows static mode. You can also use DHCP or PPPoE mode. The Agentless VPN connection is established over the WAN interface.

To configure FortiAuthenticator using the GUI:

1. On the FortiAuthenticator, go to *System > Administration > System Access* and configure a *Public IP/FQDN for FortiToken Mobile*. If the FortiAuthenticator is behind a firewall, the public IP/FQDN will be an IP/port forwarding rule directed to one of the FortiAuthenticator interfaces. The interface that receives the approve/deny FTM push responses must have the *FortiToken Mobile API* service enabled.
2. Add a FortiToken mobile license on the FortiAuthenticator:
   a. Go to *Authentication > User Management > FortiTokens*.
   b. Click *Create New*.
   c. Set *Token type* to *FortiToken Mobile* and enter the *FortiToken Activation codes*.
3. Create the RADIUS client (FortiGate) on the FortiAuthenticator:
   a. Go to *Authentication > RADIUS Service > Clients* to add the FortiGate as a RADIUS client *OfficeServer*).
   b. Enter the FortiGate IP address and set a *Secret*.
      The secret is a pre-shared secure password that the FortiGate uses to authenticate to the FortiAuthenticator.
   c. Set *Authentication method* to *Enforce two-factor authentication*.
   d. Select *Enable FortiToken Mobile push notifications authentication*.
   e. Set *Realms* to *local | Local users*.
4. Create a user and assign FortiToken mobile to the user on the FortiAuthenticator:

a. Go to *Authentication > User Management > Local Users* to create a user *agentlessvpnuser1*.
b. Enable *Allow RADIUS authentication* and click *OK* to access additional settings.
c. Enable *Token-based authentication* and select to deliver the token code by *FortiToken*.
d. Select the FortiToken added from the FortiToken Mobile dropdown menu.
e. Set *Delivery method* to *Email* and fill in the *User Information* section.
f. Go to *Authentication > User Management > User Groups* to create a group *agentlessvpngroup*.
g. Add *agentlessvpnuser1* to the group by moving the user from *Available users* to *Selected users*.

5. Install the FortiToken mobile application on your Android or iOS smartphone.
   The FortiAuthenticator sends the FortiToken mobile activation to the user's email address.
6. Activate the FortiToken mobile through the FortiToken mobile application by entering the activation code or scanning the QR code.

To configure Agentless VPN using the GUI:

1. Configure the interface and firewall address. The port1 interface connects to the internal network.
   a. Go to *Network > Interfaces* and edit the *wan1* interface.
   b. Set *IP/Network Mask* to *172.20.120.123/255.255.255.0*.
   c. Edit *port1* interface and set *IP/Network Mask* to *192.168.1.99/255.255.255.0*.
   d. Click *OK*.
   e. Go to *Policy & Objects > Address* and create an address for internet subnet *192.168.1.0*.
2. Create a RADIUS user and user group:
   a. On the FortiGate, go to *User & Authentication > RADIUS Servers* to create a user to connect to the RADIUS server (FortiAuthenticator).
   b. For *Name*, use *FAC-RADIUS*.
   c. Enter the IP address of the FortiAuthenticator, and enter the *Secret* created above.
   d. Click *Test Connectivity* to ensure you can connect to the RADIUS server.
   e. Select *Test User Credentials* and enter the credentials for *agentlessvpnuser1*.
      The FortiGate can now connect to the FortiAuthenticator as the RADIUS client.
   f. Go to *User & Authentication > User Groups* and click *Create New* to map authenticated remote users to a user group on the FortiGate.
   g. For *Name*, use *AgentlessVPNGroup*.
   h. In *Remote Groups*, click *Add*.
   i. In the *Remote Server* dropdown list, select *FAC-RADIUS*.
   j. Leave the *Groups* field blank.
3. Configure Agentless VPN portals.
   a. Go to *VPN > Agentless VPN Portals*, and click *Create New*.
   b. Enter a name, such as *agentless-portal*.
   c. Under *Predefined Bookmarks*, click *Create New*, and enter the following details:

Field	Value
Name	Windows Server
Type	RDP

Field	Value
Host	192.168.1.114
Port	3389
Single Sign-On	Disable
Username	Set the username to log in to Windows Server.
Password	Set the password to log in to Windows Server.
Port	3389

d. Click *OK* to save the predefined bookmark.
e. Click *OK* to save the portal settings.
f. Create another Agentless VPN portal and name it *portal-access-disabled*.
g. Click *OK* to save the portal settings.
h. Disable Agentless VPN for the newly created portal (that is, *portal-access-disabled*) using CLI:

```
config vpn ssl web portal
    edit "portal-access-disabled"
        set web-mode disable
    next
end
```

4. Configure Agentless VPN settings:
   a. Go to *VPN > Agentless VPN Settings*.
   b. Set *Agentless VPN status* to *Enable*.
   c. Set *Listen on Interface(s)* to *wan1*.
   d. Set *Listen on Port* to *10443*.
   e. Choose a certificate for *Server Certificate*. The default is *Fortinet_Factory*.
   f. In *Authentication/Portal Mapping*, select *All Other Users/Groups*, and click *Edit*.
   g. Use *Portal* dropdown to select *portal-access-disabled*.
   h. Click *OK*.
   i. In *Authentication/Portal Mapping*, click *Create New*.
      i. Set *Users/Groups* to *AgentlessVPNgroup*.
      ii. Set *Portal* to *agentless-portal*.
      iii. Click *OK*.
   j. Click *Apply* to save the Agentless VPN settings.
5. Configure Agentless VPN firewall policy.
   a. Go to *Policy & Objects > Firewall Policy*, and click *Create New*.
   b. Set *Name* to *Agentless VPN firewall policy*.
   c. Set *Schedule* to *always* and *Action* to *Accept*.
   d. Set *Incoming interface* to *Agentless VPN interface (ssl.root)*.
   e. Choose an *Outgoing Interface*. This example uses *port1*.
   f. Set the *Source* to *all* and *User/group* to *AgentlessVPNGroup*.
   g. In this example, the *Destination* is the internal, protected subnet *192.168.1.0*.

h. Set *Service* to *ALL*.
i. Enable *NAT*.
j. Configure any remaining firewall and security options as desired.
k. Click *OK*.

To configure Agentless VPN using the CLI:

1. Configure the interface and firewall address:

```
config system interface
    edit "wan1"
        set vdom "root"
        set ip 172.20.120.123 255.255.255.0
    next
end
```

2. Configure internal interface and protected subnet, then connect the port1 interface to the internal network:

```
config system interface
    edit "port1"
        set vdom "root"
        set ip 192.168.1.99 255.255.255.0
    next
end
```

```
config firewall address
    edit "192.168.1.0"
        set subnet 192.168.1.0 255.255.255.0
    next
end
```

3. Create a RADIUS user and user group:

```
config user radius
    edit "FAC-RADIUS"
        set server "172.20.120.161"
        set secret <FAC client secret>
    next
end
```

```
config user group
    edit "sslvpngroup"
        set member "FAC-RADIUS"
    next
end
```

4. Configure Agentless VPN portal and predefine RDP bookmark for windows server.

```
config vpn ssl web portal
    edit "agentless-portal"
        set web-mode enable
        config bookmark-group
```

```
            edit "gui-bookmarks"
                config bookmarks
                    edit "Windows Server"
                        set apptype rdp
                        set host "192.168.1.114"
                        set port 3389
                        set logon-user "your-windows-server-user-name"
                        set logon-password your-windows-server-password
                    next
                end
            next
        end
    next
end
```

5. Configure another Agentless VPN portal and disable Agentless VPN on it.

```
config vpn ssl web portal
    edit "portal-access-disabled"
        set web-mode disable
    next
end
```

6. Configure Agentless VPN settings:

```
config vpn ssl settings
    set banned-cipher SHA1 SHA256 SHA384
    set servercert "server_certificate"
    set port 1443
    set source-interface "wan1"
    set source-address "all"
    set default-portal "portal-access-disabled"
    config authentication-rule
        edit 1
            set groups "agentlessvpngroup"
            set portal "agentless-portal"
        next
    end
end
```

7. Configure one Agentless VPN firewall policy to allow remote user to access the internal network:

```
config firewall policy
    edit 1
        set name "Agentless VPN firewall policy"
        set srcintf "ssl.root"
        set dstintf "port1"
        set srcaddr "all"
        set dstaddr "192.168.1.0"
        set action accept
        set schedule "always"
        set service "ALL"
```

```
        set nat enable
        set groups “agentlessvpngroup”
    next
end
```

To see the results of web portal:

1. From a remote device, use a web browser to log into the Agentless VPN web portal *http://172.20.120.123:10443*.
2. Log in using the *agentlessvpnuser1* credentials.
   The FortiAuthenticator pushes a login request notification through the FortiToken Mobile application.
3. Check your mobile device and select *Approve*.
   When the authentication is approved, *agentlessvpnuser1* is logged into the Agentless VPN portal.

To check the Agentless VPN connection using the GUI:

1. On FortiGate, go to *Dashboard > Agentless VPN Monitor* to verify the list of Agentless VPN users.
   If the Agentless VPN Monitor is hidden, click *+* under the *Dashboard*, search for *Agentless VPN Monitor*, and add it to the display.
2. Go to *Log & Report > System Events*, and use the dropdown to select *VPN Events* to view VPN logs.

To check the Agentless VPN portal login using the CLI:

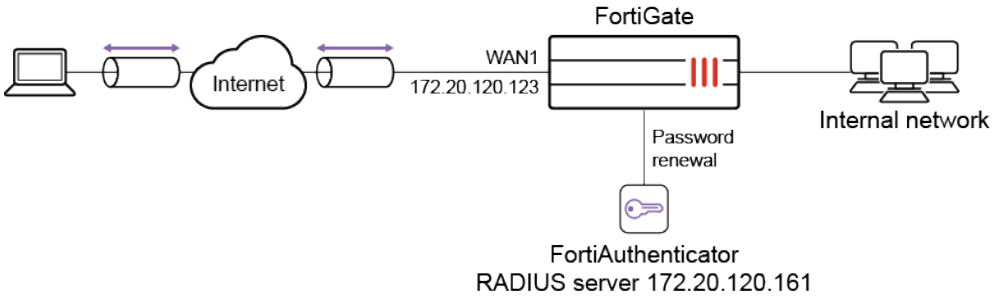
```
get vpn ssl monitor
Agentless VPN Login Users:
 Index   User          Auth Type   Timeout   From           HTTP in/out   HTTPS in/out
 0       agentlessvpnuser1   1(1)        229       10.1.100.254   0/0           0/0

Agentless VPN sessions:
 Index   User    Source IP      Duration        I/O Bytes       Tunnel/Dest IP
```

Agentless VPN with RADIUS password renew on FortiAuthenticator

This is a sample configuration of Agentless VPN for RADIUS users with *Force Password Change on next logon*. In this example, the RADIUS server is a FortiAuthenticator. A user *test1* is configured on FortiAuthenticator with *Force password change on next logon*.

Sample topology



Sample configuration

WAN interface is the interface connected to ISP. This example shows static mode. You can also use DHCP or PPPoE mode. The Agentless VPN connection is established over the WAN interface.

To configure Agentless VPN using the GUI:

1. Configure the interface and firewall address. The port1 interface connects to the internal network.
   a. Go to *Network* > *Interfaces* and edit the *wan1* interface.
   b. Set *IP/Network Mask* to *172.20.120.123/255.255.255.0*.
   c. Edit *port1* interface and set *IP/Network Mask* to *192.168.1.99/255.255.255.0*.
   d. Click *OK*.
   e. Go to *Policy & Objects* > *Address* and create an address for internet subnet *192.168.1.0*.
2. Create a RADIUS user.
   a. Go to *User & Authentication* > *RADIUS Servers* to create a user.
   b. Set *Authentication method* to *MS-CHAP-v2*.
   c. Enter the *IP/Name* and *Secret*.
   d. Click *Create*.
      Password renewal only works with the MS-CHAP-v2 authentication method.
   e. To enable the `password-renew` option, use these CLI commands.

```
config user radius
    edit "fac"
        set server "172.20.120.161"
        set secret <fac radius password>
        set auth-type ms_chap_v2
        set password-renewal enable
    next
end
```

3. Configure user group.
   a. Go to *User & Authentication* > *User Groups* to create a user group.
   b. For the *Name*, enter *fac-group*.
   c. In *Remote Groups*, click *Add* to add *Remote Server* you just created.

4. Configure Agentless VPN portal and predefine RDP bookmark for windows server.

```
config vpn ssl web portal
    edit "agentless-portal"
        set web-mode enable
        config bookmark-group
            edit "gui-bookmarks"
                config bookmarks
                    edit "Windows Server"
                        set apptype rdp
                        set host "192.168.1.114"
                        set port 3389
                        set logon-user "your-windows-server-user-name"
                        set logon-password your-windows-server-password
                    next
                end
            next
        end
    next
end
```

5. Configure another Agentless VPN portal and disable Agentless VPN on it.

```
config vpn ssl web portal
    edit "portal-access-disabled"
        set web-mode disable
    next
end
```

6. Configure Agentless VPN settings.
   a. Go to *VPN > Agentless VPN Settings*.
   b. Set *Agentless VPN* status to *Enable*.
   c. Set *Listen on Interface(s)* to *wan1*.
   d. Set *Listen on Port* to *10443*.
   e. Choose a certificate for *Server Certificate*. The default is *Fortinet_Factory*.
   f. In *Authentication/Portal Mapping*, select *All Other Users/Groups*, and click *Edit*.
   g. Use *Portal* dropdown to select *portal-access-disabled*.
   h. Click *OK*.
   i. In *Authentication/Portal Mapping*, click *Create New*.
      i. Set *Users/Groups* to *fac-group*.
      ii. Set *Portal* to *agentless-portal*.
      iii. Click *OK*.
   j. Click *Apply* to save the Agentless VPN settings.
7. Configure Agentless VPN firewall policy.
   a. Go to *Policy & Objects > Firewall Policy*, and click *Create New*.
   b. Set *Name* to *Agentless VPN firewall policy*.
   c. Set *Schedule* to *always* and *Action* to *Accept*.
   d. Set *Incoming interface* to *Agentless VPN interface (ssl.root)*.
   e. Choose an *Outgoing Interface*. This example uses *port1*.

f. Set the *Source* to *all* and *User/group* to *fac-group*.
g. In this example, the *Destination* is the internal, protected subnet *192.168.1.0*.
h. Set *Service* to *ALL*.
i. Click *OK*.

To configure Agentless VPN using the CLI:

1. Configure the interface and firewall address.

```
config system interface
    edit "wan1"
        set vdom "root"
        set ip 172.20.120.123 255.255.255.0
    next
end
```

2. Configure internal interface and protected subnet, then connect the port1 interface to the internal network.

```
config system interface
    edit "port1"
        set vdom "root"
        set ip 192.168.1.99 255.255.255.0
    next
end
```

```
config firewall address
    edit "192.168.1.0"
        set subnet 192.168.1.0 255.255.255.0
    next
end
```

3. Configure the RADIUS server.

```
config user radius
    edit "fac"
        set server "172.18.58.107"
        set secret <fac radius password>
        set auth-type ms_chap_v2
        set password-renewal enable
    next
end
```

4. Configure user group.

```
config user group
    edit "fac-group"
        set member "fac"
    next
end
```

5. Configure Agentless VPN portal and predefine RDP bookmark for windows server.

```
config vpn ssl web portal
    edit "agentless-portal"
        set web-mode enable
        config bookmark-group
            edit "gui-bookmarks"
                config bookmarks
                    edit "Windows Server"
                        set apptype rdp
                        set host "192.168.1.114"
                        set port 3389
                        set logon-user "your-windows-server-user-name"
                        set logon-password your-windows-server-password
                    next
                end
            next
        end
    next
end
```

6. Configure another Agentless VPN portal and disable Agentless VPN on it.

```
config vpn ssl web portal
    edit "portal-access-disabled"
        set web-mode disable
    next
end
```

7. Configure Agentless VPN settings.

```
config vpn ssl settings
    set servercert "server_certificate"
    set source-interface "wan1"
    set source-address "all"
    set default-portal "portal-access-disabled"
    config authentication-rule
        edit 1
            set groups "fac-group"
            set portal "agentless-portal"
        next
    end
end
```

8. Configure one Agentless VPN firewall policy to allow remote users to access the internal network. This policy does not allow traffic initiated from internal network to remote client.

```
config firewall policy
    edit 1
        set name "Agentless VPN firewall policy"
        set srcintf "ssl.root"
        set dstintf "port1"
        set srcaddr "all"
        set dstaddr "192.168.1.0"
```

```
        set action accept
        set schedule "always"
        set service "ALL"
        set nat enable
        set groups “fac-group”
    next
end
```

To see the results of web portal:

1. From a remote device, use a web browser to log into the Agentless VPN web portal *http://172.20.120.123:10443*.
2. Log in using the *test1* credentials.
   Use a user which is configured on FortiAuthenticator with *Force password change on next logon*.
3. Click *Login*. You are prompted to enter a new password.
4. On the FortiGate, go to Agentless VPN dashboard to verify the user’s connection. See Adding an Agentless VPN dashboard on page 200.

To check the Agentless VPN connection using the GUI:

1. On FortiGate, go to *Dashboard > Agentless VPN Monitor* to verify the list of Agentless VPN users.
   If the Agentless VPN Monitor is hidden, click *+* under the *Dashboard*, search for *Agentless VPN Monitor*, and add it to the display.
2. Go to *Log & Report > System Events*, and use the dropdown to select *VPN Events* to view VPN logs.

To check the Agentless VPN portal login using the CLI:

```
get vpn ssl monitor
Agentless VPN Login Users:
 Index   User    Auth Type    Timeout    From           HTTP in/out   HTTPS in/out
 0       test1   1(1)         229        10.1.100.254   0/0           0/0

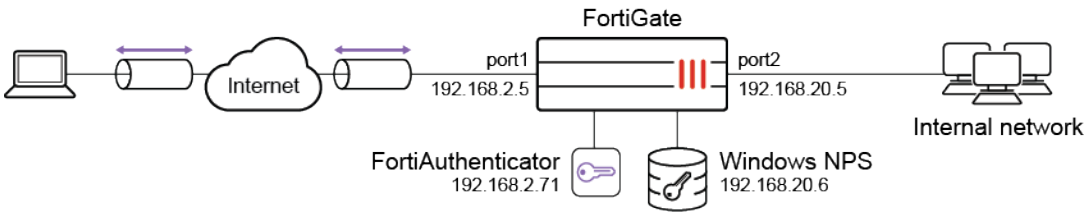
Agentless VPN sessions:
 Index   User    Source IP      Duration        I/O Bytes       Tunnel/Dest IP
```

Agentless VPN with RADIUS on Windows NPS

This is an example configuration of Agentless VPN that uses Windows Network Policy Server (NPS) as a RADIUS authentication server.

The NPS must already be configured to accept the FortiGate as a RADIUS client and the choice of authentication method, such as MS-CHAPv2. A shared key must also have been created.

Example



The user is connecting from their PC to the FortiGate's port1 interface. RADIUS authentication occurs between the FortiGate and the Windows NPS, and the Agentless VPN connection is established once the authentication is successful.

Configure Agentless VPN with RADIUS on Windows NPS in the GUI

To configure the internal and external interfaces:

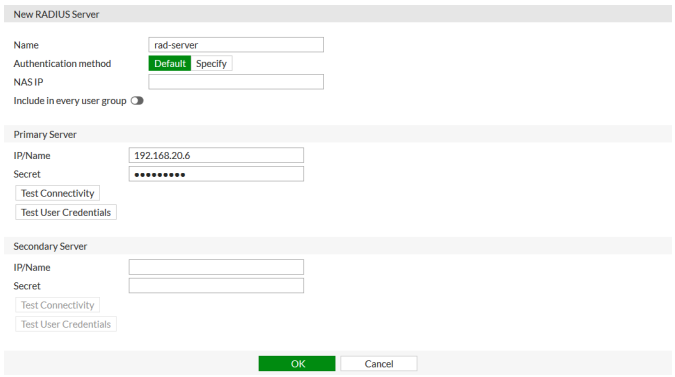
1. Go to *Network* > *Interfaces*
2. Edit the *port1* interface and set *IP/Network Mask* to *192.168.2.5/24*.
3. Edit the *port2* interface and set *IP/Network Mask* to *192.168.20.5/24*.
4. Click *OK*.

To create a firewall address:

1. Go to *Policy & Objects* > *Addresses* and select *Address*.
2. Click *Create new*.
3. Set *Name* to *192.168.20.0*.
4. Leave *Type* as *Subnet*
5. Set *IP/Netmask* to *192.168.20.0/24*.
6. Click *OK*.

To add the RADIUS server:

1. Go to *User & Authentication* > *RADIUS Servers* and click *Create New*.
2. Set *Name* to *rad-server*.
3. Leave *Authentication method* set to *Default*. The PAP, MS-CHAPv2, and CHAP methods will be tried in order.
4. Under *Primary Server*, set *IP/Name* to *192.168.20.6* and *Secret* to the shared secret configured on the RADIUS server.
5. Click *Test Connectivity* to test the connection to the server, and ensure that *Connection status* is *Successful*.
6. Optionally, click *Test User Credentials* to test user credentials. Testing from the GUI is limited to PAP.



7. Click *OK*.

To configure a user group:

1. Go to *User & Authentication* > *User Groups* and click *Create New*.
2. Set *Name* to *rad-group*.
3. Under *Remote Groups*, click *Add* and add the *rad-server*.
4. Click *OK*.

To configure Agentless VPN portals:

1. Configure Agentless VPN portals.
   a. Go to *VPN* > *Agentless VPN Portals*, and click *Create New*.
   b. Enter a name, such as *agentless-portal*.
   c. Under *Predefined Bookmarks*, click *Create New*, and enter the following details:

Field	Value
Name	Windows Server
Type	RDP
Host	192.168.1.114
Port	3389
Single Sign-On	Disable
Username	Set the username to log in to Windows Server.
Password	Set the password to log in to Windows Server.
Port	3389

   d. Click *OK* to save the predefined bookmark.
   e. Click *OK* to save the portal settings.
   f. Create another Agentless VPN portal and name it *portal-access-disabled*.
   g. Click *OK* to save the portal settings.
   h. Disable Agentless VPN for the newly created portal (that is, *portal-access-disabled*) using CLI:

```
config vpn ssl web portal
    edit "portal-access-disabled"
        set web-mode disable
    next
end
```

To configure Agentless VPN settings:

1. Go to *VPN > Agentless VPN Settings*.
2. Set Agentless VPN to *Enable*.
3. Set the *Listen on Interface(s)* to *wan1*.
4. Set *Listen on Port* to *10443*.
5. Set *Server Certificate* to the authentication certificate.
6. In *Authentication/Portal Mapping*, select *All Other Users/Groups*, and click *Edit*.
7. Use *Portal* dropdown to select *portal-access-disabled*.
8. In *Authentication/Portal Mapping*, click *Create New*.
   a. Set *Users/Groups* to *rad-group*.
   b. Set *Portal* to *agentless-portal*.
   c. Click *OK*.
9. Click *Apply* to save the Agentless VPN settings.

To configure an Agentless VPN firewall policy:

1. Go to *Policy & Objects > Firewall Policy* and click *Create New*.
2. Set *Name* as *Agentless VPN firewall policy*.
3. Set *Schedule* to *always* and *Action* to *Accept*.
4. Set *Incoming Interface* to *Agentless VPN tunnel interface (ssl.root)*.
5. Choose an *Outgoing Interface*. This example uses *port1*.
6. Set *Source* to *all* and *User/group* to *rad-group*.
7. In this example, the *Destination* is the internal, protected subnet *192.168.20.0*.
8. Set *Service* to *ALL*.
9. Click *OK*.

Configure Agentless VPN with RADIUS on Windows NPS in the CLI

To configure Agentless VPN using the CLI:

1. Configure the internal and external interfaces:

```
config system interface
    edit "port1"
        set vdom "root"
        set ip 192.168.2.5 255.255.255.0
        set alias internal
    next
    edit "port2"
```

```
        set vdom "root"
        set ip 192.168.20.5 255.255.255.0
        set alias external
    next
end
```

2. Configure the firewall address:

```
config firewall address
    edit "192.168.20.0"
        set subnet 192.168.20.0 255.255.255.0
    next
end
```

3. Add the RADIUS server:

```
config user radius
    edit "rad-server"
        set server "192.168.20.6"
        set secret *********
    next
end
```

4. Create a user group and add the RADIUS server to it:.

```
config user group
    edit "rad-group"
        set member "rad-server"
    next
end
```

5. Configure Agentless VPN portal and predefine RDP bookmark for windows server.

```
config vpn ssl web portal
    edit "agentless-portal"
        set web-mode enable
        config bookmark-group
            edit "gui-bookmarks"
                config bookmarks
                    edit "Windows Server"
                        set apptype rdp
                        set host "192.168.1.114"
                        set port 3389
                        set logon-user "your-windows-server-user-name"
                        set logon-password your-windows-server-password
                    next
                end
            next
        end
    next
end
```

6. Configure another Agentless VPN portal and disable Agentless VPN on it.

```
config vpn ssl web portal
    edit "portal-access-disabled"
        set web-mode disable
    next
end
```

7. Configure Agentless VPN settings:

```
config vpn ssl settings
    set servercert "server_certificate"
    set source-interface "wan1"
    set source-address "all"
    set default-portal "portal-access-disabled"
    config authentication-rule
        edit 1
            set groups "rad-group"
            set portal "agentless-portal"
        next
    end
end
```

8. Configure Agentless VPN firewall policy to allow remote user to access the internal network. . This policy does not allow traffic initiated from internal network to remote client.

```
config firewall policy
   edit 1
        set name "Agentless VPN firewall policy"
        set srcintf "ssl.root"
        set dstintf "port1"
        set srcaddr "all"
        set dstaddr "192.168.1.0"
        set action accept
        set schedule "always"
        set service "ALL"
        set nat enable
        set groups “rad-group”
    next
end
```

Results

To check the Agentless VPN connection using the GUI:

1. On FortiGate, go to *Dashboard > Agentless VPN Monitor* to verify the list of Agentless VPN users.
   If the Agentless VPN Monitor is hidden, click *+* under the *Dashboard*, search for *Agentless VPN Monitor*, and add it to the display.
2. Go to *Log & Report > System Events*, and use the dropdown to select *VPN Events* to view VPN logs.

To check Agentless VPN connection using the CLI:

```
# get vpn ssl monitor
Agentless VPN Login Users:
 Index   User    Group   Auth Type      Timeout         From     HTTP in/out    HTTPS in/out
 0       radkeith        rad-group        2(1)            295     192.168.2.202  0/0     0/0

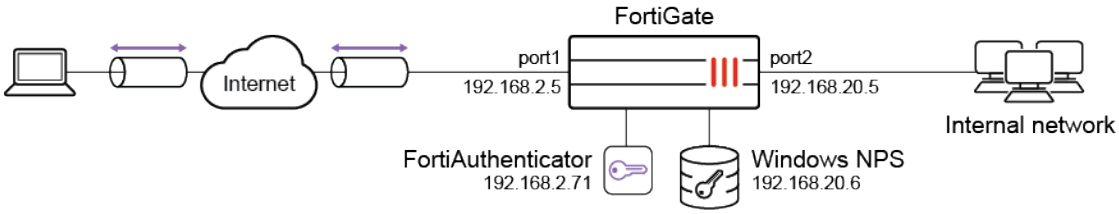
Agentless VPN sessions:
 Index   User    Group   Source IP      Duration        I/O Bytes       Tunnel/Dest IP
```

Agentless VPN with multiple RADIUS servers

When configuring two or more RADIUS servers, you can configure a Primary and Secondary server within the same RADIUS server configurations for backup purposes. You can also configure multiple RADIUS servers within the same User Group to service the access request at the same time.

A tertiary server can be configured in the CLI.

Sample topology



Sample configurations

- Configure a Primary and Secondary server for backup on page 3313
- Authenticating to two RADIUS servers concurrently on page 3319

Configure a Primary and Secondary server for backup

When you define a Primary and Secondary RADIUS server, the access request will always be sent to the Primary server first. If the request is denied with an Access-Reject, then the user authentication fails. However, if there is no response from the Primary server after another attempt, the access request will be sent to the Secondary server.

In this example, you will use a Windows NPS server as the Primary server and a FortiAuthenticator as the Secondary server. It is assumed that users are synchronized between the two servers.

To configure the internal and external interfaces:

1. Go to *Network* > *Interfaces*.
2. Edit the *port1* interface and set *IP/Network Mask* to *192.168.2.5/24*.
3. Edit the *port2* interface and set *IP/Network Mask* to *192.168.20.5/24*.
4. Click *OK*.

To create a firewall address:

1. Go to *Policy & Objects* > *Addresses* and select *Address*.
2. Click *Create new*.
3. Set *Name* to *192.168.20.0*.
4. Leave *Type* as *Subnet*
5. Set IP/*Netmask* to *192.168.20.0/24*.
6. Click *OK*.

To add the RADIUS servers:

1. Go to *User & Authentication* > *RADIUS Servers* and click *Create New*.
2. Set *Name* to *PrimarySecondary*.
3. Leave *Authentication method* set to *Default*. The PAP, MS-CHAPv2, and CHAP methods will be tried in order.
4. Under *Primary Server*, set *IP/Name* to *192.168.20.6* and *Secret* to the shared secret configured on the RADIUS server.
5. Click *Test Connectivity* to test the connection to the server, and ensure that *Connection status* is *Successful*.
6. Under *Secondary Server*, set *IP/Name* to *192.168.2.71* and *Secret* to the shared secret configured on the RADIUS server.
7. Click *Test Connectivity* to test the connection to the server, and ensure that *Connection status* is *Successful*.
8. *Click OK*.

To configure the user group:

1. Go to *User & Authentication* > *User Groups* and click *Create New*.
2. In the *Name* field, enter *PrimarySecondaryGroup*.
3. In the *Remote Groups* area, click *Add*, and from the *Remote Server* dropdown, select *PrimarySecondary*.
4. Click *OK*, and then click *OK* again.

To configure Agentless VPN portal:

1. Go to *VPN* > *Agentless VPN Portals*, and click *Create New*.
2. Enter a *Name*, such as *agentless-portal*.
3. Under *Predefined Bookmarks*, click *Create New*, and enter following details:

Field	Value
Name	Windows Server
Type	RDP
Host	192.168.1.114
Port	3389
Single Sign-On	Disable
Username	Set the username to login to Windows Server
Password	Set the password to login to Windows Server
Port	3389
Single Sign-On	Disable

4. Click *OK* to save the predefined bookmark.
5. Click *OK* to save the portal settings.
6. Create another Agentless VPN Portal and name it as *portal-access-disabled*.
7. Click *OK*.
8. Disable Agentless VPN for the newly created portal (that is, `portal-access-disabled`) using CLI:

```
config vpn ssl web portal
    edit "portal-access-disabled"
        set web-mode disable
    next
end
```

To configure the Agentless VPN settings:

1. Go to *VPN > Agentless VPN Settings*.
2. Set Agentless VPN to *Enable*.
3. Set the *Listen on Interface(s)* to *wan1*.
4. Set *Listen on Port* to *10443*.
5. Set *Server Certificate* to the authentication certificate.
6. In *Authentication/Portal Mapping*, select *All Other Users/Groups*, and click *Edit*.
7. Use *Portal* dropdown to select *portal-access-disabled*.
8. In *Authentication/Portal Mapping*, click *Create New*.
   a. Set *Users/Groups* to *PrimarySecondaryGroup*.
   b. Set *Portal* to *agentless-portal*.
   c. Click *OK*.
9. Click *Apply* to save the Agentless VPN settings.

To configure Agentless VPN firewall policy:

1. Go to *Policy & Objects > Firewall Policy* and click *Create New*.
2. Set *Name* as *Agentless VPN firewall policy*.

3. Set *Schedule* to *always* and *Action* to *Accept*.
4. Set *Incoming interface* to *Agentless VPN interface (ssl.root)*.
5. Choose an *Outgoing Interface*. This example uses *port1*.
6. Set the *Source* to *all* and *User/group* to *PrimarySecondaryGroup*.
7. In this example, the *Destination* is the internal, protected subnet *192.168.1.0*.
8. Set *Service* to *ALL*.
9. Click *OK*.

To configure Agentless VPN using the CLI:

1. Configure the internal interface and firewall address:

```
config system interface
    edit "port3"
        set vdom "root"
        set ip 192.168.20.5 255.255.255.0
        set alias "internal"
    next
                <p class="CLI_0">end
                <p class="CLI_0">config firewall address
    edit "192.168.20.0"
        set uuid cc41eec2-9645-51ea-d481-5c5317f865d0
        set subnet 192.168.20.0 255.255.255.0
    next
end
```

2. Configure the RADIUS server:

```
config user radius
    edit "PrimarySecondary"
        set server "192.168.20.6"
        set secret <secret>
        set secondary-server "192.168.2.71"
        set secondary-secret <secret>
    next
end
```

3. Add the RADIUS user to the user group:

```
config user group
    edit "PrimarySecondaryGroup"
        set member "PrimarySecondary "
    next
end
```

4. Configure Agentless VPN portal and predefine RDP bookmark for windows server.

```
config vpn ssl web portal
    edit "agentless-portal"
        set web-mode enable
        config bookmark-group
```

```
            edit "gui-bookmarks"
                config bookmarks
                    edit "Windows Server"
                        set apptype rdp
                        set host "192.168.1.114"
                        set port 3389
                        set logon-user "your-windows-server-user-name"
                        set logon-password your-windows-server-password
                    next
                end
            next
        end
    next
end
```

5. Configure another Agentless VPN portal and disable Agentless VPN on it.

```
config vpn ssl web portal
    edit "portal-access-disabled"
        set web-mode disable
    next
end
```

6. Configure Agentless VPN settings:

```
config vpn ssl settings
    set servercert "server_certificate"
    set source-interface "wan1"
    set source-address "all"
    set default-portal "portal-access-disabled"
    config authentication-rule
        edit 1
            set groups "PrimarySecondaryGroup"
            set portal "agentless-portal"
        next
    end
end
```

7. Configure one Agentless VPN firewall policy to allow remote users to access the internal network. This policy does not allow traffic initiated from internal network to remote client.

```
config firewall policy
    edit 1
        set name "Agentless VPN firewall policy"
        set srcintf "ssl.root"
        set dstintf "port1"
        set srcaddr "all"
        set dstaddr "192.168.1.0"
        set action accept
        set schedule "always"
        set service "ALL"
        set nat enable
```

```
        set groups “PrimarySecondaryGroup”
    next
end
```

To verify the connection:

User *radkeith* is a member of both the NPS server and the FAC server.

When the Primary server is up, the user successfully connects to Agentless VPN.

```
# diagnose sniffer packet any 'port 1812' 4 0 l
interfaces=[any]
filters=[port 1812]
2020-05-15 16:26:50.838453 port3 out 192.168.20.5.2374 -> 192.168.20.6.1812: udp 118
2020-05-15 16:26:50.883166 port3 in 192.168.20.6.1812 -> 192.168.20.5.2374: udp 20
2020-05-15 16:26:50.883374 port3 out 192.168.20.5.2374 -> 192.168.20.6.1812: udp 182
2020-05-15 16:26:50.884683 port3 in 192.168.20.6.1812 -> 192.168.20.5.2374: udp 228
```

The access request is sent to the Primary NPS server 192.168.20.6, and the connection is successful.

```
# get vpn ssl monitor
Agentless VPN Login Users:
Index   User            Group                   Auth Type      Timeout         From     HTTP
in/out    HTTPS in/out
0       radkeith       PrimarySecondaryGroup   2(1)            285     192.168.2.202          0/0
   0/0
Agentless VPN sessions:
Index   User       Group                   Source IP      Duration        I/O Bytes
Tunnel/Dest IP
```

When the Primary server is down, and the Secondary server is up, the user successfully connects to Agentless VPN again:

```
# diagnose sniffer packet any 'port 1812' 4 0 l
interfaces=[any]
filters=[port 1812]
2020-05-15 16:31:23.016875 port3 out 192.168.20.5.7989 -> 192.168.20.6.1812: udp 118
2020-05-15 16:31:28.019470 port3 out 192.168.20.5.7989 -> 192.168.20.6.1812: udp 118
2020-05-15 16:31:30.011874 port1 out 192.168.2.5.23848 -> 192.168.2.71.1812: udp 118
2020-05-15 16:31:30.087564 port1 in 192.168.2.71.1812 -> 192.168.2.5.23848: udp 20
```

Access request is sent to the Primary NPS server 192.168.20.6, but there was no response. RADIUS authentication falls through to the Secondary FortiAuthenticator 192.168.2.71, and the authentication was accepted. The Agentless VPN connection is established.

```
# get vpn ssl monitor
Agentless VPN Login Users:
Index   User            Group                  Auth Type      Timeout         From     HTTP in/out
   HTTPS in/out
0       radkeith        PrimarySecondaryGroup   2(1)            287     192.168.2.202        0/0
     0/0
Agentless VPN sessions:
```

```
Index   User            Group                    Source IP      Duration        I/O Bytes
Tunnel/Dest IP
```

Authenticating to two RADIUS servers concurrently

There are times where users are located on separate RADIUS servers. This may be the case when migrating from an old server to a new one for example. In this scenario, a Windows NPS server and a FortiAuthenticator are configured in the same User Group. The access-request is sent to both servers concurrently. If FortiGate receives an access-accept from either server, authentication is successful.

To configure the internal and external interfaces:

1. Go to *Network* > *Interfaces*.
2. Edit the *port1* interface and set *IP/Network Mask* to *192.168.2.5/24*.
3. Edit the *port2* interface and set *IP/Network Mask* to *192.168.20.5/24*.
4. Click *OK*.

To create a firewall address:

1. Go to *Policy & Objects* > *Addresses* and select *Address*.
2. Click *Create new*.
3. Set *Name* to *192.168.20.0*.
4. Leave *Type* as *Subnet*
5. Set IP/*Netmask* to *192.168.20.0/24*.
6. Click *OK*.

To configure the first RADIUS server:

1. Go to *User & Authentication* > *RADIUS Servers* and click *Create New*.
2. Set *Name* to *win2k16*.
3. Leave *Authentication method* set to *Default*. The PAP, MS-CHAPv2, and CHAP methods will be tried in order.
4. Under *Primary Server*, set *IP/Name* to *192.168.20.6* and *Secret* to the shared secret configured on the RADIUS server.
5. Click *Test Connectivity* to test the connection to the server, and ensure that *Connection status* is *Successful*.
6. Click *OK*.

To configure the second RADIUS server:

1. Go to *User & Authentication* > *RADIUS Servers* and click *Create New*.
2. Set *Name* to *fac*.
3. Leave *Authentication method* set to *Default*. The PAP, MS-CHAPv2, and CHAP methods will be tried in order.

4. Under *Primary Server*, set *IP/Name* to *192.168.2.71* and *Secret* to the shared secret configured on the RADIUS server.
5. Click *Test Connectivity* to test the connection to the server, and ensure that *Connection status* is *Successful*.
6. Click *OK*.

To configure the user group:

1. Go to *User & Authentication > User Groups* and click *Create New*.
2. In the *Name* field, enter *dualPrimaryGroup.*.
3. In the *Remote Groups* area, click *Add*, and from the *Remote Server* dropdown, select *fac*.
4. Click *Add* again. From the *Remote Server* dropdown select *win2k16* and click *OK*.
5. Click *OK*, and then click *OK* again.

To configure Agentless VPN portals:

1. Go to *VPN > Agentless VPN Portals*, and click *Create New*.
2. Enter a *Name*, such as *agentless-portal*.
3. Under *Predefined Bookmarks*, click *Create New*, and enter following details:

Field	Value
Name	Windows Server
Type	RDP
Host	192.168.1.114
Port	3389
Single Sign-On	Disable
Username	Set the username to login to Windows Server
Password	Set the password to login to Windows Server
Port	3389
Single Sign-On	Disable

4. Click *OK* to save the predefined bookmark.
5. Click *OK* to save the portal settings.
6. Create another Agentless VPN Portal and name it as *portal-access-disabled*.
7. Click *OK*.
8. Disable Agentless VPN for the newly created portal (that is, `portal-access-disabled`) using CLI:

```
config vpn ssl web portal
    edit "portal-access-disabled"
        set web-mode disable
    next
end
```

To configure the Agentless VPN settings:

1. Go to *VPN > Agentless VPN Settings*.
2. Set Agentless VPN to *Enable*.
3. Set the *Listen on Interface(s)* to *wan1*.
4. Set *Listen on Port* to *10443*.
5. Set *Server Certificate* to the authentication certificate.
6. In *Authentication/Portal Mapping*, select *All Other Users/Groups*, and click *Edit*.
7. Use *Portal* dropdown to select *portal-access-disabled*.
8. In *Authentication/Portal Mapping*, click *Create New*.
   a. Set *Users/Groups* to *dualPrimaryGroup*.
   b. Set *Portal* to *agentless-portal*.
   c. Click *OK*.
9. Click *Apply* to save the Agentless VPN settings.

To configure Agentless VPN firewall policy:

1. Go to *Policy & Objects > Firewall Policy* and click *Create New*.
2. Set *Name* as *Agentless VPN firewall policy*.
3. Set *Schedule* to *always* and *Action* to *Accept*.
4. Set *Incoming Interface* to *Agentless VPN tunnel interface(ssl.root)*.
5. Choose an *Outgoing Interface*. This example uses *port1*.
6. Set *Source* to *all* and *User/group* to *dualPrimaryGroup*.
7. In this example, the *Destination* is the internal, protected subnet *192.168.10.0*.
8. Set *Service* to *ALL*.
9. Click *OK*.

To configure Agentless VPN using the CLI:

1. Configure the internal interface and firewall address:

```
config system interface
    edit "port2"
        set vdom "root"
        set ip 192.168.20.5 255.255.255.0
        set alias "internal"
    next
end
config firewall address
    edit "192.168.20.0"
        set uuid cc41eec2-9645-51ea-d481-5c5317f865d0
        set subnet 192.168.20.0 255.255.255.0
    next
end
```

2. Configure the RADIUS server:

```
config user radius
    edit "win2k16"
        set server "192.168.20.6"
        set secret <secret>
    next
    edit "fac"
        set server "192.168.2.71"
        set secret <secret>
    next
end
```

3. Add the RADIUS user to the user group:

```
config user group
    edit "dualPrimaryGroup"
        set member "win2k16" “fac”
    next
end
```

4. Configure Agentless VPN portal and predefine RDP bookmark for windows server.

```
config vpn ssl web portal
    edit "agentless-portal"
        set web-mode enable
        config bookmark-group
            edit "gui-bookmarks"
                config bookmarks
                    edit "Windows Server"
                        set apptype rdp
                        set host "192.168.1.114"
                        set port 3389
                        set logon-user "your-windows-server-user-name"
                        set logon-password your-windows-server-password
                    next
                end
            next
        end
    next
end
```

5. Configure another Agentless VPN portal and disable Agentless VPN on it.

```
config vpn ssl web portal
    edit "portal-access-disabled"
        set web-mode disable
    next
end
```

6. Configure Agentless VPN settings:

```
config vpn ssl settings
    set servercert "server_certificate"
```

```
    set source-interface "wan1"
    set source-address "all"
    set default-portal "portal-access-disabled"
    config authentication-rule
        edit 1
            set groups "dualPrimaryGroup"
            set portal "agentless-portal"
        next
    end
end
```

7. Configure one Agentless VPN firewall policy to allow remote users to access the internal network. This policy does not allow traffic initiated from internal network to remote client.

```
config firewall policy
   edit 1
        set name "Agentless VPN firewall policy"
        set srcintf "ssl.root"
        set dstintf "port1"
        set srcaddr "all"
        set dstaddr "192.168.1.0"
        set action accept
        set schedule "always"
        set service "ALL"
        set nat enable
        set groups “dualPrimaryGroup”
    next
end
```

To verify the connection:

User *fackeith* is a member of the FortiAuthenticator server only.

User *radkeith* is a member of both the NPS server and the FortiAuthenticator server, but has different passwords on each server.

Case 1: Connect to the Agentless VPN web portal using a web browser and authentication with user FacAdmin:

```
# diagnose sniffer packet any 'port 1812' 4 0 l
interfaces=[any]
filters=[port 1812]
2020-05-15 17:21:31.217985 port3 out 192.168.20.5.11490 -> 192.168.20.6.1812: udp 118

Agentless VPN with local user password policy

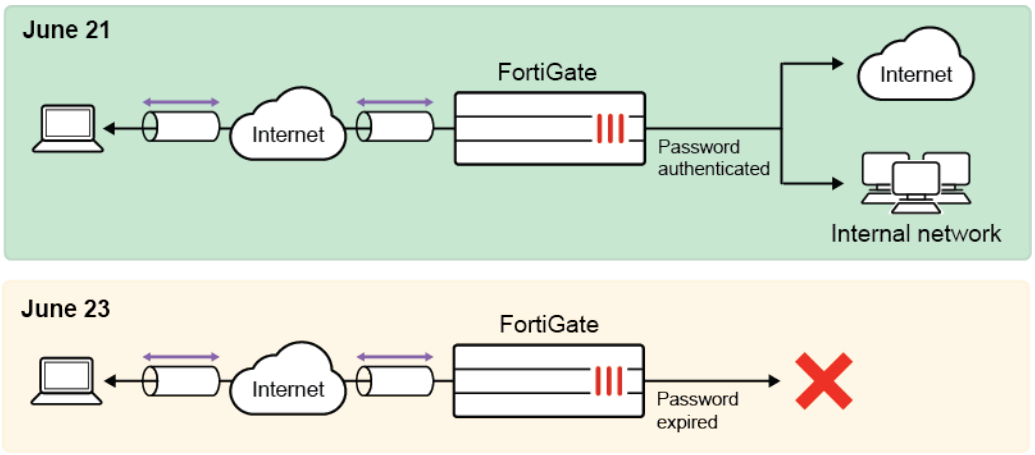
This is a sample configuration of Agentless VPN for users with passwords that expire after two days. Users are warned after one day about the password expiring. The password policy can be applied to any local user

password. The password policy cannot be applied to a user group or a local remote user such as LDAP/RADIUS/TACACS+.

In FortiOS 6.2, users are warned after one day about the password expiring and have one day to renew it. If the password expires, the user cannot renew the password and must contact the administrator for assistance.

In FortiOS 6.0/5.6, users are warned after one day about the password expiring and have to renew it. If the password expires, the user can still renew the password.

Sample topology



Sample configuration

WAN interface is the interface connected to ISP. This example shows static mode. You can also use DHCP or PPPoE mode. The Agentless VPN connection is established over the WAN interface.

To configure Agentless VPN using the GUI:

1. Configure the interface and firewall address. The port1 interface connects to the internal network.
   a. Go to *Network* > *Interfaces* and edit the *wan1* interface.
   b. Set *IP/Network Mask* to *172.20.120.123/255.255.255.0*.
   c. Edit *port1* interface and set *IP/Network Mask* to *192.168.1.99/255.255.255.0*.
   d. Click *OK*.
   e. Go to *Policy & Objects* > *Address* and create an address for internet subnet *192.168.1.0*.
2. Configure user and user group.
   a. Go to *User & Authentication* > *User Definition* to create a local user named agentlessvpnuser1.
   b. Go to *User & Authentication* > *User Groups* to create a user group named agentlessvpngroup, and add that local user to it.
3. Configure and assign the password policy using the CLI.
   a. Configure a password policy that includes an expiry date and warning time. The default start time for the password is the time the user was created.

```
config user password-policy
    edit "pwpolicy1"
        set expire-days 2
        set warn-days 1
    next
end
```

b. Assign the password policy to the user you just created.

```
config user local
    edit "agentlessvpnuser1"
        set type password
        set passwd-policy "pwpolicy1"
    next
end
```

4. Configure Agentless VPN portals.
   a. Go to *VPN > Agentless VPN Portals*, and click *Create New*.
   b. Enter a name, such as *agentless-portal*.
   c. Under *Predefined Bookmarks*, click *Create New*, and enter the following details:

Field	Value
Name	Windows Server
Type	RDP
Host	192.168.1.114
Port	3389
Single Sign-On	Disable
Username	Set the username to log in to Windows Server.
Password	Set the password to log in to Windows Server.
Port	3389

   d. Click *OK* to save the predefined bookmark.
   e. Click *OK* to save the portal settings.
   f. Create another Agentless VPN portal and name it *portal-access-disabled*.
   g. Click *OK* to save the portal settings.
   h. Disable Agentless VPN for the newly created portal (that is, *portal-access-disabled*) using CLI:

```
config vpn ssl web portal
    edit "portal-access-disabled"
        set web-mode disable
    next
end
```

5. Configure Agentless VPN settings.
   a. Set Agentless VPN to *Enable*.
   b. Set the *Listen on Interface(s)* to *wan1*.

c. Set *Listen on Port* to *10443*.
d. Choose a certificate for *Server Certificate*. The default is *Fortinet_Factory*.
e. In *Authentication/Portal Mapping*, select *All Other Users/Groups*, and click *Edit*.
f. Use *Portal* dropdown to select *portal-access-disabled*.
g. Click *OK*.
h. In *Authentication/Portal Mapping*, click *Create New*.
   i. Set *Users/Groups* to *agentlessvpngroup*.
   ii. Set *Portal* to *agentless-portal*.
   iii. Click *OK*.
i. Click *Apply* to save the Agentless VPN settings.

6. Configure Agentless VPN firewall policy.
   a. Go to *Policy & Objects > Firewall Policy* and click *Create New*.
   b. Set *Name* as *Agentless VPN firewall policy*.
   c. Set *Schedule* to *always* and *Action* to *Accept*.
   d. Set *Incoming Interface* to *Agentless VPN tunnel interface(ssl.root)*.
   e. Choose an *Outgoing Interface*. This example uses *port1*.
   f. Set *Source* to *all* and *User/group* to *agentlessvpngroup*.
   g. In this example, the *Destination* is the internal, protected subnet *192.168.10.0*.
   h. Set *Service* to *ALL*.
   i. Click *OK*.

To configure Agentless VPN using the CLI:

1. Configure the interface and firewall address.

```
config system interface
    edit "wan1"
        set vdom "root"
        set ip 172.20.120.123 255.255.255.0
    next
end
```

2. Configure internal interface and protected subnet, then connect the port1 interface to the internal network.

```
config system interface
    edit "port1"
        set vdom "root"
        set ip 192.168.1.99 255.255.255.0
    next
end
```

```
config firewall address
    edit "192.168.1.0"
        set subnet 192.168.1.0 255.255.255.0
    next
end
```

3. Configure user and user group.

```
config user local
    edit "agentlessvpnuser1"
        set type password
        set passwd your-password
    next
end
config user group
    edit "agentlessvpngroup"
        set member "agentlessvpnuser1"
    next
end
```

4. Configure and assign the password policy.
   a. Configure a password policy that includes an expiry date and warning time. The default start time for the password is the time the user was created.

```
config user password-policy
    edit "pwpolicy1"
        set expire-days 2
        set warn-days 1
    next
end
```

   b. Assign the password policy to the user you just created.

```
config user local
    edit "sslvpnuser1"
        set type password
        set passwd-policy "pwpolicy1"
    next
end
```

5. Configure Agentless VPN portal and predefine RDP bookmark for windows server.

```
config vpn ssl web portal
    edit "agentless-portal"
        set web-mode enable
        config bookmark-group
            edit "gui-bookmarks"
                config bookmarks
                    edit "Windows Server"
                        set apptype rdp
                        set host "192.168.1.114"
                        set port 3389
                        set logon-user "your-windows-server-user-name"
                        set logon-password your-windows-server-password
                    next
                end
            next
        end
    next
end
```

6. Configure another Agentless VPN portal and disable Agentless VPN on it.

```
config vpn ssl web portal
    edit "portal-access-disabled"
        set web-mode disable
    next
end
```

7. Apply the user group to the Agentless VPN portal.

```
config vpn ssl settings
    set servercert "Fortinet_Factory"
    set source-interface "wan1"
    set source-address "all"
    set default-portal "portal-access-disabled"
    config authentication-rule
        edit 1
            set groups "agentlessvpngroup"
            set portal "agentless-portal"
        next
    end
end
```

8. Configure one Agentless VPN firewall policy to allow remote user to access the internal network. This policy does not allow traffic initiated from internal network to remote client.

```
config firewall policy
    edit 1
        set name "Agentless VPN firewall policy"
        set srcintf "ssl.root"
        set dstintf "port1"
        set action accept
        set srcaddr "all"
        set dstaddr "192.168.1.0"
        set schedule "always"
        set service "ALL"
        set nat enable
        set groups "LDAP-USERGRP"
    next
end
```

To see the results of web portal:

1. From a remote device, use a web browser to log into the Agentless VPN web portal *http://172.20.120.123:10443*.
2. Log in using the *agentlessvpnuser1* credentials.

   When the warning time is reached, the user is prompted to enter a new password.

   In FortiOS 6.2, when the password expires, the user cannot renew the password and must contact the administrator.

   In FortiOS 6.0/5.6, when the password expires, the user can still renew the password.

To check the Agentless VPN connection using the GUI:

1. On FortiGate, go to *Dashboard > Agentless VPN Monitor* to verify the list of Agentless VPN users.
   If the Agentless VPN Monitor is hidden, click *+* under the *Dashboard*, search for *Agentless VPN Monitor*, and add it to the display.
2. Go to *Log & Report > System Events*, and use the dropdown to select *VPN Events* to view VPN logs.

To check that login failed due to password expired on GUI:

1. Go to *Log & Report > System Events* and select the *VPN Events* card to see the Agentless VPN alert labeled `ssl-login-fail`.
2. Click *Details* to see the log details about the *Reason*`sslvpn_login_password_expired`.

To check the Agentless web portal login using the CLI:

```
get vpn ssl monitor
Agentless VPN Login Users:
 Index   User         Auth Type   Timeout    From           HTTP in/out   HTTPS in/out
 0       agentlessvpnuser1  1(1)        229        10.1.100.254   0/0           0/0

Agentless VPN sessions:
 Index   User    Source IP      Duration        I/O Bytes       Tunnel/Dest IP
```

To check the FortiOS login password expired event log:

```
FG201E4Q17901354 # execute log  filter category event

FG201E4Q17901354 # execute log  filter field subtype vpn

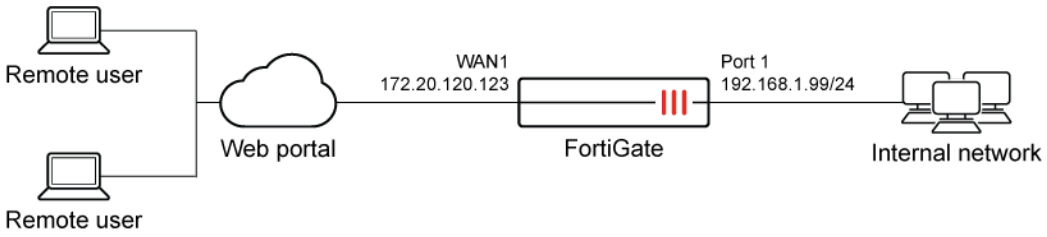
FG201E4Q17901354 # execute log  filter field action ssl-login-fail

FG201E4Q17901354 # execute log  display
1: date=2019-02-15 time=10:57:56 logid="0101039426" type="event" subtype="vpn" level="alert"
vd="root" eventtime=1550257076 logdesc="SSL VPN login fail" action="ssl-login-fail"
tunneltype="ssl-web" tunnelid=0 remip=10.1.100.254 user="u1" group="g1" dst_host="N/A"
reason="sslvpn_login_password_expired" msg="SSL user failed to logged in"
```

Agentless VPN multi-realm

This sample shows how to create a multi-realm Agentless VPN that provides different portals for different user groups.

Sample topology



Sample configuration

WAN interface is the interface connected to ISP. This example shows static mode. You can also use DHCP or PPPoE mode. The Agentless VPN connection is established over the WAN interface.

To configure Agentless VPN using the GUI:

1. Configure the interface and firewall address. The port1 interface connects to the internal network.
   a. Go to *Network* > *Interfaces* and edit the *wan1* interface.
   b. Set *IP/Network Mask* to *172.20.120.123/255.255.255.0*.
   c. Edit *port1* interface and set *IP/Network Mask* to *192.168.1.99/255.255.255.0*.
   d. Click *OK*.
   e. Go to *Policy & Objects* > *Address* and create an address for internet *QA_subnet* with subnet *192.168.1.0/24* and *HR_subnet* with subnet *10.1.100.0/24*.
2. Configure user and user group.
   a. Go to *User & Authentication* > *User Definition* to create local users *qa-user1* and *hr-user1*.
   b. Go to *User & Authentication* > *User Groups* to create separate user groups for web-only and full-access portals:
      - *QA_group* with member *qa-user1*.
      - *HR_group* with the member *hr-user1*.
3. Configure Agentless VPN portal.
   a. Go to *VPN* > *Agentless VPN Portals* to create portal *qa-tunnel*, and complete other configurations, such as Bookmarks, as required.
   b. Create another portal named *hr-web* with its own bookmark configuration.
   c. Create another portal named *portal-access-disabled*, and disable Agentless VPN on it using CLI:

```
config vpn ssl web portal
    edit "portal-access-disabled"
        set web-mode disable
    next
end
```

4. Configure Agentless VPN realms.
   a. Go to *System* > *Feature Visibility* to enable *Agentless VPN Realms*.
   b. Go to *VPN* > *Agentless VPN Realms* to create realms for *qa* and *hr*.

c. (Optional) To access each realm with FQDN instead of the default URLs *https://172.20.120.123:10443/hr* and *https://172.20.120.123:10443/qa*, you can configure a virtual-host for the realm in the CLI.

```
config vpn ssl web realm
    edit hr
        set virtual-host hr.mydomain.com
    next
    edit qa
        set virtual-host qa.mydomain.com
    next
end
```

Where `mydomain.com` is the name of your domain. Ensure FQDN resolves to the FortiGate wan1 interface and that your certificate is a wildcard certificate.

5. Configure Agentless VPN settings.
   a. Go to *VPN > Agentless VPN Settings*.
   b. Enable *Agentless VPN* status.
   c. For *Listen on Interface(s)*, select *wan1*.
   d. Set *Listen on Port* to *10443*.
   e. Choose a certificate for *Server Certificate*. The default is *Fortinet_Factory*.
   f. In *Authentication/Portal Mapping All Other Users/Groups*, set the *Portal* to *portal-access-disabled*.
   g. Create new *Authentication/Portal Mapping* for group *QA_group* mapping portal *qa-tunnel*.
   h. Specify the realm *qa*.
   i. Add another entry for group *HR_group* mapping portal *hr-web*.
   j. Specify the realm *hr*.
6. Configure Agentless VPN firewall policy.
   a. Go to *Policy & Objects > Firewall Policy*.
   b. Create a firewall policy for QA access.
   c. Fill in the firewall policy name. In this example, *QA agentlessvpn access*.
   d. Incoming interface must be *Agentless VPN tunnel interface (ssl.root)*.
   e. Choose an *Outgoing Interface*. In this example, *port1*.
   f. Set the *Source* to *all* and *User/group* to *QA_group*.
   g. In this example, the *Destination* is the internal protected subnet *QA_subnet*.
   h. Set *Schedule* to *always*, *Service* to *ALL*, and *Action* to *Accept*.
   i. Click *OK*.
   j. Create a firewall policy for HR access.
   k. Fill in the firewall policy name. In this example, *HR agentlessvpn access*.
   l. Incoming interface must be *Agentless VPN tunnel interface (ssl.root)*.
   m. Choose an *Outgoing Interface*. In this example, *port1*.
   n. Set the *Source* to *all* and *User/group* to *HR_group*.
   o. In this example, the *Destination* is the internal protected subnet *HR_subnet*.
   p. Set *Schedule* to *always*, *Service* to *ALL*, and *Action* to *Accept*.
   q. Click *OK*.

To configure Agentless VPN using the CLI:

1. Configure the interface and firewall address.

```
config system interface
    edit "wan1"
        set vdom "root"
        set ip 172.20.120.123 255.255.255.0
    next
end
```

2. Configure internal interface and protected subnet, then connect the port1 interface to the internal network.

```
config system interface
    edit "port1"
        set vdom "root"
        set ip 192.168.1.99 255.255.255.0
    next
end
```

```
config firewall address
    edit "QA_subnet"
        set subnet 192.168.1.0 255.255.255.0
    next
    edit "HR_subnet"
        set subnet 10.1.100.0 255.255.255.0
    next
end
```

3. Configure user and user group.

```
config user local
    edit "qa_user1"
        set type password
        set passwd your-password
    next
end
config user group
    edit "QA_group"
        set member "qa_user1"
    next
end
```

```
config user local
    edit "hr_user1"
        set type password
        set passwd your-password
    next
end
config user group
    edit "HR_group"
        set member "hr_user1"
```

```
    next
end
```

4. Configure Agentless VPN web portal each for HR and QA. Create another portal with Agentless VPN disabled.

```
config vpn ssl web portal
    edit "portal-access-disabled"
        set web-mode disable
    next
    edit "qa-portal"
        set web-mode enable
        config bookmark-group
            edit "gui-bookmarks"
                        config bookmarks
                        ...
            next
        end
    next
    edit "hr-portal"
        set web-mode enable
        config bookmark-group
            edit "gui-bookmarks"
                        config bookmarks
                        ...
            next
        end
    next
end
```

5. Configure Agentless VPN realms.

```
config vpn ssl web realm
    edit hr
        set virtual-host hr.mydomain.com
    next
    edit qa
        set virtual-host qa.mydomain.com
    next
end
```

The set virtual-host setting is optional. For example:

```
config vpn ssl web realm
    edit hr
    next
    edit qa
    next
end
```

6. Configure Agentless VPN settings.

```
config vpn ssl settings
    set banned-cipher SHA1 SHA256 SHA384
    set servercert "Fortinet_Factory"
    set login-attempt-limit 0
    set port 10443
    set source-interface "port1"
    set source-address "all"
    set default-portal "portal-access-disabled"
    config authentication-rule
        edit 1
            set groups "HR_group"
            set portal "hr-portal"
            set realm "hr"
        next
        edit 2
            set groups "QA_group"
            set portal "qa-portal"
            set realm "qa"
        next
    end
end
```

7. Configure two Agentless VPN firewall policies to allow remote QA user to access internal QA bookmark network and HR user to access HR bookmark network.

```
config firewall policy
    edit 1
        set name "QA sslvnpn access"
        set srcintf "ssl.root"
        set dstintf "port1"
        set srcaddr "all"
        set dstaddr "QA_subnet"
        set action accept
        set schedule "always"
        set service "ALL"
        set groups “QA_group”
    next
    edit 2
        set name "HR sslvpn access"
        set srcintf "ssl.root"
        set dstintf "port1"
        set srcaddr "all"
        set dstaddr "HR_subnet"
        set action accept
        set schedule "always"
        set service "ALL"
        set groups “HR_group”
    next
end
```

To see the results for HR and QA users:

1. In a web browser, log in to the portal https://172.20.120.123:10443/hr and https://172.20.120.123:10443/qa using the credentials you've set up.
2. Alternatively, if a virtual-host is specified, use the FQDN defined for the realm (hr.mydomain.com or qa.mydomain.com).

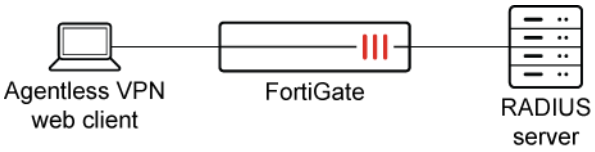
To check the Agentless VPN connection using the GUI:

1. On FortiGate, go to *Dashboard* > *Agentless VPN Monitor* to verify the list of Agentless VPN users.
   If the Agentless VPN Monitor is hidden, click *+* under the *Dashboard*, search for *Agentless VPN Monitor*, and add it to the display.
2. Go to *Log & Report* > *System Events*, and use the dropdown to select *VPN Events* to view VPN logs.

NAS-IP support per Agentless VPN realm

For RADIUS authentication and authorization, the RADIUS client (the FortiGate) passes the username, password, and NAS-IP to the RADIUS server in its access request. The RADIUS server authenticates and authorizes based on this information. Each RADIUS server can be configured with multiple NAS-IPs for authenticating different groups and NAS clients.

On the FortiGate, configuring the NAS-IP in the realm settings overrides the RADIUS server setting, allowing multiple NAS-IPs to be mapped to the same RADIUS server.



In this example, the user wants to present one FortiGate VDOM with different NAS-IPs to a single RADIUS server based on specific rules.

To configure Agentless VPN to use NAS-IP in the realm settings:

1. Configure a RADIUS user and add it to a group:

```
config user radius
    edit "fac150"
        set server "172.16.200.150"
        set secret ********
        set nas-ip 172.16.200.2
        config accounting-server
            edit 1
                set status enable
                set server "172.16.200.150"
                set secret ********
            next
        end
    next
```

```
end
config user group
    edit "radgrp"
        set member "fac150"
    next
end
```

2. Configure a realm for the user with a different NAS-IP:

```
config vpn ssl web realm
    edit "realm1"
        set login-page '.......'
        set radius-server "fac150"
        set nas-ip 10.1.100.2
    next
end
```

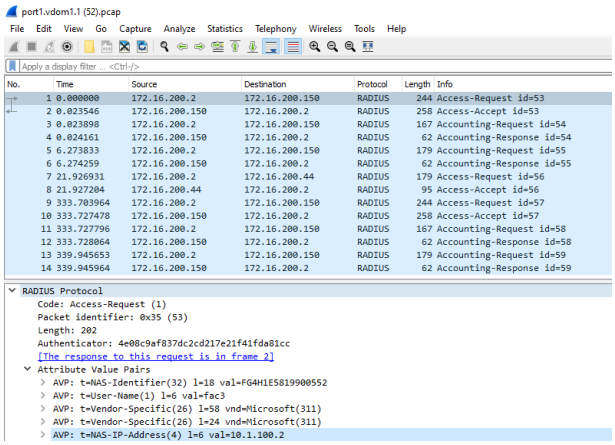
3. Configure Agentless VPN with an authentication rule that includes the user group and the realm:

```
config vpn ssl settings
    ...
    config authentication-rule
        edit 1
            set groupd "radgrp"
            set portal "testportal1"
            set realm "realm1"
        next
    end
end
```

4. Create a firewall policy:

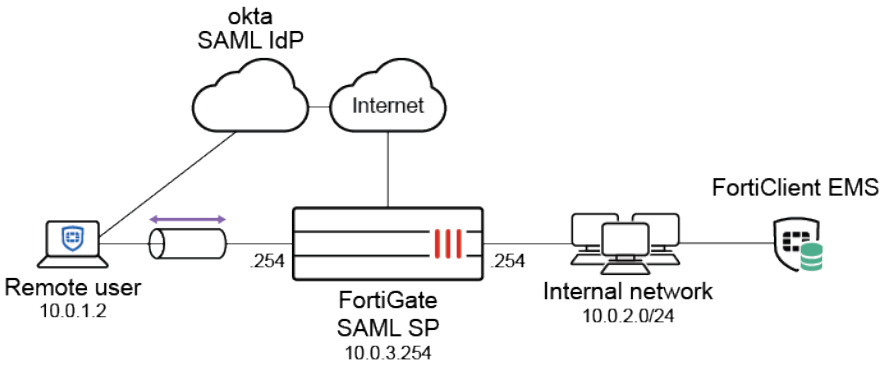
```
config firewall policy
    edit 1
        set name "sslvpn1"
        ...
        set srcintf "ssl.vdom1"
        set groups "radgrp"
    next
end
```

Because the RADIUS server and NAS-IP are specified in realm1, its NAS-IP is used for authentication.



Agentless VPN with Okta as SAML IdP

In this configuration, the FortiGate acts as a SAML service provider (SP) requesting authentication from Okta, which acts as a SAML identity provider (IdP). The following shows the topology in this configuration:



The authentication process is as follows in this deployment:

1. The user initiates an Agentless VPN request to the FortiGate using its web browser.
2. The FortiGate sends the browser POST redirect to web browser.
3. User's web browser redirects the SAML authentication request to Okta.
4. The user authenticates with Okta using their credentials.
5. Okta sends a SAML assertion that contains the user and group authentication in a POST redirect to the Agentless VPN login page.
6. User's browser sends the redirected Okta request that contains the SAML assertion to the FortiGate.
7. The FortiGate consumes the assertion and provides the user with access to resources based on the defined firewall security policy.

The example assumes that you already have an Okta account. This example uses users locally defined within the Okta directory and does not include LDAP mapping. The instructions describe the steps that you take if using the free Okta developer edition.

The following certificates are used:

Certificate	Description

SP certificate	This is the certificate used to sign the SAML messages originating from the SP to the IdP. This is configured on the FortiGate by the following CLI setting:
	
	`config user saml`
	`edit <profile>`
	`set cert <local certificate>`
	`next`
	`end`
	
	The certificate will be used by the SAML IdP (Okta) to verify the SP connection, so the certificate must be uploaded into Okta.

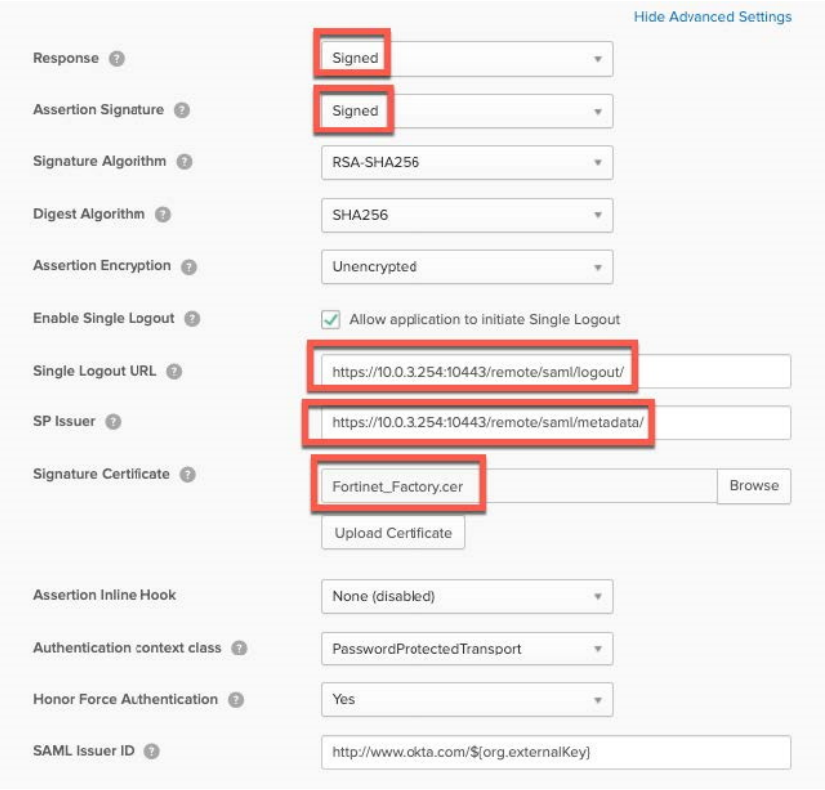
IdP certificate	This is the certificate used to sign the SAML response originating from the IdP. This must be trusted by the SP in order to verify the identity of the messages from the IdP.
	In this example, the certificate is provided by Okta. To upload this remote certificate into the FortiGate, follow the instructions in Remote certificate on page 3836.
	To use the certificate in your SAML SSO settings:
	
	`config user saml`
	`edit <profile>`
	`set idp-cert <Okta certificate>`
	`next`
	`end`

Agentless VPN server certificate	This certificate identifies the Agentless VPN portal when a remote client connects to the FortiGate using its browser.
	This is configured in the CLI as follows:
	
	`config vpn ssl settings`
	`set servercert <server certificate>`
	`end`
	
	When this is not specified, then the Fortinet factory self-signed certificate is used.

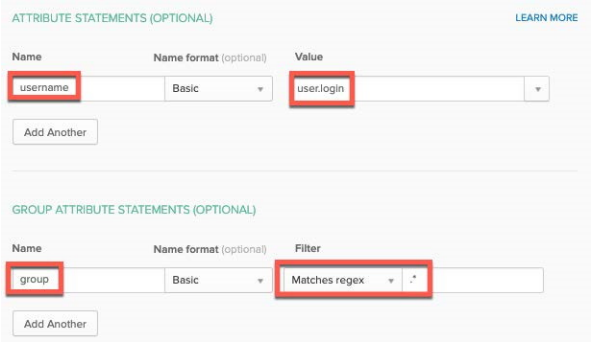
To configure Okta for Agentless VPN with FortiOS:

1. Log in to the Okta portal as the registered admin user.
2. Add the FortiGate application:
   a. Go to *Applications*.
   b. Click *Applications*, then click *Create App Integration*.
   c. Click *SAML 2.0*, then *Next*.
   d. Configure SAML settings:

i. Proceed through the application creation wizard. In the *Single sign on URL* field, enter https://<FortiGate IP address>:<port>/remote/saml/login/. In this example, it is https://10.0.3.254:10443/remote/saml/login/.
ii. Enable *Use this for Recipient URL and Destination URL*.
iii. In the *Audience URI (SP Entity ID)* field, enter the https://<FortiGate IP address>:<port>/remote/saml/metadata/. In this example, it is https://10.0.3.254:10443/remote/saml/metadata/.
iv. Click *Download Okta Certificate* to download the Okta certificate to your machine. You will provide this certificate to the FortiGate.
v. Click *Show Advanced Settings*. From the *Response* dropdown list, select *Signed*.
vi. From the *Assertion Signature* dropdown list, select *Signed*.
vii. In the *Single Logout URL* field, enter https://<FortiGate IP address>:<port>/remote/saml/logout/. In this example, it is https://10.0.3.254:10443/remote/saml/logout/.
viii. In the *SP Issuer* field, enter https://<FortiGate IP address>:<port>/remote/saml/metadata/. In this example, it is https://10.0.3.254:10443/remote/saml/metadata/.
ix. In the *Signature Certificate* field, first download the Fortinet_Factory certificate by logging into FortiOS, going to *System > Local Certificate*, then browsing to and uploading the FortiGate certificate. Okta uses this to authenticate the SAML SP.

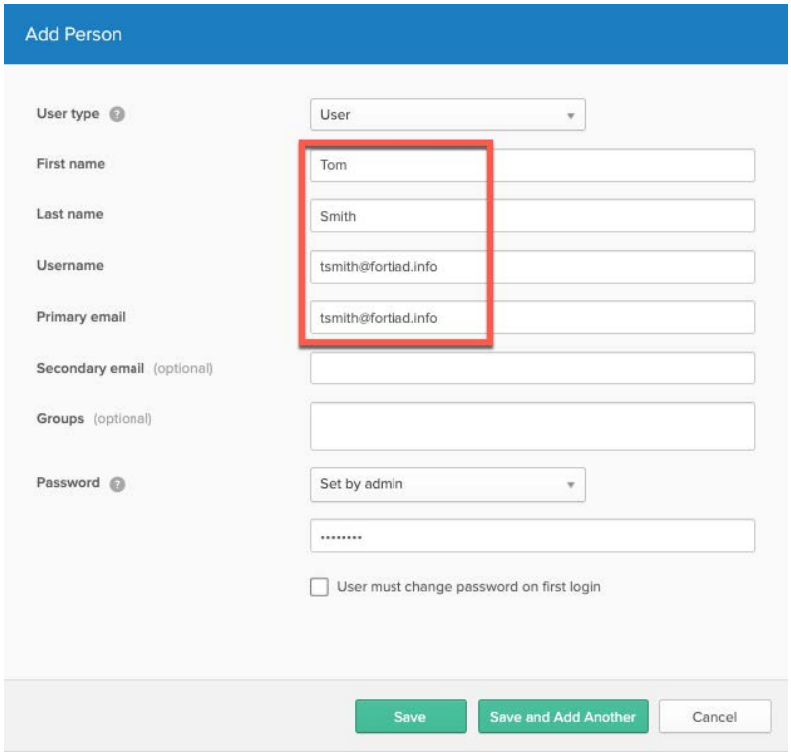


e. Under *ATTRIBUTE STATEMENTS* and *GROUP ATTRIBUTE STATEMENTS*, define attribute mappings for Okta to use in SAML assertion. In this example, the following is entered as a attribute statement and a group attribute statement, respectively:
   - username, with value user.login
   - group, with *Matches regex* filter



f. On the *Feedback* step, select *I'm an Okta customer adding an internal app*.
g. Select *This is an internal app that we have created*.
h. Click *Finish*.

3. Go to *Directory* > *People*.
4. Click *Add Person*.
5. Enter the person's details as desired. Click *Save*.



6. Add a group:
   a. Go to *Directory* > *Groups*.
   b. Click *Add Group*.
   c. Enter the desired name, then click *Add Group*. In this example, the name is corporate-saml.
   d. Select the newly added group, then click *Assign People*.
   e. Add the person that you created as a member of the new group. Click *Save*.
7. Assign the group to the FortiGate application:

   a. Go to *Applications* > *FortiGate application* > *Assignments*.
   b. From the *Assign* dropdown list, select *Assign to Groups*.
   c. Assign the group that you created to the FortiGate application.
8. To view the SAML setup instructions, do the following:
   a. Click the newly created application's name.
   b. Click *Sign On*.
   c. Go to *View SAML Setup Instructions*. Note down the *Identity Provider Single Sign-On URL*, *Identity Provider Single Logout URL*, and *Identity Provider Issuer* values.
9. Download the Okta certificate and upload it to FortiOS:
   a. From *View SAML Setup Instructions*, download the certificate.
   b. In FortiOS, go to *System* > *Certificates*.
   c. From the *Create/Import* dropdown list, select *Remote Certificate*.
   d. Click *Upload* and upload the downloaded Okta certificate.

To configure the FortiGate:

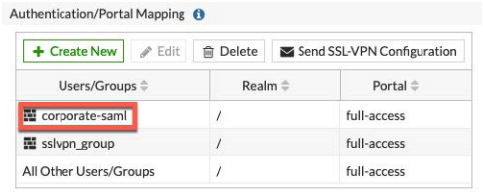
1. Configure the FortiGate SP to be a SAML user:

```
config user saml
    edit "okta-idp"
        set cert "Fortinet_Factory"
        set entity-id "https://10.0.3.254:10443/remote/saml/metadata/"
        set single-sign-on-url "https://10.0.3.254:10443/remote/saml/login"
        set single-logout-url "https://10.0.3.254:10443/remote/saml/logout"
        set idp-entity-id "http://www.okta.com/exk103foxaa8gk5qy4x7"
        set idp-single-sign-on-url "https://fortinet01.okta.com/app/fortinetorg878484_
fortigate_1/exk103foxaa8gk5qy4x7/sso/saml"
        set idp-single-logout-url "https://fortinet01.okta.com/app/fortinetorg878484_
fortigate_1/exk103foxaa8gk5qy4x7/slo/saml"
        set idp-cert "Okta-IDP_Certificate"
        set user-name "username"
        set group-name "group"
    next
end
```

2. Configure user group assertion on Okta as part of the SAML assertion attributes. It is important that the group attribute value received is locally matched with the `group-name` value:

```
config user group
    edit "corporate-saml"
        set member "okta-idp"
        config match
            edit 1
                set server-name "okta-idp"
                set group-name "corporate-saml"
            next
        end
    next
end
```

3. Go to *VPN* > *Agentless VPN Settings*. Configure VPN settings as desired.

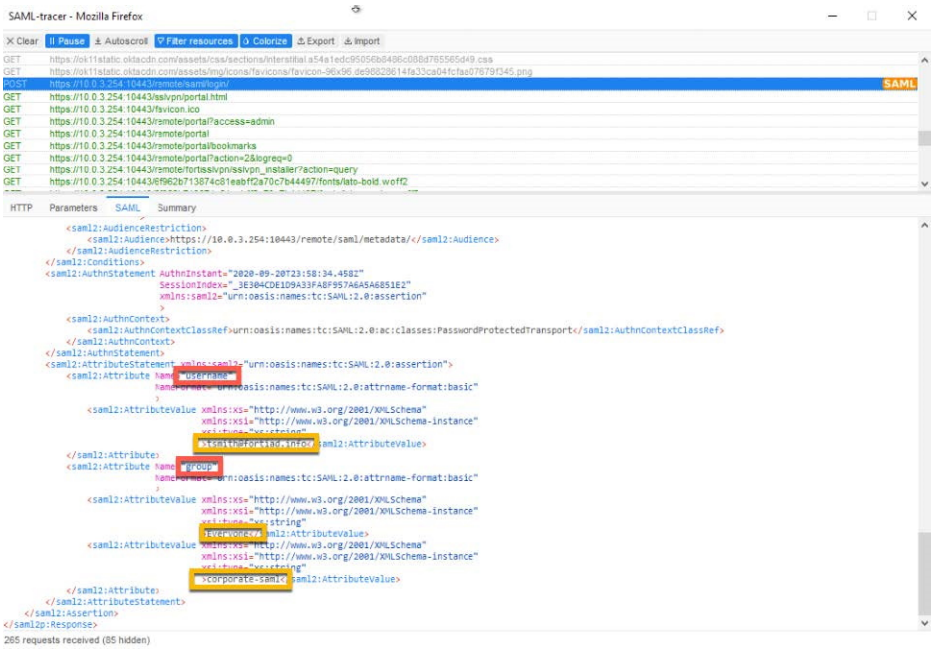


4. Configure a local or RADIUS user as a backup. This setting also provides a login web user with a choice of local or SSO login.
5. Go to *Policy and Objects* > *Firewall Policies*. Configure a policy as desired.
6. Increase the global authentication timeout period to allow users to fill in their credentials in time. The default timeout is five seconds:

```
config system global
    set remoteauthtimeout 60
end
```

To test the configuration:

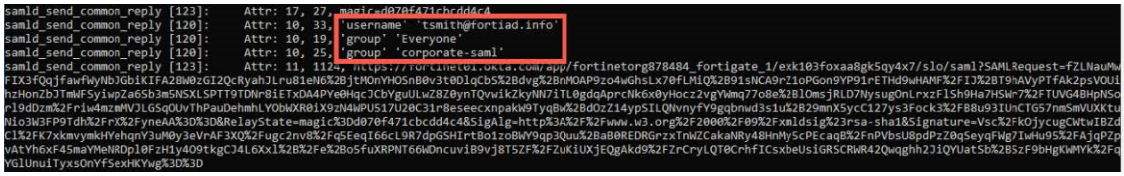
1. Install the SAML-tracer plugin to Firefox browser.
2. In Firefox, go to the FortiOS Agentless VPN login page. In this example, this is https://10.0.3.254:10443.
3. Open the SAML tracer.
4. The browser redirects to the Okta SAML login page. Enter the Okta credentials, then click *Sign in*.
5. Upon successful authentication, the browser redirects to the authenticated Agentless VPN page. If authentication does not succeed, review the SAML tracer to confirm the SAML assertion attributes that are passed during the authentication session. Select the POST message with the SAML information. On the SAML tab, confirm the username and group attributes.



To troubleshoot the configuration:

You can view FortiOS event logs in *Log & Report* > *Events* to verify successful authentication and user group allocation.

You can also run the `diagnose debug application samld -1` command to verify that the SAML IdP sent the correct information. The following shows example output for this scenario:



Agentless VPN with Microsoft Entra SSO integration

You can use SAML single sign-on to authenticate Agentless VPN users against Microsoft Entra ID, using similar SSL VPN web mode configuration. See:

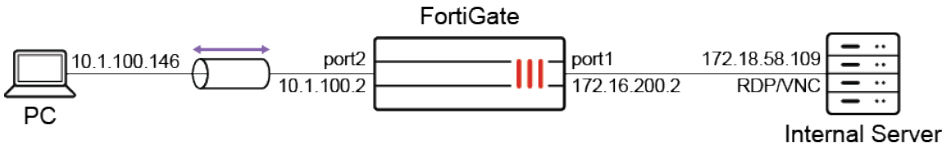
- Configuring SAML SSO login for SSL VPN with Entra ID acting as SAML IdP
- Tutorial: Microsoft Entra SSO integration with FortiGate SSL VPN

Disable the clipboard for Agentless VPN RDP connections

In Agentless VPN portals, the clipboard can be disabled for RDP/VNC connections, and the user will be unable to copy and paste content to or from the internal server.

Example

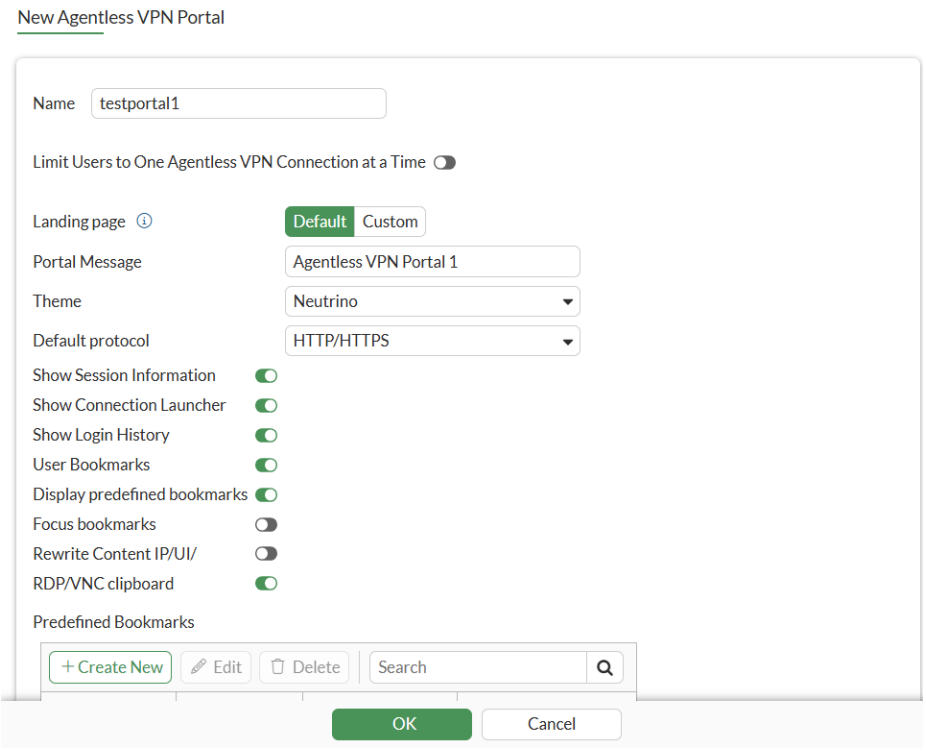
In this example, two groups of users are using Agentless VPN to access internal servers with RDP/VNC. One group is allowed to copy and paste content to and from the internal server using the clipboard, while the other is not.



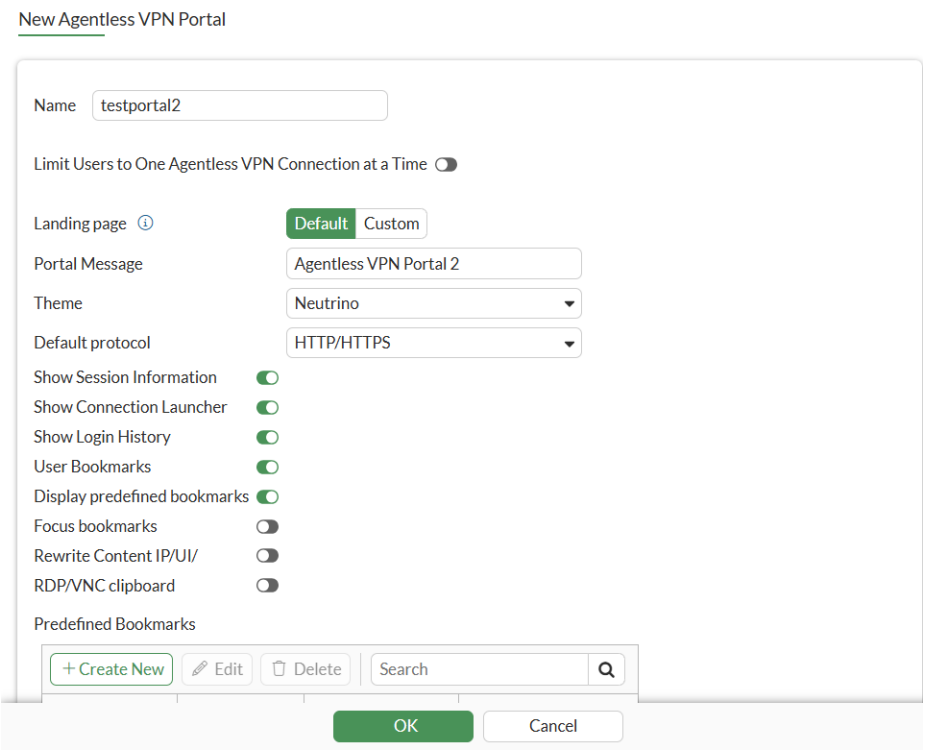
To configure Agentless VPN portals in the GUI:

1. Go to *VPN* > *Agentless VPN Portals* and click *Create New*.
2. Enter a name for the portal, such as *testportal1*.

3. Enable *RDP/VNC clipboard* to allow copying and pasting.
4. Configure the remaining settings as needed.



5. Click *OK*.
6. Click *Create New* again.
7. Enter a name for the portal, such as *testportal2*.
8. Disable *RDP/VNC clipboard* to prevent copying and pasting.
9. Configure the remaining settings as needed.



10. Click *OK*.
11. Click *Create New* again, and enter *Name* as *portal-access-disabled*.
12. Disable Agentless VPN on the portal using CLI.

```
config vpn ssl web portal
    edit "portal-access-disabled"
        set web-mode disable
    next
end
```

To configure the Agentless VPN settings in the GUI:

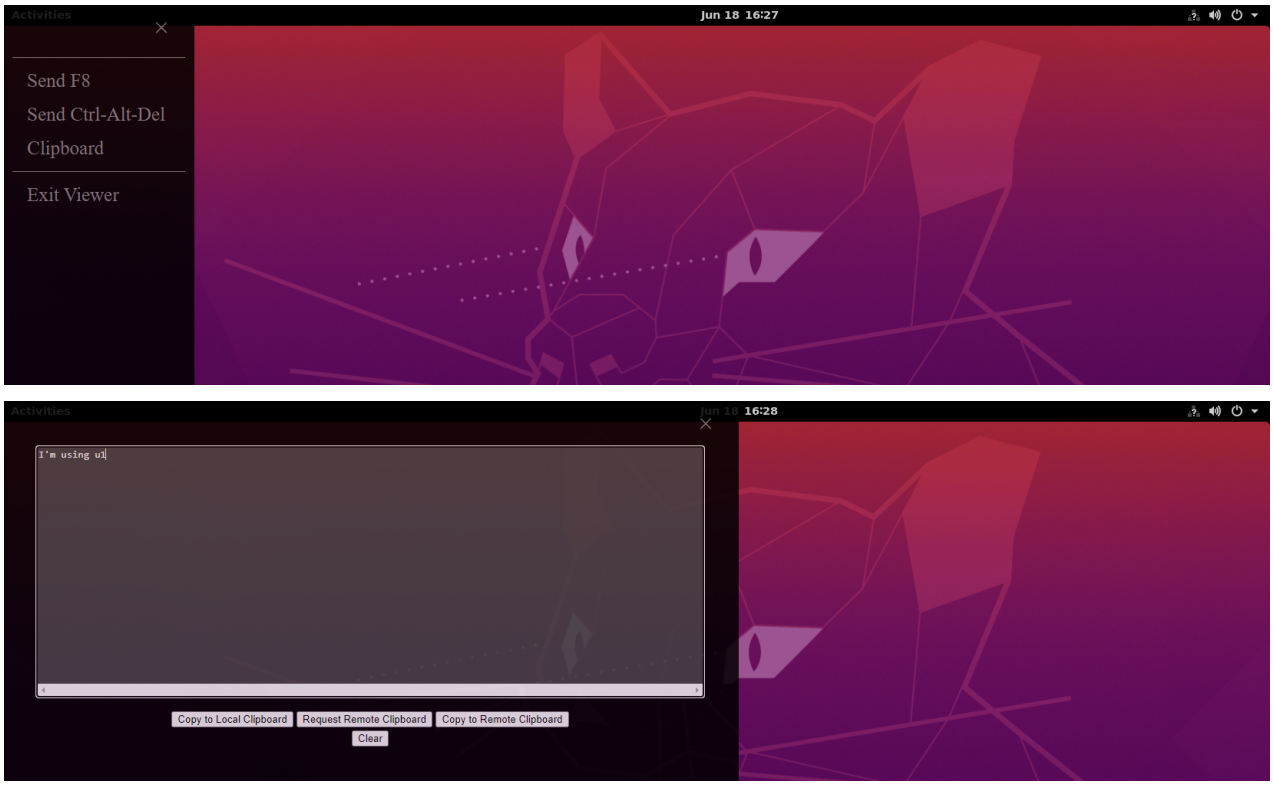
1. Go to *VPN > Agentless VPN Settings*.
2. Set Agentless VPN status to *Enable*.
3. Set *Listen on Interface* to port2.
4. In the *Authentication/Portal Mapping* table, add the users to each of the portals:
   a. Click *Create New*.
   b. Set *Users/Groups* to *u1* and *Portal* to *testportal1*.
   c. Click *OK*, then click *Create New* again.
   d. Set *Users/Groups* to *u2* and *Portal* to *testportal2*.
   e. Click *OK*.
   f. Set all *Other User/Groups* to *portal-access-disabled*.
5. Configure the remaining settings as needed.
6. Click *Apply*.

To configure a firewall policy for Agentless VPN in the GUI:

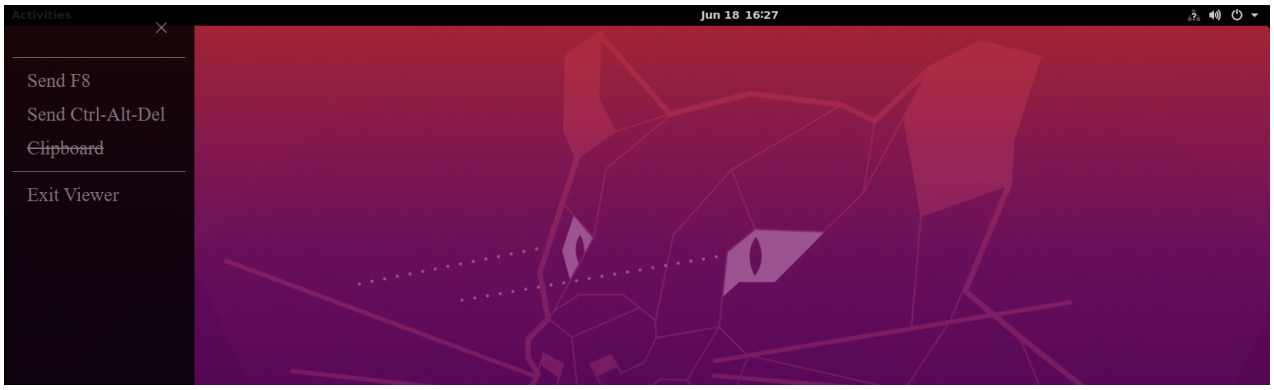
1. Go to *Policy & Objects* > *Firewall Policy* and click *Create New*.
2. Set a name for the policy, such as *policy_to_agentlessvpn*.
3. Set *Incoming Interface* to the *Agentless VPN tunnel interface (ss.root)* and *Outgoing Interface* to port1.
4. Set *Source* to *all* and *Users/groups* to *u1* and *u2*.
5. Set *Destination* to all addresses.
6. Set *Schedule* to *always*, *Service* to *All*, and *Action* to *Accept*.
7. Configure the remaining settings as needed.
8. Click *OK*.

To test the if the users can use the clipboard:

1. On the PC, open a web browser and log in to the web portal as user *u1*.
2. Access the internal server using RDP/VNC.
3. The clipboard is available and you can copy and paste content to and from the remote server.



4. Log out of the web portal, then log back in as user *u2* and access the internal server using RDP/VNC. The clipboard is disabled.



To configure the Agentless VPN portals and settings in the CLI:

1. Configure the Agentless VPN portals:

```
config vpn ssl web portal
    edit "testportal1"
        set web-mode enable
        set clipboard enable
        ...
    next
    edit "testportal2"
        set web-mode enable
        set clipboard disable
        ...
    next
end
```

2. Configure the Agentless VPN settings:

```
config vpn ssl settings
    set banned-cipher SHA1 SHA256 SHA384
    set servercert "Server_Certificate "
    set login-attempt-limit 0
    set port 1443
    set source-interface "port2"
    set source-address "all"
    set source-address6 "all"
    set default-portal "portal-access-disabled"
    config authentication-rule
        edit 1
            set users "u1"
            set portal "testportal1"
        next
        edit 2
            set users "u2"
            set portal "testportal2"
        next
    end
end
```

3. Configure a firewall policy for Agentless VPN:

```
config firewall policy
    edit 1
        set name "policy_to_Agentless_VPN"
        set srcintf "ssl.root"
        set dstintf "port1"
        set action accept
        set srcaddr "all"
        set dstaddr "all"
        set schedule "always"
        set service "ALL"
        set nat enable
        set users "u1" "u2"
    next
end
```

4. On the PC, open a web browser, log in to the web portal as user *u1*, access the internal server using RDP/VNC, and use the clipboard.
5. Check the Agentless VPN session monitor using FortiOS CLI:

```
# get vpn ssl monitor
Agentless VPN Login Users:
 Index   User    Group   Auth Type      Timeout         Auth-Timeout    From     HTTP in/out
 HTTPS in/out    Two-factor Auth
 0       u1             1(1)             N/A     10.1.100.146   0/0     0/364   0

Agentless VPN sessions:
 Index   User    Group   Source IP      Duration        I/O Bytes       Tunnel/Dest IP
```

6. On the PC, open a web browser, log in to the web portal as user *u2*, access the internal server using RDP/VNC, and note that the clipboard is not available.
7. Check the Agentless VPN session monitor:

```
# get vpn ssl monitor
Agentless VPN Login Users:
 Index   User    Group   Auth Type      Timeout         Auth-Timeout    From     HTTP in/out
 HTTPS in/out    Two-factor Auth
 0       u2             1(1)             N/A     10.1.100.146   0/0     0/2681  0

Agentless VPN sessions:
 Index   User    Group   Source IP      Duration        I/O Bytes       Tunnel/Dest IP
```

Post-Quantum Cryptography for Agentless VPN

FortiOS supports Post-Quantum Cryptography (PQC) for Agentless VPN. Pure and hybrid PQC algorithms to prepare for future quantum computing threats can be selected in the CLI. Using OpenSSL library version 3.5 enables initial PQC algorithm support and establishes a foundation for broader quantum-resistant capabilities across FortiGate platforms.

In FIPS mode, Known Answer Tests (KATs) are available for PQC algorithms, including OSSL-ML-DSA-KAT_Signature, OSSL-SLH-DSA-KAT_Signature, and OSSL-ML-KEM, along with key generation and encapsulation tests. Legacy RSA encrypt/decrypt tests are not available to align with modern cryptographic standards.

Additionally, SSL VPN supports TLS group configuration in the CLI:

```
config vpn ssl settings
    set tls-groups <groups>
end
```

Supported groups include traditional elliptic curves (P-256, P-384, P-521), finite field Diffie-Hellman (FFDHE2048–8192), pure PQC (ML-KEM512, ML-KEM768, ML-KEM1024), and hybrid combinations (such as P-384-MLKEM1024, X25519-MLKEM768). PQC groups are currently unavailable in FIPS-CC mode pending FIPS 140-3 approval.

Use Case 1: FIPS-CC compliance customer

Strict FIPS-CC compliance for all cryptographic operations is required in a FortiGate deployment supporting employees using Agentless VPN with only FIPS-compliant algorithms.

1. The FortiGate in FIPS-CC mode can boot up successfully with new KATs added:

```
[smit] Installing and loading FIPS provider:
HMAC               : KAT_Integrity               : Pass
HMAC               : Module_Integrity            : Pass
SHA2               : KAT_Digest                  : Pass
SHA3               : KAT_Digest                  : Pass
AES_GCM            : KAT_Cipher                  : Pass
AES_ECB_Decrypt    : KAT_Cipher                  : Pass
TDES               : KAT_Cipher                  : Pass
RSA                : KAT_Signature               : Pass
ECDSA              : KAT_Signature               : Pass
ECDSA              : KAT_Signature               : Pass
EDDSA              : KAT_Signature               : Pass
EDDSA              : KAT_Signature               : Pass
DSA                : KAT_Signature               : Pass
ML-DSA             : KAT_Signature               : Pass
SLH-DSA            : KAT_Signature               : Pass
SLH-DSA            : KAT_Signature               : Pass

FIPS-CC mode: enable
Current HA mode: standalone
...
System time: Mon Sep 22 15:59:24 2025
                      Last reboot reason: warm reboot
```

2. TLS groups can be set when configuring Agentless VPN:

```
config vpn ssl settings
    set tls-groups P-521 P-384 FFDHE4096 FFDHE8192
end
```

Use Case 2: Normal mode customer testing PQC

An enterprise is testing PQC capabilities in preparation for future regulatory requirements and to evaluate quantum-resistant security options without current compliance restrictions in a FortiGate deployment supporting remote workers that use Agentless VPN.

In this example TLSv1.3 is used and the client is a Chrome web browser.

1. TLS groups can be set when configuring Agentless VPN:

```
config vpn ssl settings
    set tls-groups ML-KEM512 ML-KEM768 ML-KEM1024 X25519 P-384-MLKEM1024 P-256-MLKEM768
X25519-MLKEM768
end
```

2. The **Client Hello** message shows groups supported by the Chrome browser:

```
Supported Groups (5 groups)
    Supported Group: Reserved (GREASE) (0xcaca)
    Supported Group: X25519MLKEM768 (0x11ec)
    Supported Group: x25519 (0x001d)
    Supported Group: secp256r1 (0x0017)
    Supported Group: secp384r1 (0x0018)
```

3. The **Server Hello** message shows the group that the FortiGate picked:

```
Extension: key_share (len=1124) X25519MLKEM768
    Type: key_share (51)
    Length: 1124
    Key Share extension
```

Agentless VPN troubleshooting

The following topics provide information about Agentless VPN troubleshooting:

- Debug commands on page 3353
- Troubleshooting common issues on page 3354

Debug commands

Agentless VPN debug command

Use the following diagnose commands to identify Agentless VPN issues. These commands enable debugging of Agentless VPN with a debug level of -1 for detailed results.

```
diagnose debug application sslvpn -1
diagnose debug enable
```

The CLI displays debug output similar to the following:

```
FGT60C3G10002814 # [282:root]SSL state:before/accept initialization (172.20.120.12)
[282:root]SSL state:SSLv3 read client hello A (172.20.120.12)
[282:root]SSL state:SSLv3 write server hello A (172.20.120.12)
[282:root]SSL state:SSLv3 write change cipher spec A (172.20.120.12)
[282:root]SSL state:SSLv3 write finished B (172.20.120.12)
[282:root]SSL state:SSLv3 flush data (172.20.120.12)
[282:root]SSL state:SSLv3 read finished A:system lib(172.20.120.12)
[282:root]SSL state:SSLv3 read finished A (172.20.120.12)
[282:root]SSL state:SSL negotiation finished successfully (172.20.120.12)
[282:root]SSL established: DHE-RSA-AES256-SHA SSLv3 Kx=DH Au=RSA Enc=AES(256) Mac=SHA1
```

To disable the debug:

```
diagnose debug disable
diagnose debug reset
```

Remote user authentication debug command

Use the following diagnose commands to identify remote user authentication issues.

```
diagnose debug application fnbamd -1
diagnose debug reset
```

Troubleshooting common issues

To troubleshoot no visible Agentless VPN menus in the GUI:

Enable the feature visibility in the GUI or CLI.

In the GUI:

1. Go to *System* > *Feature Visibility*.
2. In the *Core Features* section, enable *Agentless VPN*.
3. Click *Apply*.

In the CLI:

```
config system settings
    set gui-sslvpn enable
end
```

To troubleshoot no visible Agentless VPN options in the GUI or CLI:

```
config system global
    set sslvpn-web-mode enable
end
```

To troubleshoot getting no response from the Agentless VPN URL:

1. Go to *VPN* > *Agentless VPN Settings*.
   a. Confirm that Agentless VPN is enabled.
   b. Check the Agentless VPN port assignment.
   c. Check the *Restrict Access* setting to ensure the host you are connecting from is allowed.
2. Go to *Policy* > *Firewall Policy*.
   a. Check that the policy for Agentless VPN traffic is configured correctly.
   b. Check the URL you are attempting to connect to. It should follow this pattern:

```
https://<FortiGate IP>:<Port>
```

c. Check that you are using the correct port number in the URL. Ensure FortiGate is reachable from the computer.

```
ping <FortiGate IP>
```

d. Check the browser has *TLS 1.1*, *TLS 1.2*, and *TLS 1.3* enabled.

To troubleshoot FortiGate connection issues:

1. Check the Release Notes to ensure that the web browser version is compatible with your version of FortiOS.
2. Check that your browser has TLS 1.1 and TLS 1.2 enabled.

To troubleshoot Agentless VPN connections shutting down after a few seconds:

This might occur if there are multiple interfaces connected to the Internet, for example, SD-WAN. This can cause the session to become “dirty”. To allow multiple interfaces to connect, use the following CLI commands.

If you are using a FortiOS 6.0.1 or later:

```
config system interface
  edit <name>
    set preserve-session-route enable
  next
end
```

User & Authentication

In *User & Authentication*, you can control network access for different users and devices in your network. FortiGate authentication controls system access by user group. By assigning individual users to the appropriate user groups you can control each user's access to network resources. You can define local users and peer users on the FortiGate unit. You can also define user accounts on remote authentication servers and connect them to FortiOS.

⚠ When configuring an LDAP connection to an Active Directory server, an administrator must provide Active Directory user credentials.

- To secure this connection, use LDAPS on both the Active Directory server and FortiGate. See Configuring an LDAP server on page 3381 and Configuring client certificate authentication on the LDAP server on page 3396.
- Apply the principle of least privilege. For the LDAP regular bind operation, do not use credentials that provide full administrative access to the Windows server when using credentials. See Configuring least privileges for LDAP admin account authentication in Active Directory on page 3389.

To secure RADIUS connections, consider using RADSEC over TLS instead. See Configuring a RADSEC client on page 3438.

You can control network access for different device types in your network by doing the following:

- Identifying and monitoring the types of devices connecting to your network
- Using MAC address based access control to allow or deny individual devices
- Using Telemetry data received from FortiClient endpoints to construct a policy to deny access to endpoints with known vulnerabilities or to quarantine compromised endpoints

The following sections provide information about users and devices:

- User definition, groups, and settings on page 3357
- Basic authentication with cached client certificates on page 3379
- LDAP servers on page 3381
- RADIUS servers on page 3399
- SAML on page 3445
- TACACS+ servers on page 3492
- SCIM servers on page 3494
- FortiTokens on page 3504
- PKI on page 3533
- FSSO on page 3541
- Include usernames in logs on page 3559

User definition, groups, and settings

FortiGate authentication controls system access by user groups. By assigning individual users to the appropriate user groups, this controls each user's access to network resources. The user groups members are user accounts, of which there are several types. Local and peer users are defined in FortiOS. User accounts can also be defined on remote authentication servers.

This section contains information about configuring the following:

- Users on page 3357
- User groups on page 3359
- Authentication settings on page 3367
- Retail environment guest access on page 3372
- Customizing complexity options for the local user password policy on page 3374

For information about configuring authentication servers, see the LDAP servers on page 3381, RADIUS servers on page 3399, TACACS+ servers on page 3492, and SAML on page 3445 sections.

Users

A user is a user account consisting of a username, password, and sometimes other information, that is configured in FortiOS or on an external authentication server. There are several types of user accounts with slightly different methods of authentication.

User type	Authentication method
Local	The username and password must match a user account stored in FortiOS. Authentication is done by a firewall policy.
Remote	Remote users consist of usernames defined in FortiOS that are authenticated by a remote server. For example, RADIUS, TACACS+, LDAP, or FortiNAC. The server must be configured in FortiOS before creating a user.
FSSO	Users on a Microsoft Windows, Citrix, or Novell network can use their network authentication to access resources through the FortiGate. Access is controlled through FSSO user groups, which contain Windows, Citrix, or Novell user groups as members. The FSSO agent must be configured in FortiOS before creating a user (see FSSO on page 3541).
PKI or peer	A PKI or peer user is a digital certificate holder that authenticates using a client certificate. No password is required, unless two-factor authentication is enabled. In the GUI, the *User & Authentication > PKI* menu is only available after a PKI user is configured in the CLI (see Configuring a PKI user on page 3534).
SAML	Local entries for SAML users, usable in firewall policies and agentless VPNs. See Local entries for SAML users on page 3482 for more information. A working SAML IdP connection must already be configured. See SAML on page 3445 for more information.

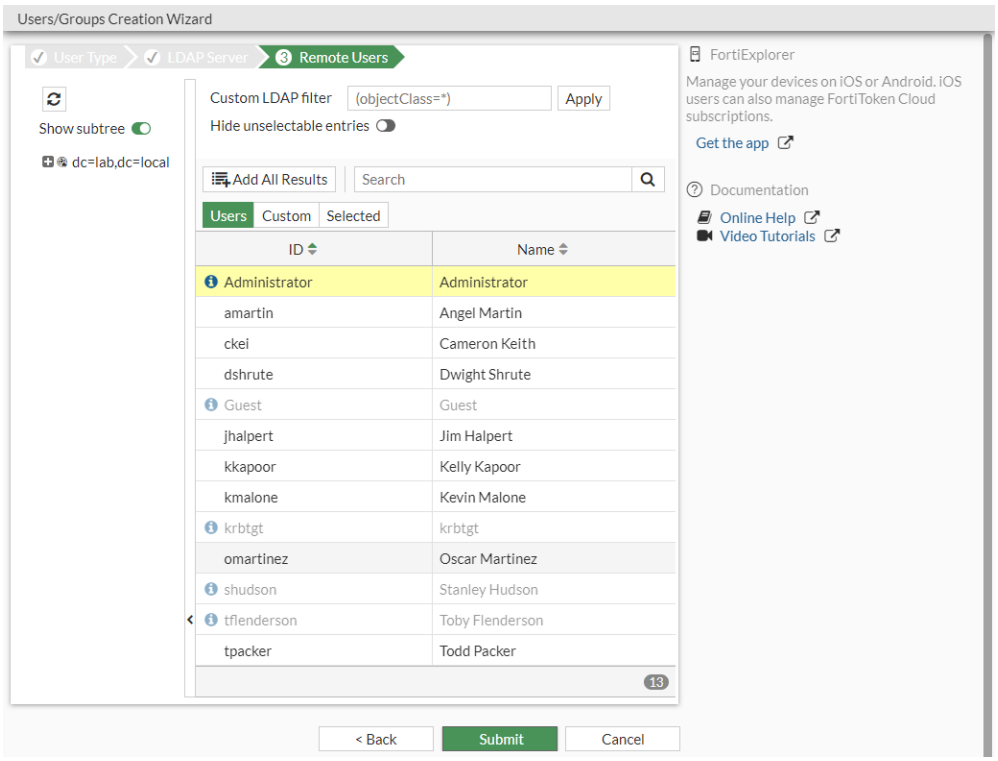
Some user types have an option to enable multi-factor authentication using FortiToken or FortiIdentity Cloud. In some cases, the user must be defined first, and then can be edited to add multi-factor authentication. See FortiTokens on page 3504 for more information.

To create a user:

1. Go to User *Authentication* > *User Definition* and click *Create New*. The *Users/Groups Creation Wizard* appears.
2. Select a *User Type* and click *Next*.
3. The remaining wizard steps depend on the user type:
   - *Local User*:
     i. Enter a *Username* and *Password*, then click *Next*.
     ii. Optionally, enable *Two-factor Authentication* and configure the following:

Authentication Type	Select *FortiToken Cloud* or *FortiToken*.
Token	If using FortiToken to authenticate, select a token.
Email Address	Enter an email address.
SMS	Enable to send an SMS message to activate the token.
Country Dial Code	Select the country code.
Phone Number	Enter a phone number.

     iii. Click *Next*
     iv. Set the *User Account Status* and, optionally, add the user to one or more user groups.
     v. Click *Submit*.
   - *Remote RADIUS User*, *Remote TACACS+ User*, and *SAML User*:
     i. Enter a *Username* and select the server.
     ii. Click *Next*.
     iii. Optionally, enable *Two-factor Authentication* and configure the settings as needed.
     iv. Click *Next*
     v. Set the *User Account Status* and, optionally, add the user to one or more user groups.
     vi. Click *Submit*.
   - *Remote LDAP User*:
     i. Select an *LDAP Server*, then click *Next*.
     ii. Select the users to add from the LDAP server. If the user ID matches an existing configured username, it cannot be added.



iii. Click *Submit*.

- *FSSO*:
  i. Select an *FSSO Agent*, click the *+* to add *AD Groups*, then click *Next*.
  ii. Select an FSSO group to add the *AD Groups* to. If an FSSO group already exists (see Configuring FSSO user groups on page 3365), click *Choose Existing* and select the group. Otherwise, click *Create New*, enter a name, and click *OK*.
  iii. Click *Next*
  iv. Set the *User Account Status* and, optionally, add the user to one or more user groups.
  v. Click *Submit*.

User groups

A user group is a list of user identities. A user identity can be a:

- Local user account (username/password) stored on the FortiGate
- Remote user account (password stored on a RADIUS, LDAP, or TACACS+ server)
- PKI user account with a digital client authentication certificate stored on the FortiGate
- RADIUS, LDAP, or TACACS+ server, optionally specifying particular user groups on that server
- User group defined on an FSSO server

User groups provide the ability to combine users that require the same permissions so they can be referenced at once, which enables consistency in configurations. User groups allow for remote servers to be referenced by leveraging the pre-existing user accounts, instead of redefining them on the FortiGate.

For example, when a new employee joins a department, they can be added to their respective group, whether in the remote authentication server or local group, and be subject to the same access as their colleagues in the same department. In FortiOS, user groups can be used when configuring firewall policies, traffic shaping policies, proxy policies, Agentless VPN portals, IPsec VPN XAUTH, ZTNA, wireless networks (SSIDs), web filtering profiles, identity-based routing, and system administrators with remote authentication.

In most cases, the FortiGate authenticates users by requesting their username and password. The FortiGate checks local user accounts first. If a match is not found, the FortiGate checks the RADIUS, LDAP, or TACACS+ servers that belong to the user group. Authentication succeeds when a matching username and password are found. If the user belongs to multiple groups on a server, those groups will also be matched.

Four types of user groups can be configured:

- Firewall
- FSSO
- RSSO
- Guest

Configuring firewall user groups

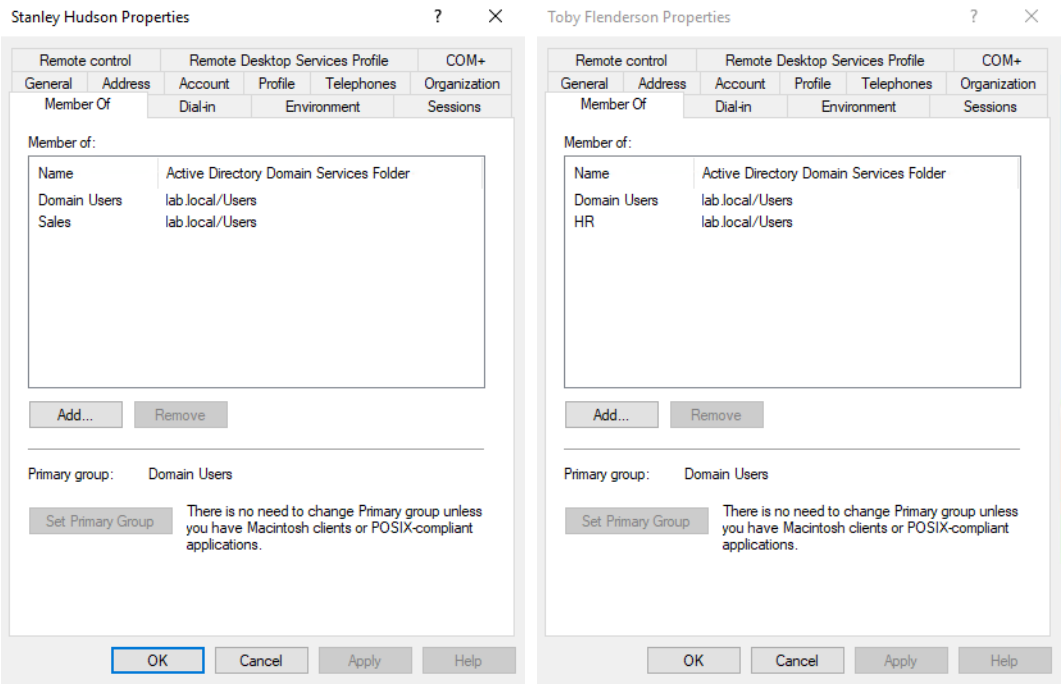
Firewall user groups are used locally as part of authentication. For example, when a firewall policy allows access only to specified user groups, users must authenticate before matching the policy. If the user authenticates successfully and is a member of one of the permitted groups, the policy is applied to the user. A firewall user group may contain local users (defined locally or authenticated remotely), PKI users, or authentication servers.

There are two options to add users in a firewall group configuration: members or remote groups. Members are the individual users who have been defined in FortiOS. Remote groups are remote server that users may authenticate to. One or more user groups can be specified within that server to limit which users can authenticate to the firewall user group. Both options may be used at the same time. The FortiGate attempts to authenticate users in the members list first, and then the remote groups if the initial authentication does not succeed.

When adding remote groups to user groups, FortiTokens cannot be applied to the users. To use remote authentication servers and FortiToken for multi-factor authentication, a remote user type must be created and then added as a user group member.

The following user group configuration examples have local members and a remote authentication server user group. There are two LDAP users, but the principle applies to other remote authentication server types.

Both LDAP users (shudson and tflenderson) belong to the primary group, Domain Users. The user, shudson belongs to the Sales group; tflenderson belongs to the HR group.

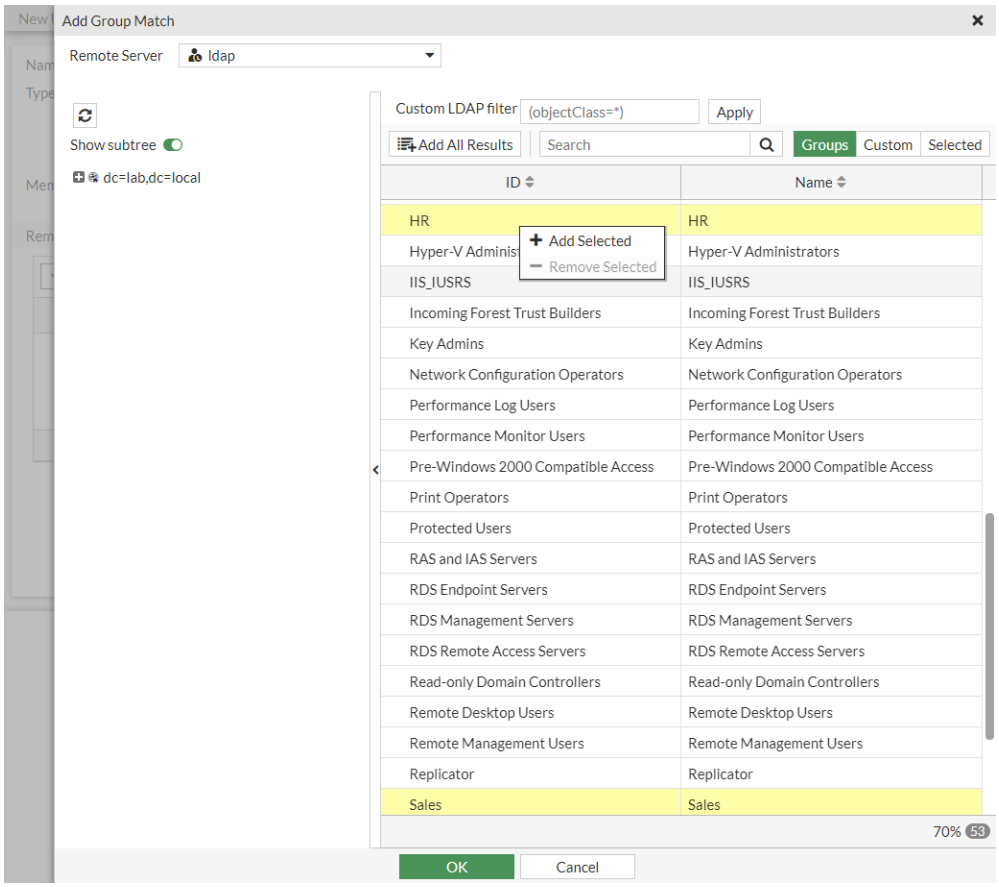


Example 1: Adding multiple remote groups to a user group

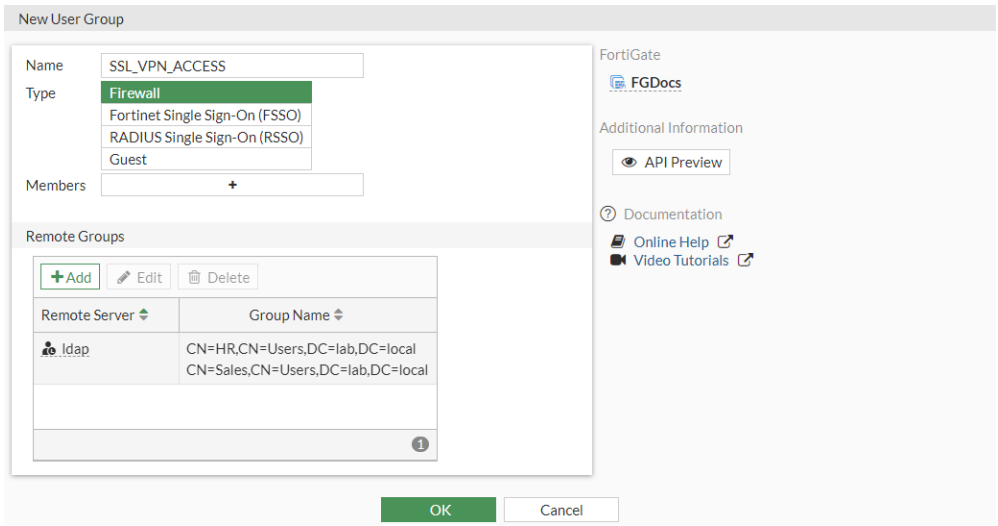
In this example, two remote groups (HR and Sales) are added to a firewall group called SSL_VPN_ACCESS.

To add multiple remote groups to a user group:

1. Go to *User & Authentication* > *User Groups* and click *Create New*. *Firewall* is selected as the default *Type*.
2. Enter the group name, *SSL_VPN_ACCESS*.
3. In the *Remote Groups Section*, click *Add*.
4. Set *Remote Server* to the LDAP server (*ldap*).
5. In the *Groups* table, select *Sales*, then right-click and select *Add Selected*.
6. Select *HR*, then right-click and select *Add Selected*.



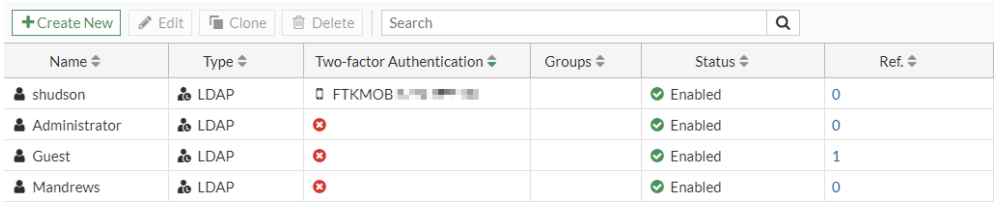
7. Click *OK*.
   Both user group paths are specified under the *Group Name*.



8. Click *OK*.
   In this configuration, shudson and tflenderson would be able to authenticate to this group.

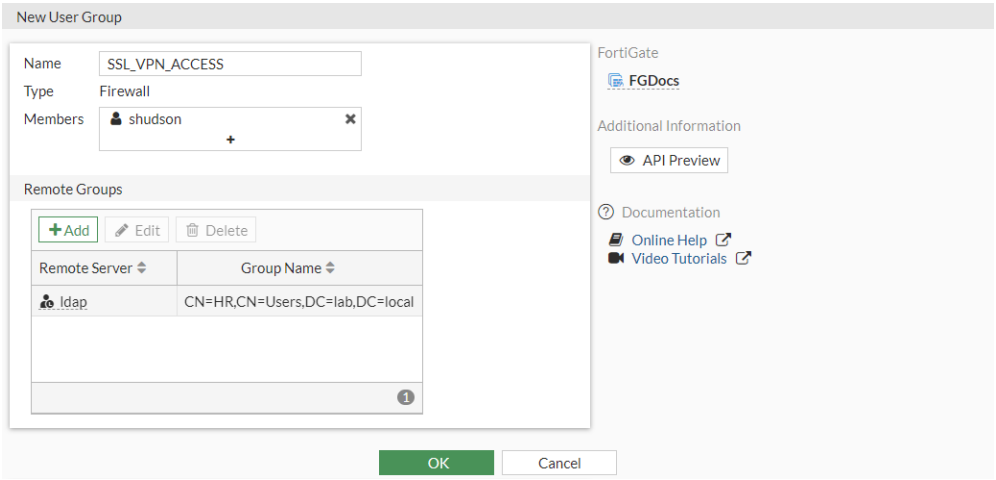
Example 2: combining remote groups and local users in a user group

In this example, the firewall group (SSL_VPN_ACCESS) is configured to contain the HR remote group and a local LDAP user (shudson) with multi-factor authentication.



To combine remote groups and local users in a user group:

1. Go to *User & Authentication* > *User Groups* and click *Create New*. *Firewall* is selected as the default *Type*.
2. Enter the group name, *SSL_VPN_ACCESS*.
3. In the *Remote Groups Section*, click *Add*.
4. Set *Remote Server* to the LDAP server (*ldap*).
5. In the *Groups* table, select *HR*, then right-click and select *Add Selected*.
6. Click *OK*.
7. In the *Members* field, click the *+* and add *shudson*.



8. Click *OK*.

   In this configuration, shudson, tflenderson, and any members of the HR LDAP group would be able to authenticate to the user group. Other users in the Sales group are not allowed.

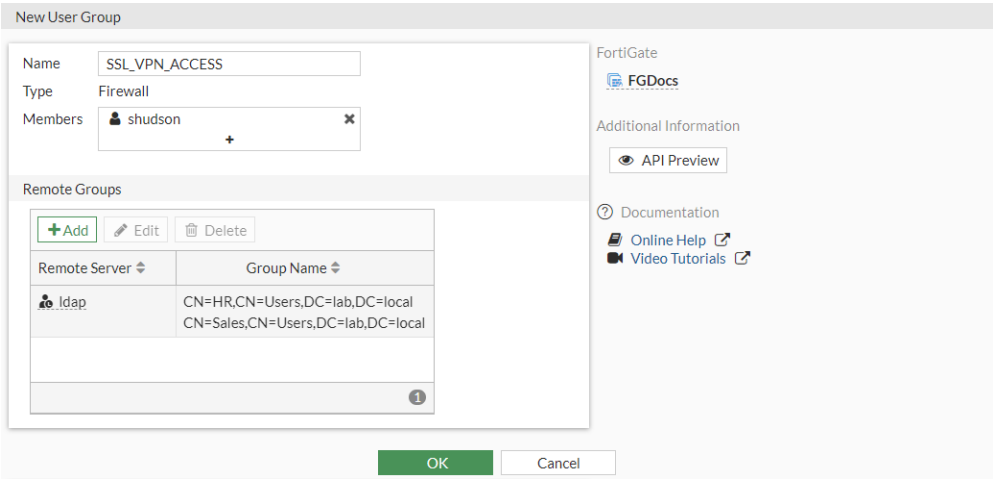
Example 3: adding a user as a member and their group as a remote groups

This example uses a combination of the previous examples. The HR and Sales groups are added as remote groups similar to example 1. The local LDAP user, shudson (using a FortiToken), from example 2 is added as a group member.

> This example is for demonstration only. It may cause unwanted results, so this configuration is not advised.

To add a user as a member and their group as a remote groups:

1. Refer to example 1 to configure the two remote groups.
2. In the *Members* field, click the *+* and add *shudson*.



3. Click *OK*.

One unwanted scenario from this configuration is that a user might be able to bypass multi-factor authentication on LDAP by changing the username case (see the related PSIRT advisory). By default, the username of the remote LDAP user is case sensitive. This means the username has to match what is configured (shudson). If a user types `sHudson`, for example, this will not match the user shudson, so it falls through to remote group authentication. It will match the Sales group in this example. To prevent this, disable username case sensitivity (see Agentless VPN for remote users with MFA and user sensitivity on page 3277 for more details).

To disable case sensitivity on the remote user:

```
config user local
    edit <name>
        set type ldap
        set two-factor fortitoken
        set fortitoken "FTKMOBxxxxxxxxxx"
        set email-to <email_address>
        set username-sensitivity disable
        set ldap-server <server_name>
    next
end
```

There is another unwanted scenario from this configuration than can occur to bypass multi-factor authentication. The LDAP server, ldap, has a user named shudson. Another LDAP server, ldap2, also has a user named shudson, but with a different password. If the ldap and ldap2 servers are added to the user group in addition to the remote shudson user, if a user tries to log in using `shudson` and the password on the ldap2 server, they would be able to bypass multi-factor authentication.

Configuring FSSO user groups

FSSO user groups contain only Windows, Citrix, and Novell network users. Information about these user groups and their member logon activities are provided by the corresponding FSSO connector. See the FSSO on page 3541 section for more information.

Configuring RSSO user groups

RADIUS single sign-on user groups leverage a RADIUS server to authenticate connecting users. This requires users to log in to their computer using their RADIUS account. The FortiGate does not interact with the remote RADIUS server. It only monitors RADIUS accounting records that the server forwards (originating from the RADIUS client). These records include the user IP address and user group. See RADIUS single sign-on agent on page 4547 for more information.

Configuring guest user groups

In some scenarios, an administrator might need to create temporary user accounts with a defined expiry time to access network resources. For example, if there is a large conference and may attendees require temporary network access for a few days. *Guest Management* can be used to combine many guest users into a group. Many guest accounts can be created at once using randomly-generated user IDs and passwords.

A guest group must be configured first. The guest user account user ID can be an email address, a randomly generated string, or an ID that the assigned by the administrator. The password can be assigned by the administrator or randomly generated. The guest group configuration determines the fields that are provided when creating guest user accounts in *Guest Management*.

To create a guest user group:

1. Go to *User & User & Authentication* > *User Groups* and click *Create New*.
2. Enter a name, and set the *Type* to *Guest*.
3. Configure the following:

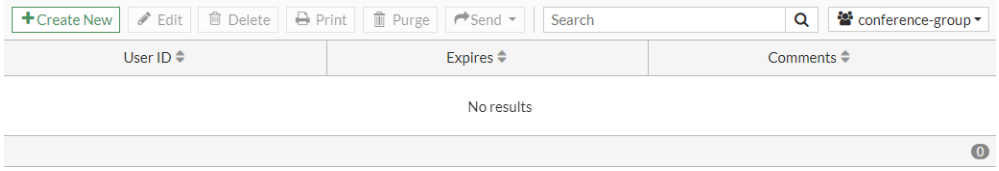
Batch Guest Account Creation	Create multiple accounts automatically. When enabled: • The user ID and password are automatically generated. • The accounts only have user ID, password, and expiration fields. The expiration field is editable in the GUI in the *Start Countdown* and *Time* settings. • An administrator can print the account information. • Users do not receive an email or SMS notification.
User ID	Select one of the following: • *Email*: use the user's email address • *Auto Generate*: FortiOS creates a random user ID • *Specify*: the administrator assigns a user ID

Maximum Accounts	Enable to set a maximum number of guest accounts that can be created for this group (disabled = unlimited).
Guest Details	
Enable Name	If enabled, the user form has a field to enter a name.
Enable Email	If enabled, the user is notified by email.
Enable SMS	If enabled, the user is notified by SMS.
Password	Select one of the following: • *Auto Generate*: FortiOS creates a random password • *Specify*: the administrator assigns a password If the setting is disabled, no password is used.
Sponsor	If enabled, the user form has a field to enter a sponsor (*Optional*). Select *Required* if the sponsor field is mandatory.
Company	If enabled, the user form has a field to enter a company (*Optional*). Select *Required* if the company field is mandatory.
Expiration	
Start Countdown	Select one of the following: • *On Account Creation*: the countdown starts from the time the account is created • *After First Login*: the countdown starts from the time the first time the user logs in
Time	Set the expiry time. There are fields to enter values for *Days*, *Hours*, *Minutes*, and *Seconds*.

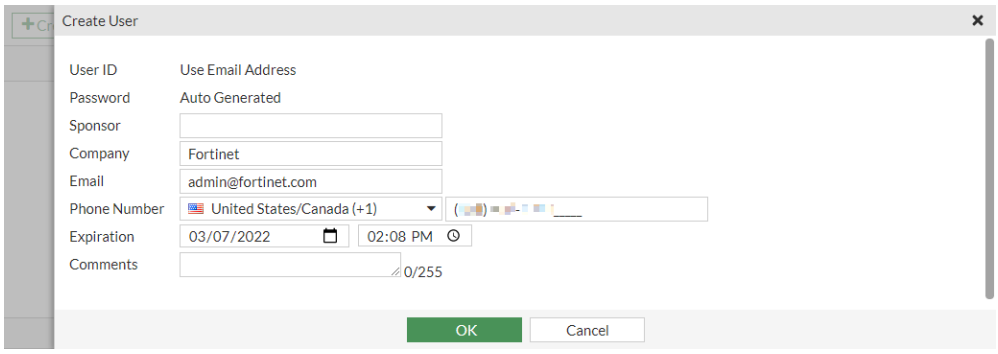
4. Click *OK*.

To manually create a guest user account:

1. Go to *User & User & Authentication* > *Guest Management*.
2. If more than one guest user group is configured, select the group from the dropdown beside the search box.



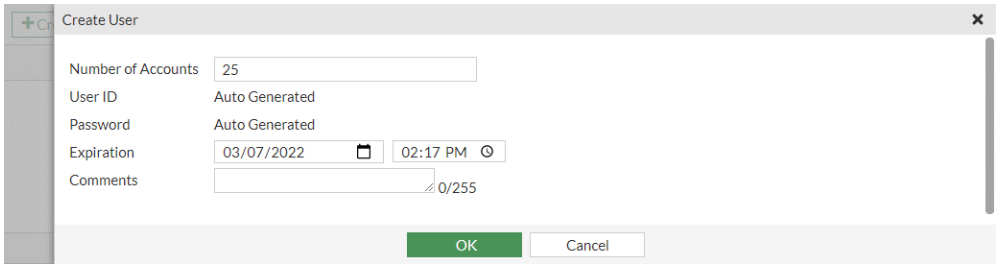
3. Click *Create New* and enter the information in the *Create User* pane. The fields are based on the guest group configuration. Optional fields can be left blank, such as *Sponsor* in this example.



4. Click *OK*.

To automatically create multiple guest user accounts:

1. Go to *User & User & Authentication* > *Guest Management*.
2. If more than one guest user group is configured, select the group from the dropdown beside the search box. The group must have *Batch Guest Account Creation* enabled.
3. Click *Create New* > *Multiple Users* and enter the *Number of Accounts*.
4. Optionally, edit the *Expiration* date and time.



5. Click *OK*.

Authentication settings

General authentication settings include:

- Timeout on page 3368
- Preserve authentication sessions after reboot on page 3369
- Protocols on page 3369
- Certificates on page 3370
- Lockouts on page 3370
- Authentication policy extensions on page 3371

Only some of the settings can be configured in the GUI.

To configure authentication settings in the GUI:

1. Go to *User & Authentication* > *Authentication Settings*.
2. Configure the following settings:

Setting	Description
Authentication Timeout	Enter the desired timeout, in minutes, from 1 to 1440 (24 hours). The default time is 5 minutes. Only idle timeout can be configured in the GUI.
Protocol support	Select the protocols to challenge during firewall user authentication.
HTTP redirect	Redirect HTTP challenge to a secure channel (HTTPS). This option is only available if *HTTP* is selected in the *Protocol Support* options.
Certificate	Select the local certificate to use for authentication.

3. Click *OK*.

Timeout

Authenticated users and user groups can have timeout values per user or group, in addition to FortiGate-wide timeouts. Three types of user timeouts can be configured:

Timeout type	Description
Idle	The idle timer starts when a user initiates a session. As long as data are transferred in this session, the timer continually resets. If the data flow stops, the timer is allowed to advance until it reaches its limit. When the user has been idle for too long, they must re-authenticate before traffic is allowed to continue in that session. This is the default setting. It can be configured in the GUI and CLI.
Hard	The hard timer starts when a user initiates a session. When the timeout is reached, all the sessions for that user must be re-authenticated. This timeout is not affected by any events. This setting can be configured in the CLI.
Session	The session timer starts when a user initiates a session. When the timeout is reached, existing sessions may continue. New sessions are not allowed until the user re-authenticates. This timeout is not affected by any events. This setting can be configured in the CLI.

The authentication timeout time is configured in minutes. The default is five minutes. If VDOMs are enabled, the global level `auth-timeout` user setting is the default that all VDOMs inherit. If the timeout time is set to zero,

To configure timeout for authenticated users:

```
config user setting
    set auth-timeout-type {idle-timeout | hard-timeout | new-session}
    set auth-timeout <integer>
end
```

To configure the authentication timeout for a user group:

```
config user group
    edit <name>
        set authtimeout <integer>
    next
end
```

If the group timeout time is zero (the default) or the user belongs to multiple RADIUS groups, then the user group timeout values are ignored and the global user timeout value is used.

Preserve authentication sessions after reboot

FortiGate models with a log disk can preserve authentication sessions a firewall reboot. This eliminates the need to reauthenticate after rebooting.

When session authentication backup is enabled, authenticated sessions are backed up at the configured interval. By default, session authentication backup is disabled.

```
config system global
    set auth-session-auto-backup {enable | disable}
    set auth-session-auto-backup-interval {1min | 5min | 15min | 30min | 1hr}
end
```

To configure authentication session backup:

1. Enable authentication backup and specify a backup interval.
   In this example, authentication backup runs every minute.

   ```
   config system global
       set auth-session-auto-backup enable
       set auth-session-auto-backup-interval 1min
   end
   ```

Protocols

When you enable user authentication within a security policy, the authentication challenge is normally issued for any of four protocols, depending on the connection protocol:

- HTTP (you can set this to redirect to HTTPS)
- HTTPS
- FTP
- Telnet

The selected protocols control which protocols support the authentication challenge. Users must connect with a supported protocol first so that they can subsequently connect with other protocols. If HTTPS is selected as a protocol support method, it allows the user to authenticate with a customized local certificate.

When you enable user authentication within a security policy, FortiOS challenges the security policy user to authenticate. For user ID and password authentication, the user must provide their username and password. For

certificate authentication (HTTPS, or HTTP redirected to HTTPS only), you can install customized certificates on the unit and the user can also install customized certificates on their browser. Otherwise, users see a warning message and must accept a default Fortinet certificate. The network user's web browser may deem the default certificate invalid.

Enable `auth-secure-http` to redirect HTTP challenges to a secure channel. Enable `auth-ssl-allow-renegotiation` to allow SSL re-negotiation for HTTPS authentication.

Enable `auth-http-basic` to use HTTP basic authentication for identity-based firewall policies. HTTP basic authentication usually causes a browser to display a pop-up authentication window instead of an authentication web page. Some basic web browsers, such as those on older mobile devices, may only support HTTP basic authentication.

FTP and Telnet authentication replacement messages cannot be customized.

To configure the protocols to challenge during firewall user authentication:

```
config user setting
    set auth-type {http https ftp telnet}
    set auth-secure-http {enable | disable}
    set auth-http-basic {enable | disable}
    set auth-ssl-allow-renegotiation  {enable | disable}
end
```

Certificates

Configure the HTTPS certificate and CA certificate to use for policy authentication.

To configure certificates for policy authentication:

```
config user setting
    set auth-cert <certificate>
    set auth-ca-cert <CA certificate>
end
```

Lockouts

Failed log in attempts can indicate malicious attempts to gain access to your network. To prevent this security risk, you can limit the number of failed log in attempts. After the configured maximum number of failed log in attempts is reached (1 - 10, default = 3), access to the account is blocked for the configured lockout duration (0 - 4294967295 seconds, default = 0)

To configure the maximum failed log in attempts and the lockout duration:

```
config user setting
    set auth-lockout-threshold <integer>
    set auth-lockout-duration <integer>
end
```

Authentication policy extensions

By default, unauthenticated traffic is permitted to fall to the next policy. This means that unauthenticated users are only forced to authenticate against a policy when there are no other matching policies. To avoid this, you can force authentication to always take place.

To set that authentication requirement:

```
config user setting
    set auth-on-demand {always | implicitly}
end
```

Where:

`always`	Always trigger firewall authentication on demand.
`implicitly`	Implicitly trigger firewall authentication on demand. This is the default setting (and the behavior in FortiOS 6.0 and earlier).

In the following example, authentication is required; traffic that would otherwise be allowed by the second policy is instead blocked by the first policy.

To use forced authentication:

```
config user setting
    set auth-on-demand always
end
```

```
config firewall policy
    edit 1
        set name "QA to Database"
        set srcintf "port10"
        set dstintf "port9"
        set srcaddr "QA_subnet"
        set dstaddr "Database"
        set action accept
        set schedule "always"
        set service "ALL"
        set fsso disable
        set groups "qa_group"
        set nat enable
    next
    edit 2
        set name "QA to Internet"
        set srcintf "port10"
        set dstintf "port9"
        set srcaddr "QA_subnet"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
```

```
        set fsso disable
        set nat enable
    next
end
```

Retail environment guest access

Businesses such as coffee shops provide free Internet access for customers. In this scenario, you do not need to configure guest management, as customers can access the WiFi access point without logon credentials.

However, consider that the business wants to contact customers with promotional offers to encourage future patronage. You can configure an email collection portal to collect customer email addresses for this purpose. You can configure a firewall policy to grant network access only to users who provide a valid email address. The first time a customer's device attempts WiFi connection, FortiOS requests an email address, which it validates. The customers' subsequent connections go directly to the Internet without interruption.

This configuration consists of the following steps:

1. Creating an email collection portal on page 3372
2. Creating a firewall policy on page 3373
3. Checking for collected emails on page 3373

Creating an email collection portal

The customer's first contact with your network is a captive portal that presents a webpage requesting an email address. When FortiOS has validated the email address, the customer's device MAC address is added to the collected emails device group.

This example modifies the freewifi WiFi interface to present an email collection captive portal.

To configure the freewifi SSID to use an email collection portal in the GUI:

1. Enable email collection:
   a. Go to *System* > *Feature Visibility*.
   b. In the *Additional Features* section, enable *Email Collection*.
   c. Click *Apply*.
2. Edit the freewifi SSID:
   a. Go to *WiFi & Switch Controller* > *SSIDs* and edit the *freewifi* SSID.
   b. In the *Security Mode Settings* section, set the *Security mode* to *Captive Portal*.
   c. Set the *Portal type* to *Email Collection*.
   d. Click *OK*.

To configure the freewifi SSID to use an email collection portal in the CLI:

```
config wireless-controller vap
    edit freewifi
        set security captive-portal
        set portal-type email-collect
```

```
    next
end
```

Creating a firewall policy

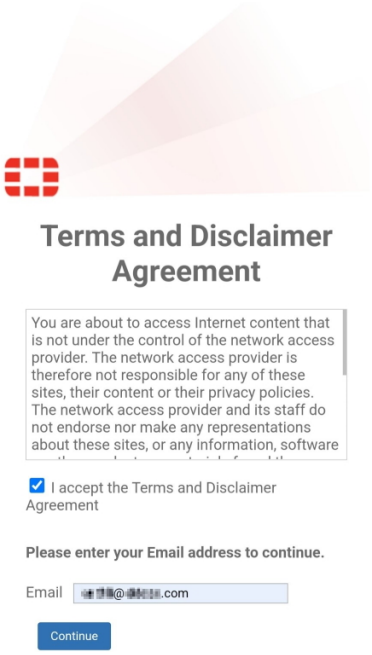
You must configure a firewall policy that allows traffic to flow from the WiFi SSID to the internet interface only for members of the collected emails device group. This policy must be listed first. Unknown devices are not members of the collected emails device group, so they do not match the policy.

To create a firewall policy:

```
config firewall policy
    edit 3
        set srcintf "freewifi"
        set dstintf "wan1"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
        set nat enable
        set email-collect enable
    next
end
```

Checking for collected emails

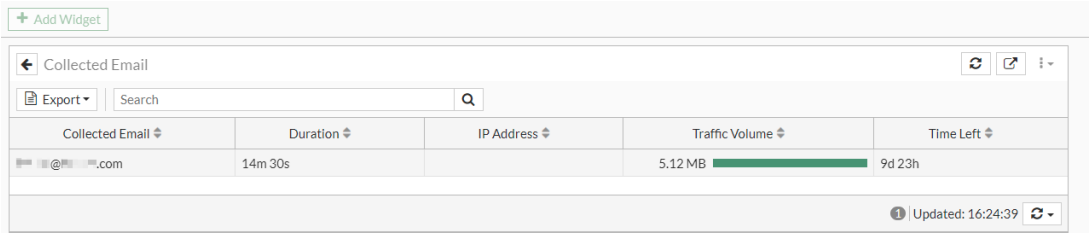
When a WiFi user connects to the freewifi SSID, they are presented with a captive portal to enter their email address.



Once the user enters their email and clicks *Continue*, they will have access to the Internet. The collected emails can be verified in FortiOS.

To check for collected emails in the GUI:

1. Go to *Dashboard* > *Assets & Identities* and click *Add Widget*.
2. In the *User & Authentication* section, select *Collected Email* and click *Add Widget*.
3. Click *Close*.
4. Click the *Collected Email* to expand to full view. The list of emails is displayed.



5. Optionally, click *Export* to export the data as a CSV or JSON file.

To check for collected emails in the CLI:

```
# diagnose firewall auth mac list

72:4d:e1:**:**:**, admin@fortinet.com
        type: email, id: 0, duration: 937, idled: 19
        expire: 863980, allow-idle: 864000
        flag(1000): src_idle
        packets: in 4753 out 4592, bytes: in 2662403 out 2458644

----- 1 listed, 0 filtered ------
```

Customizing complexity options for the local user password policy

The local firewall user password policy can be customized with various settings, such as minimum length, character types, and password reuse. These settings are similar to the ones available for the system administrator password policy, which offer more security and flexibility than the previous local user password policy.

```
config user password-policy
    edit <name>
        set minimum-length <integer>
        set min-lower-case-letter <integer>
        set min-upper-case-letter <integer>
        set min-non-alphanumeric <integer>
        set min-number <integer>
        set min-change-characters <integer>
        set expire-status {enable | disable}
```

```
        set reuse-password {enable | disable}
    next
end
```

Command	Description
`minimum-length <integer>`	Set the minimum password length (8 - 128, default = 8).
`min-lower-case-letter <integer>`	Set the minimum number of lowercase characters in the password (0 - 128, default = 0).
`min-upper-case-letter <integer>`	Set the minimum number of uppercase characters in the password (0 - 128, default = 0).
`min-non-alphanumeric <integer>`	Set the minimum number of non-alphanumeric in the password (0 - 128, default = 0).
`min-number <integer>`	Set the minimum number of numeric characters in the password (0 - 128, default = 0).
`min-change-characters <integer>`	Set the minimum number of unique characters in new password, which do not exist in the old password (0 - 128, default = 0). This attribute overrides `reuse-password` if both are enabled.
`expire-status {enable | disable}`	Enable/disable password expiration (default = disable).
`reuse-password {enable | disable}`	Enable/disable password reuse (default = enable. If both `reuse-password` and `min-change-characters` are enabled, `min-change-characters` overrides it.

After upgrading to 7.4.1 from 7.4.0, users must activate the user password policy using the CLI. The previous password policy settings will remain valid, but they will not be effective unless the password policy password expiration is enabled (`expire-status`). If the password policy password expiration is not enabled, the `expire-days <integer>` option will not force users to change their password after number of specified days.

Example

The following user password policy is configured before upgrading to 7.4.1:

```
config user password-policy
    edit "1"
        set expire-days 1
        set warn-days 1
        set expired-password-renewal enable
    next
end
```

To configure the user password policy options:

1. Check the user password policy settings after the upgrade:

```
config user password-policy
    edit 1
        get
            name                : 1
            expire-days         : 1
            warn-days           : 1
            expired-password-renewal: enable
            minimum-length      : 8
            min-lower-case-letter: 0
            min-upper-case-letter: 0
            min-non-alphanumeric: 0
            min-number          : 0
            min-change-characters: 0
            expire-status       : disable
            reuse-password      : enable
    next
end
```

2. Edit the user password policy settings, including enabling password expiration:

```
config user password-policy
    edit "1"
        set expire-days 1
        set warn-days 1
        set expired-password-renewal enable
        set min-lower-case-letter 1
        set min-upper-case-letter 1
        set min-non-alphanumeric 3
        set min-number 3
        set min-change-characters 2
        set expire-status enable
        set reuse-password disable
    next
end
```

3. Change a password for a local user.
   a. In the CLI when the password meets the criteria:

```
config user local
    edit pwd-test1
        set passwd CCbcset123!!!
    next
end
```

   b. In the CLI when the password does not meet the criteria (only two numbers, so an error message appears):

```
config user local
    edit pwd-test1
```

```
        set passwd CCbXsetp23!!!
New password must conform to the password policy enforced on this user:
Password must:
        Be a minimum length of 8
        Include at least 1 lower case letter(s) (a-z)
        Include at least 1 upper case letter(s) (A-Z)
        Include at least 3 non-alphanumeric character(s)
        Include at least 3 number(s) (0-9)
        Have at least 2 unique character(s) which don't exist in the old password
        Not be same as last two passwords

node_check_object fail! for passwd CCbXsetp23!!!

value parse error before 'CCbXsetp23!!!'
Command fail. Return code -49
```

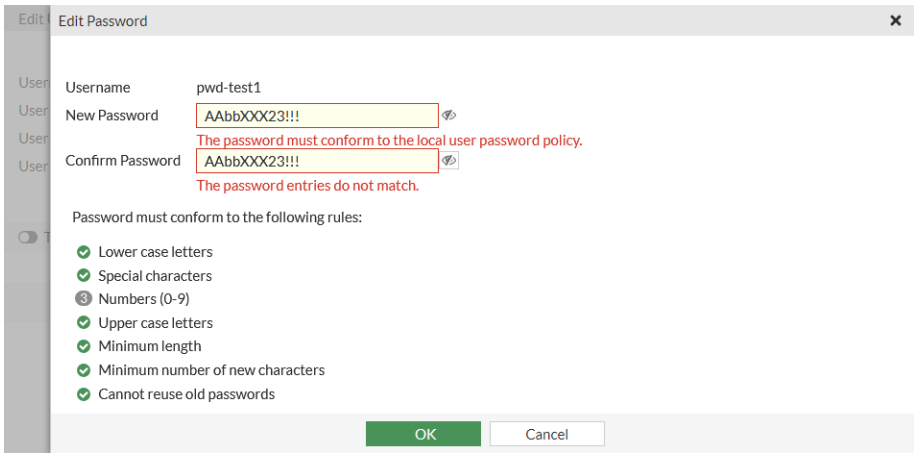
c. In the GUI:

i. Go to *User & Authentication* > *User Definition* and edit a local user.

ii. Click *Change Password*.

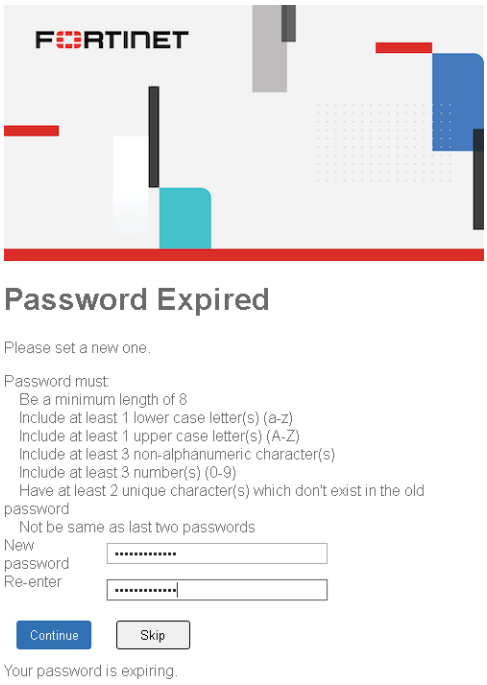
iii. Enter the *New Password*.

iv. Enter the password again (*Confirm Password*). A warning will appear when the password does not match the criteria and indicates which parameters must be fixed. In this example, there are less than three numbers used.

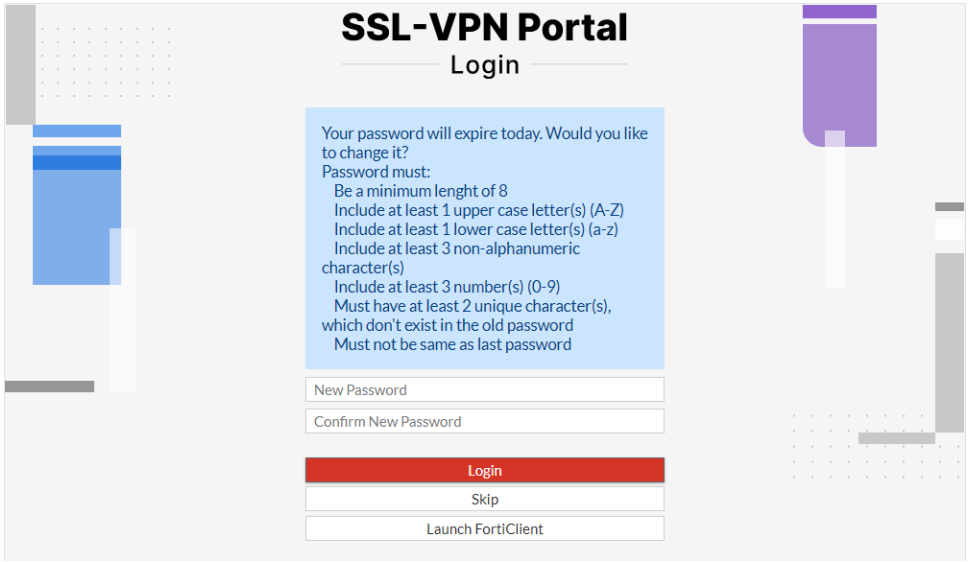


v. Click *OK*.

Sample prompt when a local user needs to update their password for firewall authentication:



Sample prompt when a local user needs to update their password for SSL VPN portal access:



Basic authentication with cached client certificates

With basic authentication, client certificates can be cached and used as authentication cookies, eliminating the need for repeated user authentication.

In this example, a CA signs a client certificate. The client certificate is installed on two endpoints, and the root CA certificate is imported to FortiGate.

During the authentication process, the client certificate from the endpoint is verified against the CA certificate. Once this verification is successful, the user is prompted to enter login credentials for user authentication. Once authenticated, the client certificate is stored as an authentication cookie so that subsequent access does not require any user authentication as long as the client certificate remains present on the endpoint.

To configure client certificates as authentication cookies:

1. Prepare the certificate:
   a. Use a CA to sign the client certificate.
   b. Import the root CA certificate that signed the client certificate to FortiGate.
   c. Install the client certificate on all endpoints.
2. In FortiOS, configure an authentication scheme to apply authentication against the local user database.

```
config authentication scheme
    edit "test"
        set method basic
        set user-database "local-user-db"
    next
end
```

3. Configure an authentication rule to enable the client certificate to be cached.

```
config authentication rule
    edit "test"
        set srcaddr "all"
        set ip-based disable
        set active-auth-method "test"
        set cert-auth-cookie enable
    next
end
```

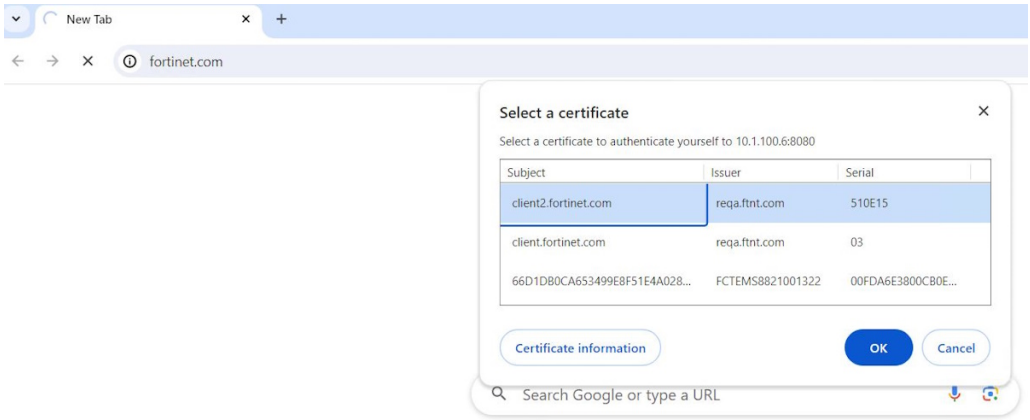
4. Configure verification of the client certificate with the root CA.

```
config authentication setting
    set user-cert-ca "root_ca"
end
```

When the user accesses a resource, such as a web site, for the first time:

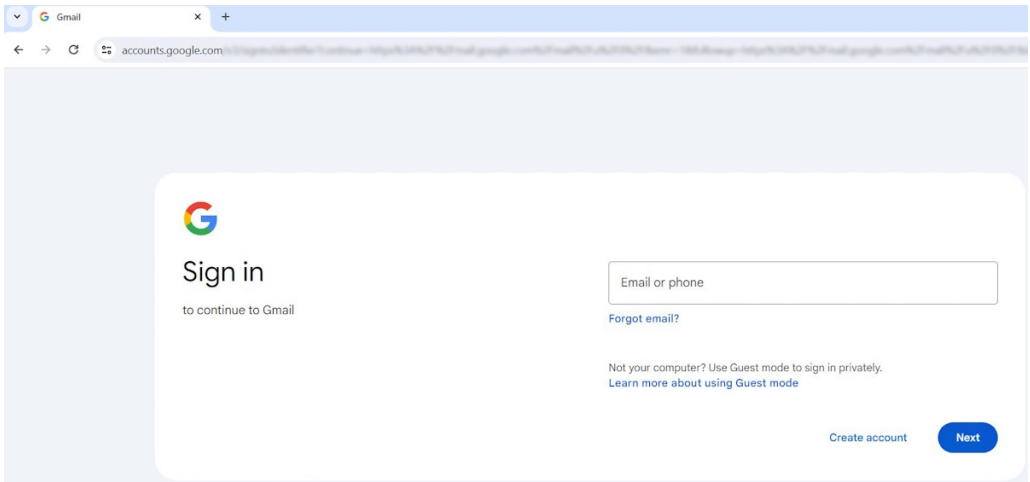
1. The browser prompts the user for a client certificate. The user selects the certificate (client2.fortinet.com), and clicks *OK*. Then the endpoint device (IP address 10.1.100.59) presents the client certificate to FortiGate

for verification.



2. Once the certificate verification passes, an authentication dialog box is displayed.

3. The user enters their username and password to authenticate with FortiGate and successfully access the web site.



FortiGate also logs the first access in the traffic log:

```
9: date=2024-04-24 time=12:28:51 eventtime=1713918531092354265 tz="+1200" logid="0005000024"
type="traffic" subtype="ztna" level="notice" vd="vdom1" srcip=10.1.100.59 srcport=63615
srcintf="port2" srcintfrole="undefined" dstcountry="United States" srccountry="Reserved"
dstip=142.251.33.69 dstport=443 dstintf="port3" dstintfrole="undefined" sessionid=51442
service="web" proxyapptype="http" proto=6 action="accept" policyid=10 policytype="proxy-
```

```
policy" poluuid="e272fe7e-00d2-51ef-5fe0-09d157495e71" duration=73 user="localuser"
group="localgroup" authserver="localuser" gatewayid=1 realserverid=1 vip="ztna"
accessproxy="ztna" clientdevicemanageable="manageable" clientcert="yes" wanin=5734
rcvdbyte=5734 wanout=1505 lanin=3226 sentbyte=3226 lanout=42588 appcat="unscanned"
```

When the user accesses the resource from the same endpoint device for the second and subsequent times, FortiGate uses the cached authentication cookie to grant access, as long as the client certificate remains present on the endpoint.

When the user has multiple endpoint devices with the same certificate installed, the certificate will match the cached authentication cookie on the FortiGate, and the user can access resources without additional authentication.

This log shows a user accessing a website from a different PC (IP address 10.1.100.78) without needing to provide user credentials.

```
2: date=2024-04-24 time=12:30:42 eventtime=1713918642320943415 tz="+1200" logid="0005000024"

appcat="unscanned"
```

LDAP servers

The following topics provide information about LDAP servers:

- Configuring an LDAP server on page 3381
- Enabling Active Directory recursive search on page 3385
- Configuring LDAP dial-in using a member attribute on page 3386
- Configuring wildcard admin accounts on page 3387
- Configuring least privileges for LDAP admin account authentication in Active Directory on page 3389
- Tracking users in each Active Directory LDAP group on page 3390
- Tracking rolling historical records of LDAP user logins on page 3393
- Configuring client certificate authentication on the LDAP server on page 3396

Configuring an LDAP server

FortiOS can be configured to use an LDAP server for authentication.

When configuring an LDAP connection to an Active Directory server, an administrator must provide Active Directory user credentials.

- To secure this connection, use LDAPS on both the Active Directory server and FortiGate. See relevant LDAPS information in this topic and Configuring client certificate authentication on the LDAP server on page 3396.
- Apply the principle of least privilege. For the LDAP regular bind operation, do not use credentials that provide full administrative access to the Windows server when using credentials. See Configuring least privileges for LDAP admin account authentication in Active Directory on page 3389.

To configure an LDAP server on the FortiGate:

1. Go to *User & Authentication* > *LDAP Servers*.
2. Click *Create New*.
3. Configure the following:

Name	This connection name is for reference within the FortiGate only.
Server IP/Name	LDAP server IP address or FQDN resolvable by the FortiGate.
Server Port	By default, LDAP uses port 389 and LDAPS uses 636. Use this field to specify a custom port if necessary.
Common Name Identifier	Attribute field of the object in LDAP that the FortiGate uses to identify the connecting user. The identifier is case sensitive. Common attributes are: • *cn* (Common Name) • *sAMAccountName* (SAMAccountName) • *uid* (User ID)
Distinguished Name	Used to look up user account entries on the LDAP server. It reflects the hierarchy of LDAP database object classes above the CN identifier in which you are doing the lookup. Enter *dc=COMPANY,dc=com* to specify the root of the domain to include all objects. Enter *ou=VPN-Users,dc=COMPANY,dc=com* to look up users under a specific organization unit.
Exchange server	Enable to specify the exchange server connector to collect information about authenticated users from a corporate exchange server. See Exchange Server connector on page 4550 for more details.
Bind Type	Select one of the following options: • *Simple*: bind using simple password authentication using the client name. The LDAP server only looks up against the distinguished name (DN), but does not search on the subtree. • *Anonymous*: bind using an anonymous user, and search starting from the DN and recurse over the subtrees. Many LDAP servers do not allow this.

	• *Regular*: bind using the username and password provided, and search starting from the DN and recurse over the subtrees.
Username	If using regular bind, enter a username with sufficient privileges to access the LDAP server. The following formats are supported: • *username\administrator* • *administrator@domain* • *cn=administrator,cn=users,dc=domain,dc=com*
Password	If using regular bind, enter the password associated with the username.
Protocol	Select *STARTTLS* (default) or *LDAPS*. Selecting *STARTTLS* sets the port to 389 and selecting *LDAPS* sets the port to 636. Secure connection can be disabled in the CLI.
Certificate	Enable and select the root CA certificate so that the FortiGate will only accept a certificate from the LDAP server that is signed by this CA. The root CA certificate should be in the Remote CA Certificate store on the FortiGate. If this setting is not enabled (meaning that no certificate is chosen), the server certificate validation will not be performed. If the wrong certificate is chosen, which is not the issuing CA for the server certificate, then the LDAP connection will fail.
Server identity check	This check verifies the server domain or IP address against the server certificate. This option is enabled by default when *Certificate* is chosen and it is recommended to leave it enabled for a secure configuration.

When specifying a secure connection, there are some considerations for the certificate used by LDAP to secure the connection. The FortiGate checks the certificate presented by the LDAP server for the IP address or FQDN as specified in the *Server IP/Name* field with the following logic:

- If there is a Subject Alternative Name (SAN), it will ignore any Common Name (CN) value and look for a match in any of the SAN fields.
- If there is no SAN, it will check the CN for a match.

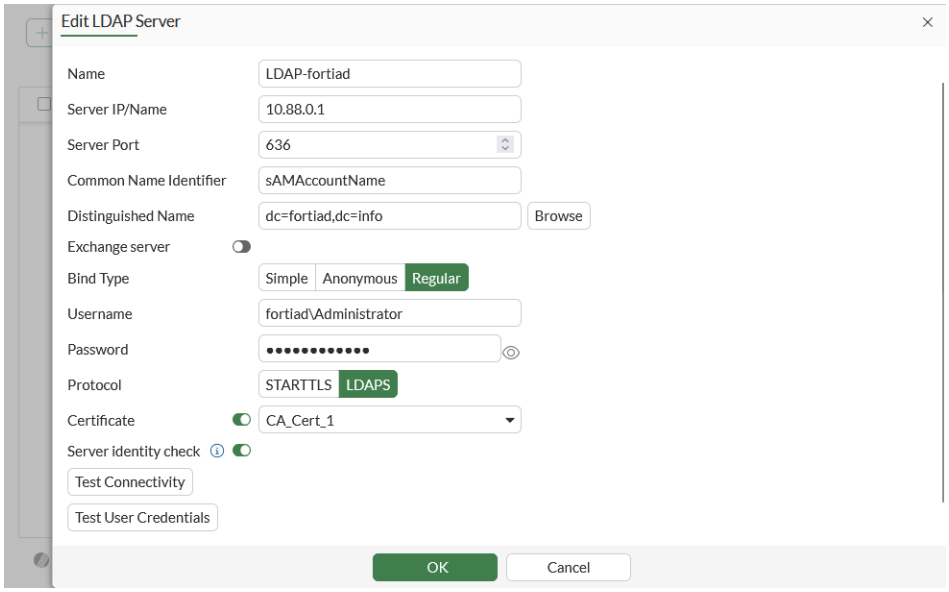
4. Optionally, click *Test User Credentials* to ensure that the account has sufficient access rights.
5. Click *OK*.
   The FortiGate checks the connection and updates the *Connection Status*.

To configure a secure connection to the LDAP server in the GUI:

1. Go to *User & Authentication > LDAP Servers*.
2. Click *Create New*.
3. Configure the following:

Name	LDAP-fortiad
Server IP/Name	10.88.0.1

Server Port	636
Common Name Identifier	sAMAccountName
Distinguished Name	dc=fortiad,dc=info
Exchange server	Disabled
Bind Type	Regular Enter the *Username* and *Password* for LDAP binding and lookup.
Protocol	LDAPS
Certificate	Enable and select the CA certificate to validate the server certificate.
Server identity check	Enable to verify the domain name or IP address against the server certificate.



4. Click *Test Connectivity* to verify the connection to the server.
5. Click *OK*.

To configure a secure connection to the LDAP server in the CLI:

```
config user ldap
    edit "LDAP-fortiad"
        set server "10.88.0.1"
        set cnid "sAMAccountName"
        set dn "dc=fortiad,dc=info"
        set type regular
        set username "fortiad\\Administrator"
        set password <password>
        set secure ldaps
        set ca-cert "CA_Cert_1"
        set port 636
```

```
    next
end
```

To account for dynamic IP address changes, such as those governed by SD-WAN rules, interface names can be used to define the source IP addresses in RADIUS, LDAP, and DNS configurations using the `source-ip-interface` command. See Implement the interface name as the source IP address in RADIUS, LDAP, and DNS configurations on page 360.

Enabling Active Directory recursive search

By default, nested groups (groups that are members or other groups) are not searched in Windows Active Directory (AD) LDAP servers because this can slow down the group membership search. There is an option in FortiOS to enable the searching of nested groups for user group memberships on AD LDAP servers.

This option is not available for other LDAP servers, such as OpenLDAP-based servers.

The default behavior does not include nested groups:

```
config user ldap
    edit "ldap-ad"
        set server "10.1.100.131"
        set cnid "cn"
        set dn "dc=fortinet-fsso,dc=com"
        set type regular
        set username "cn=Administrator,cn=users,dc=fortinet-fsso,dc=com"
        set password XXXXXXXXXXXXXXXXXXXXXXXX
    next
end
```

The default search results only show groups that have the user as member, and no groups that have groups as members:

```
diagnose test authserver ldap ldap-ad nuser nuser
    authenticate 'nuser' against 'ldap-ad' succeeded!
    Group membership(s) - CN=nested3,OU=Testing,DC=Fortinet-FSSO,DC=COM
                          CN=Domain Users,CN=Users,DC=Fortinet-FSSO,DC=COM
```

To enable recursive search to include nested groups in the results:

```
config user ldap
    edit "ldap-ad"
        set server "10.1.100.131"
        set cnid "cn"
        set dn "dc=fortinet-fsso,dc=com"
        set type regular
        set username "cn=Administrator,cn=users,dc=fortinet-fsso,dc=com"
        set password XXXXXXXXXXXXXXXXXXXXXXXX
```

```
        set search-type recursive
    next
end
```

The search results now include groups that have other groups as members:

```
diagnose test authserver ldap ldap-ad nuser nuser
    authenticate 'nuser' against 'ldap-ad' succeeded!
    Group membership(s) - CN=nested3,OU=Testing,DC=Fortinet-FSSO,DC=COM
                          CN=Domain Users,CN=Users,DC=Fortinet-FSSO,DC=COM
                          CN=nested2,OU=Testing,DC=Fortinet-FSSO,DC=COM
                          CN=nested1,OU=Testing,DC=Fortinet-FSSO,DC=COM
```

The group nested3 is a member of the group nested2, which is a member of the group nested1.

Configuring LDAP dial-in using a member attribute

In this configuration, users defined in Microsoft AD can set up a VPN connection based on an attribute that is set to `TRUE`, instead of their user group. You can activate the *Allow Dialin* property in AD user properties, which sets the `msNPAllowDialin` attribute to *TRUE*. You can use this procedure for other member attributes as your system requires.

This configuration consists of the following steps:

1. Ensure that the AD server has the `msNPAllowDialin` attribute set to *TRUE* for the desired users.
2. Configure user LDAP member attribute settings.
3. Configure LDAP group settings.
4. Ensure that you configured the settings correctly.

To configure user LDAP member attribute settings:

```
config user ldap
    edit "ldap_server"
        set server "192.168.201.3"
        set cnid "sAMAccountName"
        set dn "DC=fortilabanz,DC=com,DC=au"
        set type regular
        set username "fortigate@sample.com"
        set password ******
        set member-attr "msNPAllowDialin"
    next
end
```

To configure LDAP group settings:

```
config user group
    edit "ldap_grp"
        set member "ldap_server"
        config match
```

```
            edit 1
                set server-name "ldap_server"
                set group-name "TRUE"
            next
        end
    next
end
```

To ensure that you configured the settings correctly:

Users that are members of the `ldap_grp` user group should be able to authenticate. The following shows sample `diagnose debug` output when the `Allow Dial-in` attribute is set to `TRUE`:

```
get_member_of_groups-Get the memberOf groups.
get_member_of_groups- attr='msNPAllowDialin', found 1 values
get_member_of_groups-val[0]='TRUE'
fnbamd_ldap_get_result-Auth accepted
fnbamd_ldap_get_result-Going to DONE state res=0
fnbamd_auth_poll_ldap-Result for ldap svr 192.168.201.3 is SUCCESS
fnbamd_auth_poll_ldap-Passed group matching
```

If the attribute is not set to `TRUE` but is expected, you may see the following output:

```
get_member_of_groups-Get the memberOf groups.
get_member_of_groups- attr='msNPAllowDialin', found 1 values
get_member_of_groups-val[0]='FALSE'
fnbamd_ldap_get_result-Auth accepted
fnbamd_ldap_get_result-Going to DONE state res=0
fnbamd_auth_poll_ldap-Result for ldap svr 192.168.201.3 is SUCCESS
fnbamd_auth_poll_ldap-Failed group matching
```

The difference between the two outputs is the last line, which shows passed or failed depending on whether the member attribute is set to the expected value.

Configuring wildcard admin accounts

To avoid setting up individual admin accounts in FortiOS, you can configure an admin account with the wildcard option enabled, allowing multiple remote admin accounts to match one local admin account. This way, multiple LDAP admin accounts can use one FortiOS admin account.

You can create one global wildcard system admin account or one wildcard system admin account for each VDOM but not both.

Benefits include:

- Fast configuration of the FortiOS admin account to work with your LDAP network, saving effort and avoiding potential errors incurred when setting up multiple admin accounts
- Reduced ongoing maintenance. As long as LDAP users belong to the same group and you do not modify the wildcard admin account in FortiOS, you do not need to configure changes on the LDAP accounts. If you add

or remove a user from the LDAP group, you do not need to perform changes in FortiOS.

Potential issues include:

- Multiple users may be logged in to the same account simultaneously. This may cause issues if both users make changes simultaneously.
- Security is reduced since multiple users have login access to the same account, as opposed to an account for each user.

Wildcard admin configuration also applies to RADIUS. If configuring for RADIUS, configure the RADIUS server and RADIUS user group instead of LDAP. When using the GUI, wildcard admin is the only remote admin account that does not require you to enter a password on account creation. That password is normally used when the remote authentication server is unavailable during authentication.

This example uses default values where possible. If a specific value is not mentioned, the example sets it to its default value.

When configuring an LDAP connection to an Active Directory server, an administrator must provide Active Directory user credentials. To secure this connection, use LDAPS on both the Active Directory server and FortiGate. See Configuring an LDAP server on page 3381 and Configuring client certificate authentication on the LDAP server on page 3396.

To secure RADIUS connections, consider using RADSEC over TLS. See Configuring a RADSEC client on page 3438.

You can configure an admin account in Active Directory for LDAP authentication to allow an admin to perform lookups and reset passwords without being a member of the Account Operators or Domain Administrators built-in groups. See Configuring least privileges for LDAP admin account authentication in Active Directory on page 3389.

To configure the LDAP server:

The important parts of this configuration are the username and group lines. The username is the domain administrator account. The group binding allows only the GRP group access.

This example uses an example domain name. Configure as appropriate for your own network.

```
config user ldap
    edit "ldap_server"
        set server "192.168.201.3"
        set cnid "sAMAccountName"
        set dn "DC=example,DC=com,DC=au"
        set type regular
        set username "CN=Administrator,CN=Users,DC=example,DC=COM”
        set password *
        set group-member-check group-object
        set group-object-filter (&amp;
(objectcategory=group)member="CN=GRP,OU=training,DC=example,DC=COM"))
    next
end
```

To configure the user group and add the LDAP server:

```
config user group
    edit "ldap_grp"
        set member "ldap_server"
            config match
                edit 1
                    set server-name "ldap_server"
                    set group-name "CN=GRP,OU=training,DC=example,DC=COM"
                next
            end
        end
    end
end
```

To configure the wildcard admin account:

```
config system admin
    edit "test"
        set remote-auth enable
        set accprofile "super_admin"
        set wildcard enable
        set remote-group "ldap_grp"
    next
end
```

Configuring least privileges for LDAP admin account authentication in Active Directory

An administrator should only have sufficient privileges for their role. In the case of LDAP admin bind, you can configure an admin account in Active Directory for LDAP authentication to allow an admin to perform lookups and reset passwords without being a member of the Account Operators or Domain Administrators built-in groups.

For information about Active Directory, see the product documentation.

To configure account privileges for LDAP authentication in Active Directory:

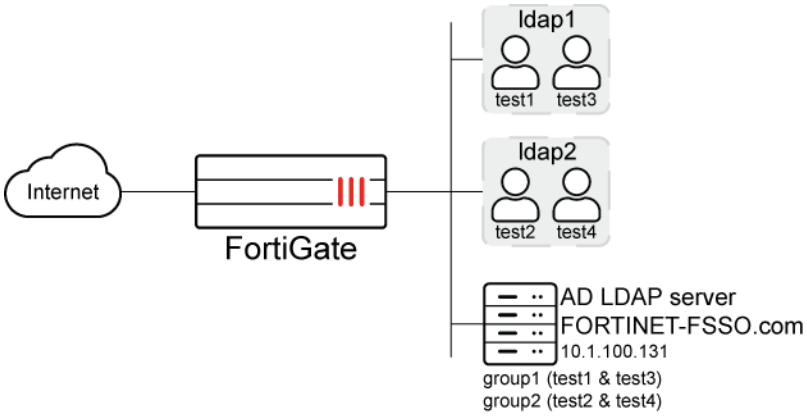
1. In the *Active Directory Users and Computers* administrative console, right-click the Organizational Unit (OU) or the top-level domain you want to configure and select *Delegate Control*.
2. In the *Delegation of Control Wizard* dialog, click *Next*.
3. In the *Users or Groups* dialog, click *Add...* and search Active Directory for the users or groups.
4. Click *OK* and then click *Next*.
5. In the *Tasks to Delegate* dialog, select *Create a custom task to delegate* and click *Next*.
6. Select *Only the following objects in the folder* and scroll to the bottom of the list. Select *User objects* and click *Next*.
7. In the *Permissions* dialog, select *General*.

8. From the *Permissions* list, select the following:
   - *Change password*
   - *Reset password*
9. Clear the *General* checkbox and select *Property-specific*.
10. From the *Permissions* list, select the following:
    - *Write lockoutTime*
    - *Read lockoutTime*
    - *Write pwdLastSet*
    - *Read pwdLastSet*
    - *Write UserAccountControl*
    - *Read UserAccountControl*
11. Click *Next* then click *Finish*.

Tracking users in each Active Directory LDAP group

When LDAP users log on through firewall authentication, the active users per Active Directory LDAP group is counted and displayed in the *Firewall Users* widget and the CLI.

Example



The Active Directory LDAP server, FORTINET-FSSO.com, is configured with two groups that contain two users each: group1 consists of users test1 and test3; group2 consists of users test2 and test4.

To configure AD LDAP user groups in the GUI:

1. Configure the Active Directory LDAP server, FORTINET-FSSO:
   a. Go to *User & Authentication* > *LDAP Servers* and click *Create New*.
   b. Enter the following:

Name	*FORTINET-FSSO*

Server IP/Name	*10.1.100.131*
Distinguished Name	*dc=FORTINET-FSSO,dc=com*
Bind Type	*Regular*
Username	*cn=administrator,cn=users,dc=FORTINET-FSSO,dc=com*
Password	Enter the password.

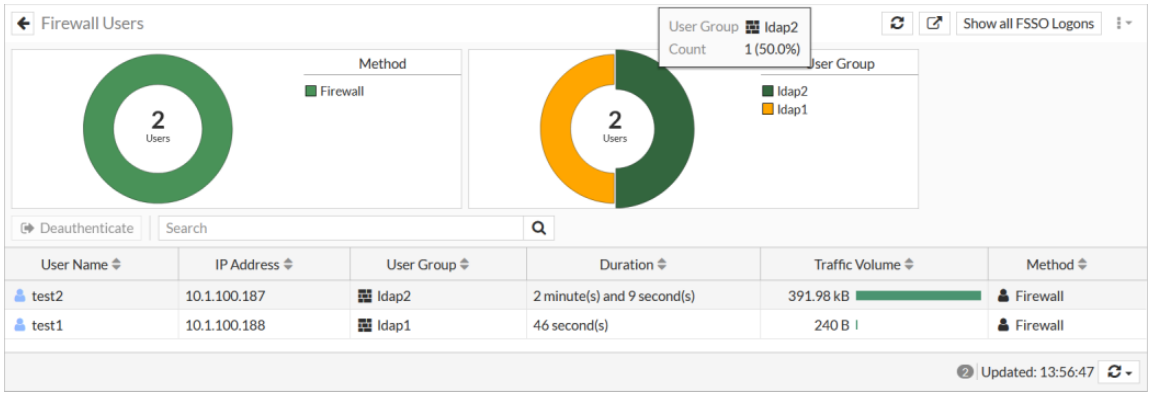
c. Click *OK*.

2. Configure the LDAP user groups:
   a. Go to *User & Authentication* > *User Groups* and click *Create New*.
   b. Enter the name, *ldap1*.
   c. In the *Remote Groups* table, click *Add*. The *Add Group Match* pane opens.
   d. For *Remote Server*, select *FORTINET-FSSO*.
   e. In the search box, enter *group1*, and select the result in the table.
   f. Click *OK*.

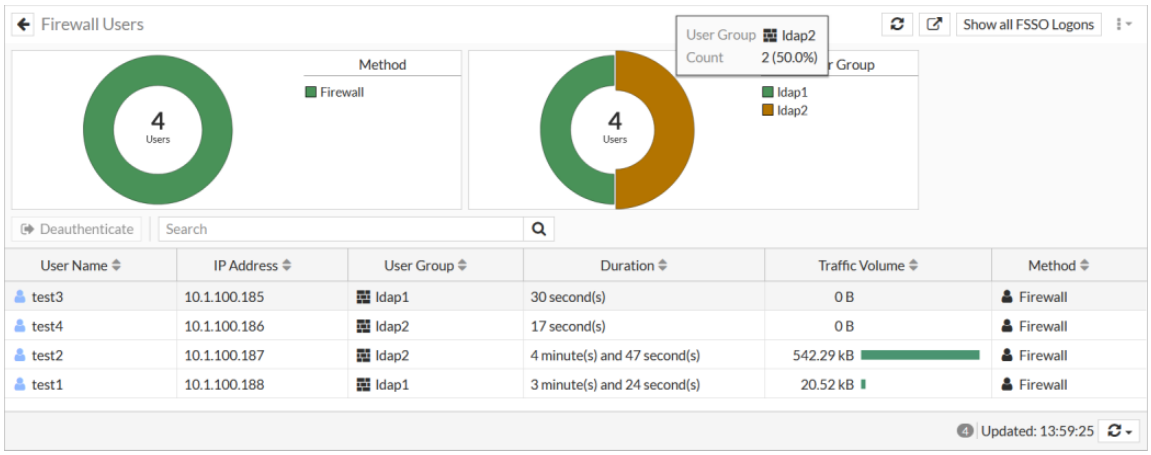
   g. Repeat these steps to configure *ldap2* with the FORTINET-FSSO *group2*.
   h. Click *OK*.
3. Configure a firewall policy with both LDAP groups:
   a. Go to *Policy & Objects* > *Firewall Policy* and click *Create New*.
   b. For *Source*, select *ldap1* and *ldap2*.
   c. Configure the other settings as needed.
   d. Click *OK*.
4. Get users test1 and test2 to log in.
5. In FortiOS, go to *Dashboard* > *Assets & Identities* and click the *Firewall Users* widget to expand to full screen view.

   Hover over a group in the *User Group* donut chart to view how many users are logged on from that group, and the number of users as a percentage of all logged on users. The chart shows that two users are logged

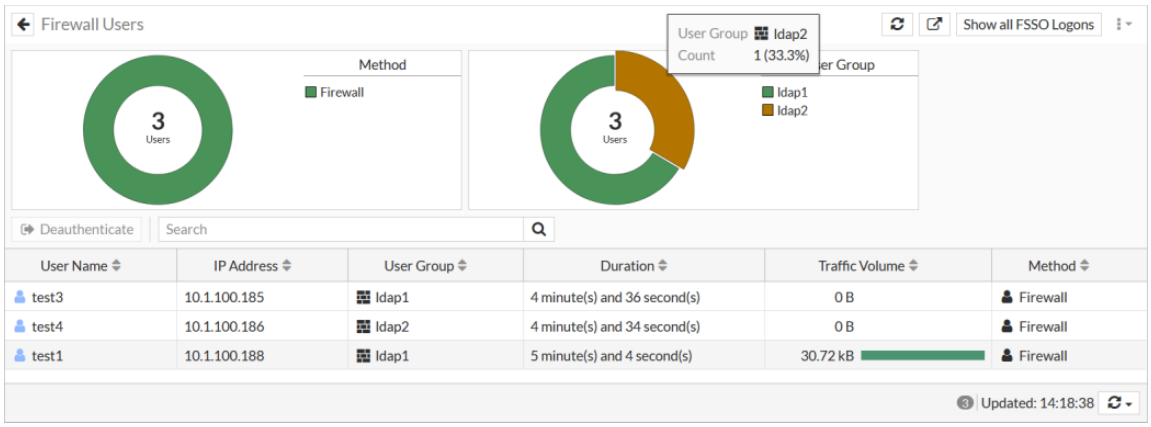
in.



6. Get users test3 and test4 to log in, and refresh the *Firewall Users* widget. Each LDAP group has two users logged in, with a total of four active users.



7. Get user test2 to log out, and refresh the *Firewall Users* widget. There is a total of three active users, and the ldap2 group only has one user that is logged in.



To verify the user group count in the CLI:

```
# diagnose user-device-store user-count list <integer>
# diagnose user-device-store user-count query <FQDN of AD group>
```

Tracking rolling historical records of LDAP user logins

Authenticated LDAP users can be tracked by logging the users' group memberships, logon timestamps, and logout timestamps into local files on a log disk over a rolling four-week period. The historical records can be queried from the CLI. This feature is only enabled on FortiGate models with a log disk.

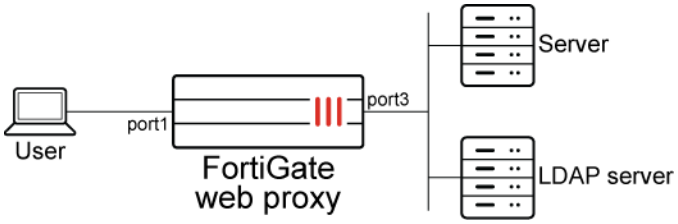
To view active user logged information:

```
# diagnose user-device-store user-stats query <yyyy-mm-dd> <range_in_days>
```

Example

In this example, the FortiGate is configured with an explicit web proxy and an LDAP server. When an LDAP user is authenticated by an IP-based authentication method in WAD, the WAD user is considered to be in an active logon status. This WAD user is listed in the `diagnose wad user list` output. If the user is removed from WAD as an authenticated, such as when the IP-based authentication expires, then the user is considered to become inactive (logout status). The user is no longer listed in the `diagnose wad user list` output.

The WAD user's group membership information and their logon and logout timestamps are written into local files on the FortiGate's disk. There is one log file for each day, and the FortiGate can maintain up to 28 log files over a rolling period of 28 days (four weeks). This means after 28 days with 28 files stored, on the 29th day, the first file will be removed and a new file will be created for the 29th day.



This feature works on other configurations such as firewall authentication, transparent web proxy, ZTNA, and Agentless VPN where an LDAP server is used.

To configure the FortiGate:

1. Enable the explicit web proxy on port1:

```
config system interface
    edit "port1"
        set explicit-web-proxy enable
        set explicit-ftp-proxy enable
        set snmp-index 3
    next
end
```

2. Configure the LDAP server:

```
config user ldap
    edit "ldap-test"
        set server "172.16.200.98"
        set cnid "cn"
        set dn "dc=fortinetqa,dc=local"
        set type regular
        set username "CN=root,CN=Users,DC=fortinetqa,DC=local"
        set password **********
    next
end
```

3. Configure the authentication scheme:

```
config authentication scheme
    edit "basic-ldap"
        set method basic
        set user-database "ldap-test"
    next
end
```

4. Configure the authentication rule:

```
config authentication rule
    edit "basic-ldap"
        set srcaddr "all"
        set active-auth-method "basic-ldap"
        set web-portal disable
    next
end
```

5. Configure the user group:

```
config user group
    edit "ldap-group"
        set member "ldap" "ldap-test"
    next
end
```

6. Configure the proxy policy:

```
config firewall proxy-policy
    edit 1
        set proxy explicit-web
        set dstintf "port3"
        set srcaddr "all"
        set dstaddr "all"
        set service "web"
        set action accept
        set schedule "always"
        set groups "ldap-group"
        set utm-status enable
        set ssl-ssh-profile "deep-custom"
```

```
        set av-profile "av"
    next
end
```

When users pass through the explicit proxy and log in and out through LDAP, their login and logout records will be logged to the disk.

In this example, there are two LDAP users, test1 and test3, with the following activity:

1. test3 logs on at 22:30:22 on February 23, 2022, then logs out at 22:31:09 on the same day.
2. test1 logs on at 23:55:02 on February 23, 2022, then logs out at 00:05:02 on February 24, 2022.
3. test3 logs on at 16:29:44 on February 24, 2022, then logs out at 16:39:44 on the same day.

The logon and logout timestamp information, and the group membership information for users test1 and test3 will be logged into two local files on the log disk.

To view the active user logged information for two days back from February 24, 2022:

```
# diagnose user-device-store user-stats query 2022-02-24 2

Record #0:
        'username' = 'test3'
        'groupname' = 'CN=Domain Admins,CN=Users,DC=FORTINETQA,DC=local'
        'groupname' = 'CN=FSSO,OU=QA,DC=FORTINETQA,DC=local'
        'logon' = '2022-02-23 22:30:22'
        'logout' = '2022-02-23 22:31:09'

Record #1:
        'username' = 'test1'
        'groupname' = 'CN=Domain Admins,CN=Users,DC=FORTINETQA,DC=local'
        'groupname' = 'CN=FSSO,OU=QA,DC=FORTINETQA,DC=local'
        'groupname' = 'CN=mytest-grp,OU=QA,DC=FORTINETQA,DC=local'
        'logon' = '2022-02-23 23:55:02'

Record #2:
        'username' = 'test1'
        'groupname' = 'CN=Domain Admins,CN=Users,DC=FORTINETQA,DC=local'
        'groupname' = 'CN=FSSO,OU=QA,DC=FORTINETQA,DC=local'
        'groupname' = 'CN=mytest-grp,OU=QA,DC=FORTINETQA,DC=local'
        'logon' = '2022-02-23 23:55:02'
        'logout' = '2022-02-24 00:05:02'

Record #3:
        'username' = 'test3'
        'groupname' = 'CN=Domain Admins,CN=Users,DC=FORTINETQA,DC=local'
        'groupname' = 'CN=FSSO,OU=QA,DC=FORTINETQA,DC=local'
        'logon' = '2022-02-24 16:29:44'
        'logout' = '2022-02-24 16:39:44'

Returned 4 records.
```

There is one record (`logon`) for test1 on `2022-02-23` because they remained active after midnight (until 00:05:02). There is another record for `2022-02-24` with logon and logout timestamps for test1.

Configuring client certificate authentication on the LDAP server

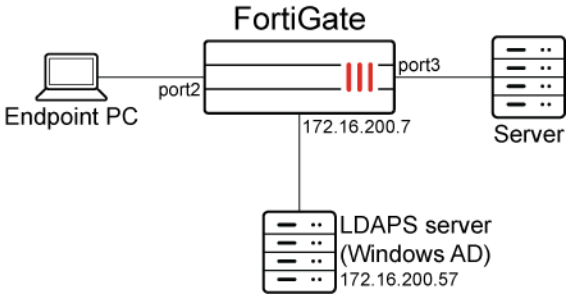
Administrators can configure a FortiGate client certificate in the LDAP server configuration when the FortiGate connects to an LDAPS server that requires client certificate authentication.

```
config user ldap
    edit <ldap_server>
        set client-cert-auth {enable | disable}
        set client-cert <source>
    next
end
```

Example

In this example, the FortiGate is configured as an explicit web proxy. It connects to the Windows AD server through LDAPS, where the Windows server requires a client certificate to connect. The client certificate is configured in the CLI.

The endpoint PC connecting to the web server will first need to authenticate to the explicit web proxy before accessing the server.



While this example demonstrates an LDAP client certificate for an explicit proxy configuration, LDAP client certificates can be used in firewall authentication, transparent proxy, ZTNA, and where ever LDAP configurations are used on the FortiGate.

To configure a client certificate on the LDAP server:

1. Enable the explicit web proxy on port2:

```
config system interface
    edit "port2"
        set explicit-web-proxy enable
    next
end
```

2. Upload the client certificate to the FortiGate:

```
config vpn certificate local
    edit "Zach"
        set password **********
        set private-key <private key>
        set certificate <certificate>
    next
end
```

3. Configure the LDAP server settings:

```
config user ldap
    edit "ldaps"
        set server "172.16.200.57"
        set server-identity-check disable
        set cnid "CN"
        set dn "CN=Users,DC=ftnt,DC=com"
        set secure ldaps
        set port 636
        set client-cert-auth enable
        set client-cert "Zach"
    next
end
```

To ensure the proper operation of LDAPS authentication, make sure that the CA that signed the server certificate for the LDAPS server, typically a private CA, is trusted by the FortiGate by uploading the private CA certificate. This is especially important for an existing configuration where this was not previously done to ensure proper operation after upgrades. See CA certificate on page 3835.

4. Configure the authentication scheme:

```
config authentication scheme
    edit "1"
        set method basic
        set user-database "ldaps"
    next
end
```

5. Configure the authentication rule:

```
config authentication rule
    edit "1"
        set srcintf "port2"
        set srcaddr "all"
        set dstaddr "all"
        set active-auth-method "1"
    next
end
```

6. Configure the user group:

```
config user group
    edit "test"
        set member "ldaps"
    next
end
```

7. Configure the proxy policy with the user group:

```
config firewall proxy-policy
    edit 1
        set proxy explicit-web
        set dstintf "port3"
        set srcaddr "all"
        set dstaddr "all"
        set service "webproxy"
        set action accept
        set schedule "always"
        set srcaddr6 "all"
        set dstaddr6 "all"
        set groups "test"
        set utm-status enable

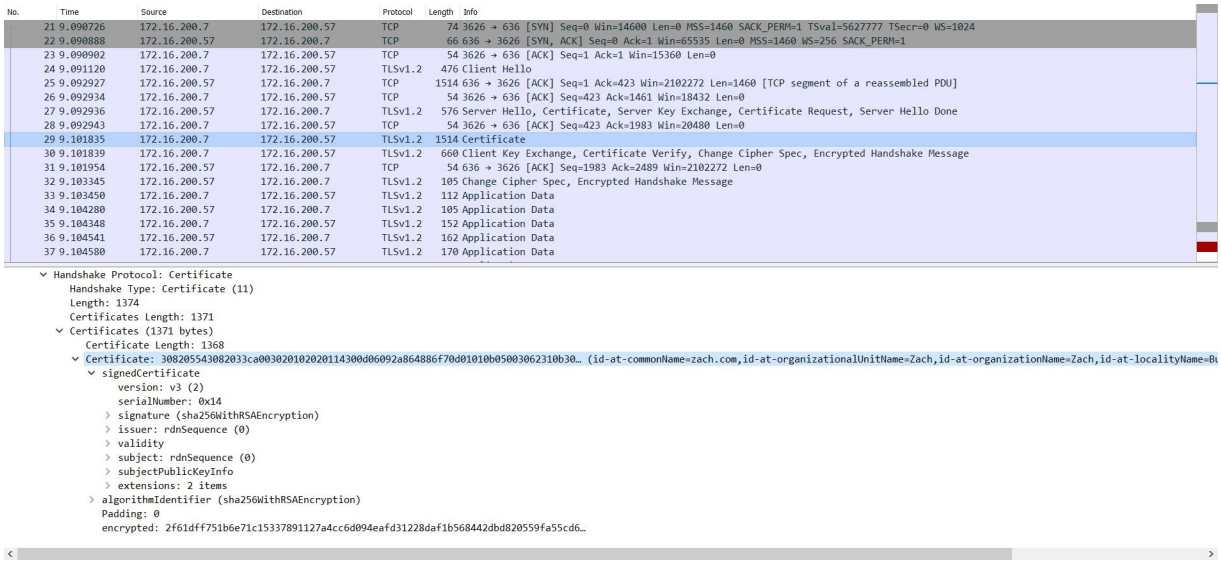
        set av-profile "av"
    next
end
```

Testing and verification

When traffic from the endpoint PC matches a policy and triggers authentication, the FortiGate starts the LDAPS TLS connection handshake with the Windows AD. The LDAPS server requests a client certificate to identify the FortiGate as a client. The FortiGate provides a configured client certificate, issued to zach.com, to the LDAPS server.

The following communication between the FortiGate and the LDAPS server shows the client certificate is sent by the FortiGate:



RADIUS servers

Remote Authentication and Dial-In User Service (RADIUS) is a broadly supported client-server protocol that provides centralized authentication, authorization, and accounting functions. RADIUS clients are built into gateways that allow access to networks such a VPN server, network access server (NAS), and a network switch or firewall that uses authentication.

RADIUS servers use UDP packets to communicate with the RADIUS clients on the network to authenticate users before allowing them access to the network, authorize access to resources by appropriate users, and account or bill for those resources that are used. RADIUS servers are currently defined by RFC 2865 (RADIUS) and RFC 2866 (RADIUS Accounting), and listen on either UDP ports 1812 (authentication) and 1813 (accounting), or ports 1645 (authentication) and 1646 (accounting) requests. RADIUS servers exist for all major operating systems.

The RADIUS server must be configured to accept the FortiGate as a client so it can use the authentication and accounting functions of the RADIUS server.

> ⚠ To secure RADIUS connections, consider using RADSEC over TLS. See Configuring a RADSEC client on page 3438.

RADIUS authentication with a FortiGate requires the following:

- Configuring one or more RADIUS server profiles on the FortiGate.
- Assigning the RADIUS server profile to a user or user group.
- Applying the user or user group to a firewall policy.

RADIUS authentication can be applied to many FortiGate functions, such as firewall authentication, SSL and IPsec VPNs, administrator profiles, ZTNA, explicit proxy, wireless, 802.1X, and more.

The RADIUS server uses a shared secret key with MD5 hashing to encrypt information passed between RADIUS servers and clients. Typically, only user credentials are encrypted. Additional security can be configured through IPsec tunnels by placing the RADIUS server behind another VPN gateway.

The following topics provide more information about RADIUS servers:

- Configuring a RADIUS server on page 3400
- Using multiple RADIUS servers on page 3403
- RADIUS AVPs and VSAs on page 3406
- RADIUS VSAs for captive portal redirects on page 3408

Configuring a RADIUS server

A RADIUS server can be configured in the GUI by going to *User & Authentication* > *RADIUS Servers*, or in the CLI under `config user radius`.

Basic configuration

The following table summarizes the common RADIUS settings that can be configured in the GUI and CLI.

GUI field	CLI setting	Description
Name	`edit <name>`	Define the RADIUS server object within FortiOS.
Authentication method	`set auth-type {auto | ms_chap_v2 | ms_chap | chap | pap}`	Specify the authentication method, or select *Default*/`auto` to negotiate PAP, MSCHAP_v2, and CHAP in that order.
NAS IP	`set nas-ip <IPv4_address>`	Optional setting, also known as Calling-Station-Id. Specify the IP address the FortiGate uses to communicate with the RADIUS server. If left unconfigured, the FortiGate will use the IP address of the interface that communicates with the RADIUS server.
Include in every user group	`set all-usergroup {enable | disable}`	Optional setting to add the RADIUS server to each user group. This allows each user group to try and authenticate users against the RADIUS server if local authentication fails.
Primary Server		
IP/Name	`set server <string>`	Enter the IP address or resolvable FQDN of the RADIUS server.
Secret	`set secret <password>`	Enter the password used to connect to the RADIUS server.

There is an option in the GUI to configure a second server, and a third server can be configured in the CLI (see Using multiple RADIUS servers on page 3403).

Advanced settings

Advanced settings for RADIUS servers can be configured in the CLI. The following are some commonly used settings.

To edit the port used to connect with the RADIUS server:

```
config system global
    set radius-port <integer>
end
```

To edit the default setting for password encoding and username case sensitivity:

```
config user radius
    edit <name>
        set password-encoding {auto | ISO-8859-1}
        set username-case-sensitive {enable | disable}
    next
end
```

Command	Description
`password-encoding {auto | ISO-8859-1}`	Set the password encoding to use the original encoding or ISO-8859-1 (default = auto). The `auth-type` must be `auto` or `pap` to change this setting.
`username-case-sensitive {enable | disable}`	Enable/disable case sensitive usernames (default = disable).

To configure different transport protocols:

```
config user radius
    edit <name>
        set transport-protocol {udp | tcp | tls}
    next
end
```

Command	Description
`transport-protocol {udp | tcp | tls}`	Set the type of transport protocol to use: • `udp`: use UDP (default) • `tcp`: use TCP, but no TLS security • `tls`: use TLS over TCP

To configure a RADSEC client with TLS:

```
config user radius
    edit <name>
        set transport-protocol tls
        set ca-cert <string>
        set client-cert <string>
        set tls-min-proto-version {default | SSLv3 | TLSv1 | TLSv1-1 | TLSv1-2}
        set server-identity-check {enable | disable}
    next
end
```

Command	Description
`ca-cert <string>`	Set the CA certificate of server to trust under TLS.
`client-cert <string>`	Set the client certificate to use under TLS.
`tls-min-proto-version {default | SSLv3 | TLSv1 | TLSv1-1 | TLSv1-2}`	Set the minimum supported protocol version for TLS connections: • `default`: follow the system global setting • `SSLv3`: use SSLv3 • `TLSv1`: use TLSv1 • `TLSv1-1`: use TLSv1.1 • `TLSv1-2`: use TLSv1.2
`server-identity-check {enable | disable}`	Enable/disable RADIUS server identity check, which verifies the server domain name/IP address against the server certificate (default = enable).

For RADSEC over TLS example configuration, see Configuring a RADSEC client on page 3438.

It is best practice to enable RadSec over TLS whenever the FortiGate and RADIUS connection must pass through unencrypted transport. When using TCP and UDP transport modes, it is recommended to ensure the FortiGate and RADIUS connection passes through a trusted network or the connection passes through an encrypted tunnel over untrusted networks.

To account for dynamic IP address changes, such as those governed by SD-WAN rules, interface names can be used to define the source IP addresses in RADIUS, LDAP, and DNS configurations using the `source-ip-interface` command. See Implement the interface name as the source IP address in RADIUS, LDAP, and DNS configurations on page 360.

RADIUS Connection

When using TCP or UDP as transport, it is possible for the RADIUS protocol to be compromised by the vulnerability described in CVE-2024-3596. In order to protect against this RADIUS vulnerability, as a RADIUS client, FortiGate will:

1. Force the validation of message authenticator.
2. Reject RADIUS response with unrecognized `proxy-state` attribute.

Message authenticator checking is made mandatory under UDP/TCP. It is not mandatory when using TLS.

Therefore, if FortiGate is using UDP/TCP mode without RADSEC, the RADIUS server should be patched to ensure the message authenticator attribute is used in its RADIUS messages. Check with your RADIUS server vendor for information about support for the message authenticator attribute.

In the case that the RADIUS server cannot be immediately patched, you may optionally disable message authenticator checking from the CLI under your RADIUS server configurations:

```
config user radius
    edit <server>
        set require-message-authenticator disable
```

```
    next
end
```

The `require-message-authenticator` setting is enable by default.

> ⚠ It is best practice to enable RadSec over TLS whenever the FortiGate and RADIUS connection must pass through unencrypted transport. When using TCP and UDP transport modes, it is recommended to ensure the FortiGate and RADIUS connection passes through a trusted network or the connection passes through an encrypted tunnel over untrusted networks.

Using multiple RADIUS servers

There are several ways to implement multiple RADIUS servers, and each has a different effect on user authentication. The three main options available are:

- Add a second (or third) RADIUS server in the same profile.
- Add a second RADIUS server profile, and add both to the same user group.
- Use two RADIUS server profiles for two user groups (one for each).

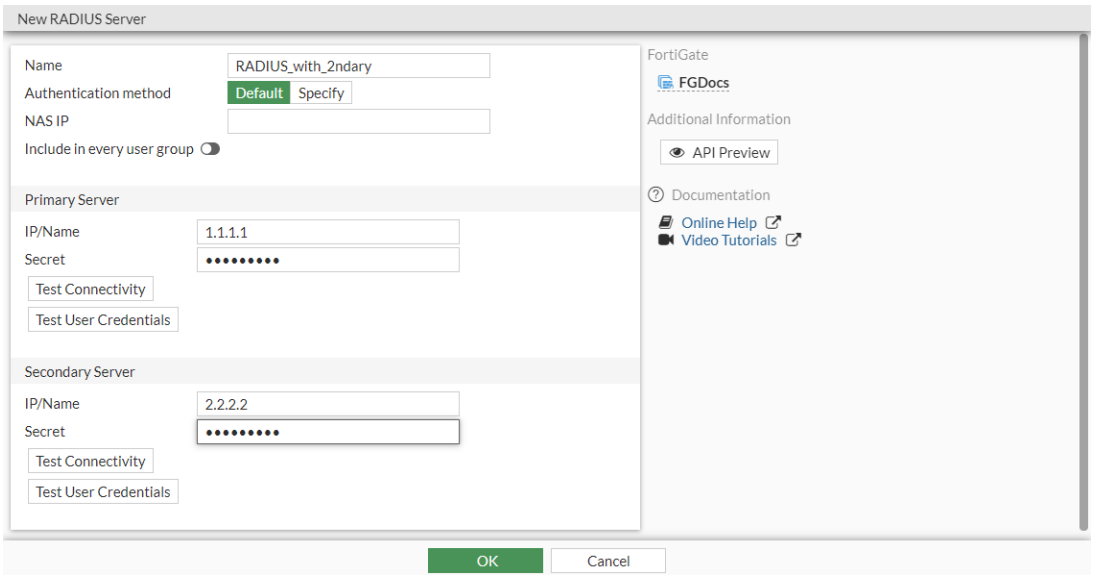
Adding a second server in a RADIUS profile

A second RADIUS server can be configured in the same RADIUS profile so in the event the first RADIUS server does not respond, the second server can be checked. If the first RADIUS server responds with an Access-Reject, no further servers are queried.

To add a second server in a RADIUS profile:

1. Go to *User & Authentication* > *RADIUS Servers* and click *Create New*.
2. Enter the following:

Name	*RADIUS_with_2ndary*
Authentication method	*Default*
Primary Server	
IP/Name	*1.1.1.1*
Secret	Enter the password used to connect to the RADIUS server.
Secondary Server	
IP/Name	*2.2.2.2*
Secret	Enter the password used to connect to the RADIUS server.



3. Click *OK*.

Adding two RADIUS server profiles in the same user group

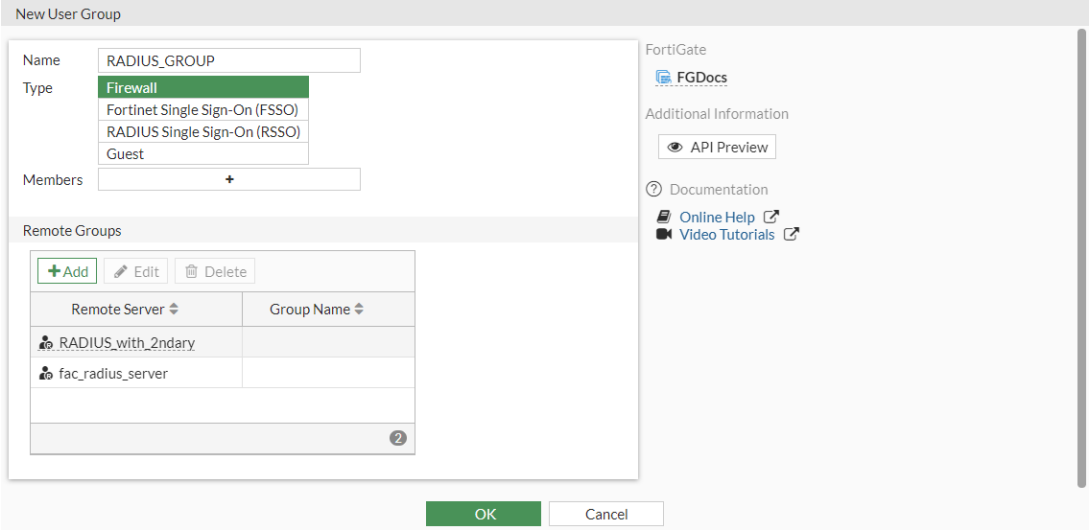
When two separate RADIUS profiles are added to a user group, the FortiGate sends an Access-Request simultaneously to both RADIUS servers, and authentication succeeds if either server sends back an Access-Accept. This example includes the settings from the previous example where one or more of the RADIUS server profiles has a secondary server configured.In this case, the secondary server in the *RADIUS_with_2ndary* profile, 2.2.2.2, is only checked if the primary server of this profile times out and the *fac_radius_server* profile does not return an Access-Accept.

To add two RADIUS server profiles in the same user group:

1. Go to *User & Authentication* > *RADIUS Servers*, click *Create New*, and configure the RADIUS servers as needed (refer to the previous example).
2. Go to *User & Authentication* > *User Groups* and click *Create New*.
3. Enter the following:

Name	*RADIUS_GROUP*
Type	*Firewall*

4. In the *Remote Groups* table, click *Add*.
5. Select *RADIUS_with_2ndary* and click *OK*.
6. Click *Add*, select *fac_radius_server*, then click *OK*.



7. Click *OK*.

Using separate RADIUS server profiles for separate user groups

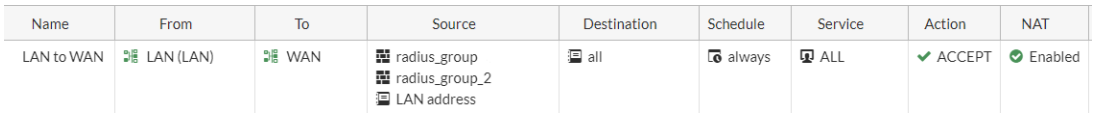
In this example, the FortiGate first evaluates if the user belongs to the first listed group (*radius_group*) in the policy. If the user fails to authenticate to this group, then the FortiGate checks if the user can successfully authenticate to the second user group (*radius_group_2*). Refer to the first and second examples for detailed instructions.

To use separate RADIUS server profiles for separate user groups:

1. Configure the RADIUS server profiles:
   a. Go to *User & Authentication* > *RADIUS Servers* and click *Create New*.
   b. Configure two RADIUS servers, *fac_radius_server* and *RADIUS_with_2ndary*, as needed (refer to the previous example).
2. Configure the firewall groups:
   a. Go to *User & Authentication* > *User Groups* and click *Create New*.
   b. Configure two firewall groups, one named *radius_group* with remote server member *fac_radius_server*, and one named *radius_group_2* with remote server member *RADIUS_with_2ndary* (refer to the previous example).

Group Name	Group Type	Members	Ref.
radius_group	Firewall	fac_radius_server	1
radius_group_2	Firewall	RADIUS_with_2ndary	1

3. Configure the firewall policy:
   a. Go to *Policy & Objects* > *Firewall Policy* and click *Create New*.
   b. For *Source*, click *User* then select *radius_group* and *radius_group_2*. Click *Address* and select *LAN address*.
   c. Configure the other settings as needed.
   d. Click *OK*.



Name	From	To	Source	Destination	Schedule	Service	Action	NAT
LAN to WAN	LAN (LAN)	WAN	radius_group radius_group_2 LAN address	all	always	ALL	ACCEPT	Enabled

RADIUS AVPs and VSAs

This topic describes RADIUS Attribute Value Pairs (AVPs) and Vendor-Specific Attributes (VSAs).

AVPs

RADIUS packets include a set of AVPs to identify information about the user, their location, and other information. The IETF defined a set of 255 standard attributes, which are well known and come in the form of Type, Length, Value (for more details, refer to RFC 2865). Of the standard 255, the FortiGate sends the following RADIUS attributes:

RADIUS attribute number	Name	Description
1	User-Name	Name of the user being authenticated by the RADIUS server.
4	NAS-IP-Address	IP address of the network access server (NAS) that is requesting authentication. The NAS is the FortiGate.
8	Framed-IP-Address	IP address to be configured for the user, by sending the IP address of a user to the RADIUS server in the Access-Request packet.
25	Class	Used in accounting packets and requests for firewall, WiFi, and proxy authentication. The attribute is returned in the Access-Accept message and is added to all accounting packets.
26	Fortinet-VSA	See VSAs.
32	NAS-Identifier	Identifier or IP address of the NAS that is requesting authentication. The NAS is the FortiGate.
42	Acct-Input-Octets	Number of octets received from the port over the course of this service being provided. Used to charge the user for the amount of traffic they used.
43	Acct-Output-Octets	Number of octets sent to the port while delivering this service. Used to charge the user for the amount of traffic they used.
44	Acct-Session-Id	Unique number assigned to each start and stop record to make it easy to match them, and to eliminate duplicate records.
55	Event-Timestamp	Records the time that the event occurred on the NAS. The timestamp is measured in seconds since January 1, 1970 00:00 UTC. Before the Event-Timestamp attribute can be sent in a packet, make sure that the correct time is set on the FortiGate.

VSAs

Some vendors want or need to send attributes that do not match any of the defined IETF attributes. This can be accomplished by using RADIUS attribute type 26, which allows a vendor to encapsulate their own specific attributes in this standard AVP.

In order to support VSAs, the RADIUS server requires a dictionary to define the VSAs. This dictionary is typically supplied by the client or server vendor.

The Fortinet RADIUS vendor ID is 12356 and contains the following attributes:

Attribute name	Attribute number	Attribute value format
Fortinet-Group-Name	1	String
Fortinet-Client-IP-Address	2	IP address
Fortinet-Vdom-Name*	3	String
Fortinet-Client-IPv6-Address	4	Octets
Fortinet-Interface-Name	5	String
Fortinet-Access-Profile	6	String
Fortinet-SSID	7	String
Fortinet-AP-Name	8	String
Fortinet-FAC-Auth-Status	11	String
Fortinet-FAC-Token-ID	12	String
Fortinet-FAC-Challenge-Code	15	String
Fortinet-Webfilter-Category-Allow	16	String
Fortinet-Webfilter-Category-Block	17	Octets
Fortinet-Webfilter-Category-Monitor	18	Octets
Fortinet-AppCtrl-Category-Allow	19	Octets
Fortinet-AppCtrl-Category-Block	20	Octets
Fortinet-AppCtrl-Risk-Allow	21	Octets
Fortinet-AppCtrl-Risk-Block	22	Octets
Fortinet-WirelessController-Device-MAC	23	Ether
Fortinet-WirelessController-WTP-ID	24	String
Fortinet-WirelessController-Assoc-Time	25	Date
Fortinet-FortiWAN-AVPair	26	String
Fortinet-Captive-Portal-URL	27	String
Fortinet-FDD-Access-Profile	30	String

Attribute name	Attribute number	Attribute value format
Fortinet-FDD-Trusted-Hosts	31	String
Fortinet-FDD-SPP-Name	32	String
Fortinet-FDD-Is-System-Admin	33	String
Fortinet-FDD-Is-SPP-Admin	34	String
Fortinet-FDD-SPP-Policy-Group	35	String
Fortinet-FDD-Allow-API-Access	36	String
Fortinet-Fpc-User-Role	40	String
Fortinet-Tenant-Identification	41	String
Fortinet-Host-Port-AVPair	42	String
Fortinet-PreShared-Key-Name	43	String
Fortinet-AS-Credential-Hash	44	String

* For Fortinet-Vdom-Name, users can be tied to a specific VDOM on the FortiGate. Refer to the documentation provided by your RADIUS server for configuration details.

RADIUS VSAs for captive portal redirects

RADIUS Vendor-Specific Attributes (VSA) for captive portal redirects provide a smoother user experience during captive portal redirects, especially in environments where vendor-specific attributes are heavily used, such as corporate networks or public Wi-Fi hotspots.

To configure RADIUS VSA for captive portal redirects:

1. Configure a RADIUS user:

```
config user radius
    edit "pc05"
        set server "172.16.200.55"
        set secret ***************
    next
end
```

2. Add the user to a group:

```
config user group
    edit "radius-group"
        set member "pc05"
    next
end
```

3. Configure the interface to use captive portal authentication and the group:

```
config system interface
    edit "port2"
        set security-mode captive-portal
        set security-groups "radius-group"
    next
end
```

4. Configure the firewall policy:

```
config firewall policy
    edit 1
        set name "1"
        set srcintf "port2"
        set dstintf "mgmt"
        set action accept
        set srcaddr "all"
        set dstaddr "all"
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set logtraffic all
        set nat enable
    next
end
```

5. To check the configuration, on a client PC:
   a. Use a browser to access a web server.
   b. Authenticate using RADIUS.
   c. Browse the redirect to https://www.fortinet.com.
   d. Check the list of authenticated users:

```
# diagnose firewall auth list

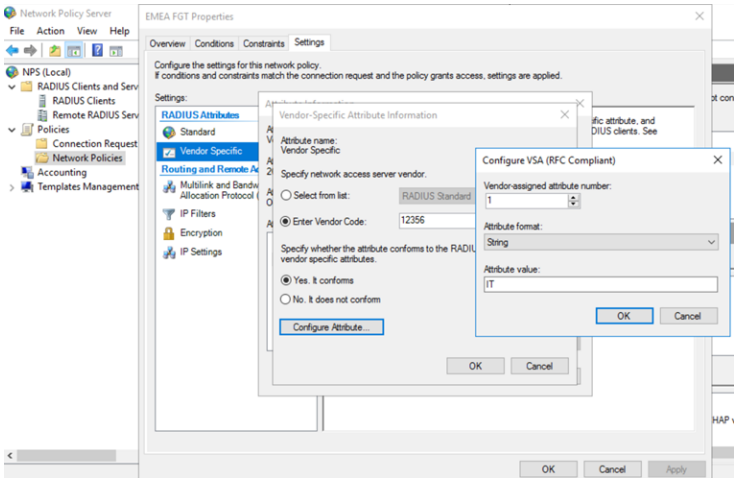
10.1.100.11, 962341
        src_mac: 00:0c:29:61:d4:13
        type: fw, id: 0, duration: 752, idled: 2
        expire: 298, allow-idle: 300
        flag(10): radius
        server: pc05
        packets: in 8531 out 7654, bytes: in 7972540 out 1104574
        group_id: 1
        group_name: radius-group

----- 1 listed, 0 filtered ------
```

Restricting RADIUS user groups to match selective users on the RADIUS server

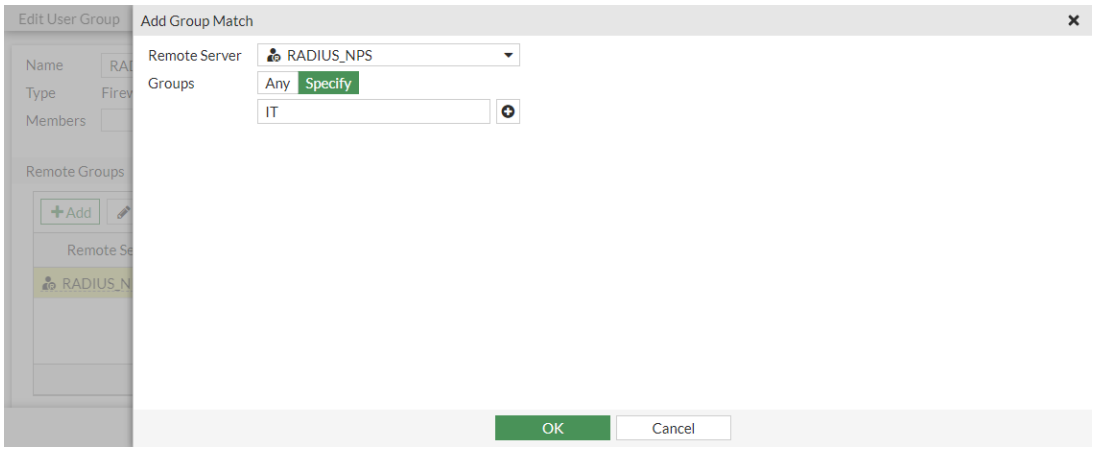
When a user group is configured in FortiOS to authenticate against a RADIUS server, it will allow any valid user account on the RADIUS server to match that user group. Sometimes you might want to specify which users on the RADIUS server should match a particular user group on the FortiGate. This can be accomplished using the RADIUS attribute value pair (AVP) 26, known as a Vendor-Specific Attribute (VSA). This attribute allows the Fortinet-Group-Name VSA to be included in the RADIUS response. In FortiOS, the user group must be configured to specifically match this group.

In the following example, a RADIUS Network Policy Server (NPS) has been configured to have the Fortinet-Group-Name be *IT*, and assumes that the user group, *RADIUS_IT* has been created, which authenticates to the *RADIUS_NPS* server.



To configure specific group matching in the GUI:

1. Go to *User & Authentication* > *User Groups* and edit the *RADIUS_IT* group.
2. In the *Remote Groups* table, select the *RADIUS_NPS* server and click *Edit*. The *Add Group Match* pane opens.
3. For *Groups*, select *Specify* and enter the group name configured on the RADIUS server (*IT*).
4. Click *OK*.



5. Click *OK*.

To configure specific group matching in the CLI:

```
config user group
    edit "RADIUS_IT"
        set member "RADIUS_NPS"
        config match
            edit 1
                set server-name "RADIUS_NPS"
                set group-name "IT"
            next
        end
    next
end
```

To change the matching back to any group, under `config match`, enter `delete 1`. Changing the `group-name` to `"Any"` will cause the FortiGate to match the Fortinet-Group-Name with the literal string, `Any`.

Configuring RADIUS SSO authentication

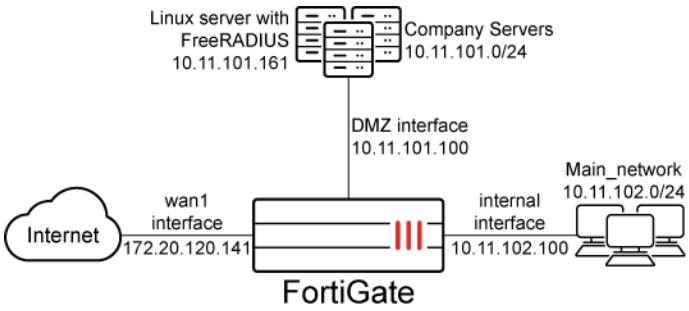
A common RADIUS SSO (RSSO) topology involves a medium-sized company network of users connecting to the Internet through the FortiGate and authenticating with a RADIUS server. The following describes how to configure FortiOS for this scenario. The example makes the following assumptions:

- VDOMs are not enabled.
- The super_admin account is used for all FortiGate configuration.
- A RADIUS server is installed on a server or FortiAuthenticator and uses default attributes.
- BGP is used for any dynamic routing.
- You have configured authentication event logging under *Log & Report*.

Example.com has an office with 20 users on the internal network who need access to the Internet. The office network is protected by a FortiGate-60C with access to the Internet through the wan1 interface, the user

network on the internal interface, and all servers are on the DMZ interface. This includes an Ubuntu sever running FreeRADIUS. This example configures two users:

User	Account
Pat Lee	plee@example.com
Kelly Green	kgreen@example.com



Configuring this example consists of the following steps:

1. Configure RADIUS.
2. Configure FortiGate interfaces.
3. Configure a RSSO agent.
4. Create a RSSO user group.
5. Configure security policies.
6. Test the configuration.

To configure RADIUS:

Configuring RADIUS includes configuring a RADIUS server such as FreeRADIUS on user's computers and configuring users in the system. In this example, Pat and Kelly belong to the exampledotcom_employees group. After completing the configuration, you must start the RADIUS daemon. The users have a RADIUS client installed on their PCs that allow them to authenticate through the RADIUS server.

For any problems installing FreeRADIUS, see the FreeRADIUS documentation.

To configure FortiGate interfaces:

You must define a DHCP server for the internal network, as this network type typically uses DHCP. The wan1 and dmz interfaces are assigned static IP addresses and do not need a DHCP server. The following table shows the FortiGate interfaces used in this example:

Interface	Subnet	Act as DHCP server	Devices
wan1	172.20.120.141	No	Internet service provider
dmz	10.11.101.100	No	Servers including RADIUS server
internal	10.11.102.100	Yes: x.x.x.110-250	Internal user network

1. Go to *Network* > *Interfaces*.
2. Edit wan1:

Alias	Internet
Addressing Mode	Manual
IP/Network Mask	172.20.120.141/255.255.255.0
Administrative Access	HTTPS, SSH
Enable DHCP Server	Not selected
Comments	Internet
Administrative Status	Up

3. Click *OK*.
4. Edit dmz:

Alias	Servers
Addressing Mode	Manual
IP/Network Mask	10.11.101.100/255.255.255.0
Administrative Access	HTTPS, SSH, PING, SNMP
Enable DHCP Server	Not selected
Listen for RADIUS Accounting Messages	Select
Comments	Servers
Administrative Status	Up

5. Click *OK*.
6. Edit internal:

Alias	Internal network
Addressing Mode	Manual
IP/Network Mask	10.11.102.100/255.255.255.0
Administrative Access	HTTPS, SSH, PING
Enable DHCP Server	Select
Address Range	10.11.102.110 - 10.11.102.250
Netmask	255.255.255.0
Default Gateway	Same as Interface IP
Comments	Internal network
Administrative Status	Up

To create a RADIUS SSO agent:

1. Go to *Security Fabric > External Connectors*.
2. Click *Create New*.
3. Under *Endpoint/Identity*, select *RADIUS Single Sign-On Agent*.
4. Enable *Use RADIUS Shared Secret*. Enter the RADIUS server's shared secret.
5. Enable *Send RADIUS Responses*. Click *OK*.

To create a RADIUS SSO user group:

1. Go to *User & Authentication > User Groups*.
2. Click *Create New*.
3. For *Type*, select *RADIUS Single Sign-On (RSSO)*.
4. In *RADIUS Attribute Value*, enter the name of the RADIUS user group that this local user group represents.
5. Click *OK*.

Configuring security policies

The following security policies are required for RADIUS SSO:

Sequence Number	From	To	Type	Schedule	Description
1	internal	wan1	RADIUS SSO	Business hours	Authenticate outgoing user traffic
2	internal	wan1	Regular	Always	Allow essential network services and VoIP
3	dmz	wan1	Regular	Always	Allow servers to access the Internet
4	internal	dmz	Regular	Always	Allow users to access servers
5	any	any	Deny	Always	Implicit policy denying all traffic that has not been matched

You must place the RADIUS SSO policy at the top of the policy list so that it is matched first. The only exception to this is if you have a policy to deny access to a list of banned users. In this case, you must put that policy at the top so that the RADIUS SSO does not mistakenly match a banned user or IP address.

You must configure lists before creating security policies.

Schedule

You must configure a business_hours schedule. You can configure a standard Monday to Friday 8 AM to 5 PM schedule, or whatever days and hours covers standard work hours at the company.

Address groups

You must configure the following address groups:

Name	Interface	Address range included
internal_network	internal	10.11.102.110 to 10.11.102.250
company_servers	dmz	10.11.101.110 to 10.11.101.250

Service groups

You must configure the service groups. The services listed are suggestions and you may include more or less as required:

Name	Interface	Description of services to be included
essential_network_services	internal	Any network protocols required for normal network operation such as DNS, NTP, BGP
essential_server_services	dmz	All the protocols required by the company servers such as BGP, HTTP, HTTPS, FTP, IMAP, POP3, SMTP, IKE, SQL, MYSQL, NTP, TRACEROUTE, SOCKs, and SNMP
user_services	internal	Any protocols required by users such as HTTP, HTTPS, FTP

The following security policy configurations are basic and only include logging and default AV and IPS. These policies allow or deny access to non-RADIUS SSO traffic. These are essential as network services including DNS, NTP, and FortiGuard require access to the Internet.

To configure security policies:

1. Go to *Policy & Objects* > *Firewall Policy*.
2. Click *Create New*.
3. Configure the policy as follows, then click *OK*:

Incoming Interface	Internal
Source Address	internal_network
Outgoing Interface	wan1
Destination Address	all
Schedule	always
Service	essential_network_services

Action	ACCEPT
NAT	ON
Security Profiles	ON: AntiVirus, IPS
Log Allowed Traffic	ON
Comments	Essential network services

4. Click *Create New*, and configure the new policy as follows, then click *OK*:

Incoming Interface	dmz
Source Address	company_servers
Outgoing Interface	wan1
Destination Address	all
Schedule	always
Service	essential_server_services
Action	ACCEPT
NAT	ON
Security Profiles	ON: AntiVirus, IPS
Log Allowed Traffic	enable
Comments	Company servers accessing the Internet

5. Click *Create New*, and configure the new policy as follows, then click *OK*:

Incoming Interface	Internal
Source Address	internal_network
Outgoing Interface	dmz
Destination Address	company_servers
Schedule	always
Service	all
Action	ACCEPT
NAT	ON
Security Profiles	ON: AntiVirus, IPS
Log Allowed Traffic	enable
Comments	Access company servers

6. Click *Create New*, and configure the RADIUS SSO policy as follows, then click *OK*. This policy allows access for members of specific RADIUS groups.

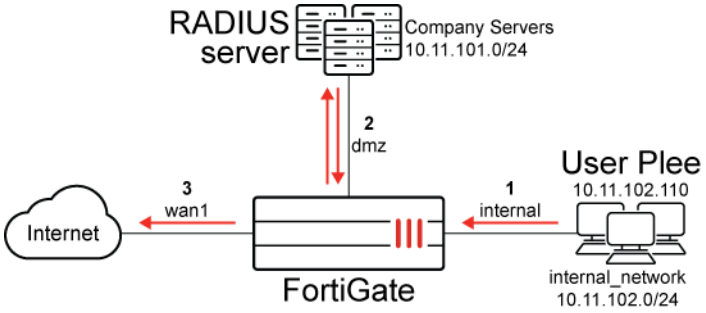
Incoming Interface	Internal
Source Address	internal_network
Source User(s)	Select the user groups that you created for RSSO.
Outgoing Interface	wan1
Destination Address	all
Schedule	business_hours
Service	ALL
Action	ACCEPT
NAT	ON
Security Profiles	ON: AntiVirus, Web Filter, IPS, and Email Filter. In each case, select the default profile.

7. Place the RSSO policy higher in the security policy list than more general policies for the same interfaces. Click *OK*.

To test the configuration:

Once configured, a user only needs to log in to their PC using their RADIUS account. After that, when they attempt to access the Internet, the FortiGate uses their session information to get their RADIUS information. Once the user is verified, they can access the website.

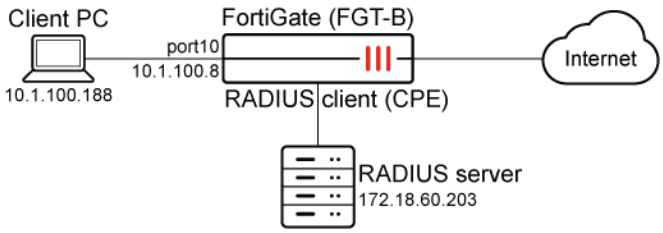
1. The user logs on to their PC and tries to access the Internet.
2. The FortiGate contacts the RADIUS server for the user's information. Once confirmed, the user can access the Internet. Each step generates logs that enable you to verify that each step succeeded.
3. If a step does not succeed, confirm that your configuration is correct.



Trigger RADIUS authentication with DNS and ICMP queries

DNS and ICMP queries can trigger RADIUS authentication. In some situations, a RADIUS client cannot trigger authentication with only HTTP, HTTPS, or Telnet traffic, such as VoIP gateways or servers. Without RADIUS authentication there is no RADIUS accounting, which can be required in some circumstances.

In this example, a Client PC is used as a VoIP gateway.



To configure FGT-B:

1. Configure a RADIUS user:

```
config user radius
    edit "FreeRADIUS"
        set server "172.18.60.203"
        set secret **********
        set acct-interim-interval 600
        set auth-type pap
        set password-renewal disable
        config accounting-server
            edit 1
                set status enable
                set server "172.18.60.203"
                set secret **********
            next
        end
    next
end
```

2. Find the MAC address on the interface. In the RADIUS accounting start message it will be the *Called-Station-Id*.

```
# get hardware nic port10 | grep HW
Current_HWaddr   80:80:2c:a3:50:f3
Permanent_HWaddr 80:80:2c:a3:50:f3
```

3. Add the RADIUS user to a group:

```
config user group
    edit "remote-radius"
        set member "FreeRADIUS"
    next
end
```

4. Configure the interface:

```
config system interface
    edit "port10"
        set vdom "root"
        set ip 10.1.100.8 255.255.255.0
        set allowaccess ping https ssh http telnet
        set type physical
```

```
        set security-mode captive-portal
        set security-ip-auth-bypass enable
        set security-groups "remote-radius"
        set device-identification enable
        set snmp-index 12
        config ipv6
            set ip6-address 2008::8/64
            set ip6-allowaccess ping https http
        end
    next
end
```

5. Configure a policy:

```
config firewall policy
    edit 1
        set name "pol1"
        set srcintf "port10"
        set dstintf "port9"
        set action accept
        set srcaddr "all"
        set dstaddr "all"
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set ssl-ssh-profile "custom-deep-inspection"
        set av-profile "default"
        set logtraffic all
        set nat enable
        set groups "remote-radius"
        set radius-ip-auth-bypass enable
    next
end
```

To test the configuration:

1. Trigger RADIUS authentication on the Client PC using the `ip-auth-bypass` feature configured on the FortiGate. This can be done by either:
   - Pinging any external resource (ICMP query).
   - Connecting to an external webpage using an FQDN URL in a browser with an empty cache, which requires a new DNS query.

   The FortiGate will use the Client PC IP address as the credentials for authentication. If successful, this will be followed by a RADIUS accounting start message.
2. On FGT-B, check the local firewall authentication list.

   The RADIUS user that is used for `ip-auth-bypass` is the IP address of the Client PC. The source MAC address is the MAC address of the Client PC.

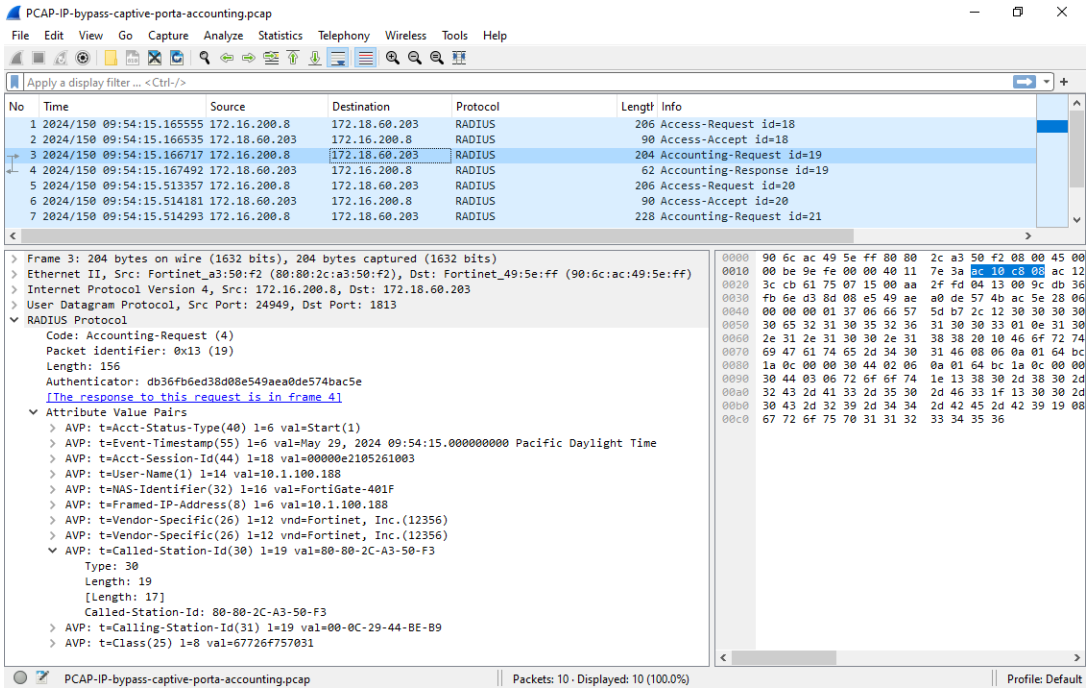
```
# diagnose firewall auth list

10.1.100.188, 10.1.100.188
```

```
        src_mac: 00:0c:29:44:be:b9
        type: fw, id: 0, duration: 16, idled: 10
        expire: 284, allow-idle: 300, max-life: 2384
        flag(14): hard radius
        server: FreeRADIUS
        packets: in 4 out 5, bytes: in 1105 out 1044
        group_id: 5
        group_name: remote-radius

----- 1 listed, 0 filtered ------
```

3. Check the RADIUS accounting start messages in the traffic between FGT-B and the RADIUS server. The MAC address of FGT-B is the *Called-Station-Id*, and the IP address of the Client PC is the *User-Name*.



RSA ACE (SecurID) servers

SecurID is a two-factor system produced by the company RSA that uses one-time password (OTP) authentication. This system consists of the following:

- Portable tokens that users carry
- RSA ACE/Server
- Agent host (the FortiGate)

When using SecurID, users carry a small device or "token" that generates and displays a pseudo-random password. According to RSA, each SecurID authenticator token has a unique 64-bit symmetric key that is combined with a powerful algorithm to generate a new code every 60 seconds. The token is time-synchronized with the SecurID RSA ACE/Server.

The RSA ACE/Server is the SecurID system's management component. It stores and validates the information about the SecurID tokens allowed on your network. Alternately, the server can be an RSA SecurID 130 appliance.

The agent host is the server on your network. In this case, this is the FortiGate, which intercepts user logon attempts. The agent host gathers the user ID and password entered from the SecurID token and sends the information to the RSA ACE/Server for validation. If valid, the RSA ACE/Server returns a reply indicating that it is a valid logon and FortiOS allows the user access to the network resources specified in the associated security policy.

Configuring SecurID with FortiOS consists of the following:

1. Configure the RSA and RADIUS servers to work with each other. See RSA server documentation.
2. Do one of the following:
   a. Configure the RSA SecurID 130 appliance.
   b. Configure the FortiGate as an agent host on the RSA ACE/Server.
3. Configure the RADIUS server in FortiOS.
4. Create a SecurID user group.
5. Create a SecurID user.
6. Configure authentication with SecurID.

The following instructions are based on RSA ACE/Server 5.1 and RSA SecurID 130 appliance. They assume that you have successfully completed all external RSA and RADIUS server configuration.

In this example, the RSA server is on the internal network and has an IP address of 192.168.100.102. The FortiOS internal interface address is 192.168.100.3. The RADIUS shared secret is fortinet123, and the RADIUS server is at IP address 192.168.100.202.

To configure the RSA SecurID 130 appliance:

1. Log on to the SecurID IMS console.
2. Go to *RADIUS* > *RADIUS clients*, then select *Add New*.

RADIUS Client Basics		
	Client Name	FortiGate
	Associated RSA Agent	FortiGate
RADIUS Client Settings		
	IP Address	Enter the FortiOS internal interface. In this example, it is 192.168.100.3.
	Make / Model	Select *Standard Radius*.
	Shared Secret	Enter the RADIUS shared secret. In this example, it is fortinet123.
	Accounting	Leave unselected.
	Client Status	Leave unselected.

3. Configure your FortiGate as a SecurID client:
4. Click *Save*.

To configure the FortiGate as an agent host on the RSA ACE/Server:

1. On the RSA ACE/Server, go to *Start > Programs > RSA ACE/Server*, then *Database Administration - Host Mode*.
2. From the *Agent Host* menu, select *Add Agent Host*.
3. Configure the following:

Name	FortiGate
Network Address	Enter the FortiOS internal interface. In this example, it is 192.168.100.3.
Secondary Nodes	You can optionally enter other IP addresses that resolve to the FortiGate.

For more information, see the RSA ACE/Server documentation.

To configure the RADIUS server in FortiOS:

1. Go to *User & Authentication > RADIUS Servers*, then click *Create New*.
2. Configure the following:

Name	RSA
Authentication method	Select *Default*.
Primary Server	
IP/Name	192.168.100.102. You can click *Test* to ensure the IP address is correct and that FortiOS can contact the RADIUS server.
Secret	fortinet123

3. Click *OK*.

To create a SecurID user group:

1. Go to *User & Authentication > User Groups*. Click *Create New*.
2. Configure the following:

Name	RSA_group
Type	Firewall

3. In *Remote Groups*, click *Add*, then select the RSA server.
4. Click *OK*.

To create a SecurID user:

1. Go to *User & Authentication > User Definition*. Click *Create New*.
2. Configure the following:

User Type	Remote RADIUS User
Type	wloman

RADIUS Server	RSA
Contact Info	(Optional) Enter email or SMS information.
User Group	RSA_group

3. Click *Create*.

You can test the configuration by entering the `diagnose test authserver radius RSA auto wloman 111111111` command. The series of 1s is the OTP that your RSA SecurID token generates that you enter for access.

Configuring authentication with SecurID

You can use the SecurID user group in several FortiOS features that authenticate by user group:

- Security policy on page 3423
- IPsec VPN XAuth on page 3424
- PPTP VPN on page 3424
- Agentless VPN

Unless stated otherwise, the following examples use default values.

Security policy

The example creates a security policy that allows HTTP, FTP, and POP3 traffic from the internal interface to WAN1. If these interfaces are not available in FortiOS, substitute other similar interfaces.

To configure a security policy with SecurID authentication:

1. Go to *Policy & Objects > Firewall Policy*.
2. Click *Create New*.
3. Configure the following:

Incoming Interface	internal
Source Address	all
Source User(s)	RSA_group
Outgoing Interface	wan1
Destination Address	all
Schedule	always
Service	HTTP, FTP, POP3
Action	ACCEPT
NAT	On
Shared Shaper	If you want to limit traffic or guarantee minimum bandwidth for traffic that uses the SecurID security policy, enable and use the default shaper, guarantee-100kbps.

Log Allowed Traffic	Enable if you want to generate usage reports on traffic that this policy has authenticated.

4. Click *OK*.

IPsec VPN XAuth

In *VPN > IPsec Wizard*, select the SecurID user group on the *Authentication* page. The SecurID user group members must enter their SecurID code to authenticate.

PPTP VPN

When configuring PPTP in the CLI, set `usrgrp` to the SecurID user group.

Agentless VPN

You must map the SecurID user group to the portal that will serve SecurID users and include the SecurID user group in the security policy's *Source User(s)* field.

To map the SecurID group to an Agentless VPN portal:

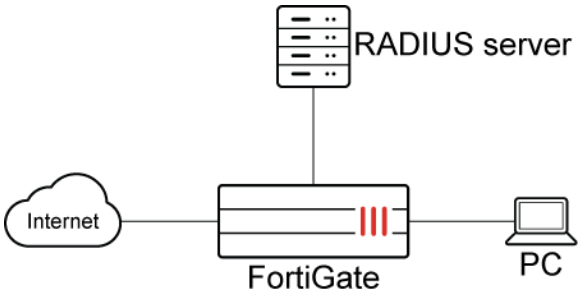
1. Go to *VPN > Agentless VPN Settings*.
2. Under *Authentication/Portal Mapping*, click *Create New*.
3. Configure the following:

Users/Groups	RSA_group
Portal	Select the desired portal.

4. Click *OK*.

Support for Okta RADIUS attributes filter-Id and class

RADIUS user group membership information can be returned in the filter-Id (11) and class (25) attributes in RADIUS Access-Accept messages. The group membership information can be used for group matching in FortiGate user groups in firewall policies and for FortiGate wildcard administrators with remote RADIUS authentication.



In this example, a FortiAuthenticator is used as the RADIUS server. A local RADIUS user on the FortiAuthenticator is configure with two groups in the filter-Id attribute: *okta-group1* and *okta-group2*.

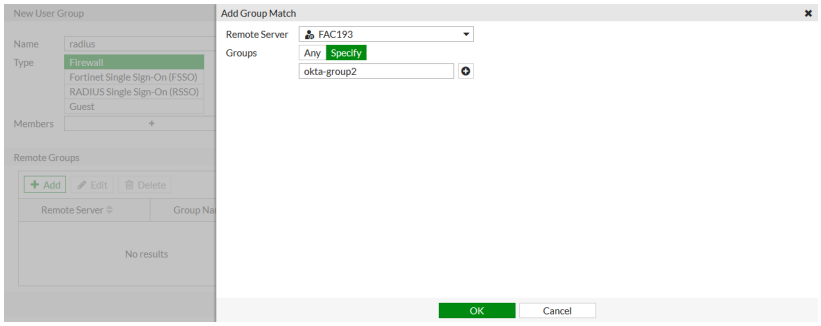
To create the RADIUS user and set the attribute type to override group information:

```
config user radius
    edit "FAC193"
        set server "10.1.100.189"
        set secret **********
        set group-override-attr-type filter-Id
    next
end
```

FortiOS will only use the configured filter-Id attribute, even if the RADIUS server sends group names in both class and filter-id attributes. To return group membership information from the class attribute instead, set `group-override-attr-type` to `class`.

To configure group match in the user group:

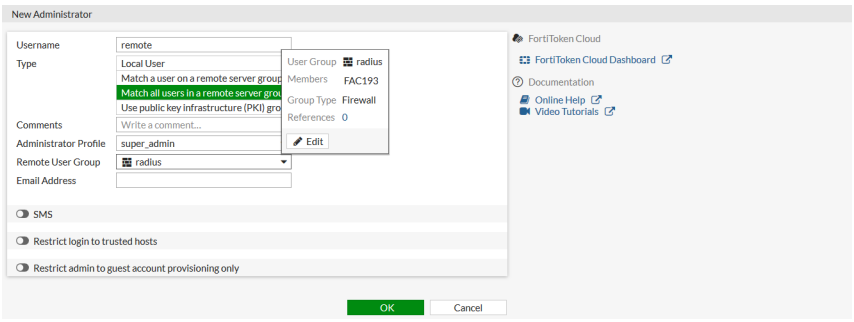
1. Go to *User & Authentication* > *User Groups*.
2. Click *Create New*.
3. Enter a name for the group, and set *Type* to *Firewall*.
4. In the *Remote Groups* table, click *Add*.
5. Set *Remote Server* to the just created RADIUS server, *FAC193*.
6. Set *Groups* to *Specify*, and enter the group name, `okta-group2`. The string must match the group name configured on the RADIUS server for the filter-Id attribute.



7. Click *OK*.
   The remote server is added to the *Remote Groups* table.
8. Click *OK*.
9. Add the new user group to a firewall policy and generate traffic on the client PC that requires firewall authentication, such as connecting to an external web server.
10. After authentication, on the FortiGate, verify that traffic is authorized in the traffic log:
    a. Go to *Log & Report* > *Forward Traffic*.
    b. Verify that the traffic was authorized.

To use the remote user group with group match in a system wildcard administrator configuration:

1. Go to *System* > *Administrators*.
2. Edit an existing administrator, or create a new one.
3. Set *Type* to *Match all users in a remote server group*.
4. Set *Remote User Group* to the remote server.



5. Configure the remaining settings as required.
6. Click *OK*.
7. Log in to the FortiGate using the remote user credentials on the RADIUS server.
   If the correct group name is returned in the filter-Id attribute, administrative access is allowed.

Sending multiple RADIUS attribute values in a single RADIUS Access-Request

A managed FortiSwitch can be configured to send multiple RADIUS attribute values in a single RADIUS Access-Request. This option is configured per RADIUS user, and is set to none by default.

The available service type options are:

login	User should be connected to a host.
framed	User use Framed Protocol.
callback-login	User disconnected and called back.
callback-framed	User disconnected and called back, then a Framed Protocol.
outbound	User granted access to outgoing devices.
administrative	User granted access to the administrative unsigned interface.
nas-prompt	User provided a command prompt on the NAS.
authenticate-only	Authentication requested, and no authentication information needs to be returned.
callback-nas-prompt	User disconnected and called back, then provided a command prompt.
call-check	Used by the NAS in an Access-Request packet, Access-Accept to answer the call.
callback-administrative	User disconnected and called back, granted access to the admin unsigned interface.

To configure a managed FortiSwitch to the RADIUS attributes login, framed, and authenticate-only all at the same time:

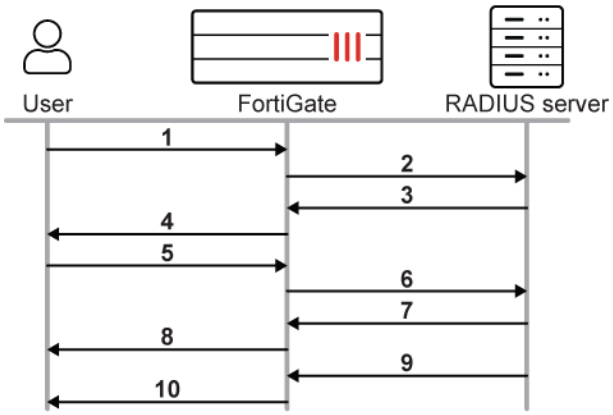
```
config user radius
    edit "Radius_Server"
        set switch-controller-service-type login framed authenticate-only
        ....
    next
end
```

Traffic shaping based on dynamic RADIUS VSAs

A FortiGate can use the WISPr-Bandwidth-Max-Down and WISPr-Bandwidth-Max-Up dynamic RADIUS VSAs (vendor-specific attributes) to control the traffic rates permitted for a certain device. The FortiGate can apply different traffic shaping to different users who authenticate with RADIUS based on the returned RADIUS VSA values. When the same user logs in from an additional device, the RADIUS server will send a CoA (change of authorization) message to update the bandwidth values to 1/*N* of the total values, where *N* is the number of logged in devices from the same user.

This feature is not supported by FortiGates with NP6, NP6Lite (SoC3), or NP6XLite (SoC4) processors. NP6 offloading is automatically disabled on the policy if this feature is enabled. This feature is supported by FortiGates with NP7 and NP7Lite (SoC5) processors.

When a user logs in to two devices through RADIUS authentication. The authentication and authorization flow is as follows:



1. The user logs in to a device and the authentication is sent to the FortiGate.
2. The FortiGate sends the Access-Request message to the RADIUS server.
3. The RADIUS server sends the Access-Accept message to the FortiGate. The server also returns the WISPr-Bandwidth-Max-Up and WISPr-Bandwidth-Max-Down VSAs.
4. Based on the VSA values, the FortiGate applies traffic shaping for the upload and download speeds based on its IP.
5. The user logs in to a second device and the authentication is sent to the FortiGate.
6. The FortiGate sends the Access-Request message to the RADIUS server.

7. The RADIUS server sends the Access-Accept message to the FortiGate. The server also returns the WISPr-Bandwidth-Max-Up and WISPr-Bandwidth-Max-Down VSAs at half the value from the first device.
8. Based on the VSA values, the FortiGate applies traffic shaping for the upload and download speeds on the second device based on its IP.
9. The RADIUS server sends a CoA message and returns WISPr-Bandwidth-Max-Up and WISPr-Bandwidth-Max-Down VSAs for the first device at half the value.
10. Based on the VSA values, the FortiGate updates traffic shaping for the upload and download speeds on the first device based on its IP.

Example

In this example, the FortiGate is configured to dynamically shape user traffic based on the WISPr-Bandwidth-Max-Up and WISPr-Bandwidth-Max-Down VSAs returned by the RADIUS server when the user logs in through firewall authentication.

To configure traffic shaping based on dynamic RADIUS VSAs:

1. Configure the RADIUS server users file to identify WISPr-Bandwidth-Max-Up and WISPr-Bandwidth-Max-Down:

   The WISPr-Bandwidth is measured in bps, and the FortiOS dynamic shaper is measured in Bps.

   ```
   WISPr-Bandwidth-Max-Up = 1004857,
   WISPr-Bandwidth-Max-Down = 504857,
   ```

2. In FortiOS, configure the RADIUS server:

   ```
   config user radius
       edit "rad1"
           set server "172.16.200.44"
           set secret ************
           set radius-coa enable
           set acct-all-servers enable
           config accounting-server
               edit 1
                   set status enable
                   set server "172.16.200.44"
                   set secret ************
               next
           end
       next
   end
   ```

3. Configure the RADIUS user group:

```
config user group
    edit "group_radius"
        set member "rad1"
    next
end
```

4. Configure the firewall policy with dynamic shaping and the RADIUS group:

```
config firewall policy
    edit 2
        set srcintf "port2"
        set dstintf "wan1"
        set srcaddr "all"
        set dstaddr "all"
        set srcaddr6 "all6"
        set dstaddr6 "all6"
        set action accept
        set schedule "always"
        set service "ALL"
        set dynamic-shaping enable
        set groups "group_radius"
        set nat enable
    next
end
```

Verification

After a client PC is authenticated by the RADIUS server, dynamic shaping is applied to the client based on the IP address.

Use the following commands to monitor the dynamic shaper:

```
# diagnose firewall shaper dynamic-shaper stats
```

```
# diagnose firewall shaper dynamic-shaper list {ip | ipv6 | user} <address or username>
```

Use case 1

User1 is paying for rate plan A that limits their maximum bandwidth to 10 Mbps download and 5 Mbps upload. User2 is paying for rate plan B that limits their maximum bandwidth to 5 Mbps download and 5 Mbps upload. The speeds in both plans are provided by best effort, so there is no guaranteed minimum bandwidth.

User1 logs in to pc1 with RADIUS authentication and IP-based dynamic shaping is applied. User2 logs in to pc2 with RADIUS authentication and IP-based dynamic shaping is applied.

To verify the dynamic shaping:

1. On pc1, verify the bandwidth and transfer speed:

```
root@pc1:~# iperf -c 172.16.200.44 -u -t 25 -b 20M
------------------------------------------------------------
Client connecting to 172.16.200.44, UDP port 5001
Sending 1470 byte datagrams
UDP buffer size:  208 KByte (default)
------------------------------------------------------------
[  3] local 10.1.100.11 port 50510 connected with 172.16.200.44 port 5001
[ ID] Interval       Transfer     Bandwidth
[  3]  0.0-25.0 sec  59.6 MBytes  20.0 Mbits/sec
[  3] Sent 42518 datagrams
[  3] Server Report:
[  3]  0.0-25.3 sec  30.1 MBytes  9.99 Mbits/sec  15.651 ms 21058/42518 (50%)
```

2. On pc2, verify the bandwidth and transfer speed:

```
root@pc2:~# iperf -c 172.16.200.44 -u -t 25 -b 20M
------------------------------------------------------------
Client connecting to 172.16.200.44, UDP port 5001
Sending 1470 byte datagrams
UDP buffer size:  208 KByte (default)
------------------------------------------------------------
[  3] local 10.1.100.22 port 52814 connected with 172.16.200.44 port 5001
[ ID] Interval       Transfer     Bandwidth
[  3]  0.0-25.0 sec  59.6 MBytes  20.0 Mbits/sec
[  3] Sent 42518 datagrams
[  3] Server Report:
[  3]  0.0-25.3 sec  15.1 MBytes  5.03 Mbits/sec  15.652 ms 31710/42514 (75%)
```

3. In FortiOS, check the authentication list:

```
# diagnose firewall auth  list
10.1.100.11, test-shaper1
        src_mac: **:**:**:**:**:**
        type: fw, id: 0, duration: 38, idled: 16
        expire: 562
        flag(814): hard radius no_idle
        server: rad1
        packets: in 8207 out 3999, bytes: in 12306164 out 226963
        group_id: 3
        group_name: group_radius
10.1.100.22, test-shaper2
        src_mac: **:**:**:**:**:**
        type: fw, id: 0, duration: 24, idled: 24
        expire: 156, max-life: 35976
        flag(814): hard radius no_idle
        server: rad1
        packets: in 0 out 5, bytes: in 0 out 300
        group_id: 3
```

```
       group_name: group_radius
----- 2 listed, 0 filtered ------
```

4. Check the dynamic shaper list:

```
# diagnose firewall shaper dynamic-shaper list
addr: 10.1.100.11
bandwidth(original/reply): 1250000 Bps/625000 Bps
current bandwidth(original/reply): 1237072 Bps/0 Bps
allow packets(original/reply): 38524/14
allow bytes(original/reply): 55270378/11285
drop packets(original/reply): 10136/0
drop bytes(original/reply): 13516198/0
life: 441
idle: 0/40
idle time limit: 600 s

addr: 10.1.100.22
bandwidth(original/reply): 625000 Bps/625000 Bps
current bandwidth(original/reply): 622909 Bps/0 Bps
allow packets(original/reply): 3232/3
allow bytes(original/reply): 4841536/243
drop packets(original/reply): 2753/0
drop bytes(original/reply): 4123994/0
life: 10
idle: 0/10
idle time limit: 36000 s
```

5. Check the session list:

```
# diagnose sys session list
session info: proto=6 proto_state=05 duration=3 expire=116 timeout=3600 flags=00000004
socktype=4 sockport=10001 av_idx=0 use=4

        [0:0x0:0/(0,65535)->(0,65535)] helper:auto
```

Use case 2

A user logs in to a device (pc1, 10.1.100.11) and has a maximum bandwidth of 10 Mbps download and 5 Mbps upload. The same user logs in to a second device (pc2, 10.1.100.22) and the RADIUS server sends a CoA request with the WISPr-Bandwidth-Max to pc1. The maximum bandwidth on pc1 changes to 5 Mbps download and 2.5Mbps upload. On pc2, the maximum bandwidth is also 5 Mbps download and 2.5Mbps upload.

When the user logs out from pc1, the RADIUS server sends CoA request with the new WISPr-Bandwidth-Max for pc2. The FortiGate updates the authentication user list and dynamic shaper for pc2. The maximum bandwidth on pc2 changes to 10 Mbps download and 5 Mbps upload.

To verify the dynamic shaping:

1. Check the dynamic shaper list after the user logs in to pc1:

```
# diagnose firewall shaper dynamic-shaper list
addr: 10.1.100.11
bandwidth(original/reply): 1250000 Bps/625000 Bps
current bandwidth(original/reply): 0 Bps/0 Bps
allow packets(original/reply): 0/3
allow bytes(original/reply): 0/243
drop packets(original/reply): 0/0
drop bytes(original/reply): 0/0
life: 491
idle: 4/4
idle time limit: 86400 s
```

2. Check the dynamic shaper list after the user logs in to pc2:

```
# diagnose firewall shaper dynamic-shaper list
addr: 10.1.100.11
bandwidth(original/reply): 625000 Bps/312500 Bps
current bandwidth(original/reply): 0 Bps/0 Bps
allow packets(original/reply): 0/0
allow bytes(original/reply): 0/0
drop packets(original/reply): 0/0
drop bytes(original/reply): 0/0
life: 652
idle: 5/5
idle time limit: 600 s

addr: 10.1.100.22
bandwidth(original/reply): 625000 Bps/312500 Bps
current bandwidth(original/reply): 0 Bps/0 Bps
allow packets(original/reply): 0/3
allow bytes(original/reply): 0/243
drop packets(original/reply): 0/0
drop bytes(original/reply): 0/0
life: 3
idle: 3/3
idle time limit: 86400 s
```

3. Check the authentication list:

```
# diagnose firewall auth list
10.1.100.11, test
        src_mac: **:**:**:**:**:**
        type: fw, id: 0, duration: 171, idled: 11
        expire: 589, max-life: 589
        flag(814): hard radius no_idle
        server: rad1
        packets: in 0 out 0, bytes: in 0 out 0
        group_id: 15
        group_name: group_radius
```

```
10.1.100.22, test
        src_mac: **:**:**:**:**:**
        type: fw, id: 0, duration: 9, idled: 9
        expire: 86391
        flag(814): hard radius no_idle
        server: rad1
        packets: in 0 out 0, bytes: in 0 out 0
        group_id: 15
        group_name: group_radius
----- 2 listed, 0 filtered ------
```

4. Check the dynamic shaper list after the user logs out from pc1:

```
# diagnose firewall shaper dynamic-shaper list
addr: 10.1.100.22
bandwidth(original/reply): 1250000 Bps/625000 Bps
current bandwidth(original/reply): 0 Bps/0 Bps
allow packets(original/reply): 0/0
allow bytes(original/reply): 0/0
drop packets(original/reply): 0/0
drop bytes(original/reply): 0/0
life: 414
idle: 9/9
idle time limit: 600 s
```

5. Check the authentication list again:

```
# diagnose firewall auth  list
10.1.100.22, test
        src_mac: **:**:**:**:**:**
        type: fw, id: 0, duration: 453, idled: 49
        expire: 551, max-life: 551
        flag(814): hard radius no_idle
        server: rad1
        packets: in 0 out 0, bytes: in 0 out 0
        group_id: 15
        group_name: group_radius
----- 1 listed, 0 filtered ------
```

RADIUS Termination-Action AVP in wired and wireless scenarios

When authenticating with RADIUS in a wired or wireless scenario, the FortiGate can support proper handling of the Termination-Action AVP.

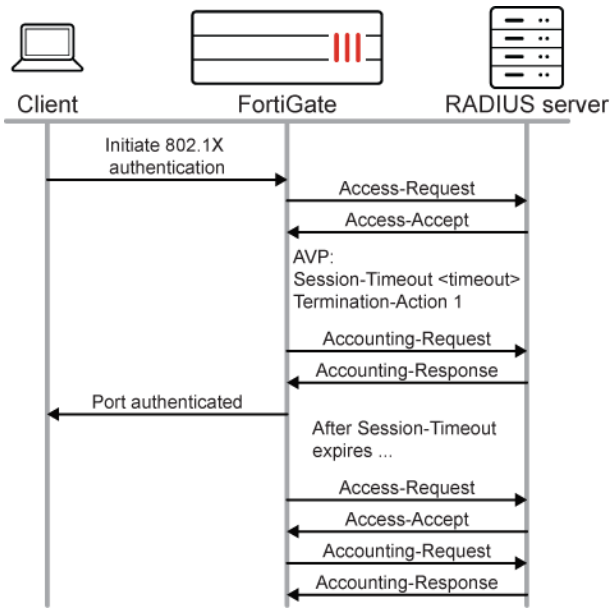
In a wired scenario, a hardware switch configured with 802.1X security authentication can read the Termination-Action attribute value from the RADIUS Access-Accept response. If the Termination-Action is 1, the FortiGate will initiate re-authentication when the session time has expired. During re-authentication, the port stays authorized. If the Termination-Action is 0, the session will be terminated.

In a wireless scenario, when a virtual AP is configured with WPA2-Enterprise security with RADIUS and has CoA enabled, it processes the RADIUS CoA request immediately upon receiving it and re-authenticates when the Termination-Action is 1.

Wired example

This example has a FortiGate configured with a hardware switch with two ports: port3 and port5. The hardware switch is enabled with 802.1X security and assigned to a RADIUS user group. Upon a successful authentication, the RADIUS server responds with an Access-Accept containing the authentication Session-Timeout and Termination-Action attributes. In this example, the Termination-Action value is 1, which informs the client to re-authenticate when the session time expires. During this time, the FortiGate keeps the client/port authorized while it initiates the re-authentication with the RADIUS server.

The message exchange is as follows:



To configure the RADIUS server and the FortiGate to handle the Termination-Action AVP:

1. On the RADIUS server, configure the Termination-Action AVP with the value `RADIUS-Request (1)` to indicate that re-authentication should occur upon expiration of the Session-Time.
2. On the FortiGate, configure the RADIUS server:

```
config user radius
    edit "rad1"
        set server "172.18.60.203"
        set secret ENC **********
        set radius-coa enable
        config accounting-server
            edit 1
                set status enable
                set server "172.18.60.203"
                set secret ENC **********
```

```
            next
        end
    next
end
```

3. Configure the RADIUS user group:

```
config user group
    edit "group_radius"
        set member "rad1"
    next
end
```

4. Configure the hardware switch with 802.1X enabled.
   a. Configure the virtual switch settings:

```
config system virtual-switch
    edit hw2
        set physical-switch "sw0"
        config port
            edit port3
            next
            edit port5
            next
        end
    next
end
```

   b. Configure the interface settings:

```
config system interface
    edit hw2
        set vdom vdom1
        set ip 6.6.6.1 255.255.255.0
        set allowaccess ping https ssh
        set stp enable
        set security-mode 802.1X
        set security-groups "group_radius"
    next
end

WARNING: Changing 802.1X could interrupt network connectivity on affected interfaces.
Do you want to continue? (y/n)y
```

5. On the client device, initiate 802.1X authentication, then verify that the switch port shows as authorized:

```
# diagnose sys 802-1x status
Virtual switch 'hw2' (default mode) 802.1x member status:
  port3: Link up, 802.1X state: unauthorized
  port5: Link up, 802.1X state: authorized
```

6. After successful authentication, wait for the session to timeout.

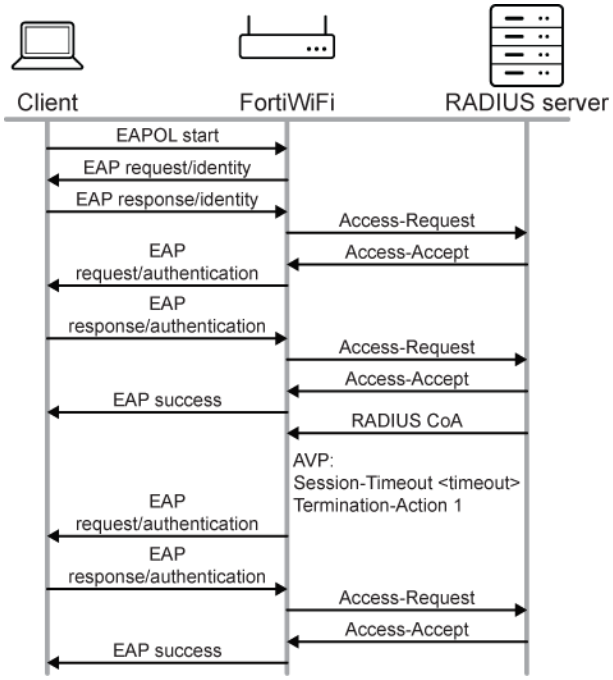
7. The FortiGate will keep the 802.1X port authenticated, and initiate re-authentication with the same Acct-Session-Id to the RADIUS server. The 802.1X status of the port remains unchanged:

```
# diagnose sys 802-1x status
Virtual switch 'hw2' (default mode) 802.1x member status:
  port3: Link up, 802.1X state: unauthorized
  port5: Link up, 802.1X state: authorized
```

Wireless example

In this example, a virtual AP is configured with WPA2-Enterprise security with RADIUS and has CoA enabled. After a wireless user authenticates and connects to the wireless SSID, the RADIUS server triggers a CoA event with AVPs Session-timeout and a Termination-Action of 1. This signals the FortiGate to trigger re-authentication of the client, which the client immediately performs to stay connected to the wireless SSID.

The message exchange is as follows:



To configure the FortiGate to handle the Termination-Action AVP:

1. Configure the RADIUS server:

```
config user radius
    edit "peap"
        set server "172.16.200.55"
        set secret **********
        set radius-coa enable
    next
end
```

2. Configure the VAP:

```
config wireless-controller vap
    edit "wifi"
        set ssid "FWF-60F-coa"
        set security wpa2-only-enterprise
        set auth radius
        set radius-server "peap"
        set schedule "always"
    next
end
```

3. Verify that the wireless station connects to the SSID:

```
# diagnose wireless-controller wlac -d sta online
   vf=0 wtp=1 rId=1 wlan=wifi vlan_id=0 ip=10.10.80.2 ip6=:: mac=**:**:**:**:**:** vci=
host=wifi-qa-01 user=test1 group=group1 signal=-28 noise=-95 idle=1 bw=0 use=6 chan=149 radio_
type=11AC security=wpa2_only_enterprise mpsk= encrypt=aes cp_authed=no online=yes mimo=2
```

4. From the RADIUS server, manually trigger a RADIUS CoA event.
   a. RADIUS CoA sent to the FortiGate:

```
Sent CoA-Request Id 7 from 0.0.0.0:54158 to 172.16.200.201:3799 length 39
    User-Name = "test1"
    Session-Timeout = 120
    Termination-Action = RADIUS-Request
```

   b. RADIUS CoA-ACK received from the FortiGate:

```
Received CoA-ACK Id 7 from 172.16.200.201:3799 to 0.0.0.0:0 length 44
    Event-Timestamp = "Jan  5 2022 14:43:12 PST"
    Message-Authenticator = 0x3311ba3b763d68da653ab34351b0308
```

5. On the wireless station console, verify that the re-authentication happens immediately:

```
root@wifi-qa-01:/home/wpa-test# wlan1: CTRL-EVENT-EAP-STARTED EAP authentication started
wlan1: CTRL-EVENT-EAP-PROPOSED-METHOD vendor=0 method=25
wlan1: CTRL-EVENT-EAP-METHOD EAP vendor 0 method 25 (PEAP) selected
EAP-TLV: TLV Result - Success - EAP-TLV/Phase2 Completed
wlan1: CTRL-EVENT-EAP-SUCCESS EAP authentication completed successfully
wlan1: PMKSA-CACHE-REMOVED **:**:**:**:**:** 0
wlan1: PMKSA-CACHE-ADDED **:**:**:**:**:** 0
wlan1: WPA: Key negotiation completed with **:**:**:**:**:** [PTK=CCMP GTK=CCMP]
```

Configuring a RADSEC client

FortiOS supports RADSEC clients in order to secure the communication channel over TLS for all RADIUS traffic, including RADIUS authentication and RADIUS accounting over port 2083. A FortiGate acting as a TLS client can initiate the TLS handshake with a remote RADIUS server. Administrators can specify a client certificate, perform a server identity check (enabled by default), and verify against a particular trust anchor (CA certificate). During a TLS handshake, the SNI check will use the RADIUS server FQDN if configured.

TCP connections are also supported, which use port 1812 for authentication and port 1813 for accounting.

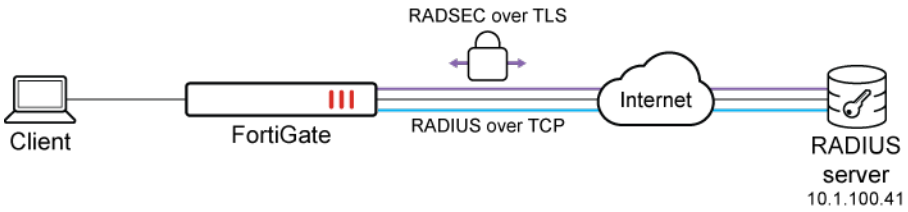
```
config user radius
    edit <name>
        set transport-protocol {udp | tcp | tls}
        set ca-cert <string>
        set client-cert <string>
        set tls-min-proto-version {default | SSLv3 | TLSv1 | TLSv1-1 | TLSv1-2}
        set server-identity-check {enable | disable}
    next
end
```

`transport-protocol {udp | tcp | tls}`	Set the type of transport protocol to use: • `udp`: use UDP (default) • `tcp`: use TCP, but no TLS security • `tls`: use TLS over TCP
`ca-cert <string>`	Set the CA certificate of server to trust under TLS.
`client-cert <string>`	Set the client certificate to use under TLS.
`tls-min-proto-version {default | SSLv3 | TLSv1 | TLSv1-1 | TLSv1-2}`	Set the minimum supported protocol version for TLS connections: • `default`: follow the system global setting • `SSLv3`: use SSLv3 • `TLSv1`: use TLSv1 • `TLSv1-1`: use TLSv1.1 • `TLSv1-2`: use TLSv1.2
`server-identity-check {enable | disable}`	Enable/disable RADIUS server identity check, which verifies the server domain name/IP address against the server certificate (default = enable).

⚠ It is best practice to enable RadSec over TLS whenever the FortiGate and RADIUS connection must pass through unencrypted transport. When using TCP and UDP transport modes, it is recommended to ensure the FortiGate and RADIUS connection passes through a trusted network or the connection passes through an encrypted tunnel over untrusted networks.

Examples

The following topology is used to demonstrate configurations using RADSEC over TLS and RADIUS over TCP.



Example 1: RADSEC over TLS

When using TLS, FortiOS uses port 2083 for RADIUS authentication and RADIUS accounting. There is no need to configure the RADIUS accounting separately.

Before configuring RADSEC over TLS, make sure that the CA certificate (which issues the remote RADIUS server certificate) is imported into the FortiGate trusted root store. If a customized local FortiGate client certificate is used, both the certificate and private key are imported into local FortiGate certificate store.

To configure RADSEC over TLS:

1. Configure the RADIUS server:

```
config user radius
    edit "radius-tls"
        set server "10.1.100.41"
        set secret ********
        set acct-interim-interval 600
        set radius-port 2083
        set auth-type pap
        set transport-protocol tls
        set ca-cert "CA_Cert_2"
        set client-cert "portal.fortinet-fsso"
        config accounting-server
            edit 1
                set status enable
                set server "10.1.100.41"
                set secret ********
            next
        end
    next
end
```

2. Enable fnbamd debug messages on the FortiGate to verify the RADIUS authentication triggered by client traffic requesting access to external networks, which requires user authentication by the firewall policy. Note the highlighted initial RADSEC TLS authentication, successfully completed TLS handshake, and RADIUS accounting using TLS over port 2083:

```
# diagnose debug application fnbamd -1
Debug messages will be on for 30 minutes.

# diagnose debug enable
...
[629] __fnbamd_cfg_add_radius_by_user-
[1726] fnbamd_match_and_update_auth_user-Found a matching user in CMDB 'test1'

[758] __rad_rxtx-Start rad conn timer.
...
```

Example 2: RADIUS over TCP

When using TCP, the default RADIUS ports remain same as with UDP: 1812 for authentication and 1813 for accounting.

To configure RADIUS over TCP:

1. Configure the RADIUS server:

```
config user radius
    edit "radius-tcp"
        set server "10.1.100.41"
        set secret ********
        set acct-interim-interval 600
        set transport-protocol tcp
        config accounting-server
```

```
            edit 1
                set status enable
                set server "10.1.100.41"
                set secret ********
            next
        end
    next
end
```

2. Enable fnbamd debug messages on the FortiGate to verify the RADIUS authentication triggered by client traffic requesting access to external networks, which requires user authentication by the firewall policy. Note the highlighted initial RADIUS authentication over TCP: 1812 and initial RADIUS accounting over TCP: 1813:

```
# diagnose debug application fnbamd -1
Debug messages will be on for 30 minutes.

# diagnose debug enable
...

[806] __fnbamd_rad_get_next_addr-Next available address of rad 'radius-tcp': 10.1.100.41:1812.
[981] __auth_ctx_start-Connection starts radius-tcp:10.1.100.41, addr 10.1.100.41:1812 proto:

RADIUS integrated certificate authentication for Agentless VPN

Secure connections to Agentless VPNs can be established using certificate-based authentication. Access can be granted to the user by using the content inside the Subject Alternative Name (SAN) of the user certificate to authenticate to the RADIUS server. An extra layer of security is added by ensuring that only users with valid certificates can access the VPN.

Certificate-based authentication with RADIUS supports UserPrincipalName (UPN), RFC822 Name (corporate email address) defined in the SAN extension of the certificate, the DNS defined in the user certificate as the unique identifier in the SAN field for peer user certificates, and the Subject Common Name (CN) defined in the certificate.

```
config user radius
    edit <name>
        set account-key-processing {same | strip}
        set account-key-cert-field {othername | rfc822name | dnsname | cn}
    next
end
```

`account-key-processing {same | strip}`	Account key processing operation. The FortiGate will keep either the whole domain or strip the domain from the subject identity. • `same`: Same as subject identity field (default). • `strip`: Strip domain string from subject identity field.
`account-key-cert-field {othername | rfc822name | dnsname}`	Define subject identity field in certificate for user access right checking. • `othername`: match to UPN in SAN (default). • `rfc822name`: match to RFC822 email address in SAN. • `dnsname`: match to DNS name in SAN. • `cn`: match to CN in subject.

The RADIUS server configurations are applied to the user peer configuration when the PKI user is configured.

```
config user peer
    edit <name>
        set ca <string>
        set subject <string>
        set cn <string>
        set mfa-mode subject-identity
        set mfa-server <string>
    next
end
```

When a user authenticates to FortiGate over Agentless VPN, the user presents a user certificate signed by a trusted CA to FortiGate. This CA should also be trusted by the FortiGate. See CA certificate on page 3835 for more information about importing a CA certificate to FortiGate trusted CA store. The following sequence of events occurs as the FortiGate processes the certificate for authentication:

1. The FortiGate checks whether the certificate is issued by a trusted CA. If the CA is not a public CA, FortiGate ensures that the CA certificate is uploaded and trusted by the FortiGate, and applies it to the user

peer configurations (`set ca <string>`).

2. The FortiGate verifies that the CN field of the certificate matches the CN specified in the user peer configurations (`set cn <string>`).
3. If the user peer configuration has `mfa-mode` set to `subject-identity` and the `mfa-server` is configured, then the FortiGate uses a unique identifier in the certificate to authenticate against the RADIUS server.
   - If `account-key-cert-field` is set to `othername` (the default setting), then the FortiGate uses the UPN in the certificate's SAN field to authenticate against RADIUS.
   - If `account-key-cert-field` is set to `rfc822name`, then the FortiGate uses the RFC822 Name in the certificate's SAN field to authenticate against RADIUS.
   - If `account-key-cert-field` is set to `dnsname`, then the FortiGate uses the DNS name in the certificate's SAN field to authenticate against RADIUS.
   - If `account-key-cert-field` is set to `cn`, then the FortiGate uses the CN in the certificate's subject to authenticate against RADIUS.

Some RADIUS servers do not require a password in an Access Request, while others need a valid password to return an ACCESS ACCEPT. If your RADIUS server requires a valid password to return an ACCESS ACCEPT, then you can configure an MFA password for each peer user using the `set mfa-password` command.

When you configure a user MFA password in a user peer, you must need to have a user peer configuration on the FortiGate for each user with `cn=USER`.

Example

In this example, a user certificate is issued to a user by a customer's CA. The certificate is used to authenticate the user to the Agentless VPN web portal. The administrator uses the RFC822 Name in the SAN field to authenticate against their corporate RADIUS. The Active Directory mail attribute is used to check against the RFC822 Name field.

The configuration used in this example assumes the following:

- The CA certificate has already been uploaded to the FortiGate.
- Agentless VPN has already been configured, pending the assignment of the PKI user group.

To configure the authentication settings:

1. Configure the RADIUS server:

```
config user radius
    edit "NPS-MFA"
        set server "172.18.60.214"
        set secret  XXXXXXXXXX
        set auth-type pap
        set password-encoding ISO-8859-1
        set account-key-processing strip
        set account-key-cert-field rfc822name
    next
end
```

2. Configure the local peer user:

```
config user peer
    edit "peer2"
        set ca "CA_Cert_1"
        set subject "L = Burnaby"
        set cn "test2"
        set mfa-mode subject-identity
        set mfa-server "NPS-MFA"
    next
end
```

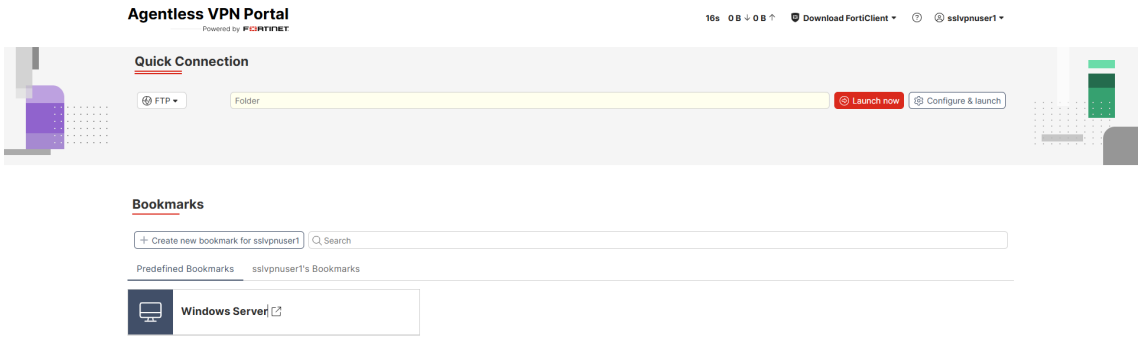
3. Configure the firewall user group for Agentless VPN authentication:

```
config user group
    edit "sslvpn-mfa"
        set member  "peer2"
    next
end
```

4. Apply the user group to the Agentless VPN configuration and firewall policy.

To verify the configuration:

When a user authenticates to Agentless VPN using their browser, the FortiOS fnbamd daemon first validates the certificate supplied by the user. If the certificate check is successful, the information in the SAN field of the user certificate is used to find a matching user record on the RADIUS server. See Agentless VPN on page 3221 for information about configuring Agentless VPN.



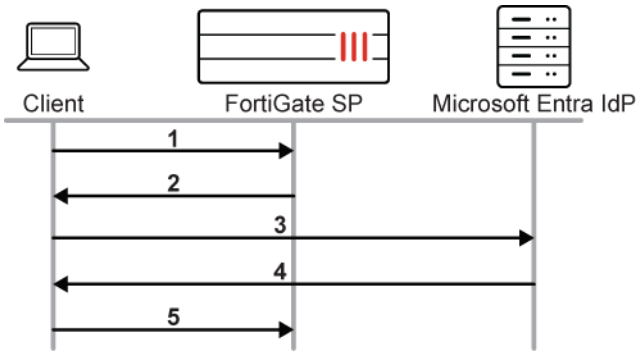
SAML

SAML authentication allows a user to complete authentication and authorization between a Service Provider (SP) and an Identity Provider (IdP). It enables Single Sign-On (SSO) by allowing users who have been authenticated against an IdP to be allowed access to different applications (the SPs providing a service such as a web application).

A FortiGate (SP) can provide a web service, such as an Agentless VPN connection, that requires users to be authenticated through SAML. The user identities for the company can be stored remotely in an IdP, such as Microsoft Entra ID. Other applications might also require authentication from the same IdP, so after a user is

authenticated once, the same SAML assertion carrying user and group information can be used to authorize the user access to the FortiGate Agentless VPN, as well as other applications.

To illustrate the communication between the user or browser, SP, and IdP:



1. The user initiates an Agentless VPN connection to the FortiGate.
2. The FortiGate SP redirects the user to the SAML IdP.
3. The user connects to the Microsoft log in page for the SAML authentication request.
4. The SAML IdP authenticates the user and sends the SAML assertion containing the user and group within the SAML response.
5. The browser forwards the SAML response to the FortiGate SP. If the user and group are allowed by the FortiGate, the user is allowed to access the application, in this case, connecting to Agentless VPN.

Usage

There are many practical uses and applications for SAML authentication on the FortiGate. For example:

- Authentication for Agentless VPN
- Authentication for IPsec VPN (with compatible FortiClient endpoint 7.2.4 and above)
- Firewall authentication for firewall policy access
- Authentication for ZTNA
- Authentication for Explicit Proxy
- Authentication for Administrative Access

Identity providers

FortiGate's SAML SSO configurations can be integrated with any common Identity providers, such as Microsoft Entra ID, Okta, Google Workspace, Onelogin, and others. You can also use FortiAuthenticator as an identity provider with local or remote user integration, or as an IdP Proxy to other IdP providers.

For more information on using FortiAuthenticator, see the FortiAuthenticator Administration Guide and FortiAuthenticator Examples Guide.

Response and assertion signing

For security purposes, FortiGate can perform signature verification for both the SAML response message and the SAML assertion carried inside the SAML response. This means that the SAML response must have a valid signature, and the SAML assertion must also have a valid signature. If the Identity Provider (IdP) provides an invalid signature, or fails to sign one of these, the FortiGate will reject the SAML response.

This check is disabled by default but can be enabled using the following configuration:

```
config user saml
    edit <name>
        set require-signed-resp-and-asrt {enable | disable}
    next
end
```

Option	Description
`enable`	Both response and assertion must be signed and valid.
`disable`	At least one of response or assertion must be signed and valid (default).

When disabled, the FortiGate performs a signature check using the following logic:

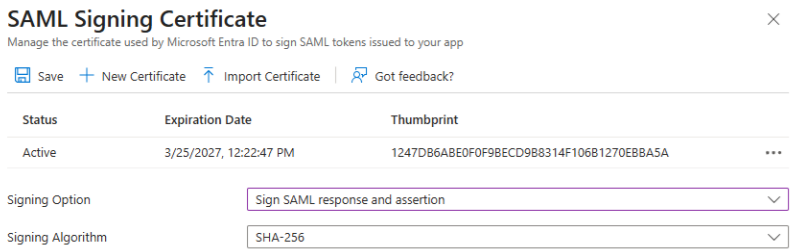
1. If the SAML response is missing signature, each SAML assertion must have a valid signature.
2. If the SAML response signature is invalid, check fails.
3. If the SAML response signature is valid, check the following:
   a. If the SAML assertion signature is missing, check passes.
   b. If the SAML assertion signature is invalid, check fails.
   c. If the SAML assertion signature is valid, check passes.

Example

Some SAML IdPs defaults to signing the SAML assertions only. To increase security, you can enable signing both the SAML response and assertion to work natively with the FortiGate.

To enable Sign SAML response and assertion in Microsoft Entra ID:

1. Go to the *Microsoft Entra admin center*.
2. Navigate to *Enterprise Applications*.
3. Select your application.
4. Go to *Single sign-on* > *SAML*.
5. Scroll to *SAML Signing Certificate* and click *Edit* (the pencil icon).
6. For *Signing Option*, choose *Sign SAML response and assertion*.



7. Click *Save*.
   For details, see Certificate signing options in a SAML token - Microsoft Entra ID | Microsoft Learn.

For other SAML IdP vendors, check the setting to enable signing both the SAML response and assertion.

If the SAML IdP vendor does not have a setting to sign both the SAML response and assertion, or fails to sign both even when configured, you can considering loosening up the requirement on the FortiGate per Response and assertion signing on page 3447.

Configuring SAML SSO

SAML Single Sign-On (SSO) can be configured from the GUI or CLI. The configurations allow administrators to set up the FortiGate as a SAML Service Provider (SP) while inputting the necessary settings for the Identity Provider (IdP).

There are many use cases for applying SAML authentication, as explained in the SAML introduction. For each use case, the configuration steps vary slightly. In general, to successfully configure SAML authentication for an application, you will need to perform the following:

1. Obtain IdP configurations from the Identity Provider. This is outside the scope of the FortiGate.
2. Create a Single Sign-On object in *User & Authentication* > *Single Sign-On*.
3. Apply the FortiGate SP URLs to the IdP.
4. Install appropriate IdP and SP certificates.
5. Configure user group with the SSO object as member.

After these steps are completed, the user group object can be applied to whatever type of policy is applicable to the use case.

Common SAML SSO settings

Configuring the IdP is outside the scope of this topic, but to successfully configure SAML on the FortiGate the following information must be obtained from the Identity Provider:

From IdP	Description
Entity ID	The identifier URL for the IdP used to identify the issuer of the SAML response or assertion.
Assertion consumer service (ACS) URL	The ACS URL, sometimes called the Login URL, informs the SP and end user where to send the Login request to the IdP.

From IdP	Description
Single logout service URL	The Single logout service URL, sometimes called the Logout URL, informs the SP and end user where to send the Logout request to the IdP.
SAML Signing Certificate	The certificate used to sign the SAML response originating from the IdP. This must be trusted by the SP in order to verify the identity of the messages from the IdP. To upload a remote certificate from the IdP, follow the instructions in Remote certificate on page 3836. Starting in FortiOS 7.6.4, the SAML IdP must sign both the SAML assertion and response. See Identity providers on page 3446.

At the same time, to complete the configurations on the IdP, it will require information about the SP from the FortiGate. The following describes the settings configured on the FortiGate, including the information needed for the IdP configuration.

To configure the FortiGate SP settings for SSO in the GUI:

1. Go to *User & Authentication* > *Single Sign-On* and click *Create new*.
2. Configure the SP settings:

Setting	Description
Name	Name of the SSO object.
Address	FQDN or IP address that clients will be connecting to. If this requires a non-standard port (eg. 443), specify the port in this format *<address>:<port>*.
Entity ID	The identifier URL for the SP used to identify the issuer of the SAML request. This URL must be provided to the IdP. Modifying the URL must be done in CLI.
Assertion consumer service URL	The ACS URL, sometimes referred to as the reply URL or the single sign-on URL, informs the IdP and end user the URL to send the SAML Assertion for login to. This URL must be provided to the IdP. Modifying the URL must be done in CLI.
Single logout service URL	The logout URL informs the IdP and end user the URL to send the request to logout to. This URL must be provided to the IdP. Modifying the URL must be done in CLI.
Certificate	The certificate used to sign the SAML messages originating from the SP to the IdP. This is typically an optional configuration.

3. Click *Next*.
4. Configure the IdP settings:

Setting	Description
Type	• *Fortinet Product*: If the IdP is a FortiAuthenticator or FortiTrust-ID,

Setting	Description
	IdP configurations are simplified. See FortiAuthenticator Admin Guide > Authentication > SAML IdP for more information • *Custom*: If the IdP is any other vendor, or you want to configure each field manually, select this option.
Fortinet Product setup	
Address	Enter the address of the FortiAuthenticator or FortiTrust-ID that users will access to authenticate to the IdP.
Prefix	Enter the prefix specified by the FortiAuthenticator or FortiTrust-ID.
Certificate	Select the SAML Signing certificate from the IdP. If this is not yet uploaded, use the *Import* option to import the remote certificate.
Custom setup	
Entity ID	Input the Entity ID URL from the IdP. See Entity ID on page 3448.
Assertion consumer service URL	Input the ACS URL from the IdP. See Assertion consumer service (ACS) URL on page 3448.
Single logout service URL	Input the Single logout service URL from the IdP. See Single logout service URL on page 3449.
Certificate	Select the SAML Signing certificate from the IdP. If this is not yet uploaded, use the *Import* option to import the remote certificate. See SAML Signing Certificate on page 3449.
Additional SAML Attributes	
AD FS claim	This setting is only available after the initial SSO object has been configured. Enable this setting to select the attribute names based on Active Directory Federated Services (AD FS) claim types.
User claim type	Select the AD FS claim type that will be used to match the user within the SAML assertion statement.
Group claim type	Select the AD FS claim type that will be used to match the group within the SAML assertion statement.
Attribute used to identify users	Specify the name of the attribute for a user within the SAML assertion statement. This value is case sensitive. If AD FS claim is enabled, this field will be auto-populated to reflect the claim type.
Attribute used to identify groups	Specify the name of the attribute for a group within the SAML assertion statement. This value is case-sensitive. If AD FS claim is enabled, this field will be auto-populated to reflect the claim type.

5. Click *Submit*.

To configure the FortiGate SP settings for SSO in the CLI:

```
config user saml
    edit <name>
        set adfs-claim [enable|disable]
        set cert {string}
        set clock-tolerance {integer}
        set digest-method [sha1|sha256]
        set entity-id {string}
        set group-claim-type [email|given-name|...]
        set group-name {string}
        set idp-cert {string}
        set idp-entity-id {string}
        set idp-single-logout-url {string}
        set idp-single-sign-on-url {string}
        set limit-relaystate [enable|disable]
        set reauth [enable|disable]
        set single-logout-url {string}
        set single-sign-on-url {string}
        set user-claim-type [email|given-name|...]
        set user-name {string}
    next
end
```

Setting	Description
`adfs-claim`	See AD FS claim on page 3450.
`cert`	The SP certificate used to sign SAML messages.
`clock-tolerance`	A SAML assertion is only valid for a specific duration. When the FortiGate SP and the SAML IdP clocks are not in synchronization, use clock-tolerance to define the number of seconds that the skew in time is tolerated. The setting is only available in the CLI.
`digest-method`	The type of hash used to compute the hash value of the content of the SAML assertion. The setting is only available in the CLI.
`entity-id`	The SP Entity ID.
`group-claim-type`	Specify the group claim type when `adfs-claim` is enabled.
`group-name`	The attribute used to identify a group within the SAML assertion statement.
`idp-cert`	The SAML Signing certificate from the IdP.
`idp-entity-id`	The Entity ID from the IdP.
`idp-single-logout-url`	The Single logout service URL from the IdP.
`idp-single-sign-on-url`	The ACS URL, sometimes called the Login URL, from the IdP.
`limit-relaystate`	Enable/disable limiting the relay-state parameter when it exceeds SAML 2.0 specification limits (80 bytes).

Setting	Description
	The setting is only available in the CLI.
`reauth`	Enable/disable signaling the IdP to force user re-authentication. The SAML AuthnRequest is set to ForceAuthn=”true”. The setting is only available in the CLI.
`single-logout-url`	The Single logout service URL from the SP.
`single-sign-on-url`	The ACS URL, sometimes referred to as the reply URL or the single sign-on URL, from the SP.
`user-claim-type`	Specify the user claim type when `adfs-claim` is enabled.
`user-name`	The attribute used to identify a user within the SAML assertion statement.

Other SAML related global settings

Authentication port

By default, the FortiGate listens on port 1003 for incoming authentication requests when traffic matches an identity based firewall policy. As a SAML SP with an identity based firewall policy configured for the SAML user group, the FortiGate will use the same port to listen for SAML authentication requests and redirect them to the IdP.

To change the default port:

```
config system global
    set auth-https-port <port>
end
```

Configuring the user authentication setting

When the FortiGate receives an authentication request in an identity based firewall policy, the authentication daemon uses a local server certificate to secure the connection. The client making the authentication request must trust the certificate presented by the FortiGate that is acting as the TLS server.

In SAML authentication, when a user initiates traffic to the SP, the traffic matches the identity based firewall policy which triggers the authentication request to hit the authentication daemon. The server certificate used by the authentication daemon must be trusted by the user, otherwise they will receive a certificate warning. To avoid a certificate warning, use a custom certificate that the user trusts.

To configure a custom certificate in the GUI:

1. Go to *User & Authentication* > *Authentication Settings*.
2. Set *Certificate* to the custom certificate.
   If the certificate is not available, click *Create* to create or import a new custom certificate.
   The custom certificate's SAN field should have the FQDN or IP address from the SP URL.

To configure a custom certificate in the CLI:

```
config user setting
    set auth-cert <custom certificate name>
end
```

Alternatively, assigning a CA certificate allows the FortiGate to automatically generate and sign a certificate for the authentication daemon. This will override any assigned server certificate.

To assign a CA certificate:

1. Edit the user setting :

```
config user setting
    set auth-ca-cert <CA certificate name>
end
```

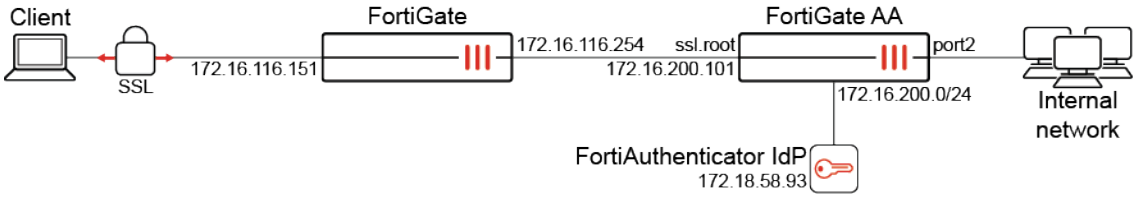
2. Go to *System* > *Certificates* and download the certificate.
3. Install the certificate into the client's certificate store.

Agentless VPN with FortiAuthenticator as a SAML IdP

A FortiGate can act as a SAML service provider (SP) for Agentless VPN that requests authentication from a SAML identity provider (IdP), such as Entra ID, Okta, Fortinet's FortiAuthenticator, or others. The following example shows the use of FortiAuthenticator as the IdP.

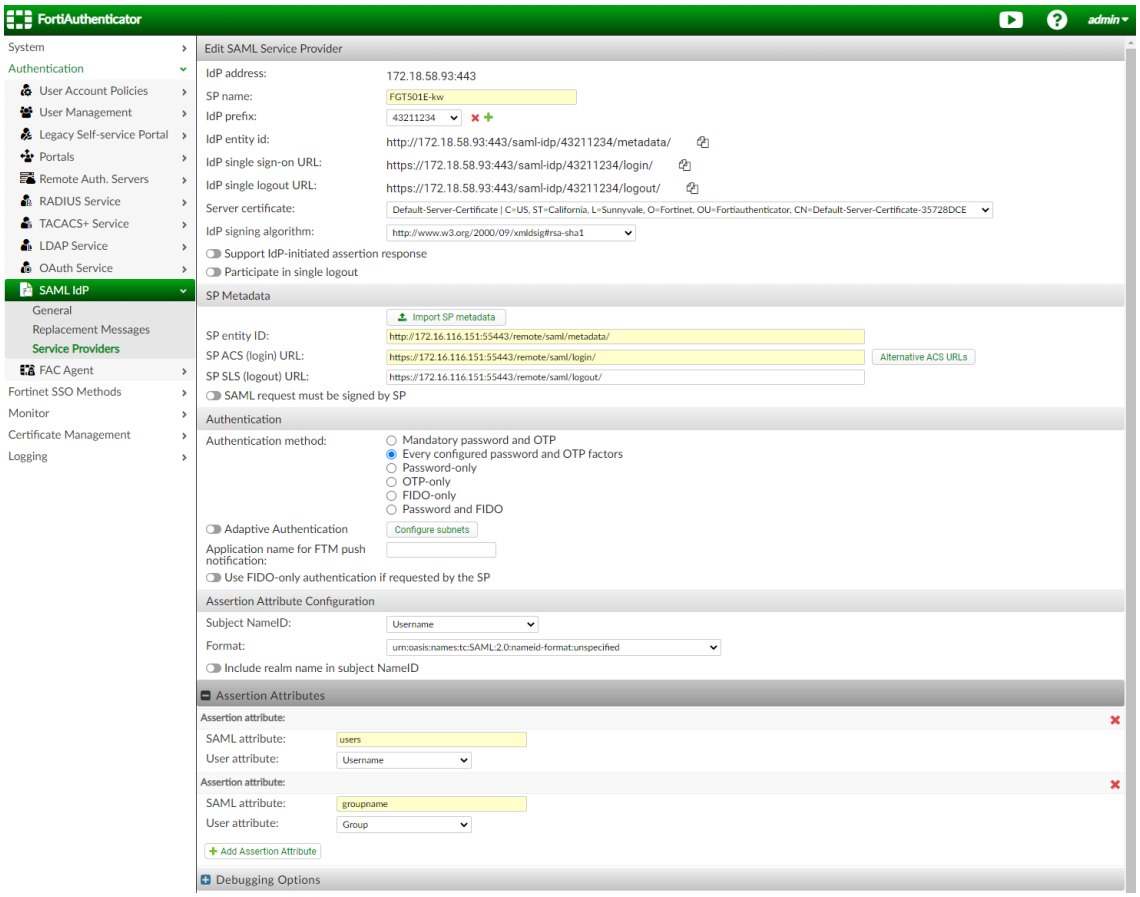
Using FortiAuthenticator as an IdP

In this example, FortiGate AA is the inside firewall (172.16.200.101). The other FortiGate is the outside firewall that only does port forwarding from 172.16.116.151:55443 to 172.16.200.101:443. FortiGate AA is configured to allow full Agentless VPN access to the network in port2.



This Agentless VPN portal allows users from the user group *saml_grp* and SAML server *saml_test* to log in. The FortiAuthenticator acts as the SAML identity provider (IdP), while the FortiGate is the SAML SP. External users are directed to the FortiAuthenticator IdP login URL to authenticate.

The FortiAuthenticator in this example has the following configuration:

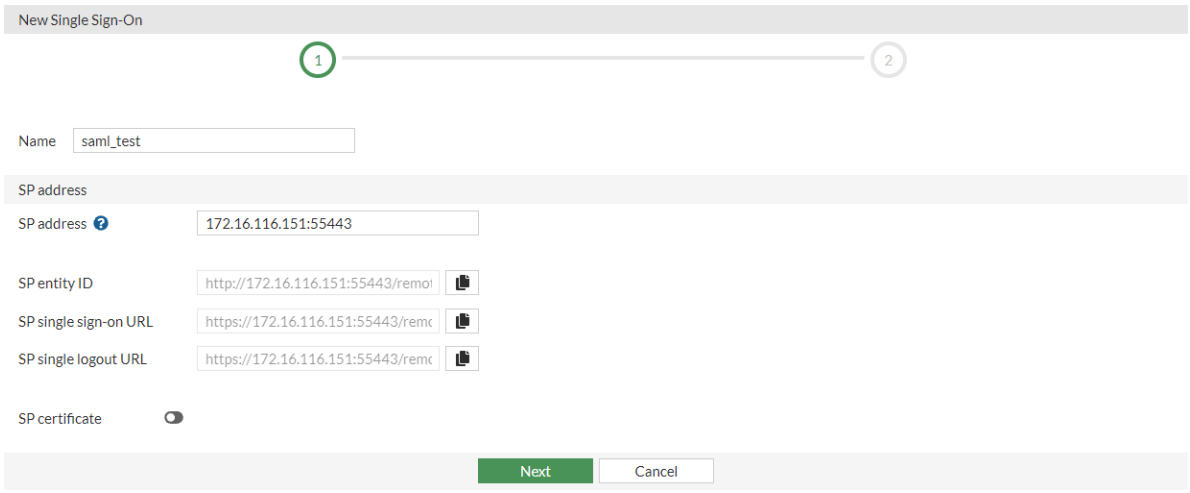


For a deep-dive into how to configure FortiAuthenticator as an IdP, including integration with Windows AD via LDAP for user authentication, see the FortiGate Agentless VPN with FortiAuthenticator as SAML IdP section in the FortiAuthenticator Examples Guide.

This example also demonstrates using FortiAuthenticator to act as a root CA to sign certificates for the SP, IdP, and Agentless VPN portal.

To configure FortiGate AA as an SP:

1. Create a new SAML server entry:
   a. Go to *User & Authentication* > *Single Sign-On* and click *Create New*. The single-sign on wizard opens.
   b. Enter a name (*saml_test*). The other fields will automatically populate based on the FortiGate's WAN IP and port.



Click the icon beside the *SP entity ID*, *SP single sign-on URL*, and *SP single logout URL* fields to copy the text.

c. Click *Next*.

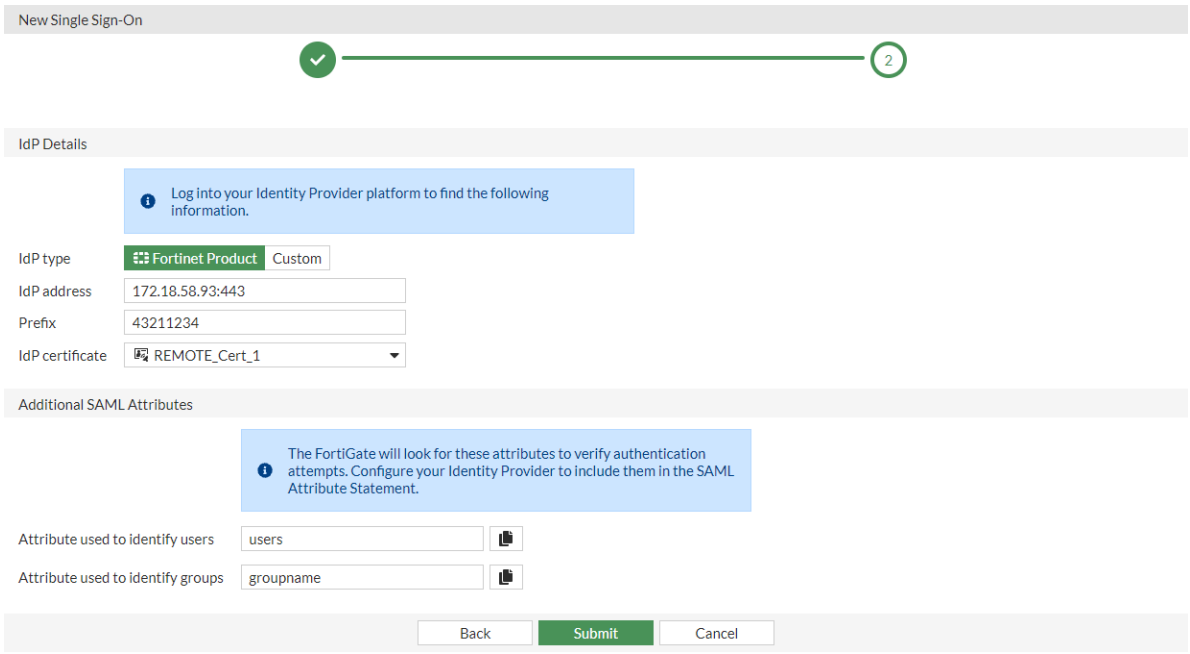
d. Enter the FortiAuthenticator IdP details:

IdP address	172.18.58.93:443
Prefix	43211234
IdP certificate	REMOTE_Cert_1

e. Enter the additional SAML attributes that will be used to verify authentication attempts:

Attribute used to identify users	users
Attribute used to identify groups	groupname

The IdP must be configured to include these attributes in the SAML attribute statement. In FortiAuthenticator, this is configured in the *Assertion Attributes* section.



f. Click *Submit*.

The following is created in the backend:

```
config user saml
    edit "saml_test"
        set cert "fgt_gui_automation"
        set entity-id "http://172.16.116.151:55443/remote/saml/metadata/"
        set single-sign-on-url "https://172.16.116.151:55443/remote/saml/login/"
        set single-logout-url "https://172.16.116.151:55443/remote/saml/logout/"
        set idp-entity-id "http://172.18.58.93:443/saml-idp/43211234/metadata/"
        set idp-single-sign-on-url "https://172.18.58.93:443/saml-idp/43211234/login/"
        set idp-single-logout-url "https://172.18.58.93:443/saml-idp/43211234/logout/"
        set idp-cert "REMOTE_Cert_1"
        set user-name "users"
        set group-name "groupname"
        set digest-method sha1
    next
end
```

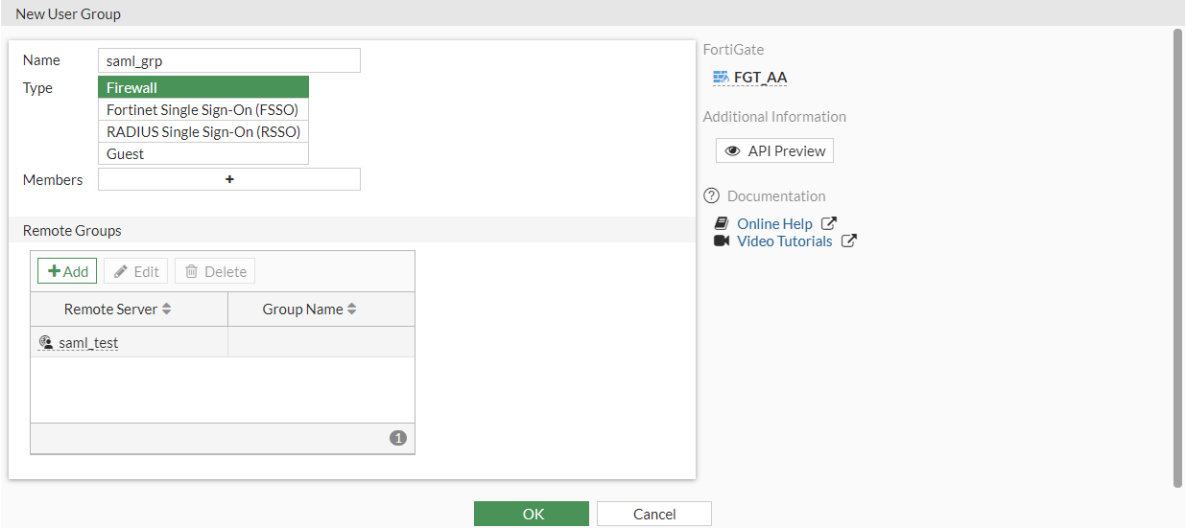
2. Create the SAML group:

a. Go to *User & Authentication* > *User Groups* and click *Create New*.

b. Enter a name, *saml_grp*.

c. In the *Remote Groups* table, click *Add*.

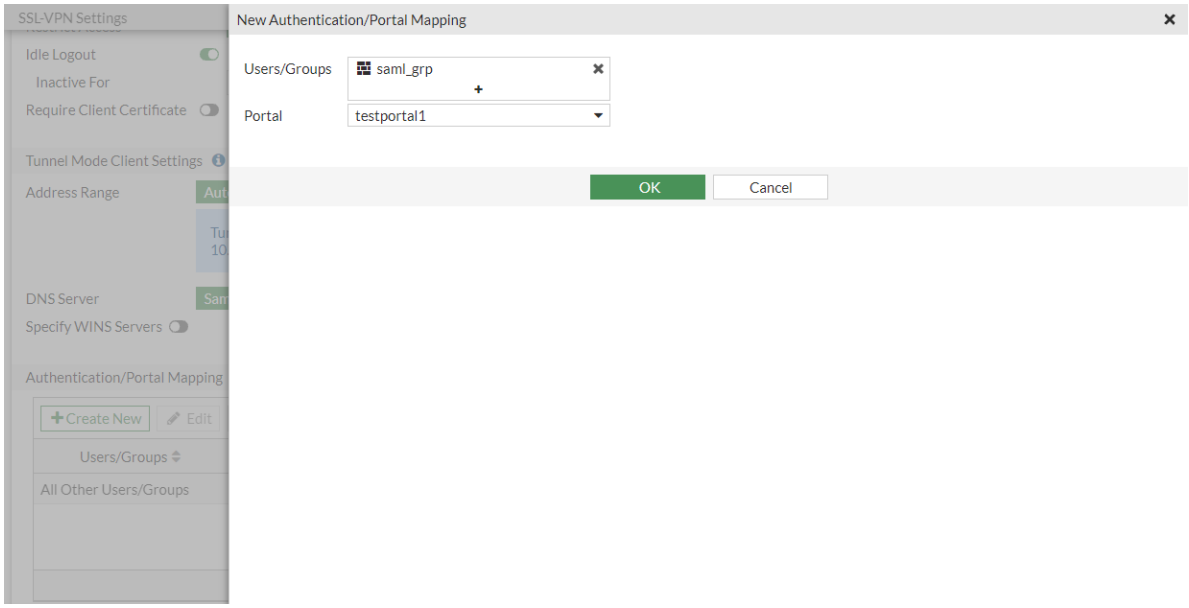
d. In the *Remote Server* dropdown, select *saml_test* and click *OK*.



e. Click *OK*.
The following is created in the backend:

```
config user group
    edit "saml_grp"
        set member "saml_test"
    next
end
```

3. Add the SAML group in the Agentless VPN settings:
   a. Go to *VPN > Agentless VPN Settings*.
   b. In the *Authentication/Portal Mapping* table, click *Create New*.
   c. For *Users/Groups*, click the + and select *saml_grp*.
   d. Select the *Portal* (*testportal1*).
   e. Click *OK*.



f. Click *Apply*.

4. Configure the firewall policy:
   a. Go to *Policy & Objects* > *Firewall Policy* and click *Create New*.
   b. Enter the following:

Incoming Interface	ssl.root
Outgoing Interface	port2
Source	all, saml_grp, saml_test

   c. Configure the other settings as needed.
   d. Click *OK*.
5. On the client, log in with SAML using the Agentless VPN web portal.
6. In FortiOS, go to *Dashboard* > *Agentless VPN Monitor* to expand to full view and verify the connection information.

   If the Agentless VPN Monitor is hidden, click + under the *Dashboard*, search for *Agentless VPN Monitor*, and add it to the display.

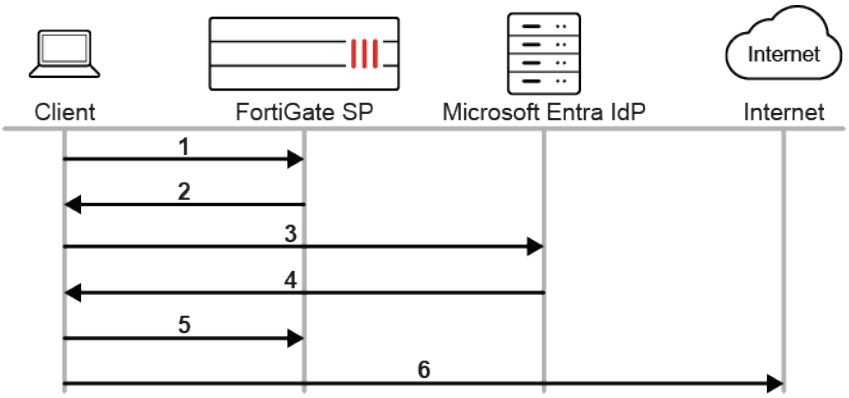
IPsec VPN with SAML IdP

For information about configuring IPsec VPN with SAML IdP, see SAML-based authentication for FortiClient remote access VPNs on page 2992.

Outbound firewall authentication with Microsoft Entra ID as a SAML IdP

In this example, users are managed through Microsoft Entra ID (formerly Azure Active Directory). The FortiGate is configured for SSO firewall authentication for outbound traffic, with authentication performed by the Microsoft Entra ID as a SAML identity provider (IdP).

The SAML interaction occurs as follows:

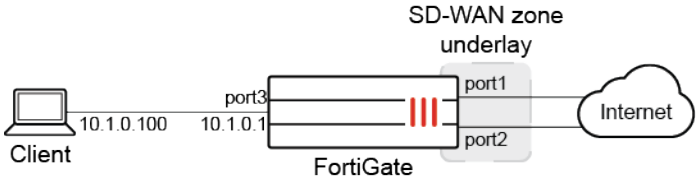


1. The user initiates web traffic to the internet.
2. The FortiGate redirects to the local captive portal port (default is 1003), then redirects the user to the SAML IdP.
3. The user connects to the Microsoft log in page for the SAML authentication request.
4. The SAML IdP sends the SAML assertion containing the user and group.
5. The browser forwards the SAML assertion to the SAML SP.
6. If the user and group are allowed by the FortiGate, the user is allowed to access the internet.

In this example environment, a user is added in the Microsoft Entra ID belonging to the security group called Firewall.

- Username: John Locus
- User login: jlocus@azure.kldocs.com
- Group: Firewall (ID 62b699ce-4f80-48c0-846e-c1dfde2dc667)

The goal is to allow users in the Firewall group to access the internet after passing firewall authentication.



Configuring the Microsoft Entra ID

The following Microsoft Entra ID configuration demonstrates how to add the FortiGate as an enterprise non-gallery application. This application provides SAML SSO connectivity to the Microsoft Entra IdP. Some steps are performed concurrently on the FortiGate.

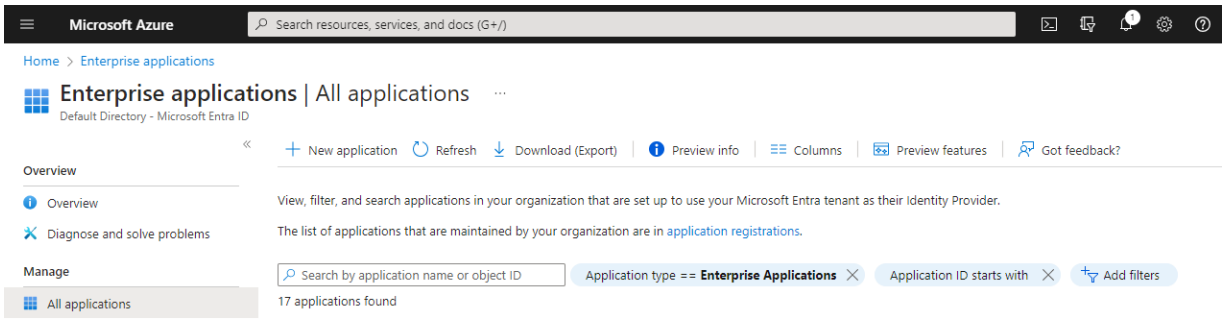
> This example is configured with an Microsoft Entra ID free-tier directory. There may be limitations to managing users in Azure in this tier that are not limited in other tiers. Consult the Microsoft Entra ID documentation for more information.

There are three steps to configure the Microsoft Entra ID:

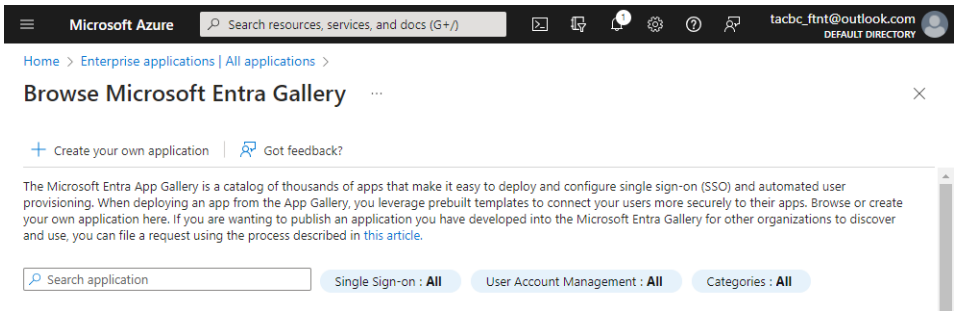
1. Create a new enterprise application.
2. Configure the SAML SSO settings on the application and FortiGate.
3. Assign Microsoft Entra ID users and groups to the application.

To create a new enterprise application:

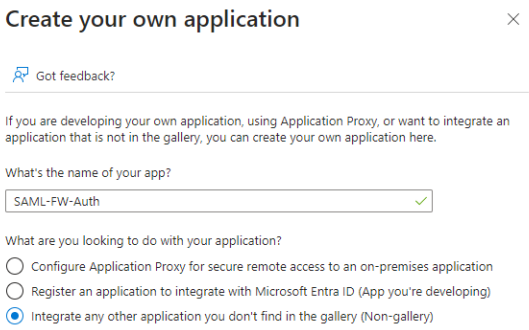
1. Log in to the Azure portal.
2. In the Azure portal menu, click *Microsoft Entra ID*.
3. In the left-side menu go *Manage* > *Enterprise applications*.
4. Click *New application*.



5. Click *Create your own application*.



6. Enter a name for the application (*SAML-FW-Auth*) and select *Integrate any other application you don't find in the gallery (Non-gallery)*.

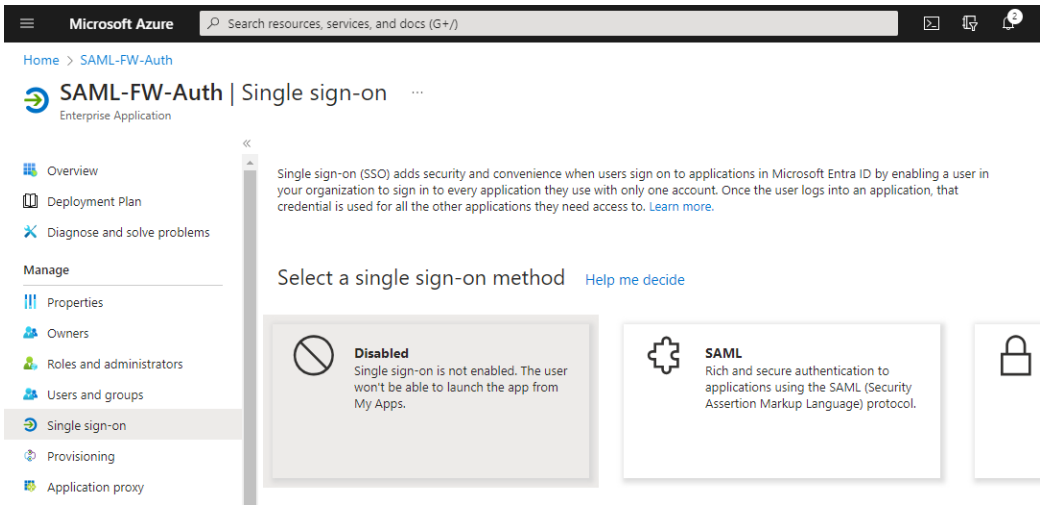


7. Click *Create*.

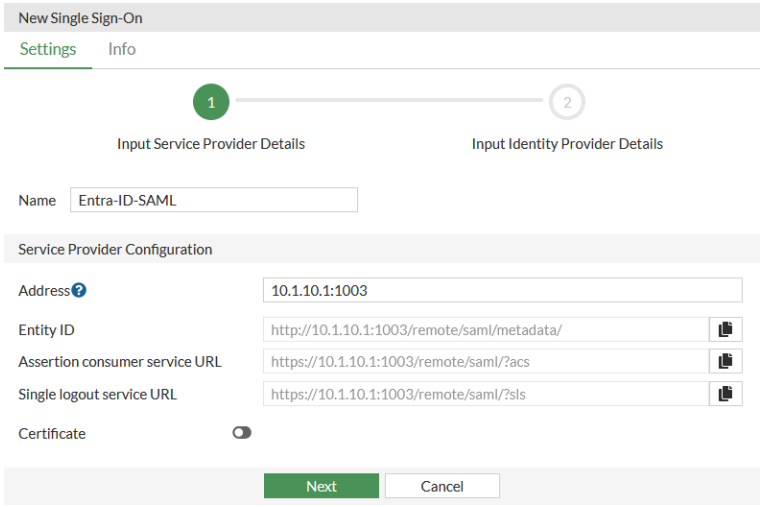
To configure the SAML SSO settings on the application and FortiGate:

This procedure requires going back and forth between Azure and the FortiGate GUI. Leave the FortiGate GUI open for the entire procedure.

1. On the *Overview* page for your new application, go to *Manage* > *Single sign-on* and select *SAML* as the single sign-on method.



2. The *Basic SAML Configuration* section in Azure describes the SAML SP entity and links that Azure will reference. Configure these settings on the FortiGate by creating a new SAML server object and defining the SP address. The SP (IP or FQDN) address should be accessible by the user who is authenticating against the firewall. The port used should match the port used by the FortiGate firewall authentication captive portal. By default, this is port 1003 for HTTPS. A captive portal does not need to be configured separately.
   a. Go to *User & Authentication > Single Sign-On* and click *Create New*.
   b. Enter a *Name* for the SAML object, *Entra-ID-SAML*.
   c. Enter the *SP address*, *10.1.0.1:1003*. The three SP URLs are automatically populated.

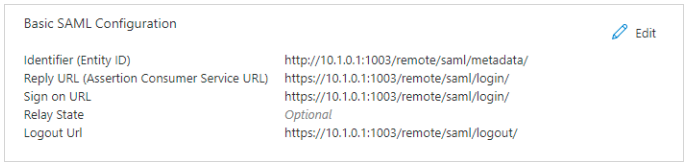


3. In Azure on the *Set up Single Sign-On with SAML* page, copy the following URLs from the FortiGate to the *Basic SAML Configuration* section:

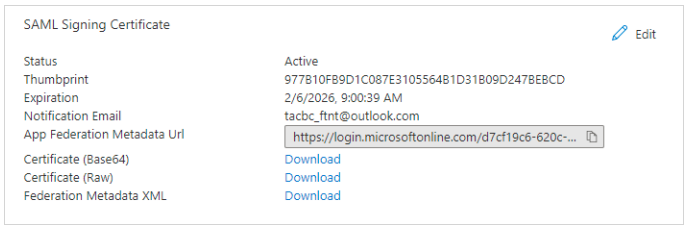
From FortiGate	To Azure field
Entity ID (http://10.1.0.1:1003/remote/saml/metadata/)	*Identifier (Entity ID)*, set to *Default*
Assertion consumer service URL (https://10.1.0.1:1003/remote/saml/login/)	*Reply URL* and *Sign on URL*

From FortiGate	To Azure field
Single logout service URL (https://10.1.0.1:1003/remote/saml/logout/)	*Logout URL*

4. Click *Save*.



5. Under the *SAML Signing Certificate* section, download the Base64 certificate.



6. Import the certificate from Azure on the FortiGate as the IdP certificate:
   a. Go to *System* > *Certificates* and click *Create/Import* > *Remote Certificate*.
   b. Upload the certificate from Azure and click *OK*. The new certificate appears under the *Remote Certificate* section with the name *REMOTE_Cert_(N)*.
   c. Optionally, rename the certificate in the CLI to give it a more recognizable name:

```
config vpn certificate remote
    rename REMOTE_Cert_3 to ENTRA_ID_SAML_FW
end
```

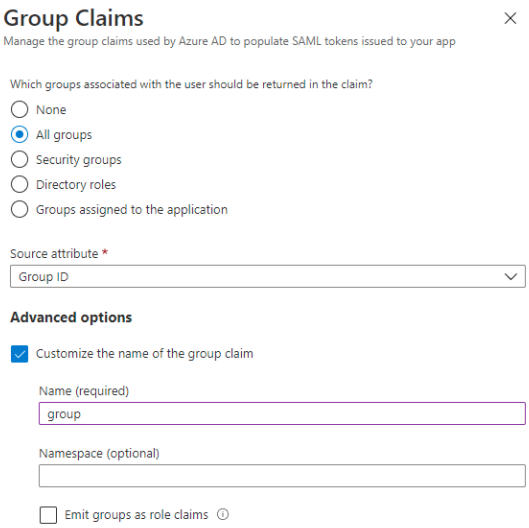
7. In the *Set up <application name>* section, copy the URLs from Azure to the FortiGate in the *IdP Details* section:

   a. On the FortiGate, click *Next*.
   b. For *IdP type*, select *Custom* and copy the following from Azure to the corresponding field:

From Azure	To FortiGate field
Microsoft Entra Identifier	*Entity ID*
Login URL	*Assertion consumer service URL*
Logout URL	*Single logout service URL*

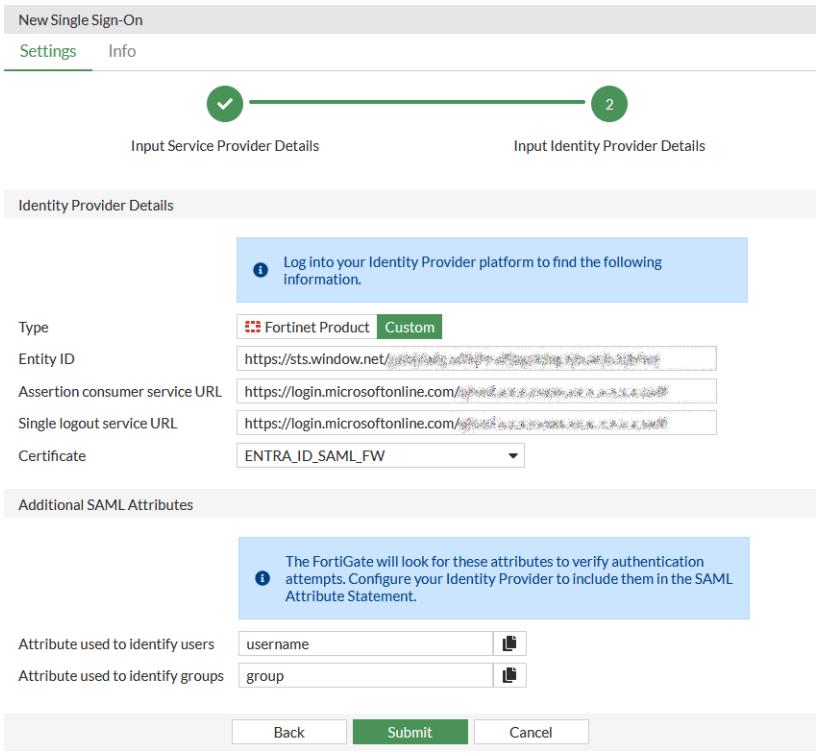
   c. For *Certificate*, select the remote certificate imported earlier.
8. In Azure, edit the *User Attributes & Claims* section. The attributes are returned in the SAML assertion, which the FortiGate uses to verify the user and group. Configuring group matching is optional.

a. Click *Add new claim*, name it *username*, and set the *Source attribute* to *user.displayname*. The source attribute can be any of the related username fields. The value of the username returned to the FortiGate will be used in logs and monitors to identify the user.
b. Click *Save*.
c. Click *Add a group claim* and in the *Group Claims* pane, select *All groups*.
d. In *Advanced Options*, select *Customize the name of the group claim*. Set the name to *group*.



e. Click *Save*. The *User Attributes & Claims* section displays the update settings.

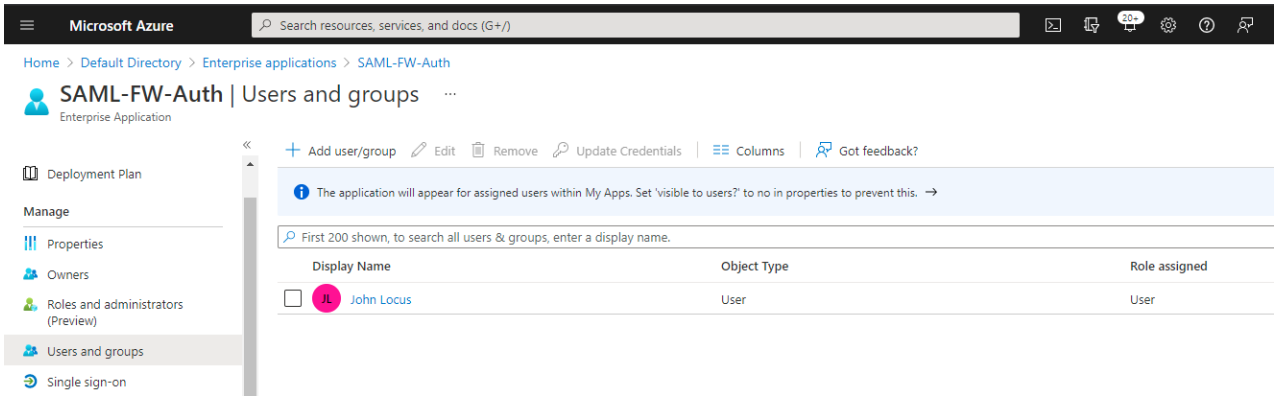
9. On the FortiGate, update the *Additional SAML Attributes* section with the username and group created in Azure:
   a. For *Attribute used to identify users*, enter *username*.
   b. For *Attribute used to identify groups*, enter *group*.



c. Click *Submit*.

To assign Microsoft Entra users and groups to the application:

1. In Azure, go to the application's *Overview* page.
2. Go to *Manage* > *Users and groups* and click *Add user/group*.
3. Click *Users* to select the users or groups (*John Locus* is selected in this example).
4. Click *Assign* to add the assignment.



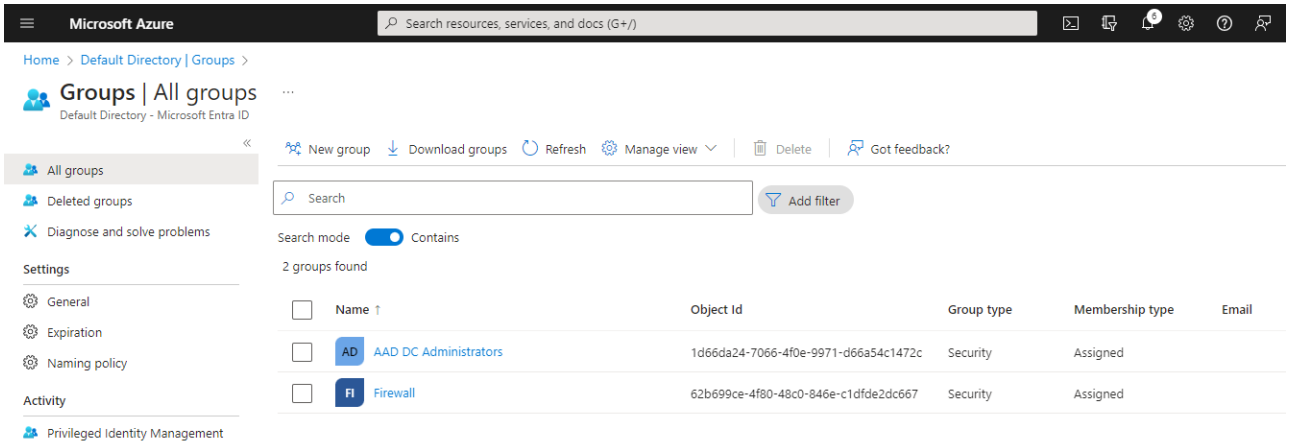
Configuring the FortiGate

The user group, user authentication settings, and firewall policies must be configured on the FortiGate.

Configuring the user group

A user group named *Azure-FW-Auth* is created with the member *Entra-ID-SAML*.

Configuring group matching is optional, and the *Object ID* from Azure is needed for the `config match` settings. In the Azure default directory, go to *Manage* > *Groups* and locate the *Object ID* for the *Firewall* group.



To configure the user group:

```
config user group
    edit "Azure-FW-Auth"
        set member "Entra-ID-SAML"
        config match
            edit 1
                set server-name "Entra-ID-SAML"
                set group-name "62b699ce-4f80-48c0-846e-c1dfde2dc667"
            next
        end
    next
end
```

Configuring the user authentication setting

When a user initiates traffic, the FortiGate will redirect the user to the firewall authentication captive portal before redirecting them to the SAML IdP portal. After the SAML IdP responds with the SAML assertion, the user is again redirected to the firewall authentication captive portal. If the firewall portal's certificate is not trusted by the user, they will receive a certificate warning. Use a custom certificate that the user trusts to avoid the certificate warning.

To configure a custom certificate:

1. Go to *User & Authentication* > *Authentication Settings*.
2. For *Certificate*, select the custom certificate. The custom certificate's SAN field should have the FQDN or IP from the SP URL.

Alternatively, assigning a CA certificate allows the FortiGate to automatically generate and sign a certificate for the portal page. This will override any assigned server certificate. In this example, the built-in Fortinet_CA_SSL is used.

To assign a CA certificate:

1. Edit the user setting:

```
config user setting
    set auth-ca-cert "Fortinet_CA_SSL"
end
```

2. Go to *System* > *Certificates* and download the certificate.
3. Install the certificate into the client's certificate store.

Configuring the firewall policies

Firewall policies must be configured to apply user authentication and still allow users behind the FortiGate to access the Microsoft log in portal without authentication.

To configure the firewall policies:

1. Configure a policy to allow traffic to the Microsoft Azure internet service:
   a. Go to *Policy & Objects* > *Firewall Policy* and click *Create New*.
   b. Enter the following:

Name	*LAN-to-AuthPortal*
Incoming Interface	*port3*
Outgoing Interface	*Underlay*
Source	*all*
Destination	*Microsoft-Azure* (under *Internet Service*)
Schedule	*always*
Service	*ALL*
Action	*ACCEPT*
NAT	Enable and select *NAT*.
Log Allowed Traffic	Enable and select *All Sessions*.

   c. Configure the other settings as needed.
   d. Click *OK*.
2. Configure a policy to apply user authentication:

a. Click *Create New* and enter the following:

Name	*LAN-auth-policy*
Incoming Interface	*port3*
Outgoing Interface	*Underlay*
Source	*all*, *Azure-FW-Auth*
Destination	*all*
Schedule	*always*
Service	*ALL*
Action	*ACCEPT*
NAT	Enable and select *NAT*.
Log Allowed Traffic	Enable and select *All Sessions*.

b. Configure the other settings as needed.

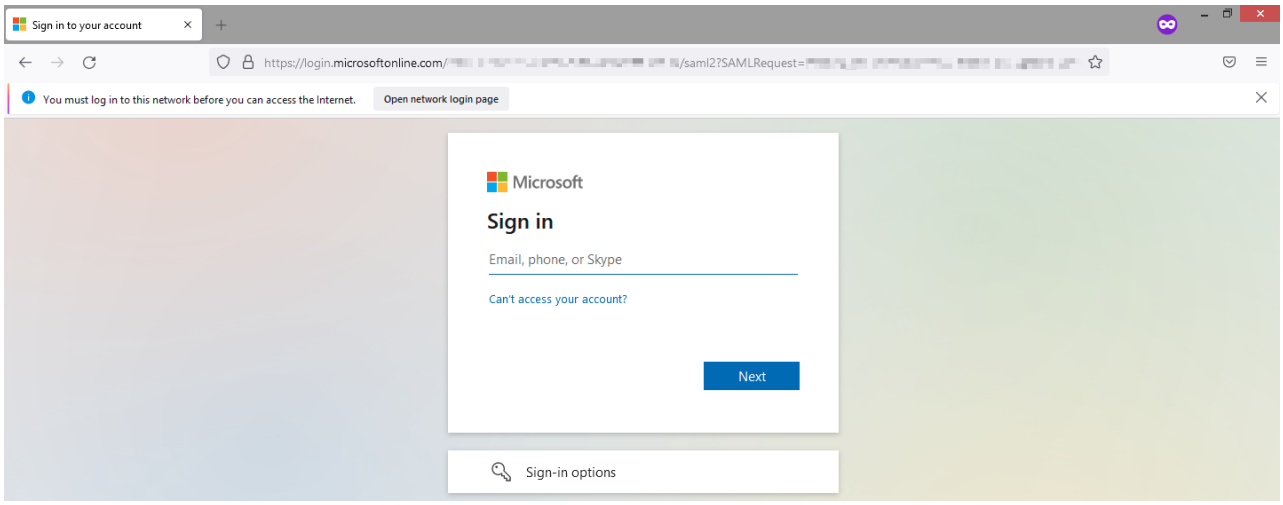
c. Click *OK*.

Connecting from the client

When the client connects to the internet from a browser, they will be redirected to the Microsoft log in page to authenticate against the Microsoft Entra ID. The FortiGate's authentication portal certificate should be installed on the client.

To connect from the client:

1. On the client, open a browser (such as Firefox) and go to a website. The user is redirected to the Microsoft log in page.
2. Enter the user credentials.



3. If the log in attempt is successful, the user is allowed to access the internet

Viewing logs and diagnostics

To verify user logins, go to the *Dashboard > Assets & Identities* and expand the *Firewall Users* widget, or enter the following in the CLI:

```
# diagnose firewall auth list
10.1.0.100, John Locus
        src_mac: 02:09:0f:00:03:03
        type: fw, id: 0, duration: 152, idled: 7
        expire: 292, allow-idle: 300
        server: Entra-ID-SAML
        packets: in 2097 out 932, bytes: in 2208241 out 143741
        group_id: 2
        group_name: Azure-FW-Auth
----- 1 listed, 0 filtered ------
```

To verify user login logs, go to *Log & Report > System Events* and select the *User Events* card, or enter the following in the CLI:

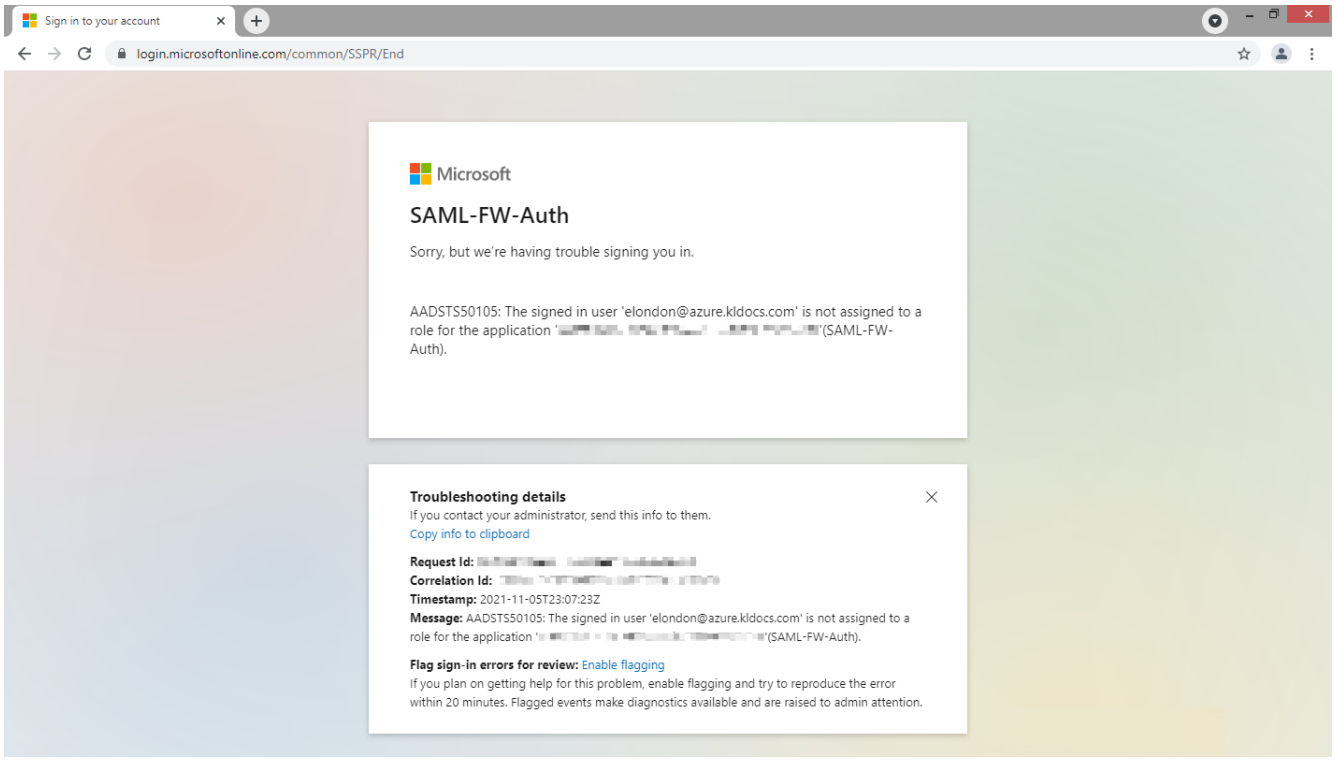
```
# execute log filter category event
# execute log filter field subtype user
# execute log display
17 logs found.
10 logs returned.
7: date=2021-09-30 time=09:49:25 eventtime=1633020565577584390 tz="-0700" logid="0102043039"
type="event" subtype="user" level="notice" vd="root" logdesc="Authentication logon"
srcip=10.1.0.100 user="John Locus" authserver="Entra-ID-SAML" action="auth-logon" status="logon"
msg="User John Locus added to auth logon"

8: date=2021-09-30 time=09:49:25 eventtime=1633020565577075629 tz="-0700" logid="0102043008"
type="event" subtype="user" level="notice" vd="root" logdesc="Authentication success"
srcip=10.1.0.100 dstip=10.1.0.1 policyid=11 interface="port3" user="John Locus" group="Azure-FW-
Auth" authproto="HTTPS(10.1.0.100)" action="authentication" status="success" reason="N/A"
msg="User John Locus succeeded in authentication"
```

If user authentication is successful in Microsoft Entra ID, but their group does not match the one defined in the FortiGate user group, the user will receive a *Firewall Authentication Failed* message in the browser. A log is also recorded:

```
# execute log filter category event
# execute log filter field subtype user
# execute log display
1: date=2021-09-30 time=10:39:35 eventtime=1633023575381139214 tz="-0700" logid="0102043009"
type="event" subtype="user" level="notice" vd="root" logdesc="Authentication failed"
srcip=10.1.0.100 dstip=10.1.0.1 policyid=11 interface="port3" user="Adam Thompson" group="N/A"
authproto="HTTPS(10.1.0.100)" action="authentication" status="failure" reason="No matched SAML
user or group name in auth resp" msg="User Adam Thompson failed in authentication"
```

If a user receives the following error message, this means the user is not assigned to the enterprise application *SAML-FW-Auth* in Azure.



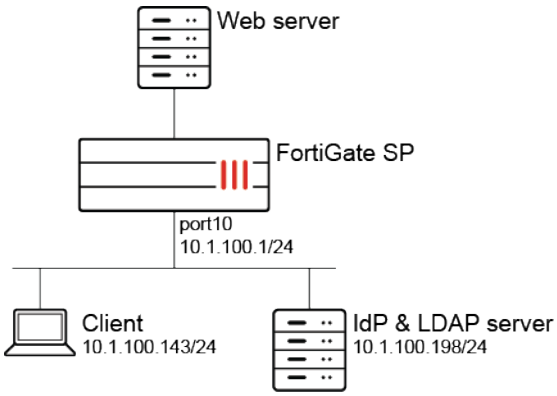
To troubleshoot SAML issues:

```
# diagnose debug application samld -1
# diagnose debug enable
```

SAML authentication in a proxy policy

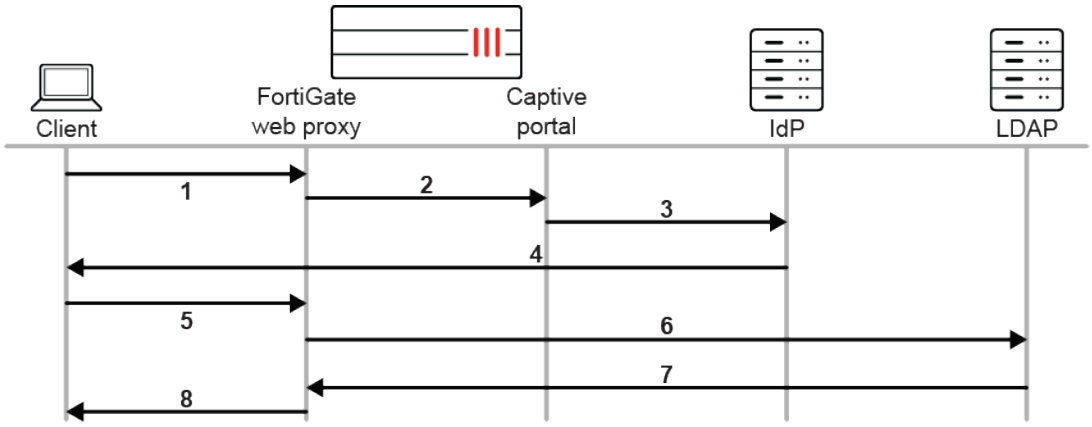
SAML user authentication can be used in explicit web proxies and transparent web proxies with the FortiGate acting as a SAML SP. SAML can be used as an authentication method for an authentication scheme that requires using a captive portal.

Topology



In this configuration, SAML authentication is used with an explicit web proxy. The IdP is a Windows 2016 server configured with ADFS. The LDAP and IdP servers are on the same server. The LDAP server is used as the user backend for the IdP to perform authentication; however, they are not required to be on the same server.

The authentication and authorization flow is as follows:



1. The client opens a browser and visits https://www.google.com.
2. The browser is redirected by the web proxy the captive portal.
3. The request is redirected to the IdP's sign-in page.
4. If the user signs in, the IdP authenticates the user and sends back a SAML assertion message to the user's browser with the user group information.
5. The browser forwards the SAML assertion response as a HTTP POST to the FortiGate SAML assertion consumer service URL (https://fgt9.myqalab.local:7831/XX/YY/ZZ/saml/login/).
6. If the FortiGate authentication scheme has a user database configured, the FortiGate will query the LDAP server for the user group information and ignore the user group information from the SAML message.
7. The user group information is returned. The FortiGate matches the user group information against the LDAP group in the proxy policy group settings. If there is a match, the request is authorized and the proxy policy is matched.
8. If all policy criteria match successfully, then the webpage is returned to the client.

To configure SAML authentication with an explicit web proxy:

1. Enable the web proxy:

```
config web-proxy explicit
    set status enable
    set http-incoming-port 8080
end
```

2. Enable the proxy captive portal:

```
config system interface
    edit "port10"
        set vdom "vdom1"
        set ip 10.1.100.1 255.255.255.0
        set allowaccess ping https ssh snmp http telnet
        set type physical
        set explicit-web-proxy enable
        set explicit-ftp-proxy enable
        set proxy-captive-portal enable
        set snmp-index 12
    next
end
```

3. Configure the LDAP server:

```
config user ldap
    edit "ldap-10.1.100.198"
        set server "10.1.100.198"
        set cnid "cn"
        set dn "dc=myqalab,dc=local"
        set type regular
        set username "cn=fosqa1,cn=users,dc=myqalab,dc=local"
        set password ************
        set group-search-base "dc=myqalab,dc=local"
    next
end
```

4. Configure the user group:

```
config user group
    edit "ldap-group-saml"
        set member "ldap-10.1.100.198"
    next
end
```

5. Configure SAML:

```
config user saml
    edit "saml_user"
        set cert "Fortinet_CA_SSL"
        set entity-id "https://fgt9.myqalab.local:7831/XX/YY/ZZ/saml/metadata/"
        set single-sign-on-url "https://fgt9.myqalab.local:7831/XX/YY/ZZ/saml/login/"
```

```
        set single-logout-url "https://fgt9.myqalab.local:7831/XX/YY/ZZ/saml/logout/"
        set idp-entity-id "http://MYQALAB.LOCAL/adfs/services/trust"
        set idp-single-sign-on-url "https://myqalab.local/adfs/ls"
        set idp-single-logout-url "https://myqalab.local/adfs/ls"
        set idp-cert "REMOTE_Cert_4"
        set digest-method sha256
        set adfs-claim enable
        set user-claim-type name
        set group-claim-type group
    next
end
```

6. Configure the authentication scheme, rule, and setting:

```
config authentication scheme
    edit "saml"
        set method saml
        set saml-server "saml_user"
        set user-database "ldap-10.1.100.198"
    next
end
```

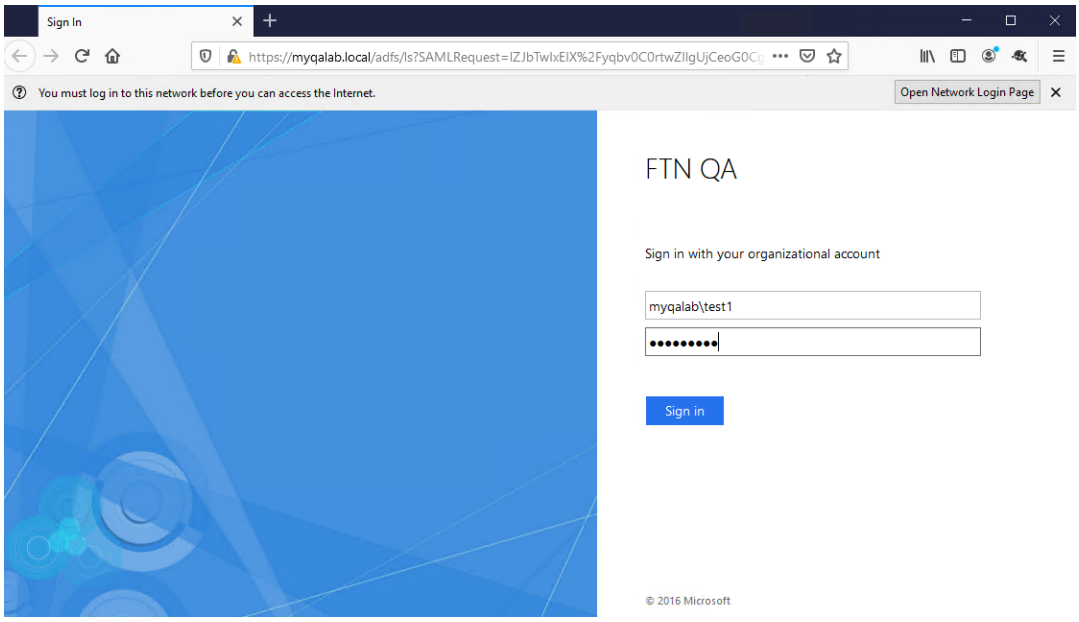
```
config authentication rule
    edit "saml"
        set srcaddr "all"
        set active-auth-method "saml"
    next
end
```

```
config authentication setting
    set captive-portal "fgt9.myqalab.local"
end
```

7. Configure the proxy policy:

```
config firewall proxy-policy
    edit 3
        set proxy explicit-web
        set dstintf "port9"
        set srcaddr "all"
        set dstaddr "all"
        set service "webproxy"
        set action accept
        set schedule "always"
        set logtraffic all
        set groups "ldap-group-saml"
        set utm-status enable
        set profile-protocol-options "protocol"
        set ssl-ssh-profile "deep-custom"
        set av-profile "av"
    next
end
```

When a user goes to www.google.com in a browser that is configured to use the FortiGate as a proxy, the IdP sign-in page appears.



Sample log

```
7: date=2021-03-16 time=21:11:19 eventtime=1615954279072391030 tz="-0700" logid="0000000010"

```

SAML authentication in a proxy policy using SCIM

The existing SCIM client support extends to authentication scheme using SAML, allowing `scim-client` to be used as `user-database`.

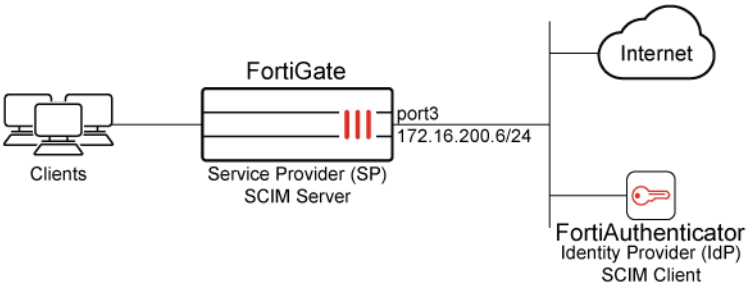
```
config authentication scheme
    edit <name>
        set method saml
        set saml-server <string>
        set user-database <Authentication server name>
    next
end
```

Example

In this example, FortiGate is configured as the SCIM server Service Provider (SP), and FortiAuthenticator is configured as the SCIM client Identity Provider (IdP). Two groups are configured on FortiAuthenticator: `scim_group` and `scim_group2`. The `scim_group` contains one user: `example@fortinet-us.com`.

Upon successful configuration, users and groups are provisioned on FortiGate. This setup can leverage SAML to provide access to authenticated users when using explicit web proxy policy.

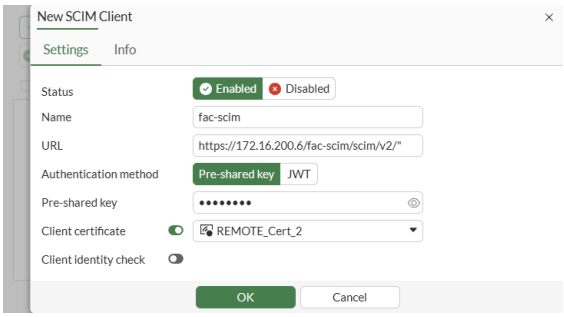
Ensure the IdP root CA is imported into the FortiGate. Without this, the FortiGate will be unable to verify the IdP server certificate during the synchronization of SCIM client user information. In this example, we are using FortiAuthenticator as the IdP, and after importing, the FortiAuthenticator root certificate is referred to as `REMOTE_Cert_2` in the FortiGate.



To configure SAML authentication using SCIM with an explicit web proxy in the GUI:

1. Configure FortiGate as an SCIM server:
   a. Allow SCIM access on an interface:
      i. Go to *Network* > *Interfaces* and edit the interface.
      ii. In the *Administrative Access* section, select *SCIM*.

      iii. Click *OK*.
   b. Configure SCIM client entries:
      i. Go to *User & Authentication* > *SCIM Clients*.
      ii. Click *Create New*.
      iii. Set *Status* to *Enabled*, enter a *Name*, then configure the remaining settings as needed.



iv. Click *OK*.

2. Configure FortiAuthenticator as an SCIM client:
   a. On FortiAuthenticator, use your admin account to log in.
   b. Click *Authentication > SCIM > Service Provider*.
   c. Click *Create New*.
   d. Configure the following settings:

Field	Value
Name	Test-SCIM
SCIM endpoint	https://172.16.200.6:44559/fac-scim/scim/v2
Access token	********

   e. Configure the remaining settings as required.
   f. Click *Save*.
   g. Once the setting is saved, double-click the newly created entry to open the settings pane, and click *Sync* to automatically add existing users to the SCIM server.

   See Service providers for more information.

> The SCIM endpoint and access token must match the `base-url` and `secret` respectively, as configured on the FortiGate.
>
> Furthermore, an initial synchronization is necessary to commence provisioning for the first time. However, when alterations to identities occur in the IdP, including creation, updating, and deletion, these changes are automatically synchronized with SP in accordance with the SCIM protocol.

3. In the CLI, verify whether users and groups are provisioned on the FortiGate:

```
# diagnose test scim list-users fac-scim
example@fortinet-us.com
total:1
# diagnose test scim list-groups fac-scim
displayName     externalId
scim_group      1
scim_group2     2
total:2

# diagnose test scim get-user fac-scim example@fortinet-us.com
```

```
schemas num: 1
        [0]:schema: 1
id: user_2
userName: example@fortinet-us.com
externalId: local3
name:
meta: resourceType:User, created:2025-05-27T22:54:15Z, lastModified:2025-05-29T18:11:20Z,
location:https://172.16.200.6/fac-scim/scim/v2//Users/user_2,version: 1.0
emails num: 0
groups num:1
        groups[0]: value:group_3, $ref:https://172.16.200.6/fac-scim/scim/v2//Groups/group_3,
display:scim_group
Active: 1
index: 0
```

For brevity, only the commands relevant to this enhancement are included. See SAML on page 3445 for more information about configuring SP and IdP.

4. Configure an authentication scheme and authentication rule to use `scim-client` as a `user-database`:
   a. Go to *Policy & Objects* > *Authentication* and select *Authentication Schemes*.
   b. Click *Create New* > *Authentication Scheme*.
   c. Configure the following settings:

Field	Value
Name	saml
Method	SAML
SAML SSO server	test_example_saml
User database	fac-scim

   d. Click *OK*.

   e. Click *Create New* > *Authentication Rule*.
   f. Configure the following settings:

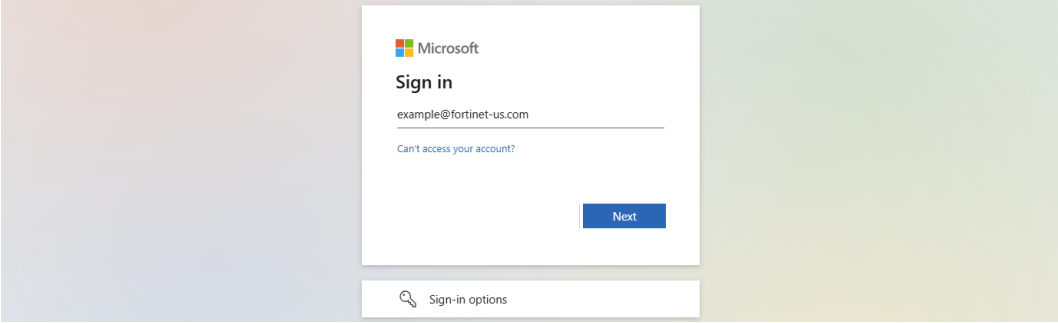
Field	Value
Name	saml
Source Address	all
Authentication Scheme	Enabled; saml

g. Click *OK*.

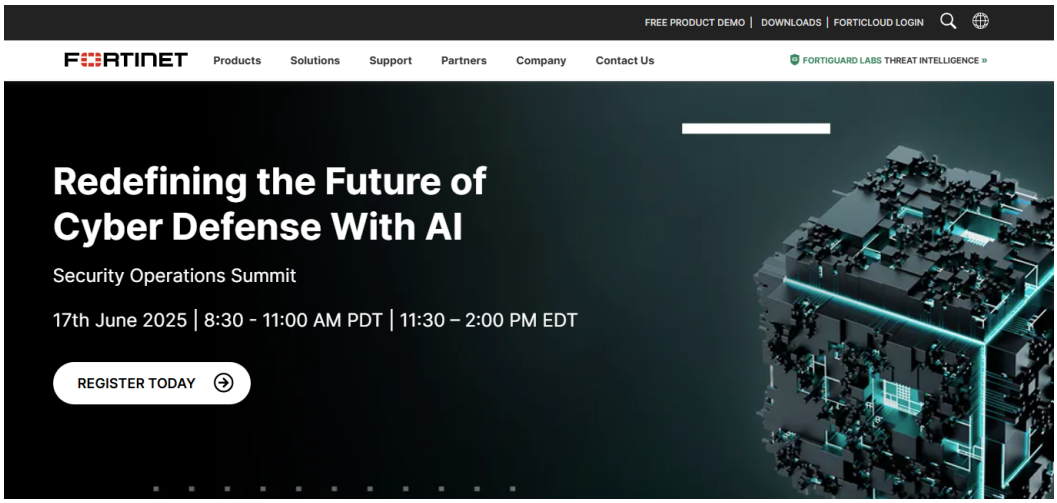
5. Configure the user group:
   a. Go to *User & Authentication* > *User Groups*.
   b. Click *Create New*.
   c. Enter the name `saml`.
   d. Set *Type* to *Firewall*.
   e. Under *Remote groups*, click *Add*.
   f. Select `test_example_saml` from the drop-down menu
   g. Click *OK* to save the Remote Group.
   h. Click *OK* to save the User Group.
6. Enable the web proxy:
   a. Go to *Network* > *Explicit Proxy*.
   b. Enable *Explicit Web Proxy*.
   c. Click *Apply* to save the setting.
7. Apply SAML authentication using SCIM with an explicit web proxy:
   a. Go to *Policy & Objects* > *Proxy Policy*.
   b. Click *Create new*.
   c. Configure the following settings:

Field	Value
Name	saml
Type	Explicit Web
Outgoing Interface	port3
Source	Address: all User: saml
Destination	all
Schedule	Always
Service	webproxy
Action	Accept
Log Allowed Traffic	Enabled; All Sessions

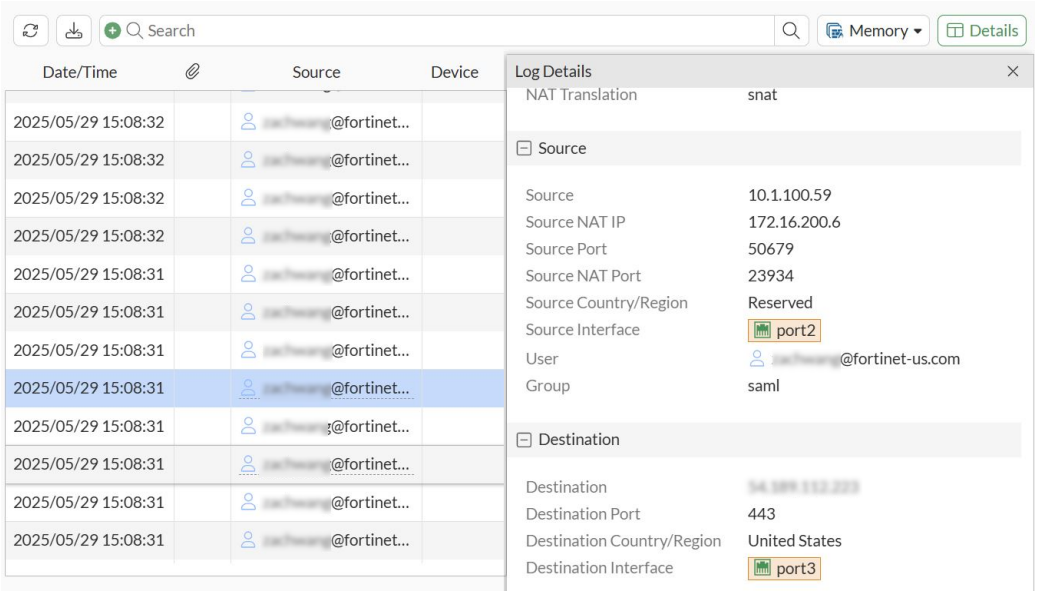
When a user goes to www.fortinet.com in a browser that is configured to use the FortiGate as a proxy, the authentication window will pop-up in the browser.



After entering user credentials and successfully passing authentication, the Fortinet page opens successfully.



Log are displayed in *Log & Report*.



To configure SAML authentication using SCIM with an explicit web proxy in the CLI:

1. Configure FortiGate as an SCIM server:
   a. Allow SCIM access on an interface:

```
config system interface
    edit port3
        append allowaccess scim
    next
end
```

   b. Configure SCIM client entries:

```
config user scim
    edit "fac-scim"
        set status enable
        set base-url "https://172.16.200.6/fac-scim/scim/v2/"
        set auth-method base
        set secret **********
        set certificate REMOTE_Cert_2
        set client-identity-check disable
    next
end
```

2. Configure FortiAuthenticator as an SCIM client:
   a. On FortiAuthenticator, use your admin account to log in.
   b. Click *Authentication > SCIM > Service Provider*.
   c. Click *Create New*.
   d. Configure the following settings:

Field	Value
Name	Test-SCIM
SCIM endpoint	https://172.16.200.6:44559/fac-scim/scim/v2
Access token	********

   e. Configure the remaining settings as required.
   f. Click *Save*.
   g. Once the setting is saved, double-click the newly created entry to open the settings pane, and click *Sync* to automatically add existing users to the SCIM server.
   See Service providers for more information.

   The SCIM endpoint and access token must match the `base-url` and `secret` respectively, as configured on the FortiGate.

   Furthermore, an initial synchronization is necessary to commence provisioning for the first time. However, when alterations to identities occur in the IdP, including creation, updating, and deletion, these changes are automatically synchronized with SP in accordance with the SCIM protocol.

3. Verify whether users and groups are provisioned on the FortiGate:

```
# diagnose test scim list-users fac-scim
example@fortinet-us.com
total:1
# diagnose test scim list-groups fac-scim
displayName     externalId
scim_group      1
scim_group2     2
total:2

# diagnose test scim get-user fac-scim example@fortinet-us.com
schemas num: 1
        [0]:schema: 1
id: user_2
userName: example@fortinet-us.com
externalId: local3
name:
meta: resourceType:User, created:2025-05-27T22:54:15Z, lastModified:2025-05-29T18:11:20Z,
location:https://172.16.200.6/fac-scim/scim/v2//Users/user_2,version: 1.0
emails num: 0
groups num:1
        groups[0]: value:group_3, $ref:https://172.16.200.6/fac-scim/scim/v2//Groups/group_3,
display:scim_group
Active: 1
index: 0
```

For brevity, only the commands relevant to this enhancement are included. See SAML on page 3445 for more information about configuring SP and IdP.

4. Configure an authentication scheme and authentication rule to use `scim-client` as a `user-database`:

```
config authentication scheme
    edit "saml"
        set method saml
        set saml-server "test_example_saml"
        set user-database "fac-scim"
    next
end
config authentication rule
    edit "saml"
        set srcaddr "all"
        set active-auth-method "saml"
    next
end
```

5. Configure the user group:

```
config user group
    edit "ldap-group-saml"
        set member "ldap-10.1.100.198"
    next
end
```

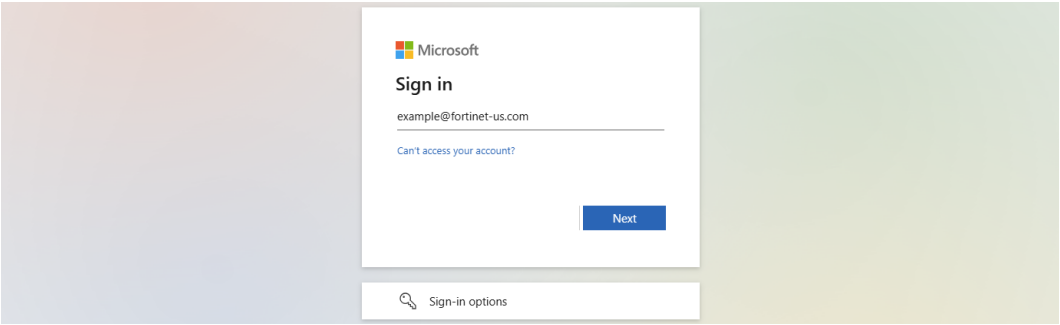
6. Enable the web proxy:

```
config web-proxy explicit
    set status enable
    set http-incoming-port 8080
end
```

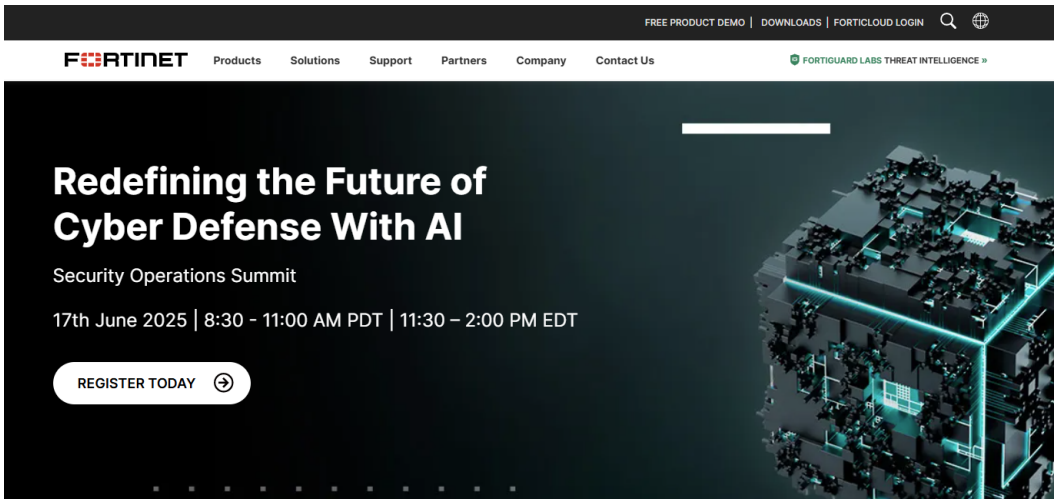
7. Apply SAML authentication using SCIM with an explicit web proxy:

```
config firewall proxy-policy
   edit 1
        set name "saml"
        set proxy explicit-web
        set dstintf "port3"
        set srcaddr "all"
        set dstaddr "all"
        set service "webproxy"
        set action accept
        set schedule "always"
        set logtraffic all
        set groups "saml"
    next
end
```

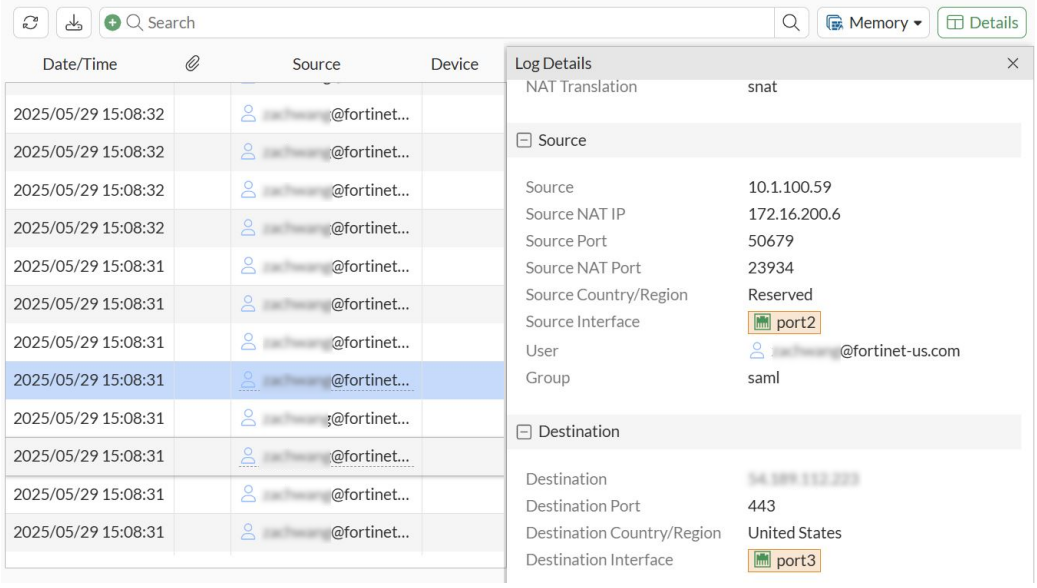
When a user goes to www.fortinet.com in a browser that is configured to use the FortiGate as a proxy, the authentication window will pop-up in the browser.



After entering user credentials and successfully passing authentication, the Fortinet page opens successfully.



Log are displayed in *Log & Report*.



Local entries for SAML users

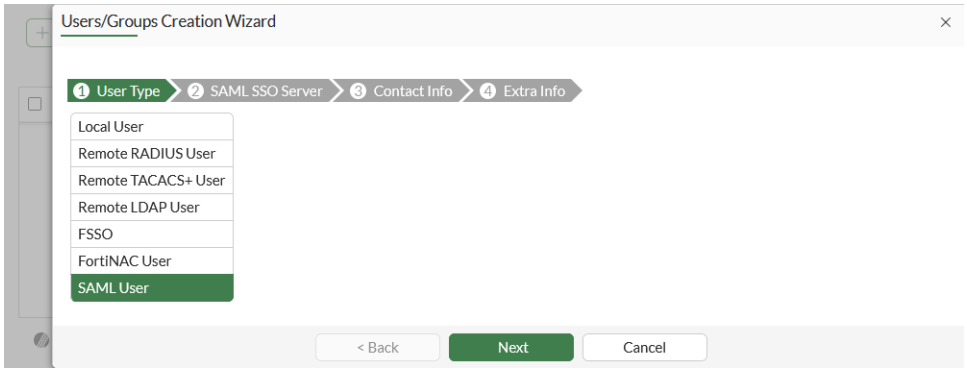
FortiOS supports SAML users when configuring local users, expanding its ability to define individual remote users for policy enforcement.

Administrators can create local entries for SAML users, enabling precise, user-specific control in both firewall policies and agentless VPNs. This streamlines policy management and enhances flexibility for environments using SAML authentication.

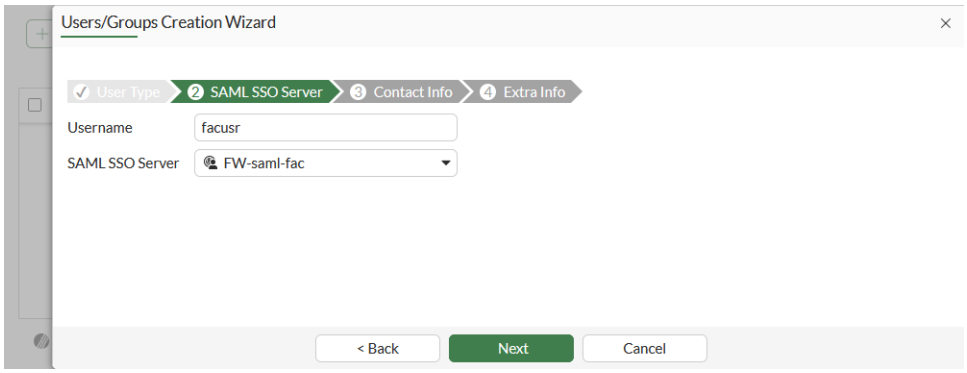
A working SAML IdP connection must already be configured.

To configure a local SAML user in the GUI:

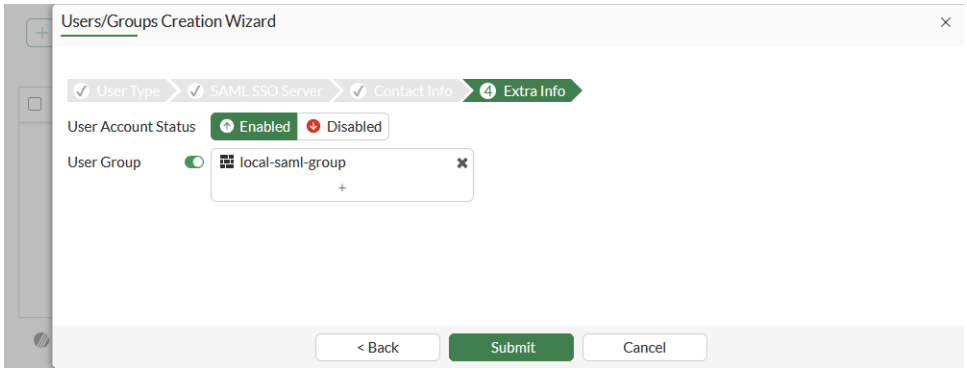
1. Go to *User & Authentication* > *Single Sign-On* and confirm that a SAML IdP connection is configured. See SAML for more information.
2. Go to *User & Authentication* > *User Definition* and click *Create New*.



3. Select *SAML User*, then click *Next*.
4. Enter a *Username* and select a *SAML SSO Server*, then click *Next*.



5. Optionally, enable and configure *Two-factor Authentication*, then click *Next*.
6. Add the SAML user to a local user group, then click *Submit*.



To configure a local SAML user in the CLI:

1. Make sure that a SAML server is configure:

```
show user saml
   edit "FW-saml-fac"
        set entity-id "http://10.1.100.7:1000/metadata/"
        set single-sign-on-url "https://10.1.100.7:1003/saml/acs"
        set single-logout-url "https://10.1.100.7:1003/saml/sls"
        set idp-entity-id "http://10.1.100.195/saml-idp/77778888/metadata/"
        set idp-single-sign-on-url "https://10.1.100.195/saml-idp/77778888/login/"
        set idp-single-logout-url "https://10.1.100.195/saml-idp/77778888/logout/"
        set idp-cert "REMOTE_Cert_2"
        set user-name "username"
        set group-name "group"
        set digest-method sha1
    next
end
```

2. Configure the local user as a SAML user, and map them to the SAML user:

```
config user local
    edit "facusr"
        set type saml
        set saml-server "FW-saml-fac"
    next
end
```

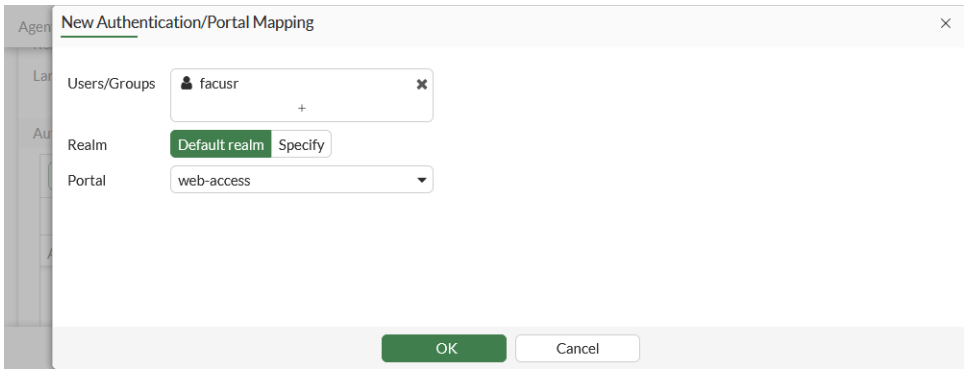
3. Optionally, add the user to a group:

```
config user group
    edit "local-saml-group"
        set member "facusr"
    next
end
```

Verification

To test the local SAML user on an agentless VPN portal in the GUI:

1. Add the user to an agentless VPN portal mapping:
   a. Go to *VPN > Agentless VPN Settings*.
   b. In the *Authentication/Portal Mapping* table click *Create New*.
   c. Set *Users/Groups* to the SAML user. The user group that the SAML user was added to could also be used.
   d. Set *Portal* to *web-access*.



e. Click *OK*.

f. Click *Apply*.

2. On a client PC, connect to the agentless VPN portal and enter valid SAML user credentials for authentication to access the portal page.
3. On the FortiGate, check the connection in the FortiView VPN widget.

To test the local SAML user on an agentless VPN portal in the CLI:

1. Add the user to an agentless VPN portal mapping:

```
config vpn ssl settings
    config authentication-rule
        edit 1
            set users "facusr"
            set portal "web-access"
        next
    end
end
```

The user group that the SAML user was added to could also be used:

```
config vpn ssl settings
    config authentication-rule
        edit 1
            set groups "local-saml-group"
        next
    end
end
```

2. On a client PC, connect to the agentless VPN portal and enter valid SAML user credentials for authentication to access the portal page.
3. On the FortiGate, check the connection:

```
# get vpn ssl monitor
Agentless VPN Login Users:
|Index|User  |Group|Auth Type|Idle-Timeout|Auth-Timeout|From        |HTTP in/out|HTTPS
in/out|Two-factor Auth|
|0|   facuser|N/A  |256(1)|273|28772                  |10.1.100.188|0/0|0/0|0|
```

To test the local SAML user used in a policy in the CLI:

1. Add the user to a firewall policy:

```
config firewall policy
    edit 2
        set users "facusr"
    next
end
```

   The user group that the SAML user was added to could also be used:

```
config firewall policy
    edit 2
        set groups "local-saml-group"
    next
end
```

2. On a client PC, use a browser to connect to an external website. The browser will redirect to the IdP login screen for authentication.
3. Enter valid SAML user credentials for authentication. After successful authentication, the browser reroutes to the external website.
4. On the FortiGate, check the list of authenticated users:

```
# diagnose firewall auth list

10.1.100.188, facuser
        src_mac: 00:0c:29:44:be:b9
        type: fw, id: 0, duration: 63, idled: 12
        expire: 237
        flag(804): hard no_idle
        server: FW-saml-fac
        packets: in 29 out 39, bytes: in 12594 out 4409
        user_id: 16777229
        group_id:
        group_name:

----- 1 listed, 0 filtered ------
```

Per-Session SAML authentication logging and logout support for ZTNA and explicit proxy users

FortiGate supports per-session SAML authentication logging for identical usernames from the same IP address for proxy policies, which are used with ZTNA and explicit proxy configurations. When session-based authentication with cookies is enabled and SAML is configured, with the added session logout option enabled, ZTNA and explicit proxy users can log out individually from each browser session.

The FortiGate configured as SAML Service Provider (SP) generates a unique logout URL for the individual user or session that can be used to sign the user out from both the SP and the SAML Identity Provider (IdP). The SAML single signout flow between client, SP (FortiGate), and IdP is as follows:

1. The client uses the SP single-logout-url configured on the FortiGate to send a logout request to the FortiGate as SP.
2. The FortiGate logs out of the local user corresponding to the SAML assertion and returns a unique IdP logout URL to the client.
3. The client uses this unique IdP logout URL to send a logout request to the IdP.
4. When the session has been logged out on the IdP, the FortiGate receives a SAML logout response.

The `session-logout` option in the proxy policy authentication rule can be enabled to turn on additional session tracking to support SAML single sign out:

```
config authentication rule
    edit < name >
        …
        set ip-based disable
        set active-auth-method < auth_method >
        set web-auth-cookie enable
        …
        set session-logout enable
    next
end
```

By default, `session-logout` is disabled. The option is only available when the following conditions are satisfied:

1. Session-based authentication is enabled (`set ip-based disable`).
2. Device certificate as authentication cookie is enabled (`set web-auth-cookie enable`).
3. SAML authentication is used:
   a. `set active-auth-method` refers to an authentication scheme using SAML.
   b. SAML configuration for SP and IdP are validly configured on the FortiGate. See SAML on page 3445.

Example

This example demonstrates an explicit proxy configuration using SAML SSO authentication with `session-logout` enabled to enable session tracking, required for SAML single sign out.

To configure a SAML server and SAML user group:

```
config user saml
    edit "saml"
        set cert "Fortinet_CA_SSL"
        set entity-id "http://192.0.2.1/remote/saml/metadata/"
        set single-sign-on-url "https://192.0.2.1:7831/remote/saml/login"
        set single-logout-url "https://192.0.2.1:7831/remote/saml/logout"
        set idp-entity-id "http://198.51.100.1/saml-idp/saml/metadata/"
        set idp-single-sign-on-url "https://198.51.100.1/saml-idp/saml/login/"
        set idp-single-logout-url "https://198.51.100.1/saml-idp/saml/logout/"
        set idp-cert "SAML"
        set user-name "Username"
        set group-name "Group"
        set digest-method sha1
```

```
    next
end
```

```
config user group
    edit "saml_group"
        set member "saml"
    next
end
```

The `single-logout-URL` of `https://192.0.2.1:7831/remote/saml/logout` will be used by the client to initiate SAML single sign out.

To configure the authentication rule and scheme to match the new SAML server:

```
config authentication rule
    edit "saml_rule"
        set srcaddr "all"
        set ip-based disable
        set active-auth-method "saml_scheme"
        set web-auth-cookie enable
        set cors-stateful enable
        set cors-depth 8
        set session-logout enable
    next
end
```

```
config authentication scheme
    edit "saml_scheme"
        set method saml
        set saml-server "saml"
    next
end
```

To enable user group authentication in a firewall proxy-policy:

```
config firewall proxy-policy
    edit 1
        set proxy explicit-web
        set dstintf "port3"
        set srcaddr "all"
        set dstaddr "all"
        set service "webproxy"
        set action accept
        set schedule "always"
        set logtraffic all
        set groups "saml_group"
        set ssl-ssh-profile "deep-custom"
    next
end
```

To test SAML session tracking and single sign out :

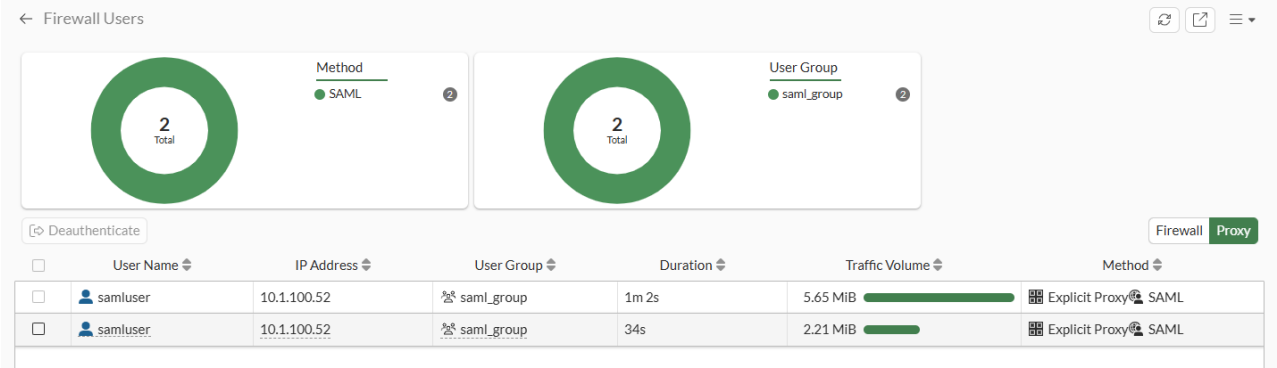
1. On a client PC, access one website (website 1) from one web browser (browser 1) and access another web site (website 2) from another web browser (browser 2). The FortiGate will record user information from different browsers with the same IP address.
2. The SAML IdP will present an authentication page when accessing website 1 from browser 1. Enter your username and password in the authentication page. Observe website 1 load as expected.
3. The SAML IdP will present an authentication page when accessing website 2 from browser 2. Enter your username and password in the authentication page. Observe website 2 load as expected.
4. In the CLI, check the WAD user list

```
# diagnose wad user list

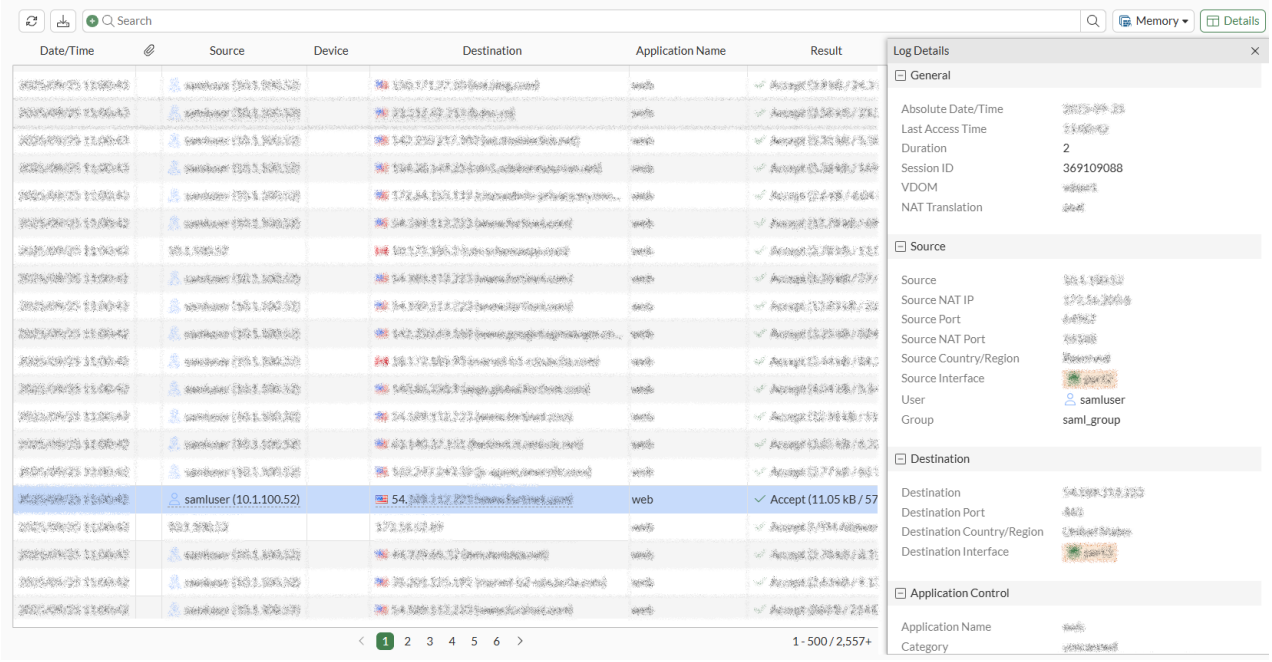
ID: 2, VDOM: vdom1, IPv4: 10.1.100.52
  user name   : samluser
  worker      : 22
  duration    : 40
  auth_type   : Session
  auth_method : SAML
  pol_id      : 1
  g_id        : 10
  user_based  : 0
  expire      : no
  LAN:
    bytes_in=461676 bytes_out=5421390
  WAN:
    bytes_in=5331093 bytes_out=597696

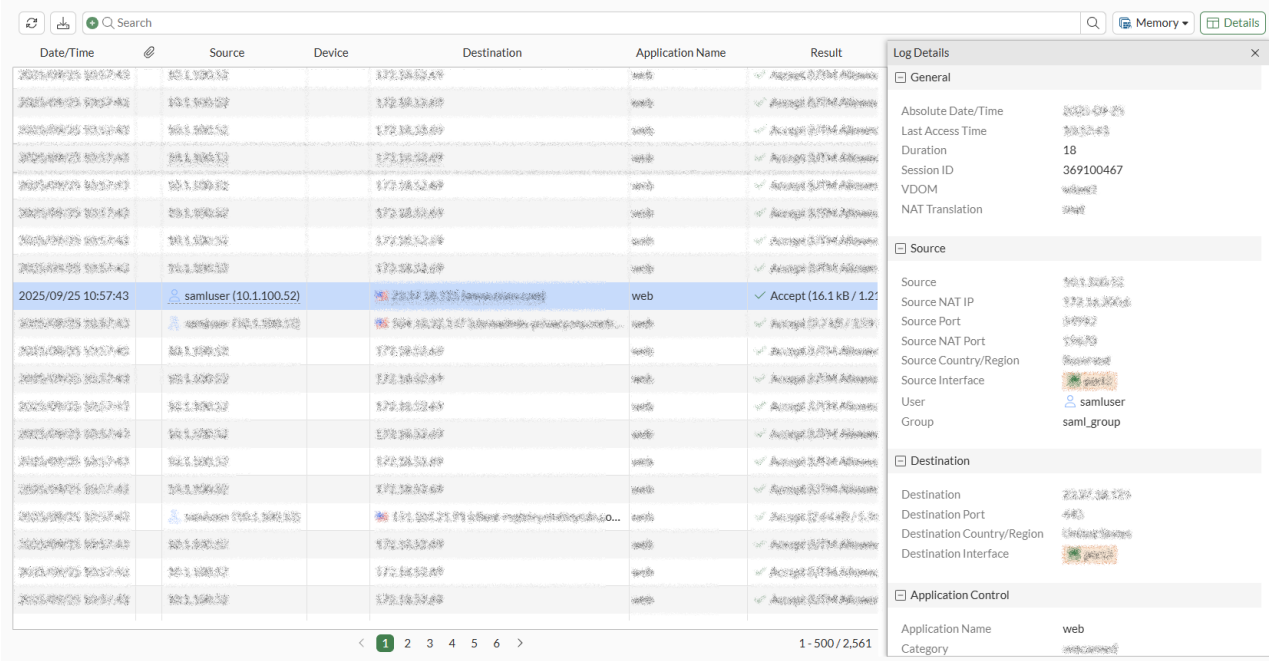
ID: 3, VDOM: vdom1, IPv4: 10.1.100.52
  user name   : samluser
  worker      : 22
  duration    : 12
  auth_type   : Session
  auth_method : SAML
  pol_id      : 1
  g_id        : 10
  user_based  : 0
  expire      : no
  LAN:
    bytes_in=33402 bytes_out=2253163
  WAN:
    bytes_in=2238161 bytes_out=81347
```

   Observe two sets of user information entries corresponding to the two SAML authenticated sessions.
5. Go to *Dashboard > Status* and expand the *Firewall Users* widget. Observe the two user sessions:

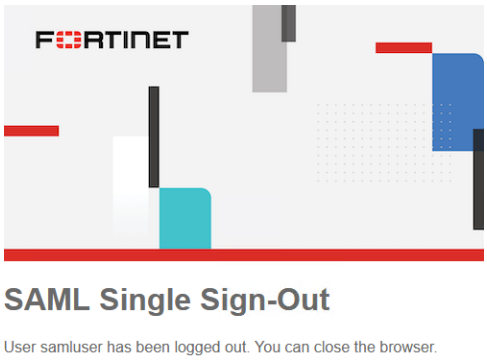


6. View the traffic logs and note the unique session IDs for the websites visited:





7. Recall from the SAML server configuration that the `single-logout-URL` of `https://192.0.2.1:7831/remote/saml/logout` was configured. On the client in web browser 2, initiate a SAML single sign out by accessing `https://192.0.2.1:7831/remote/saml/logout`.



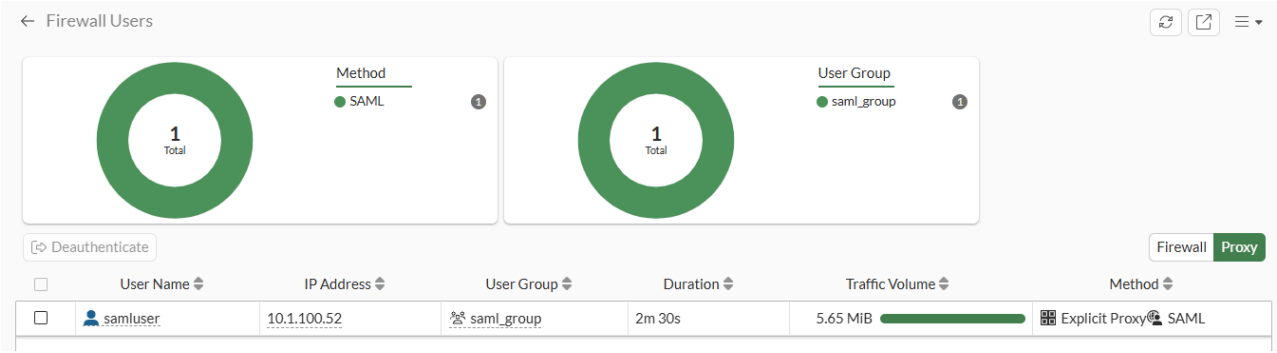
8. Check that the user information for the first SAML authenticated session for web browser 1 is still present:

```
# diagnose wad user list

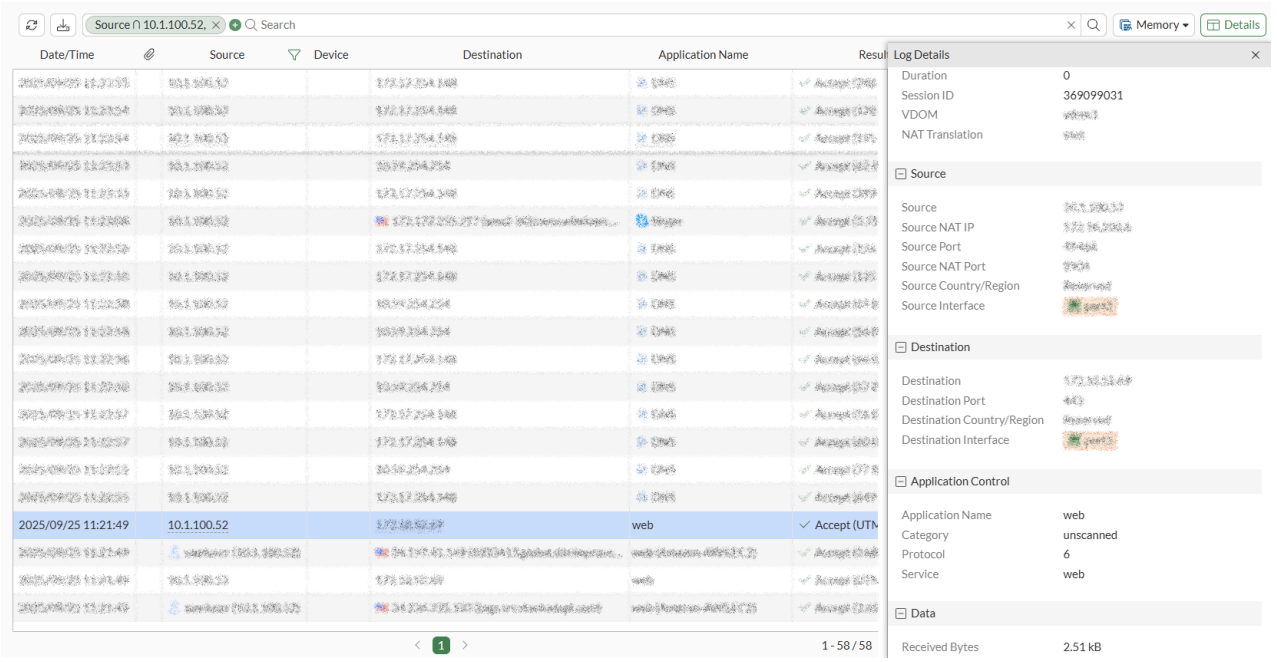
ID: 2, VDOM: vdom1, IPv4: 10.1.100.52
  user name    : samluser
  worker       : 22
  duration     : 133
  auth_type    : Session
  auth_method  : SAML
  pol_id       : 1
  g_id         : 10
  user_based   : 0
  expire       : no
  LAN:
    bytes_in=461676 bytes_out=5421755
```

```
WAN:
  bytes_in=5331434 bytes_out=597899
```

9. Go to *Dashboard* > *Status*, expand the *Firewall Users* widget, and see the first user session corresponding to web browser 1:



10. Check the traffic logs and note the unique session ID for the SAML log out request:



TACACS+ servers

TACACS+ is a remote authentication protocol that provides access control for routers, network access servers, and other network devices through one or more centralized servers.

FortiOS sends the following proprietary TACACS+ attributes to the TACACS+ server during authorization requests:

Attribute	Description
service=<name>	User must be authorized to access the specified service.
memberof	Group that the user belongs to.
admin_prof	Administrator profile (admin access only).

Only memberof and admin_prof attributes are parsed in authentication replies.

You can configure up to ten remote TACACS+ servers in FortiOS. You must configure at least one server before you can configure remote users.

A TACACS+ server must first be added in the CLI to make the option visible in the GUI.

To configure TACACS+ authentication in the CLI:

1. Configure the TACACS+ server entry:

```
config user tacacs+
    edit "TACACS-SERVER"
        set server <IP address>
        set key <string>
        set authen-type ascii
        set source-ip <IP address>
    next
end
```

2. Configure the remote user group:

```
config user group
    edit "TACACS-GROUP"
        set group-type firewall
        set member "TACACS-SERVER"
    next
end
```

3. Configure the remote user:

```
config system admin
    edit TACACS-USER
        set remote-auth enable
        set accprofile "super_admin"
        set vdom "root"
        set wildcard enable
        set remote-group "TACACS-GROUP"
    next
end
```

To configure a TACACS+ server in the GUI:

1. Go to *User & Authentication* > *TACACS+ Servers*.
2. Click *Create New*.
3. Configure the following settings:

Name	Enter the TACACS+ server name.
Authentication Type	Select the authentication type used for the TACACS+ server. Selecting *Auto* tries PAP, MSCHAP, and CHAP, in that order.
Server IP/Name	Enter the domain name or IP address for the primary server.
Server Secret	Enter the key to access the primary server.

4. Click *OK*.

SCIM servers

System for Cross-domain Identity Management (SCIM) is an open-standard protocol that facilitates the exchange of identity data between platforms. See the following RFCs for more information:

- See RFC 7642 for information about definitions, overview, concepts, and requirements.
- See RFC 7643 for information about the core schema.
- See RFC 7644 for information about the protocol.

SCIM is based on a client-server model where the client is usually an identity provider (IdP) that maintains a directory of user identities, and the server is typically a service provider (SP). The client sends user and group information to the server, enabling automatic provisioning of users and groups between the SP and IdP.

With SCIM servers, FortiGate can communicate with an Identity Provider (IdP) using the SCIM 2.0 protocol, which facilitates the automatic provisioning of users and groups on FortiGate. Once users and groups are provisioned on FortiGate, they can be used with SAML to provide user authentication.

The *config system global* command includes SCIM settings:

```
config system global
    set scim-http-port <integer>
    set scim-https-port <integer>
    set scim-server-cert <string>
end
```

`scim-http-port <integer>`	Specify the port on which the SCIM server will listen for HTTP requests (default = 44558).
`scim-https-port <integer>`	Specify the port on which the SCIM server will listen for HTTPS requests (default = 44559).
`scim-server-cert <string>`	Specify the certificate that will be used if the HTTPS protocol is being used to communicate with the SCIM client. The certificate used by FortiGate must be trusted by the SCIM client.

To allow SCIM access in the GUI:

1. Go to *Network* > *Interfaces*.
2. Create or edit an interface.
3. In the *Administrative Access* section, select *SCIM*.
4. Click *OK*.

To allow SCIM access in the CLI:

For IPv4:

```
config system interface
    edit <name>
        append allowaccess scim
    next
end
```

For IPv6:

```
config system interface
    edit <name>
        ...
        config ipv6
            append ip6-allowaccess scim
        end
    next
end
```

To specify the SCIM server certificate and HTTP(S) port in the GUI:

1. Go to *System* > *Settings* > *Access*.
2. In the *SCIM Settings* section, configure the *HTTP port*, *HTTPS port*, and *Server certificate* as required.
3. Click *Apply*.

To specify the SCIM server certificate and HTTP(S) port in the CLI:

```
config system global
    set scim-http-port <port>
    set scim-https-port <port>
    set scim-server-cert <certificate>
end
```

To configure SCIM clients in the GUI:

1. Go to *User & Authentication* > *SCIM Clients*, and click *Create New*.
2. Set *Status* to *Enabled*, enter a *Name*, then configure the remaining settings as needed.
3. Click *OK*.

To configure SCIM clients in the CLI:

```
config user scim
    edit <name>
        set status {enable| disable}
        set base-url <string>
        set authe-method {token | base}
        set token-certificate <name>
        set secret <passwd>
        set certificate <name>
        set client-identity-check {enable| disable}
    next
end
```

`status {enable| disable}`	Enable/disable System for Cross-domain Identity Management (SCIM).
`base-url <string>`	Server URL to receive SCIM create, read, update, delete (CRUD) requests.
`auth-method {token | base}`	TLS client authentication methods (default = bearer token).
`token-certificate <name>`	Certificate for token verification.
`secret <passwd>`	Secret for token verification or base authentication.
`certificate <name>`	Certificate for client verification during TLS handshake.
`client-identity-check {enable| disable}`	Enable/disable client identity check.

To add a SCIM client to SAML server configuration in the GUI:

1. Go to *User & Authentication* > *Single Sign-On* and edit an existing entry or click *Create New* to create a new single sign-on.
2. In the *Additional SAML Attributes* section, enable *SCIM client* and select a SCIM client.
3. Click *OK*.

To add a SCIM client to SAML server configuration in the CLI:

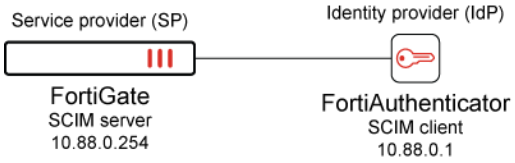
```
config user saml
    edit <name>
        set scim-client <name>
        set scim-group-attr-type {display-name | external-id}
    next
end
```

Example

In this example, FortiGate is configured as the SCIM server (SP), and FortiAuthenticator is configured as the SCIM client (IdP). Two groups are configured on FortiAuthenticator: `IT` and `Pochiya clan`. The groups contain the following users:

- The `IT` group contains three users: `admin`, `sk`, and `sy`.
- The `Pochiya clan` group contains two users: `naynay` and `kiki`.

Upon successful configuration, users and groups are provisioned on FortiGate. This setup can leverage SAML to provide access to authenticated users.

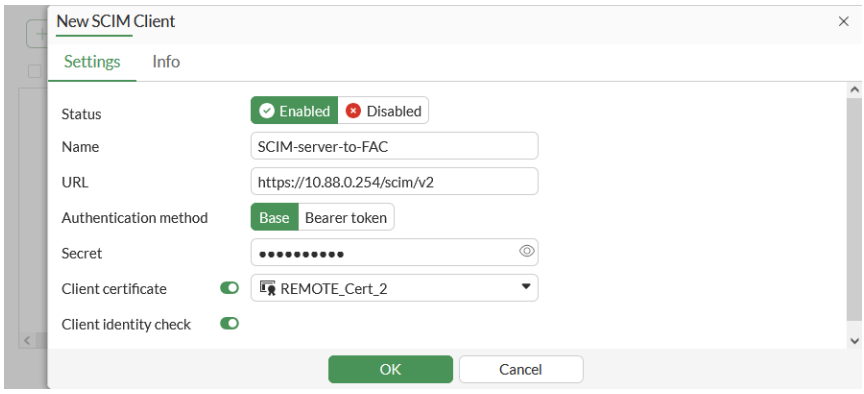


To configure FortiGate as an SCIM server in the GUI:

1. Allow SCIM access on an interface:
   a. Go to *Network* > *Interfaces* and edit the interface.
   b. In the *Administrative Access* section, select *SCIM*.

   c. Click *OK*.
2. Specify the SCIM server certificate:
   a. Go to *System* > *Settings* > *Access*.
   b. In the *SCIM Settings* section, set *Server certificate*.

   c. Click *Apply*.
3. Configure SCIM client entries:
   a. Go to *User & Authentication* > *SCIM Clients*, and click *Create New*.
   b. Set *Status* to *Enabled*, enter a *Name*, then configure the remaining settings as needed.



c. Click *OK*.

To configure FortiGate as an SCIM server in the CLI:

1. Allow SCIM access on an interface:
   In IPv4:

```
config system interface
    edit port2
        append allowaccess scim
    next
end
```

   In IPv6:

```
config system interface
    edit port2
        ...
        config ipv6
            append ip6-allowaccess scim
        end
    next
end
```

2. Specify the SCIM server certificate:

```
config system global
    set scim-server-cert SCIM-Demo-CA-SSL
end
```

3. Configure SCIM client entries:

```
config user scim
    edit "SCIM-server-to-FAC"
        set status enable
        set base-url https://10.88.0.254/scim/v2
        set auth-method base
        set secret **********
        set certificate REMOTE_Cert_2
        set client-identity-check enable
```

```
    next
end
```

To configure FortiAuthenticator as an SCIM client:

1. On FortiAuthenticator, use your admin account to log in.
2. Click *Authentication > SCIM > Service Provider*.
3. Click *Create New*, and configure the following settings:

Name	Test-SCIM
SCIM endpoint	https://10.88.0.254:44559/scim/v2
Access token	**********

4. Configure the remaining settings as required, and click *Save*.
5. Once the setting is saved, double-click the newly created entry to open the settings pane, and click *Sync* to automatically add existing users to the SCIM server.

See Service providers for more information

The SCIM endpoint and access token must match the `base-url` and `secret` respectively, as configured on the FortiGate.

Furthermore, an initial synchronization is necessary to commence provisioning for the first time. However, when alterations to identities occur in the IdP, including creation, updating, and deletion, these changes are automatically synchronized with SP in accordance with the SCIM protocol.

To verify whether users and groups are provisioned on FortiGate:

```
# diagnose test scim list-clients
There are 1 clients in vdom.
id:1 name:SCIM-server-to-FAC
```

```
# diagnose test scim list-groups SCIM-server-to-FAC

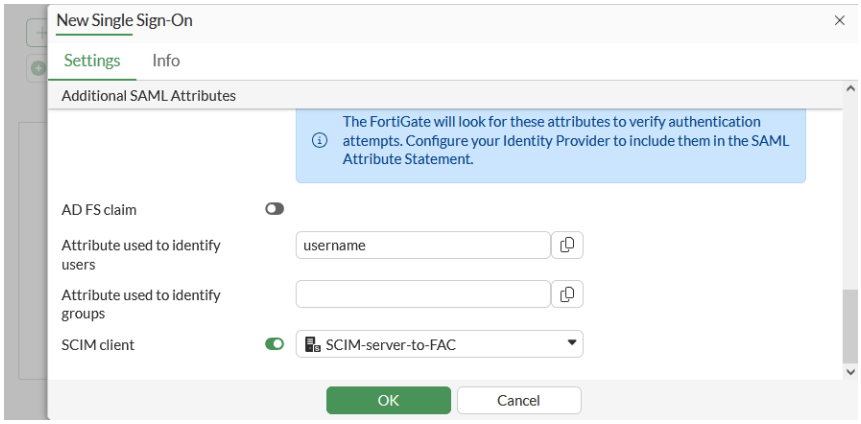
IT
pochiya clan
total:2
```

```
# diagnose test scim list-users SCIM-server-to-FAC

admin
kiki
naynay
sk
sy
```

To add a SCIM client to SAML server configuration in the GUI:

1. Go to *User & Authentication* > *Single Sign-On* and edit an existing entry or click *Create New* to create a new single sign-on.
2. In the *Additional SAML Attributes* section, enable *SCIM client* and select the SCIM client.



3. Click *OK*.

To add the SCIM group to a SAML server configuration in the CLI:

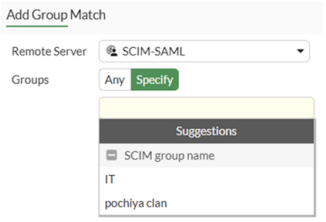
```
config user saml
    edit "SCIM-SAML"
        set scim-client "SCIM-server-to-FAC"
        set scim-group-attr-type {display-name | external-id}
    next
end
```

Modify the SAML user group used in the firewall policy

The configuration in this topic incorporates all the SCIM groups configured on FortiAuthenticator and enables all users to authenticate. However, if you want to limit authentication to users who belong to specific groups, such as the IT group, the following additional configuration is necessary:

To modify the SAML user group used in the firewall policy in the GUI:

1. Go to *User & Authentication* > *User Groups* and click *Create New*. *Firewall* is selected as the default *Type*.
2. Enter the group name, such as *saml-scim*.
3. In the *Remote Groups* section, click *Add*.
4. Set *Remote Server* to the SAML user, *SCIM-SAML*.
5. For the *Groups*, select *Specify*, then click the text box to see the groups pulled from SCIM client as *Suggestions*.



6. Select the required group then click *OK*.

To modify the SAML user group used in the firewall policy in the CLI:

```
config user group
    edit saml-scim
        set member "SCIM-SAML"
        config match
            edit 1
                set server-name "SCIM-SAML"
                set group-name "IT"
            next
        end
    next
end
```

For brevity, only the commands relevant to this enhancement are included. See SAML on page 3445 for more information about configuring SP and IdP.

Bearer token authentication for SCIM servers

Bearer token authentication can be used for SCIM to improve security between the SCIM server and client. Bearer tokens generated by FortiOS can be temporary or long lived, and the SCIM client can verify the token.

Use the `execute gen-token` command to generate bearer tokens. The command is available for each VDOM.

```
execute gen-token <type> <string> <algorithm> <expire>
```

`<type>`	Type for token generation: • `cert`: certificate • `key`: pre-shared key
`<string>`	Name of the certificate or pre-shared key for token generation.
`<algorithm>`	Algorithm for token generation. Ensure that the signing algorithm supports the type. Available algorithms: • When the type is `cert`: `RS256`, `RS384`, `RS512`, `ES256`, `ES384`, or `ES512`. • When the type is `key`: `HS256`, `HS384`, or `HS512`.

<expire>	Expire interval, in hours (1 - 32767, 0 = long lived). When the token expires, administrators must manually generate another token on FortiGate and copy it to the SCIM client.

Use the `config user scim` command to configure token verification.

Example

This example explains how to generate a certificate type of bearer token and configure verification of the bearer token.

When generating a bearer token on FortiGate, remember:

- You can use any of the built-in or custom certificates available in the local certificate store.
- You must select a signing algorithm that supports the certificates.
- When the bearer token expires, the administrator must manually generate a new bearer token on FortiGate and copy the token to the SCIM client.

To generate a bearer token:

1. Enter `execute gen-token cert` to display the list of certificates available in the local certificate store:
   Custom and built-in certificates are displayed, and either can be used to generate tokens. In this example, `FGT401E-II-SAN-all` is a custom certificate, and `Fortinet_CA_SSL` is a built-in certificate.

```
# execute gen-token cert
<string>    Certificate or preshared-key for token generation.
Available certificates:
FGT401E-II-SAN-all      local
Fortinet_CA_SSL     local
Fortinet_CA_Untrusted   local           "
Fortinet_Factory        local           "
Fortinet_Factory_Backup local
Fortinet_GUI_Server     local           "
Fortinet_SSL    local
Fortinet_SSL_DSA1024    local
Fortinet_SSL_DSA2048    local
Fortinet_SSL_ECDSA256   local
Fortinet_SSL_ECDSA384   local
Fortinet_SSL_ECDSA521   local
Fortinet_SSL_ED448      local
Fortinet_SSL_ED25519    local
Fortinet_SSL_RSA1024    local
Fortinet_SSL_RSA2048    local
Fortinet_SSL_RSA4096    local
```

2. Enter `?` to display additional information:

```
# execute gen-token cert
Please specify <certificate or preshared-key> <algorithm> <expire>.
```

3. Enter the certificate name and `?` to display additional information:
   In this example, the `FGT401E-II-SAN-all` certificate is specified.

```
# execute gen-token cert FGT401E-II-SAN-all
<Algorithm>    Algorithm for token generation.
Please ensure that the signing algorithm matches the type of certificate and its corresponding
private key.
Available Algorithms:
RS256, RS384, RS512, ES256, ES384, ES512 for cert.
HS256, HS384, HS512 for key.
```

4. Enter the algorithm and `?` to display additional information:
   In this example, the `RS256` algorithm is specified.

```
# execute gen-token cert FGT401E-II-SAN-all RS256
<Expire>    Expire interval in hours, 0 for long live token.
```

5. Enter the expiration value:
   In this example, no expiration time (`0`) is specified.

```
# execute gen-token cert FGT401E-II-SAN-all RS256 0
```

   The following values display after successful token generation:

```
Added key:iat val:1732547333
Generated token:eyAidHlwIjogIkpXVCIsICJhbGciOXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXX
```

6. Copy the `Generated token` to your SCIM client.

```
Generated token:eyAidHlwIjogIkpXVCIsICJhbGciOXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXX
```

   - On FortiAuthenticator, the generated token is called an *access token*.
   - For Azure, the generated token is called a *secret token*.

To configure verification of the bearer token:

1. Configure the certificate name or pre-shared key to use for verification of the bearer token.
   In this example, a certificate (`cert`) type of bearer token is configured. You must specify the same certificate used to generate the bearer token:

```
config user scim
    edit "SCIM-server-to-FAC"
        set id 1
        set status enable
        set base-url "https://10.1.100.7/SCIM-server-to-FAC/scim/v2/"
        set auth-method token
        set token-certificate "FGT401E-II-SAN-all"
        set certificate "REMOTE_Cert_1"
        set client-identity-check disable
    next
end
```

When using a pre-shared key (key), you must specify the same value used to generate the bearer token, for example:

```
config user scim
    edit "SCIM-server-to-FAC"
        set id 1
        set status enable
        set base-url "https://10.1.100.8/SCIM-server-to-FAC/scim/v2/"
        set auth-method token
        set secret ENC mSoyZXvQ/tM1v1VOuS31DOrCZRNQ383JiXXXXXXXXXXXXXXXXXXXXX"
        set certificate "REMOTE_Cert_2"
        set client-identity-check disable
    next
end
```

FortiTokens

FortiTokens are security tokens used as part of a multi-factor authentication (MFA) system on FortiGate and FortiAuthenticator. A security token is a 6-digit or 8-digit (configurable) one-time password (OTP) that is used to authenticate one's identity electronically as a prerequisite for accessing network resources. FortiToken is available as either a mobile or a physical (hard) token. Mobile tokens can be purchased as a license, or consumed with points as part of the FortiIdentity Cloud (formerly FortiToken Cloud) service.

FortiToken Mobile and physical FortiTokens store their encryption seeds on the cloud. FortiToken Mobile seeds are generated dynamically when the token is provisioned. They are always encrypted whether in motion or at rest.

You can only register FortiTokens to a single FortiGate or FortiAuthenticator for security purposes. This prevents malicious third parties from making fraudulent requests to hijack your FortiTokens by registering them on another FortiGate or FortiAuthenticator. If re-registering a FortiToken Mobile or Hard Token on another FortiGate is required, you must contact Fortinet Customer Support.

To migrate FortiToken Mobile tokens from FortiAuthenticator to FortiIdentity Cloud, see Migrating FTM tokens from FortiAuthenticator to FortiIdentity Cloud.

Common usage for FortiTokens includes:

- Applying MFA to a VPN dialup user connecting to the corporate network
- Applying MFA to FortiGate administrators
- Applying MFA to firewall authentication and captive portal authentication

The MFA process commonly involves:

- **Something you know**: User password
- **Something you have**: The FortiToken OTP

A third factor of authentication is added to the authentication process:

- **Something you are**: Your fingerprint or face

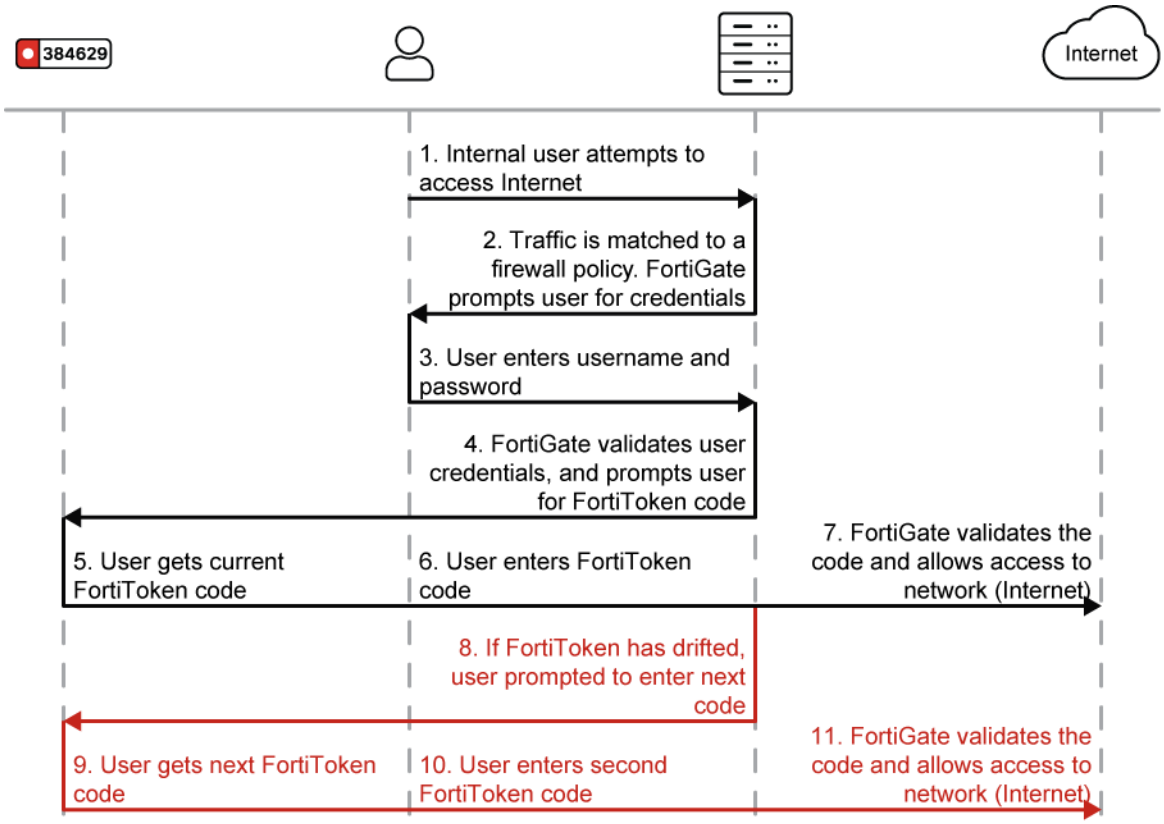
To enable the third factor, refer to the Activating FortiToken Mobile on a mobile phone on page 3509 section.

The following illustrates the FortiToken MFA process:

1. The user attempts to access a network resource.
2. FortiOS matches the traffic to an authentication security policy and prompts the user for their username and password.
3. The user enters their username and password.
4. FortiOS verifies their credentials. If valid, it prompts the user for the FortiToken code.
5. The user views the current code on their FortiToken. They enter the code at the prompt.
6. FortiOS verifies the FortiToken code. If valid, it allows the user access to network resources.

If the FortiToken has drifted, the following must take place for the FortiToken to resynchronize with FortiOS:

1. FortiOS prompts the user to enter a second code to confirm.
2. The user gets the next code from the FortiToken. They enter the code at the prompt.
3. FortiOS uses both codes to update its clock to match the FortiToken.



This section includes the following topics to quickly get started with FortiTokens:

- FortiToken Mobile quick start on page 3506
- FortiIdentity Cloud on page 3514
- Registering hard tokens on page 3514
- Managing FortiTokens on page 3517
- FortiToken Mobile Push on page 3519
- Synchronizing LDAP Active Directory users to FortiIdentity Cloud using the two-factor filter on page 3521
- Enable the FortiIdentity Cloud free trial directly from the FortiGate on page 3525
- FortiGuard distribution of updated Apple certificates for push notifications on page 3527
- Configure FTM push with dynamic IP handling in the GUI on page 3528
- Troubleshooting and diagnosis on page 3530

FortiToken Mobile quick start

FortiToken Mobile is an OATH compliant, event- and time-based one-time password (OTP) generator for mobile devices. It provides an easy and flexible way to deploy and provision FortiTokens to your end users through mobile devices. FortiToken Mobile produces its OTP codes in an application that you can download onto your Android or iOS mobile device without the need for a physical token.

You can download the free FortiToken Mobile application for Android from the Google Play Store, and for iOS from the Apple App Store.

This section focuses on quickly getting started and setting up FortiToken Mobile for use on a FortiGate:

- Registering FortiToken Mobile on page 3507
- Provisioning FortiToken Mobile on page 3508
- Activating FortiToken Mobile on a mobile phone on page 3509
- Applying multi-factor authentication on page 3514

Registering FortiToken Mobile

To deploy FortiToken Mobile for your end users, you must first register the tokens on your FortiGate. After registering the tokens, you can assign them to your end users.

Each FortiGate comes with two free FortiToken Mobile tokens. These tokens should appear under *User & Authentication > FortiTokens*. If no tokens appear, you may import them. Ensure that your FortiGate is registered and has internet access to connect to the FortiToken servers to import the tokens.

To import FortiTokens from the FortiGate GUI:

1. Go to *User & Authentication > FortiTokens*.
2. Click the *Import Free Trial Tokens* icon at the top. The two free tokens are imported.

To import FortiTokens from the FortiGate CLI:

```
# execute fortitoken-mobile import 0000-0000-0000-0000-0000
# show user fortitoken
```

If only one free token appears, you can first delete that token and then follow the procedure to import the two free tokens from either the GUI or the CLI.

If you have the FortiToken Mobile redemption certificate, you can register FortiToken Mobile on a FortiGate.

To register FortiToken Mobile from the FortiGate GUI:

1. Go to *User & Authentication > FortiTokens* and click *Create New*. The *New FortiToken* dialog appears.
2. For the *Type* field, select *Mobile Token*.
3. Locate the 20-digit code on the redemption certificate and type it in the *Activation Code* field.
4. Click *OK*. The token is successfully registered.

If you attempt to add invalid FortiToken serial numbers, there is no error message. FortiOS does not add invalid serial numbers to the list.

To register FortiToken Mobile from the FortiGate CLI:

```
# execute fortitoken-mobile import <20-digit activation code>
# show user fortitoken
```

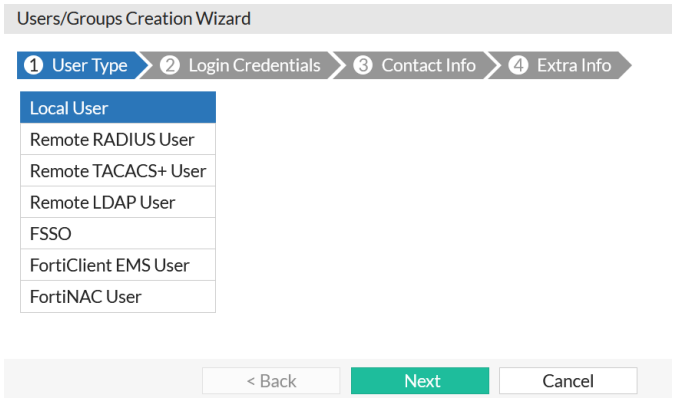
FortiToken Mobile stores its encryption seeds on the cloud. You can only register it to a single FortiGate or FortiAuthenticator.

Provisioning FortiToken Mobile

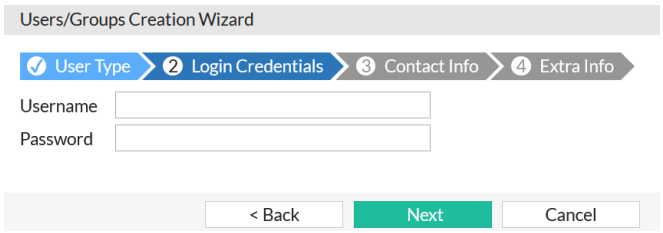
Once registered, FortiTokens need to be provisioned for users before they can be activated. In this example, you will provision a mobile token for a local user. Similar steps can be taken to assign FortiTokens to other types of users.

To create a local user and assign a FortiToken in the FortiGate GUI:

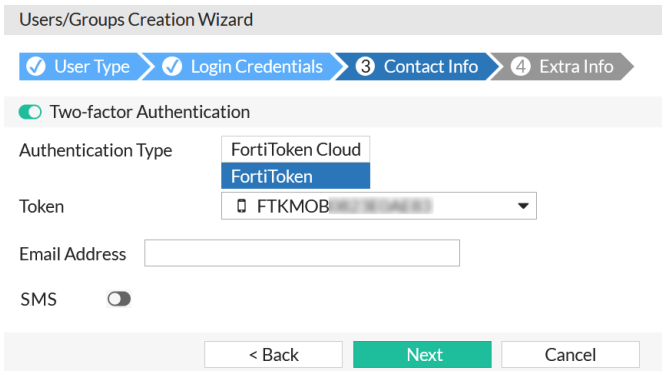
1. Go to *User & Authentication* > *User Definition*, and click *Create New*. The *Users/Groups Creation Wizard* appears.
2. In the *User Type* tab, select *Local User*, and click *Next*.



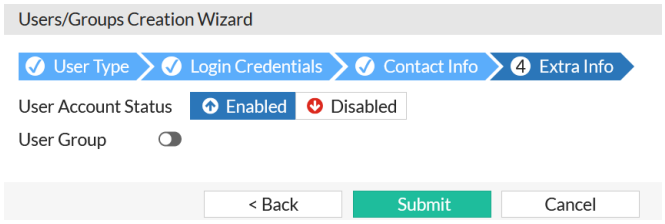
3. In the *Login Credentials* tab, enter a *Username* and *Password* for the user, and click *Next*.



4. In the *Contact Info* tab:
   a. Enable the *Two-factor Authentication* toggle.
   b. Select *FortiToken* for *Authentication Type*.
   c. Select a *Token* to assign to the user from the drop-down list.
   d. Enter the user's email address in the *Email Address* field. This is the email where the user will receive the QR code for activation of the FortiToken.
   e. Click *Next*.



5. In the *Extra Info* tab, make sure the *User Account Status* field is set to Enabled. You can also optionally assign the user to a user group by enabling the *User Group* toggle.



6. Click *Submit*. An activation code should be sent to the created user by email or SMS, depending upon the delivery method configured above.

FortiGate has the *Email Service* setting configured using the server *notifications.fortinet.net* by default. To see configuration, go to *System > Settings > General*.

The activation code expires if not activated within the 3-day time period by default. However, the expiry time period is configurable.

To configure the time period (in hours) for FortiToken Mobile, using the CLI:

```
config system global
    set two-factor-ftm-expiry <1-168>
end
```

To resend the email or SMS with the activation code, refer to the Managing FortiTokens on page 3517 section.

Activating FortiToken Mobile on a mobile phone

After your system administrator provisions your token, you receive a notification with an activation code and expiry date via SMS or email. If you do not activate your token by the expiry date, you must contact your system administrator so that they can reassign your token for activation.

Platforms that support FortiToken Mobile:

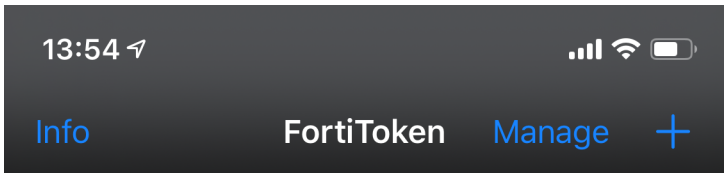
Platform	Device and firmware support
iOS	iPhone, iPad, and iPod Touch with iOS 6.0 and later.
Android	Phones and tablets with Android Jellybean 4.1 and later.
Windows	Windows 10 (desktop and mobile), Windows Phone 8.1, and Windows Phone 8. FortiToken is a Windows Universal Platform (UWP) application. To download FortiToken for Windows 10 desktop and mobile platforms, see FortiToken for Windows on the Microsoft Store.

The following instructions describe procedures when using FortiToken Mobile for iOS on an iPhone. Procedures may vary depending on your device and firmware.

To activate FortiToken Mobile on iOS:

1. On your iOS device, tap on the FortiToken application icon to open the application. If this is your first time opening the application, it may prompt you to create a PIN for secure access to the application and tokens.

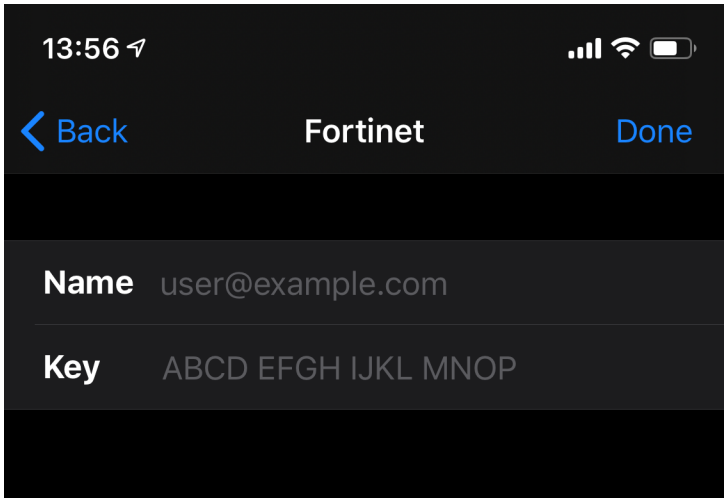
2. Tap on the + icon. The *Scan Barcode* screen appears.



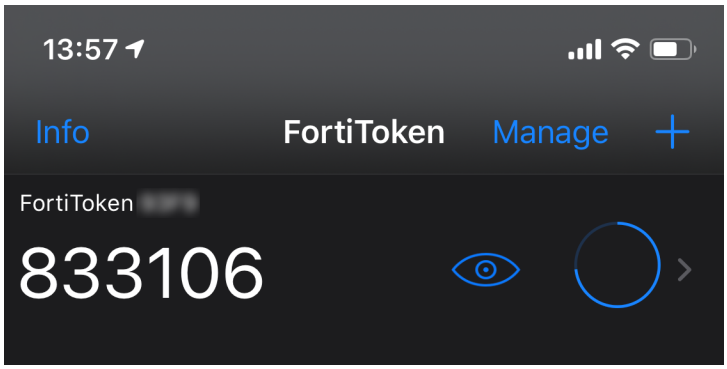
3. 
If you received the QR code via email, locate and scan the QR code in your email.

OR

If you received the activation key via SMS, tap on *Enter Manually* at the bottom of the screen, and tap on *Fortinet*. Enter your email address in the *Name* field, the activation key in the *Key* field, and tap *Done*.



4. FortiToken Mobile activates your token, and starts generating OTP digits immediately. To view or hide the OTP digits, tap the eye icon.

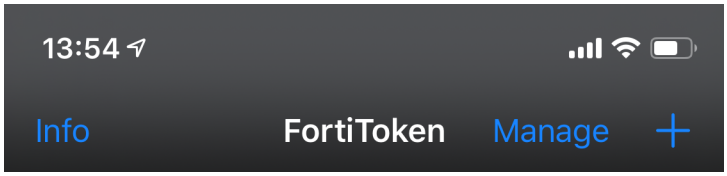


After you open the application, FortiToken Mobile generates a new 6-digit OTP every 30 seconds. All configured tokens display on the application homescreen.

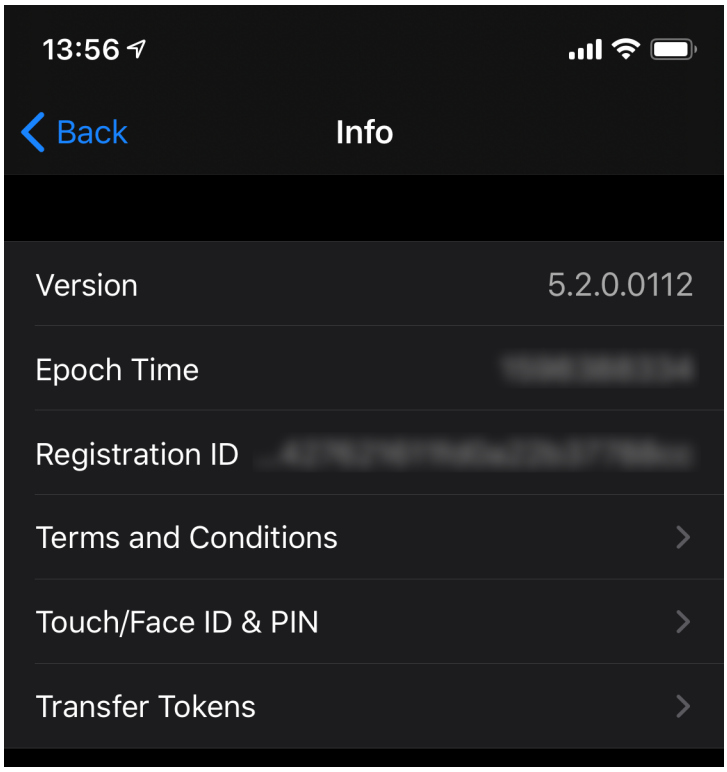
The FortiToken Mobile activation process described above caters to the MFA process that involves two factors (password and OTP) of the authentication process. A third factor (fingerprint or face) can be enabled as well.

To enable *Touch/Face ID* on iOS for FortiToken Mobile:

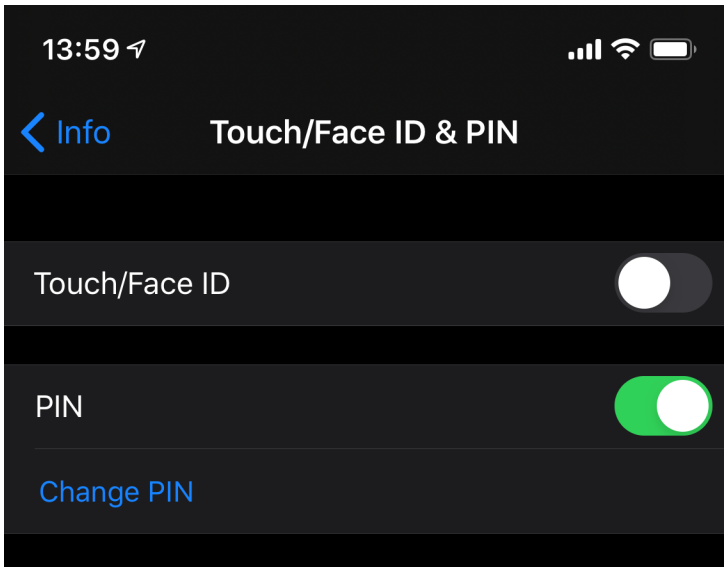
1. Open the FortiToken application and tap on *Info*.



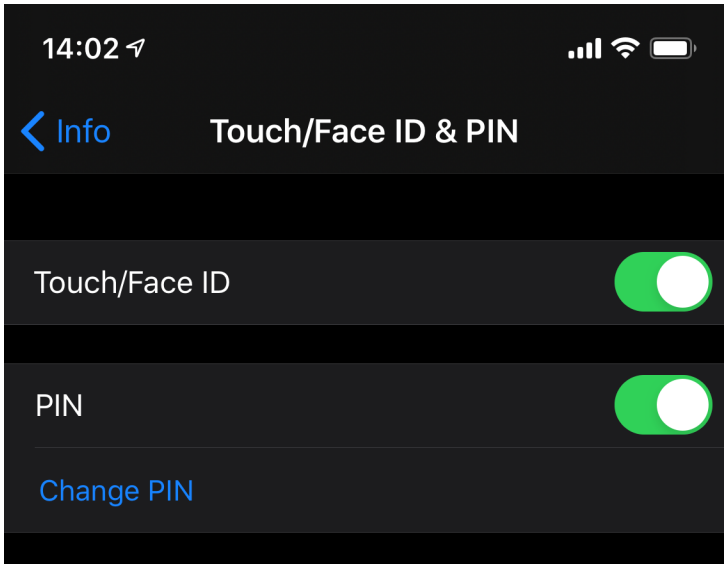
2. Tap on *Touch/Face ID & PIN*.



3. Enable and set up a 4-digit *PIN* for the application. The *PIN* is required to be enabled before you can enable *Touch/Face ID*.

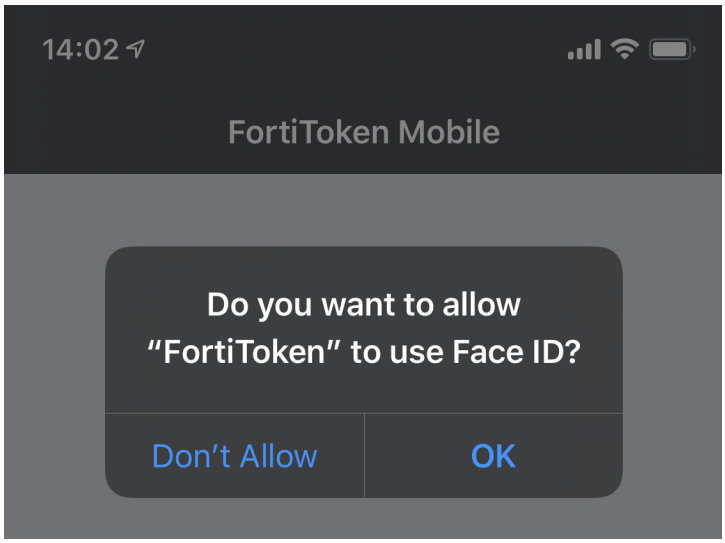


4. Enable *Touch/Face ID*.



> You cannot enable *Touch/Face ID* for FortiToken if *Touch/Face ID* is not set up and enabled for device unlock (*iPhone Unlock* in this case) on iOS. You must first set up and enable *Touch/Face ID* from *Settings* on your iOS device.

5. When prompted by iOS, allow the FortiToken application to use *Touch/Face ID* by tapping on *OK* in the prompt.



Applying multi-factor authentication

Multi-factor authentication (MFA) may also be set up for Agentless VPN users, administrators, firewall policy, wireless users, and so on. The following topics explain more about how you may use the newly created user in such scenarios:

- MFA for IPsec VPN: Add FortiToken multi-factor authentication on page 2921
- MFA for Administrators: Administrator account options on page 3578
- MFA with Captive Portal
- MFA for wireless users via Captive Portal
- Configuring FSSO firewall authentication on page 3552

FortiIdentity Cloud

FortiToken Cloud is now called FortiIdentity Cloud.

FortiIdentity Cloud is an Identity and Access Management as a Service (IDaaS) cloud service offering by Fortinet. It enables FortiGate and FortiAuthenticator customers to add MFA for their respective users, through the use of Mobile tokens or Hard tokens. It protects local and remote administrators as well as firewall and VPN users.

For information, see Getting started—FGT-FIC users in the FortiIdentity Cloud Administration Guide.

Registering hard tokens

Registering FortiTokens consists of the following steps:

1. Adding FortiTokens to FortiOS.
2. Activating FortiTokens.
3. Associating FortiTokens with user accounts.

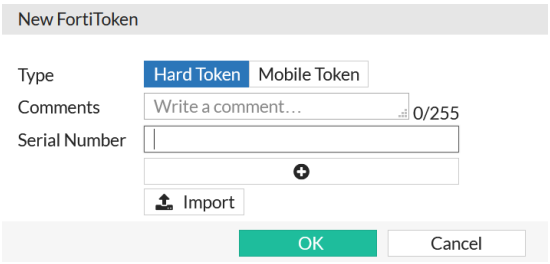
Adding FortiTokens to FortiOS

You can add FortiTokens to FortiOS in the following ways:

- Add FortiToken serial numbers using the GUI
- Add FortiToken serial numbers using the CLI
- Import FortiTokens using a serial number or seed file using the GUI

To manually add single hard token to FortiOS using the GUI:

1. Go to *User & Authentication* > *FortiTokens*.
2. Click *Create New*.
3. For *Type*, select *Hard Token*.
4. In the *Serial Number* field, enter one or more FortiToken serial numbers.
5. Click *OK*.

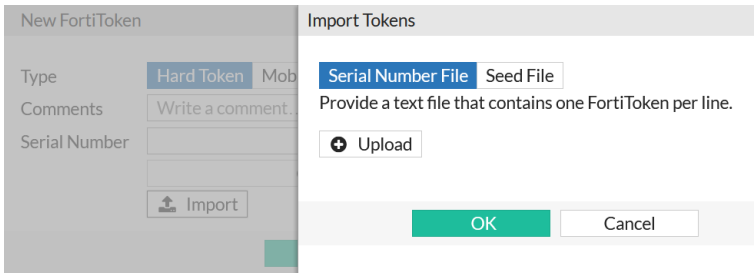


To add multiple FortiTokens to FortiOS using the CLI:

```
config user fortitoken
    edit <serial_number>
    next
    edit <serial_number2>
    next
end
```

To import multiple FortiTokens to FortiOS using the GUI:

1. Go to *User & Authentication* > *FortiTokens*.
2. Click *Create New*.
3. For *Type*, select *Hard Token*.
4. Click *Import*. The *Import Tokens* section slides in on the screen.



5. Select *Serial Number File*.

> Seed files are only used with FortiToken-200CD. These are special hardware tokens that come with FortiToken seeds on a CD. See the FortiToken Comprehensive Guide for details.

6. Click *Upload*.
7. Browse to the file's location on your local machine, select the file, then click *OK*.
8. Click *OK*.

Activating FortiTokens

You must activate the FortiTokens before starting to use them. FortiOS requires connection to FortiGuard servers for FortiToken activation. During activation, FortiOS queries FortiGuard servers about each token's validity. Each token can only be used on a single FortiGate or FortiAuthenticator. If tokens are already registered, they are deemed invalid for re-activation on another device. FortiOS encrypts the serial number and information before sending for added security.

To activate a FortiToken using the GUI:

1. Go to *User & Authentication* > *FortiTokens*.
2. Select the desired FortiTokens that have an *Available* status.
3. Click *Activate* from the menu above.
4. Click *Refresh*. The selected FortiTokens are activated.

To activate a FortiToken using the CLI:

```
config user fortitoken
    edit <token_serial_num>
        set status activate
    next
end
```

Associating FortiTokens with user accounts

You can associate FortiTokens with local user or administrator accounts.

To associate a FortiToken to a local user account using the GUI:

1. Ensure that you have successfully added your FortiToken serial number to FortiOS and that its status is *Available*.

2. Go to *User & Authentication* > *User Definition*. Edit the desired user account.
3. Enable *Two-factor Authentication*.
4. From the *Token* dropdown list, select the desired FortiToken serial number.
5. In the *Email Address* field, enter the user's email address.
6. Click *OK*.

To associate a FortiToken to a local user account using the CLI:

```
config user local
    edit <username>
        set type password
        set passwd "myPassword"
        set two-factor fortitoken
        set fortitoken <serial_number>
        set email-to "username@example.com"
        set status enable
    next
end
```

Before you can use a new FortiToken, you may need to synchronize it due to clock drift.

To associate a FortiToken to an administrator account, refer to the Administrator account options on page 3578 section.

Managing FortiTokens

This section focuses on the following:

- Resending an activation email on page 3517
- Locking/unlocking FortiTokens on page 3518
- Managing FortiTokens drift on page 3518
- Deactivating FortiTokens on page 3519
- Moving FortiTokens to another device on page 3519

Resending an activation email

To resend an activation email/SMS for a mobile token on a FortiGate:

1. Go to *User & Authentication* > *User Definition* and edit the user.
2. Click *Send Activation Code Email* from the *Two-factor Authentication* section.

Locking/unlocking FortiTokens

To change FortiToken status to active or to lock:

```
config user fortitoken
    edit <token_serial_num>
        set status <active | lock>
    next
end
```

A user attempting to log in using a locked FortiToken cannot successfully authenticate.

Managing FortiTokens drift

If the FortiToken has drifted, the following must take place for the FortiToken to resynchronize with FortiOS:

1. FortiOS prompts the user to enter a second code to confirm.
2. The user gets the next code from the FortiToken. They enter the code at the prompt.
3. FortiOS uses both codes to update its clock to match the FortiToken.

If you still experience clock drift, it may be the result of incorrect time settings on your mobile device. If so, make sure that the mobile device clock is accurate by confirming the network time and the correct timezone.

If the device clock is set correctly, the issue could be the result of the FortiGate and FortiTokens being initialized prior to setting an NTP server. This will result in a time difference that is too large to correct with the synchronize function. To avoid this, selected Tokens can be manually drift adjusted.

To show current drift and status for each FortiToken:

```
# diagnose fortitoken info
FORTITOKEN DRIFT STATUS
FTK200XXXXXXXXC 0 token already activated, and seed won't be returned
FTK200XXXXXXXXE 0 token already activated, and seed won't be returned
FTKMOBXXXXXXXXA 0 provisioned
FTKMOBXXXXXXXX4 0 new
Total activated token: 0
Total global activated token: 0
Token server status: reachable
```

This command lists the serial number and drift for each configured FortiToken. You can check if it is necessary to synchronize the FortiGate and any particular FortiTokens.

To adjust Mobile FortiToken for drift:

```
# execute fortitoken sync <FortiToken_ID> <token_code1> <next_token_code2>
```

Deactivating FortiTokens

To deactivate FortiToken on a FortiGate:

1. Go to *User & Authentication* > *User Definition*.
2. Select and edit the user for which you want to deactivate the token.
3. Disable the *Two-factor Authentication* toggle.
4. Click *OK*. The token will be removed from the user's *Two-factor Authentication* column. The user will also be removed from the token's *User* column under *User & Authentication* > *FortiTokens*.

Moving FortiTokens to another device

FortiTokens can only be activated on a single FortiGate or FortiAuthenticator. To move FortiTokens to another device, you would first have to reset the registered FortiTokens on a device and then reactivate them on another device.

To reset Hard tokens registered to a FortiGate appliance (non-VM model), you can reset all hardware FTK200 tokens from the Support Portal, or during RMA transfer. See the Migrating users and FortiTokens to another FortiGate KB article, for more information.

The above process will reset all Hard tokens and you cannot select individual tokens to reset.

To reset FortiToken Mobile, a single Hard token, a Hard token registered to a VM, and so on, an administrator must contact Customer Support and/or open a ticket on the Support Portal.

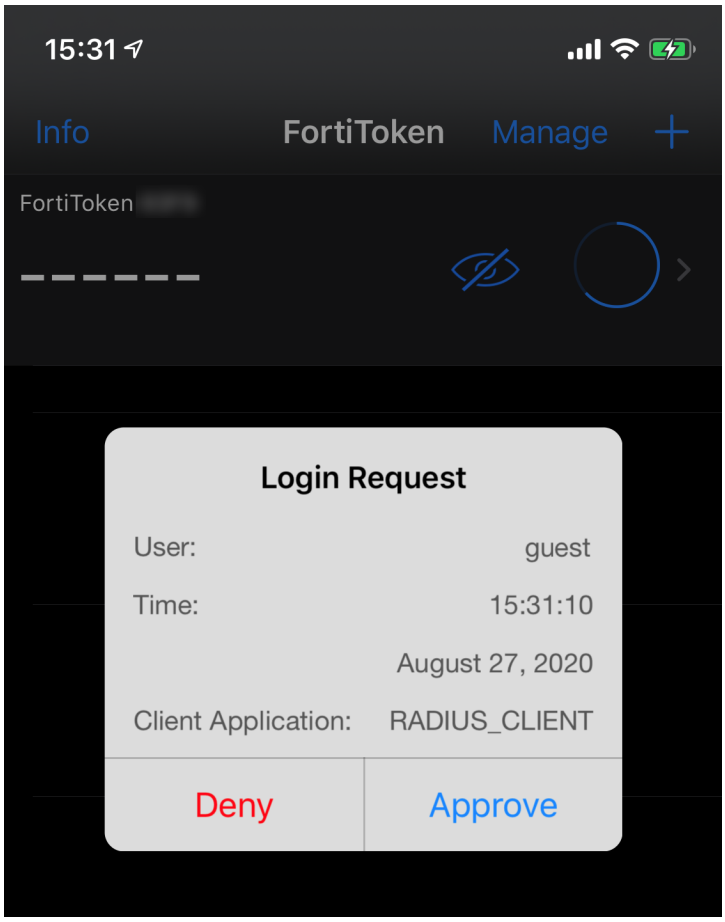
Once reset, the FortiTokens can be activated on another FortiGate or FortiAuthenticator.

FortiToken Mobile Push

FortiToken Mobile Push allows authentication requests to be sent as push notifications to the end user's FortiToken Mobile application.

The FortiToken Mobile push service operates as follows:

1. FortiGate sends a DNS query to the FortiToken Mobile Push proxy server (*push.fortinet.com*).
2. FortiGate connects to the proxy server via an encrypted connection over TCP/443.
3. The proxy server handles the notification request by making a TLS connection with either Apple (for iOS) or Google (for Android) notification servers. Notification data may include the recipient, session, FortiGate callback IP and port, and so on.
4. The notification service from either Apple or Google notifies the user's mobile device of the push request.
5. The FortiToken Mobile application on the user's mobile displays a prompt for the user to either *Approve* or *Deny* the request.



To configure FortiToken Mobile push services using the CLI:

```
config system ftm-push
    set proxy {enable | disable}
    set interface <string>
    set server-port [1-65535]
    set server-cert <certificate-name>
    set server <ip-address>
    set status enable
end
```

The default server port is 4433.

The server IP address is the public IP address of the FortiOS interface that FortiToken Mobile calls back to. FortiOS uses this IP address for incoming FortiToken Mobile calls.

If an SSL VPN user authenticates with their token, then logs out and attempts to reauthenticate within a minute, a *Please wait x seconds to login again* message displays. This replaces a previous error/permission denied message. The x value depends on the calculation of how much time is left in the current time step.

```
config system interface
    edit "guest"
        set allowaccess ftm
```

```
    next
end
```

FortiOS supports FortiAuthenticator-initiated FortiToken Mobile Push notifications for users attempting to authenticate through an SSL VPN and/or RADIUS server (with FortiAuthenticator as the RADIUS server).

Synchronizing LDAP Active Directory users to FortiIdentity Cloud using the two-factor filter

To synchronize Active Directory users and apply two-factor authentication using FortiIdentity Cloud (formerly FortiToken Cloud), two-factor authentication can be enabled in the `user ldap` object definition in FortiOS. By default, FortiOS retrieves all Active Directory users in the LDAP server with a valid email or mobile number (`mail` and `mobile` attributes), and synchronizes the users to FortiIdentity Cloud. Users are then created on FortiIdentity Cloud and activation is sent out using email or SMS.

Two-factor filters can be used to reduce the number of the Active Directory users returned, and only synchronize the users who meet the filter criteria.

```
config user ldap
    edit <name>
        set dn <string>
        set two-factor {disable | fortitoken-cloud}
        set two-factor-filter <string>
    next
end
```

`dn <string>`	Set the distinguished name used to look up entries on the LDAP server. The search for users and groups starts here based on what is defined.
`two-factor {disable | fortitoken-cloud}`	Enable/disable two-factor authentication: • `disable`: disable two-factor authentication • `fortitoken-cloud`: use the FortiIdentity Cloud service
`two-factor-filter <string>`	Set the filter used to synchronize users to FortiIdentity Cloud.

When configuring an LDAP connection to an Active Directory server, an administrator must provide Active Directory user credentials.

- To secure this connection, use LDAPS on both the Active Directory server and FortiGate. See Configuring an LDAP server on page 3381 and Configuring client certificate authentication on the LDAP server on page 3396.
- Apply the principle of least privilege. For the LDAP regular bind operation, do not use credentials that provide full administrative access to the Windows server when using credentials. See Configuring least privileges for LDAP admin account authentication in Active Directory on page 3389.

Two-factor filter examples

In the following examples, a `user ldap` object is defined to connect to an Active Directory on a Windows server. The search will begin in the root of the fortinet-fsso.com directory.

To configure a default LDAP server configuration without a two-factor filter:

```
config user ldap
    edit "ad-ldap-auth"
        set server <ip_address>
        set cnid "cn"
        set dn "dc=fortinet-fsso,dc=com"
        set type regular
        set two-factor fortitoken-cloud
        set username "cn=Administrator,cn=users,dc=fortinet-fsso,dc=com"
        set password **********
    next
end
```

When a two-factor filter is not used, all users in the Active Directory with a valid email or mobile number will be retrieved.

Example 1: specific users and email address with wildcard

With this `two-factor-filter`, users under fortinet-fsso.com that have oliver* in their username and *fortinet* in their email will be matched.

```
config user ldap
    edit "ad-ldap-auth"
        set two-factor-filter "(&(SAMAccountName=oliver*)(mail=*fortinet*))"
    next
end
```

Example 2: all users with matching email

With this `two-factor-filter`, all users under fortinet-fsso.com with *fortinet* in their email will be matched.

```
config user ldap
    edit "ad-ldap-auth"
        set two-factor-filter "(&(SAMAccountName=*)(mail=*fortinet*))"
    next
end
```

Example 3: all users in a group

With this `two-factor-filter`, all users within the group fortinet-fsso.com > Testing > ftc-users will be matched.

```
config user ldap
    edit "ad-ldap-auth"
        set two-factor-filter "(&(objectCategory=Person)(sAMAccountName=*)( memberOf=cn=ftc-
```

```
users,ou=Testing,dc=fortinet-fsso,DC=com))"
    next
end
```

Example configuration

In this example, Active Directory users are configured to be synchronized to FortiIdentity Cloud. The same two-factor filter is used from example 1 and searches the Active Directory for users named oliver* with email *fortinet*.

Before configuring the FortiGate:

1. Gather the information to connect to the Active Directory server through LDAP. Include all necessary fields, such as the server IP, port, CN name identifier, DN for the start of the search, bind type, and username associated with a regular bind.
2. Consider the users or groups that require two-factor authentication and should be synchronized. If necessary, group the users under the same group in the Active Directory.
3. If using a two-factor filter, formulate the `two-factor-filter` string to limit the match. For this example, `(&(SAMAccountName=oliver*)(mail=*fortinet*))`.
4. Test the filter by using the FortiOS CLI to perform a quick LDAP search:

```
# diagnose test authserver ldap-search <server_ip> 389 "ou=Testing,dc=fortinet-fsso,DC=com" cn
Administrator@fortinet-fsso.com PASSWORD 0 '(&(SAMAccountName=oliver*)(mail=*fortinet*))' 2

searching 'ou=Testing,dc=fortinet-fsso,DC=com, cn=cn' on 10.1.100.131:389 for
(Administrator@fortinet-fsso.com, PASSWORD), secure(0), filter((&(SAMAccountName=oliver*)
(mail=*fortinet*))), flag(0x2), page_no(0)...
CN=oliver2022,OU=Testing,DC=Fortinet-FSSO,DC=COM (oliver2022, 0 entries)
```

   The user, `oliver2022`, was found.
5. Estimate how many users will be retrieved, and ensure that the FortiIdentity Cloud account has enough user licenses to support the number of users.

To configure Active Directory users to be synchronized to FortiIdentity Cloud:

1. Configure the user LDAP settings:

```
config user ldap
    edit "ad-ldap-auth"
        set server "10.1.100.131"
        set cnid "cn"
        set dn "dc=fortinet-fsso,dc=com"
        set type regular
        set two-factor fortitoken-cloud
        set username "cn=Administrator,cn=users,dc=fortinet-fsso,dc=com"
        set password **********
        set two-factor-filter "(&(SAMAccountName=oliver*)(mail=*fortinet*))"
    next
end
```

2. In the background, the FortiGate FAS daemon scans the LDAP server for users to be synchronized based on the two-factor filter pattern, but will not send them to the FortiIdentity Cloud server yet. Optionally, verify the users that are retrieved from the Active Directory based on the filter:

```
# diagnose fortitoken-cloud debug enable
# diagnose debug enable
# diagnose fortitoken-cloud sync
...
fas_sync_ftc[2788]: Sending packet to FTC server: "IP-of-FTC-server" Port: 8686(length:444)
fas_sync_ftc[2792]: FTC User Sync Packet(length:444):
POST /api/v1/user_sync HTTP/1.1
Host: ftc.fortinet.com
Connection: keep-alive
User-Agent: FortiGate-401E v7.0.6,build****
Content-Type: application/json
Content-Length: 246
{"users":[{"username":"oliver2022","vdom":"vdom1","email":"o****@fortinet.com","mobile_
number":"XXXXXXXXXXX","user_data":1,"action":"create"}],"sn":"FG4H1E5819900000","cluster_
members":[ "FG4H1E5819900000" ],"group_name":"FGT400D","group_id":"0"}
Reminder: User sync packet not actually sent out because of diagnose purpose!
```

   As expected, only the user that matches the current filter is returned.

3. Manually trigger the synchronization process with FortiIdentity Cloud:

```
# execute fortitoken-cloud sync
```

   The user is added to FortiIdentity Cloud, and an activation email or SMS message is sent to the user.

4. In FortiIdentity Cloud, go to *User Management* > *Users* to verify that the user was added.

   If the activation email was sent, but user has not downloaded and activated the mobile token yet, a pending symbol appears in the *Status* column (such as for the *admin*, *test6*, and *test3* users).

5. In FortiOS, add the `ad-ldap-auth` object in a user group. The user group can be used for VPN, firewall authentication, and so on.

The `ldap user` object should not be used in remote LDAP user groups that require group matching because it is not supported.

Enable the FortiIdentity Cloud free trial directly from the FortiGate

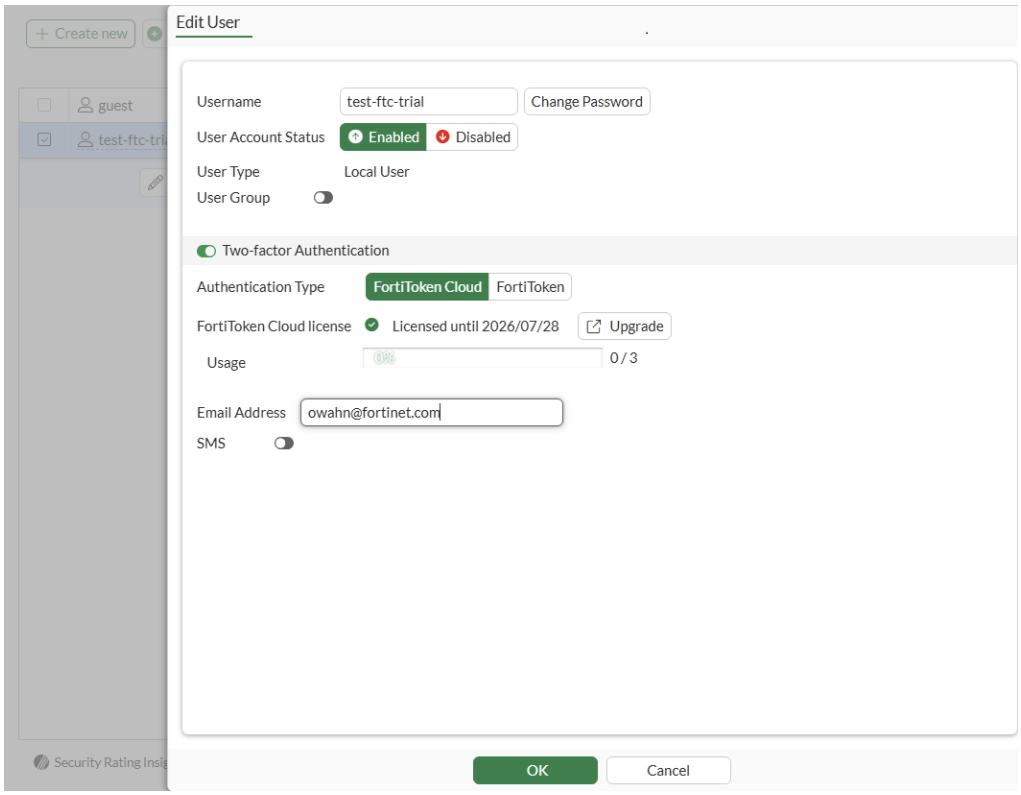
A free trial of FortiIdentity Cloud (formerly FortiToken Cloud) with a maximum of three seats is available from FortiGates with a valid support contract registered to a FortiCare/FortiCloud account with Fortinet Technical Support. See Product registration with FortiCare on page 115 for more information.

You can access the free trial by enabling two-factor authentication within a user or administrator configuration.

The free trail of FortiIdentity Cloud remains active as long as the support contract is valid.

To enable the FortiIdentity Cloud free trial for a local user:

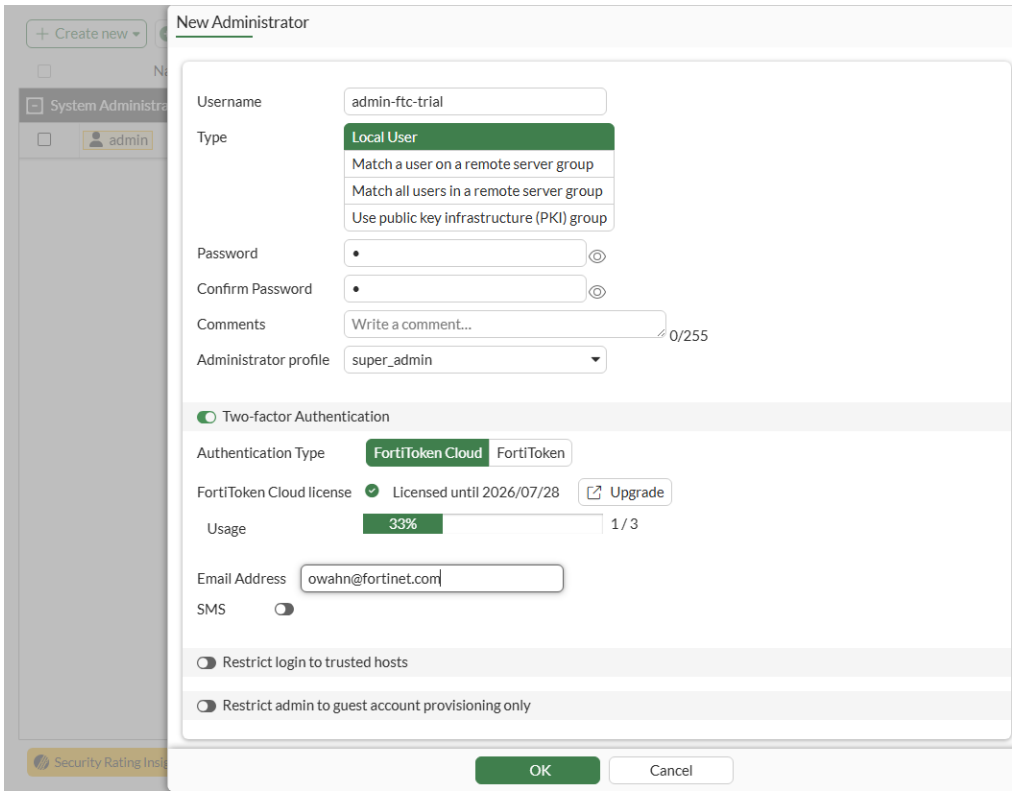
1. Go to *User & Authentication* > *User Definition*.
2. Click *Create new*.
3. Configure settings as needed.
4. Enable *Two-factor Authentication*.
5. Set *Authentication Type* to *FortiToken Cloud*.
   The *FortiToken Cloud license* field displays *Licensed* and the expiration date of the license.
   The *Usage* field displays the number of available and used seats. In this example, 0 of 3 (*0/3*) seats are used because the user configuration hasn't been saved yet.



6. Complete the remaining fields, and click *OK*.
   A FortiIdentity Cloud enrollment email is sent to the provided email.

To enable the FortiIdentity Cloud free trial for an administrator:

1. Go to *System* > *Administrators*.
2. Click *Create new* > *Administrator*.
3. Enable *Two-factor Authentication*.
4. Set *Authentication Type* to *FortiToken Cloud*.
   The *FortiToken Cloud license* field displays *Licensed* and the expiration date of the license.
   The *Usage* field displays the number of available and used seats. In this example, 1 of 3 (*1/3*) seats are used. After this administrator configuration is saved, a second seat will be used.



5. Complete the remaining fields, and click *OK*.
   A FortiIdentity Cloud enrollment email is sent to the provided email.

To view the FortiIdentity Cloud status in the CLI:

```
# execute fortitoken-cloud show
FortiToken Cloud service status: licensed. Region code: 01. Region name: eu.
Service balance: 1.00 users. Expiration date: 2026-07-29. Customer ID: 1336761.
FortiToken Cloud account number of users: 2, max number of users: 3.
```

FortiGuard distribution of updated Apple certificates for push notifications

Push notifications for iPhone (for the purpose of two-factor authentication) require a TLS server certificate to authenticate to Apple. As this certificate is only valid for one year, a service extension allows FortiGuard to distribute updated TLS server certificates to FortiGate when needed.

FortiGuard update service updates local Apple push notification TLS server certificates when the local certificate is expired. FortiGuard update service also reinstalls certificates when the certificates are lost.

You can verify that the feature is working on the FortiGate by using the CLI shell.

To verify certificate updates:

1. Using FortiOS CLI shell, verify that all certificates are installed:

```
/data/etc/apns # ls -al
drwxr-xr-x    2 0        0       Tue Jan 15 08:42:39 2019          1024 .
drwxr-xr-x   12 0        0       Tue Jan 15 08:45:00 2019          2048 ..
-rw-r--r--    1 0        0       Sat Jan 12 00:06:30 2019          2377 apn-dev-cert.pem
-rw-r--r--    1 0        0       Sat Jan 12 00:06:30 2019          1859 apn-dev-key.pem
-rw-r--r--    1 0        0       Sat Jan 12 00:06:30 2019          8964 apn-dis-cert.pem
-rw-r--r--    1 0        0       Sat Jan 12 00:06:30 2019          4482 apn-dis-key.pem
```

2. Rename all current Apple certificates.
   Apple push notification no longer works after you rename the certificates.

```
/data/etc/apns # mv apn-dis-cert.pem apn-dis-cert.pem.save
/data/etc/apns # mv apn-dev-key.pem apn-dev-key.pem.save
/data/etc/apns # mv apn-dev-cert.pem apn-dev-cert.pem.save
/data/etc/apns # mv apn-dis-key.pem apn-dis-key.pem.save
/data/etc/apns # ls -al
drwxr-xr-x   2 0  0   Tue Jan 15 08:51:15 2019   1024 .
drwxr-xr-x  12 0  0   Tue Jan 15 08:45:00 2019   2048 ..
-rw-r--r--   1 0  0   Sat Jan 12 00:06:30 2019   2377 apn-dev-cert.pem.save
-rw-r--r--   1 0  0   Sat Jan 12 00:06:30 2019   1859 apn-dev-key.pem.save
-rw-r--r--   1 0  0   Sat Jan 12 00:06:30 2019   8964 apn-dis-cert.pem.save
-rw-r--r--   1 0  0   Sat Jan 12 00:06:30 2019   4482 apn-dis-key.pem.save
```

3. Run a FortiGuard update, and verify that all certificates are installed again:

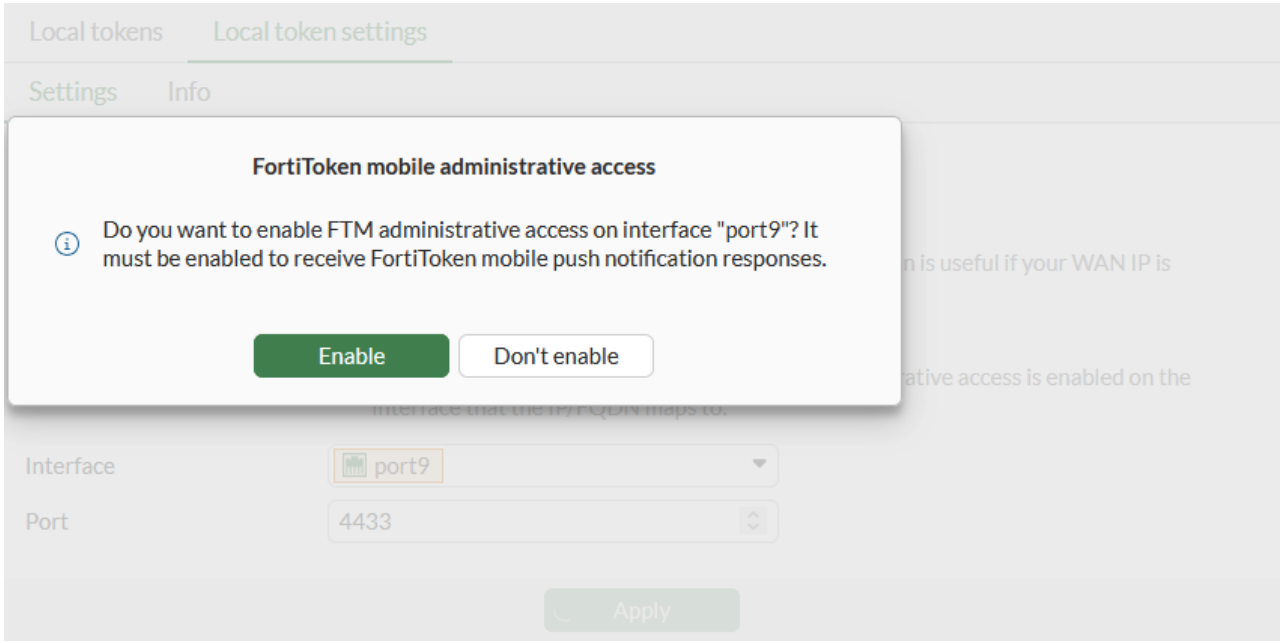
```
/data/etc/apns # ls -al
drwxr-xr-x   2 0  0   Tue Jan 15 08:56:20 2019   1024 .
drwxr-xr-x  12 0  0   Tue Jan 15 08:56:15 2019   2048 ..
-rw-r--r--   1 0  0   Sat Jan 12 00:06:30 2019   2377 apn-dev-cert.pem.save
-rw-r--r--   1 0  0   Sat Jan 12 00:06:30 2019   1859 apn-dev-key.pem.save
-rw-r--r--   1 0  0   Tue Jan 15 08:56:20 2019   2167 apn-dis-cert.pem  <-- downloaded from
FortiGuard
-rw-r--r--   1 0  0   Sat Jan 12 00:06:30 2019   8964 apn-dis-cert.pem.save
-rw-r--r--   1 0  0   Tue Jan 15 08:56:20 2019   1704 apn-dis-key.pem   <-- downloaded from
FortiGuard
-rw-r--r--   1 0  0   Sat Jan 12 00:06:30 2019   4482 apn-dis-key.pem.save
-rw-r--r--   1 0  0   Tue Jan 15 08:56:20 2019     41 apn-version.dat   <-- downloaded from
FortiGuard
/data/etc/apns #
```

Configure FTM push with dynamic IP handling in the GUI

A new GUI-based configuration page for FTM push has been added to complement the existing CLI setup. Previously, users had to manually enter the IPv4 address or domain name of the FortiToken Mobile push services server, which required updates when the IP address changed. The new option allows users to select an interface instead. The system will automatically use the current IP address of the selected interface, making it ideal for environments where the WAN IP is dynamically assigned.

To configure FTM push dynamic IP handling in the GUI:

1. Go to *User & Authentication* > *FortiTokens* and select the *Local token settings* tab.
2. Set *Push notifications* to *Enabled*.
3. By default, *Direct push responses to* in set to *Interface*. The IP address of the selected interface is used. This is useful if your WAN IP is dynamically assigned.
4. Set *Interface* to a physical interface.
5. Optionally, change the default listening *Port*.
6. Click *Apply*.
7. If FortiToken mobile administrative access is not enabled on the selected interface, a pop-up message will ask to enable it. Click *Enable*.



FortiToken mobile administrative access can also be configured in the interface settings; see Configure administrative access to interfaces on page 229.

When an interface is configured in the GUI, the `server` option is empty in the CLI:

```
config system ftm-push
    set proxy enable
    set interface "port9"
    set server ''
    set server-port 4433
    set server-cert "Fortinet_GUI_Server"
    set status enable
end
```

If the IP/FQDN is configured in the GUI, after upgrading from previous FortiOS version, the `interface` option (`server-ip` in previous versions) will be empty and the `server` options will contain the static IP address or FQDN:

```
config system ftm-push
    set proxy enable
```

```
    set interface ''
    set server "172.18.60.184"
    set server-port 4433
    set server-cert "Fortinet_GUI_Server"
    set status enable
end
```

Troubleshooting and diagnosis

This section contains some common scenarios for FortiTokens troubleshooting and diagnosis:

- FortiToken Statuses on page 3530
- Recovering trial FortiTokens on page 3531
- Recovering lost Administrator FortiTokens on page 3532
- Agentless VPN with multi-factor authentication expiry timers on page 3533

FortiToken Statuses

When troubleshooting FortiToken issues, it is important to understand different FortiToken statuses. FortiToken status may be retrieved either from the CLI or the GUI, with a slightly different naming convention.

Before you begin, verify that the FortiGate has Internet connectivity and is also connected to both the FortiGuard and registration servers:

```
# execute ping fds1.fortinet.com
```

```
# execute ping directregistration.fortinet.com
```

```
# execute ping globalftm.fortinet.net
```

The `globalftm.fortinet.net` server is the Fortinet Anycast server added in FortiOS 6.4.2.

If there are connectivity issues, retrieving FortiToken statuses or performing FortiToken activation could fail. Therefore, troubleshoot connectivity issues before continuing.

To retrieve FortiToken statuses:

- In the CLI:

  ```
  # diagnose fortitoken info
  ```

- In the GUI:
  Go to *User & Authentication* > *FortiTokens*.

Various FortiToken statuses in either the CLI or the GUI may be described as follows:

CLI	GUI	Description
`new`	*Available*	Newly added, not pending, not activated, not yet assigned.
`active`	*Assigned*	Assigned to a user, hardware token.
`provisioning`	*Pending*	Assigned to a user and waiting for activation on the FortiToken Mobile app.
`provisioned`	*Assigned*	Assigned to user and activated on the FortiToken Mobile app.
`provision timeout`		Token provided to user but not activated on the FortiToken Mobile app. To fix, the token needs to be re-provisioned and activated in time.
`token already activated, and seed won't be returned`	*Error*	Token is locked by FortiGuard FDS. The hardware token was already activated on another device and locked by FDS.
`locked`		Either manually locked by an Administrator (`set status lock`), or locked automatically, for example, when the token is unassigned and the FortiCare FTM provisioning server was unreachable to process that change.

Recovering trial FortiTokens

You can recover trial FortiTokens if deleted from a FortiGate, or if stuck in a state where it is not possible to provision to a user.

When a token is stuck in an unusual state or with errors, delete the FortiTokens from the unit and proceed to recover trial FortiTokens.

To recover trial tokens via the GUI:

1. Go to *User & Authentication* > *FortiTokens*.
2. Click the *Import Free Trial Tokens* button at the top. The two free trial tokens are recovered.

To recover trial tokens via the CLI:

```
# execute fortitoken-mobile import 0000-0000-0000-0000-0000
```

- Before attempting to recover the trial tokens, both the tokens should be deleted from the unit first.
- If VDOMs are enabled, trial tokens are in the management VDOM (`root` by default).

Following error codes might come up in the CLI:

- If the device is not registered:

```
# execute fortitoken-mobile import 0000-0000-0000-0000-0000
import fortitoken license error: -7571
```

- If the serial number format is incorrect:

```
# execute fortitoken-mobile import 0000-0000-0000-0000-00
import fortitoken license error: -7566
```

Recovering lost Administrator FortiTokens

If an Administrator loses their FortiToken or the FortiToken is not working, they will not be able to log into the admin console through the GUI or the CLI. If there is another Administrator that can log into the device, they may be able to reset the two-factor settings configured for the first Administrator, or create a new Admin user for them. Note that a *super_admin* user will be able to edit other admin user settings, but a *prof_admin* user will not be able to edit *super_admin* settings.

In the case where there are no other administrators configured, the only option is to flash format the device and reload a backup config file. You must have console access to the device in order to format and flash the device. It is recommended to be physically on site to perform this operation.

Before formatting the device, verify that you have a backup config file. You may or may not have the latest config file backed up, though you should consider using a backed up config file, and reconfigure the rest of the recent changes manually. Otherwise, you may need to configure your device starting from the default factory settings.

To recover lost Administrator FortiTokens:

1. If you have a backed up config file:
   a. Open the config file and search for the specific admin user. For representational purposes we will use `Test` in our example.

```
# edit "Test"
    set accprofile "super_admin"
    set vdom "root"
    set two-factor fortitoken
    set fortitoken "FTKXXXXXXXXXX"
    set email-to "admin@email.com"
    set password *********
    next
end
```

   b. Once you find the settings for the `Test` user, delete the `fortitoken`-related settings:

```
# edit "Test"
    set accprofile "super_admin"
    set vdom "root"
    set password *********
    next
end
```

2. Format the boot device during a maintenance window and reload the firmware image using instructions in the Formatting and loading FortiGate firmware image using TFTP KB article.
3. Once the reload is complete, log into the admin console from the GUI using the default admin user credentials, and go to *Configuration > Restore* from the top right corner to reload your config file created in Step 1 above.

4. Once the FortiGate reboots and your configuration is restored, you can log in with your admin user credentials.

Agentless VPN with multi-factor authentication expiry timers

When Agentless VPN is configured with multi-factor authentication (MFA), sometimes you may require a longer token expiry time than the default 60 seconds.

To configure token expiry timers using the CLI:

```
config system global
    set two-factor-ftk-expiry <number of seconds>
    set two-factor-ftm-expiry <number of seconds>
    set two-factor-sms-expiry <number of seconds>
    set two-factor-fac-expiry <number of seconds>
    set two-factor-email-expiry <number of seconds>
end
```

These timers apply to the tokens themselves and remain valid for as long as configured above. However, Agentless VPN does not necessarily accept tokens for the entire duration they are valid. To ensure SSLVPN accepts the token for longer durations, you need to configure the remote authentication timeout setting accordingly.

To configure the remote authentication timeout:

```
config system global
    set remoteauthtimeout <1-300 seconds>
end
```

Agentless VPN waits for a maximum of five minutes for a valid token code to be provided before closing down the connection, even if the token code is valid for longer.

> The `remoteauthtimout` setting shows how long Agentless VPN waits not only for a valid token to be provided before closing down the connection, but also for other remote authentication like LDAP, RADIUS, and so on.

PKI

The following topics include information about public key infrastructure (PKI):

- Configuring a PKI user on page 3534
- Using the SAN field for LDAP-integrated certificate authentication on page 3538
- Agentless VPN with certificate authentication on page 3264
- Agentless VPN with LDAP-integrated certificate authentication on page 3270

Configuring a PKI user

PKI users are users who are identified by a digital certificate they hold. Defining a PKI user in FortiOS specifies:

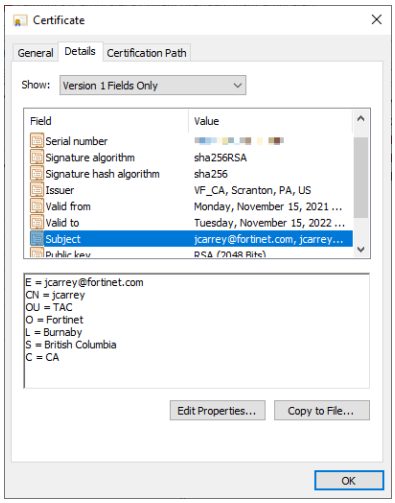
- Which CA certificate to use to validate the user's certificate
- The field and value of the user's certificate that FortiOS will check to verify a user

These peer users can then be used in a FortiGate user group, or as a peer certificate group used for IPsec VPN configurations that accept RSA certificate authentication.

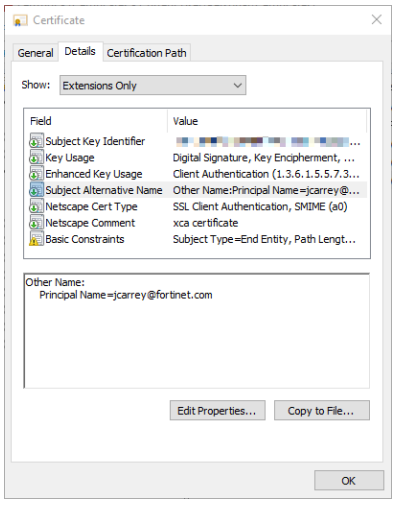
Example X.509 certificate

The following certificate demonstrates which FortiGate settings can be used to match on different fields.

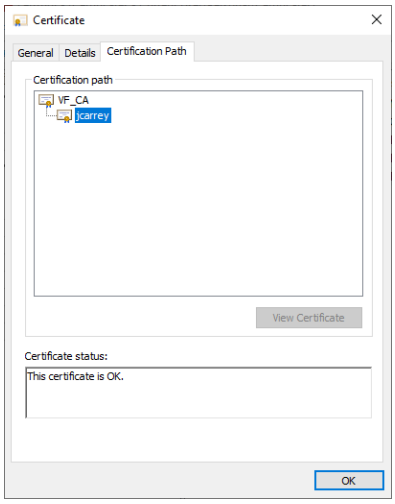
Subject:



Subject Alternative Name:



Certification path:



To configure a PKI user:

```
config user peer
    edit <name>
        set ca <string>
        set mandatory-ca-verify {enable | disable}
        set subject <string>
        set cn <string>
        set cn-type {string | email | FQDN | ipv4 | ipv6}
        set mfa-server <string>
        set mfa-username <string>
        set mfa-password <string>
        set mfa-mode {none | password | subject-identity}
    next
end
```

Command	Description
`ca <string>`	Specify which certificate on the FortiGate is used to validate the client's certificate. This can be any CA in the client's certificate chain. You may need to upload a CA certificate to the FortiGate specifically to identify PKI peer users (see CA certificate on page 3835).
`mandatory-ca-verify {enable | disable}`	Control the action if the CA certificate used to sign the client's certificate is not installed on the FortiGate (default = enable). Disabling this setting makes the FortiGate consider any certificate presented by the peer as valid. In the example certificate, the certification path shows that VF_CA signed jcarrey's certificate.
`subject <string>`	Enter the peer certificate name constraints.
`cn <string>`	Enter the peer certificate common name.
`cn-type {string | email | FQDN | ipv4 | ipv6}`	Set the peer certificate common name type: string, email, FQDN, IPv4 address, or IPv6 address. See CN on page 3537 for more details.

Command	Description
`mfa-server <string>`	Enter the name of a multi-factor authentication server defined under `config user ldap` for performing client access rights checks. See LDAP servers on page 3381 for more details.
`mfa-mode {none | password | subject-identity}`	Set the mode for remote peer authentication, either by password or subject identity extracted from certificate. See LDAP on page 3537 for more details.
`mfa-username <string>`	Enter the username for the remote multi-factor authentication server bind when the MFA mode is password.
`mfa-password <string>`	Enter the password for the multi-factor authentication server bind when the MFA mode is password.

Identifying users based on their client certificate

When the client's certificate is valid, or `mandatory-ca-verify` is disabled, the FortiGate can then inspect the certificate to check specific fields for matching values. There are three ways of specifying which certificate field to verify: by subject, CN, or LDAP. All string comparisons are case sensitive.

Subject

This basic method verifies that the subject string defined in the PKI user setting matches a value or substring in the subject field of the user certificate. Further matching is controlled in the following VPN certificate settings.

```
config vpn certificate setting
    set subject-match {substring | value}
    set subject-set {superset | subset}
    set cn-match {substring | value}
    set cn-allow-multi {enable | disable}
end
```

Command	Description
`subject-match {substring | value}`	Control how to do relative distinguished name (RDN) value matching with the certificate subject name: • substring: find a match if any string in the certificate subject name matches the name being searched for (such as `set subject jcarrey`). • value: find a match if any attribute value string in a certificate subject name is an exact match with the name being searched for (such as `set subject "OU=TAC"` or `set subject "C=CA, CN=jcarrey, OU=TAC"`).
`subject-set {superset | subset}`	Control how to do RDN value matching with the certificate subject name: • superset: a certificate only passes verification if it contains all the RDNs defined in the subject settings (such as `set subject "E = jcarrey@fortinet.com, CN = jcarrey, OU = TAC, O = Fortinet, L = Burnaby, S = British Columbia, C = CA"`). • subset: a certificate passes verification if the RDN is a subset of the certificate subject (such as `set subject "CN = jcarrey, OU = TAC"`).

Command	Description
`cn-match {substring | value}`	Control how to do CN value matching with the certificate subject name: • substring: find a match if any string in the certificate subject name matches the name being searched for. • value: find a match if any attribute value string in a certificate subject name is an exact match with the name being searched for.
`cn-allow-multi {enable | disable}`	Enable/disable allowing multiple CN entries with the certificate subject name (default = enable).

CN

Common name (CN) certificate verification compares the CN in the subject field with the configured string (such as `set cn "jcarrey"`. The following logic is used when configuring different CN types:

Type	Action
`string`	Based on the `cn-match` setting, perform a substring or exact match in the certificate subject.
`email`	Look for a match in the certificate subject.
`FQDN`	Look for a match in the certificate subject, then compare the mapped IP and client IP. The FQDN is only retrieved from the CN.
`ipv4`	Look for a match in the certificate subject, then compare the IP.
`ipv6`	Look for a match in the certificate subject, then compare the IP.

The CN type also controls the format checking of the CN string. In this example, if the CN type is set to email, the CN must be in email format (`set cn "jcarrey@fortinet.com"`).

LDAP

LDAP-integrated user authentication allows the FortiGate to check the connecting user against an LDAP server in two ways: through a username and password, or the certificate's principal name. The `password` method requires the username and password of each authenticating user to be entered, so it is not recommended when configuring PKI users. The `subject-identity` method is recommended.

The UPN in the user certificate's Subject Alternative Name (SAN) field is used to look up the user in the LDAP directory. The SAN in the certificate for UPN matching can the UPN on the AD LDAP server (default), RFC 822 Name (corporate email address), or DNS name. If a match is found, then authentication succeeds. This type of configuration scales well since only one PKI user needs to be created on the FortiGate. Connecting clients use their unique user certificate to match within the configured LDAP server. See Using the SAN field for LDAP-integrated certificate authentication on page 3538 for an example.

Using the SAN field for LDAP-integrated certificate authentication

Certificate-based authentication against Active Directory LDAP (AD LDAP) supports the UserPrincipalName (UPN), RFC822 Name (corporate email address) defined in the Subject Alternative Name (SAN) extension of the certificate, the DNS defined in the user certificate as the unique identifier in the SAN field for peer user certificates, and the Subject Common Name (CN) defined in the certificate.

```
config user ldap
    edit <name>
        set account-key-cert-field {othername | rfc822name | dnsname | cn}
    next
end
```

Command	Description
`account-key-cert-field {othername | rfc822name | dnsname | cn}`	Define subject identity field in certificate for user access right checking: • `othername`: match to UPN in SAN (default). • `rfc822name`: match to RFC822 email address in SAN. • `dnsname`: match to DNS name in SAN. • `cn`: match to CN in subject.

The LDAP server configurations are applied to the user peer configuration when the PKI user is configured.

```
config user peer
    edit <name>
        set ca <string>
        set cn <string>
        set mfa-server <string>
        set mfa-mode subject-identity
    next
end
```

When a user authenticates to the FortiGate for an administrative log in, Agentless VPN, IPsec dialup, or firewall authentication using a user certificate, it presents a signed certificate issued by a trusted CA to the FortiGate. The following sequence of events occurs as the FortiGate processes the certificate for authentication:

1. The FortiGate verifies if the certificate is issued by a trusted CA. If the CA is not a public CA, ensure that the CA certificate is uploaded and trusted by the FortiGate, and is applied to the user peer configurations (`set ca <string>`).
2. The FortiGate verifies that the CN field of the certificate matches the CN specified in the user peer configurations (`set cn <string>`).
3. If the `user peer` configuration has `mfa-server` configured and the `mfa-mode` is set to `subject-identity`, the FortiGate uses the unique identifier in the certificate to authenticate against the LDAP server.
   - If `set account-key-cert-field othername` is configured (the default setting), the FortiGate uses the UPN in the certificate's SAN field to authenticate against LDAP.
   - If `set account-key-cert-field rfc822name` is configured, the FortiGate uses the RFC822 Name in the certificate's SAN field to authenticate against LDAP.

- If `set account-key-cert-field dnsname` is configured, the FortiGate uses the DNS name in the certificate's SAN field to authenticate against LDAP.
- If `account-key-cert-field` is set to `cn`, then the FortiGate uses the CN in the certificate's subject to authenticate against LDAP.

4. By default, the FortiGate tries to match the UPN attribute on the AD LDAP. If this needs to be changed to another field, configure the `account-key-filter` setting on the LDAP configuration:

```
config user ldap
    edit <name>
        set account-key-filter <string>
    next
end
```

When configuring an LDAP connection to an Active Directory server, an administrator must provide Active Directory user credentials.

- To secure this connection, use LDAPS on both the Active Directory server and FortiGate. See Configuring an LDAP server on page 3381 and Configuring client certificate authentication on the LDAP server on page 3396.
- Apply the principle of least privilege. For the LDAP regular bind operation, do not use credentials that provide full administrative access to the Windows server when using credentials. See Configuring least privileges for LDAP admin account authentication in Active Directory on page 3389.

Example
