Introduction

FortiExtender is a plug-and-play customer premises equipment (CPE) device. As a 3G/4G LTE and 5G wireless WAN extender, FortiExtender can provide a primary WAN link for retail POS, ATM, and kiosk systems, or a failover WAN link to your primary Internet connection to ensure business continuity. You can deploy it both indoors and outdoors by choosing the right model and appropriate enclosures.

FortiExtender can be deployed in standalone mode as a wireless router, managed individually or centrally from FortiExtender Cloud, or managed by FortiGate as part of the integrated Fortinet Fabric Solutions.

This *Guide* is for FortiExtender managed by FortiGate only. For information about standalone FortiExtender or FortiExtender managed by FortiExtender Cloud, refer to their respective Admin Guides.

Before you begin

For information about FortiExtender hardware compatibility, refer to the table below.

Hardware & operating system compatibility

| Hardware platform | FortiExtender OS | | |
|-------------------|------------------|-------|-------|
| | 4.2.3 | 7.0.0 | 7.0.1 |
| 201E | Yes | Yes | Yes |
| 211E | Yes | Yes | Yes |
| 200F | No | Yes | Yes |
| 511F | No | No | Yes |

Before you start to configure your FortiGate-managed FortiExtender unit, we assume:

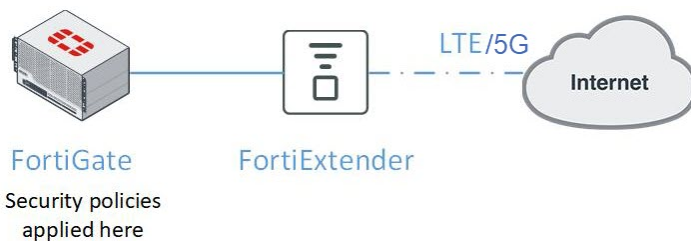

- You have completed the installation of the FortiExtender unit, as outlined in the QuickStart Guide. (**Note:** You can power FortiExtender unit using an external power adapter or by POE when connected to the POE/PSE port of FortiGate.)
- You have administrative access to the FortiExtender GUI or CLI for any troubleshooting needed.
- You have installed a FortiGate unit on your network and have administrative access to the FortiGate GUI and CLI.

FortiExtender and FortiGate integration

FortiExtender works as an extended WAN interface in IP pass-through mode.

The following paragraphs highlight the network topology for integrating FortiExtender with FortiGate.

In this scenario, FortiGate manages FortiExtender over the Control and Provisioning of Wireless Access Points (CAPWAP) protocol in IP pass-through mode. Unlike a standalone 3G/4G/5G wireless WAN extender, the FortiExtender managed by FortiGate integrates directly into the FortiGate Connected UTM (Unified Threat Management) and is managed from the familiar FortiOS interface. This not only enables security policies to be seamlessly applied to FortiExtender, but also provides visibility to the performance and data usage of the connection.

In this scenario, you can connect a FortiExtender to two FortiGate devices for a high availability (HA) configuration in Active-Passive, and two FortiExtenders to two FortiGate devices in Active-Active deployments, providing dual active redundancy for wireless WAN access as well.

FortiExtender and FortiGate share the same LTE IP in WAN-extension mode. In pre-4.2.2 releases, FortiExtender does not allow access to ssh/https/http/telnet service via the LTE interface, so all the traffic to those default service goes to FortiGate. FortiExtender 4.2.2 adds local ssh/https/telnet/http service support via the LTE interface. To distinguish local services from FortiGate services, you must configure FortiExtender to use different ports. Otherwise, all traffic to these default services will be sent to FortiExtender locally instead of FortiGate.

To configure FortiExtender local ssh/https/http/telnet service support via the LTE interface:

```
config system management
    config local-access
        set https 22443
        set ssh 2222
    end
end
```

FortiGate-FortiExtender zero-touch provisioning (ZTP)

FortiExtender supports FortiGate-FortiExtender zero-touch provision (ZTP). FortiExtender default discovery mode is set to auto with DHCP server enabled over the LAN interface. The process is outlined stepwise as follows:

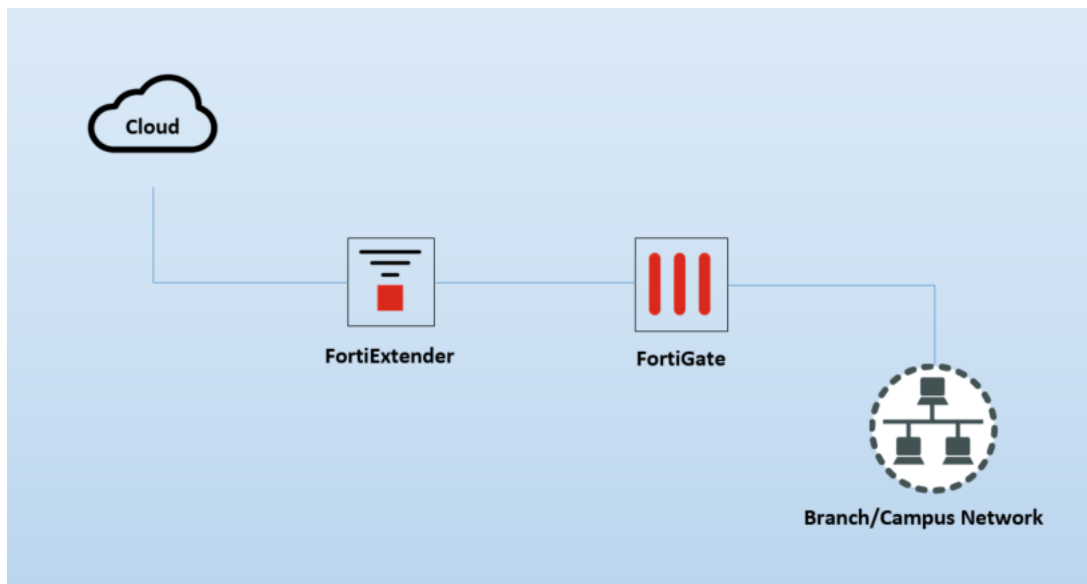

1. A SIM card without a PIN code is expected to be used for ZTP, and the default APN should be retrieved automatically at first connection.
2. Acting as a DHCP client, FortiGate connects to a FortiExtender LAN port (1, 2, or 3) interface to obtain a private IP to reach FortiManager.
3. FortiGate reports the discovered FortiExtender to FortiManager to authorize it (FortiExtender).
4. Once authorized, FortiExtender switches to IP-passthrough mode and then reboots itself.
5. Upon booting up in IP-passthrough mode, FortiExtender serves as the FortiExtender WAN interface of FortiGate.

Connect to FortiGate

When setting up a FortiExtender out of box with FortiExtender OS version 7.0.0 or later, you can connect FortiExtender to FortiGate in either of the following ways:

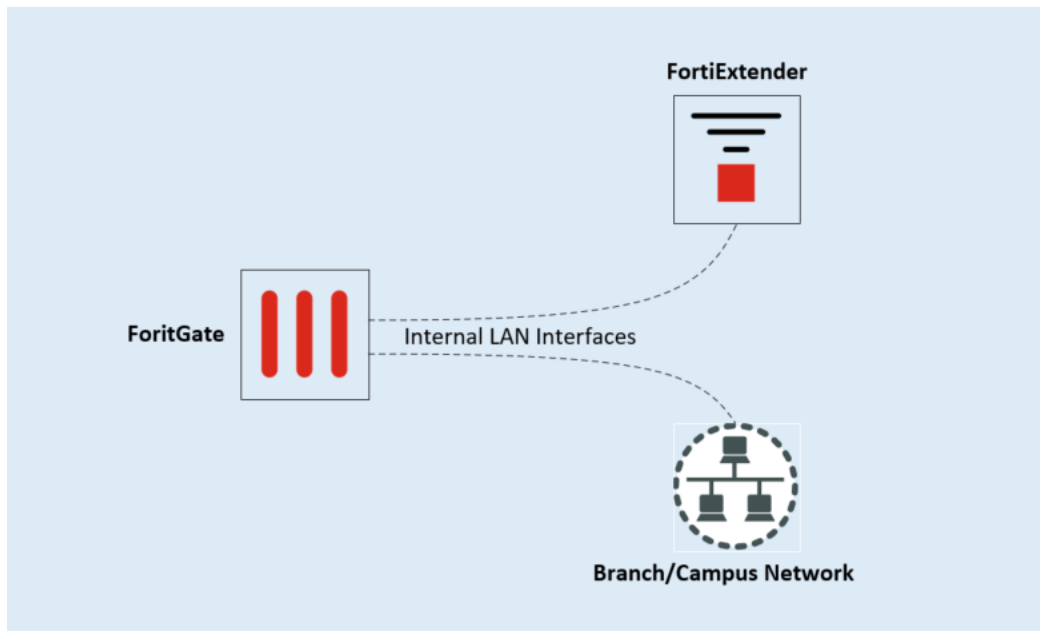

- Connect the FortiGate port in DHCP client mode (such as WAN1/WAN2) to a FortiExtender LAN port (1—3). In this option, the FortiGate interface acquires DHCP lease from the FortiExtender LAN DHCP server, and has a default gateway as the FortiExtender LAN interface IP address.
- If the FortiGate internal /LAN is running a DHCP server, connect the FortiGate to port4 of FortiExtender, which acquires DHCP lease from the FortiGate DHCP server.

Wireless WAN extension to WAN interfaces of FortiGate

Connect the FortiGate WAN port(e.g., WAN1, WAN2) which is in DHCP client mode to a FortiExtender LAN port (LAN 1—3 in FortiExtender 201E/211E). In this option, the FortiGate WAN interface acquires DHCP lease from the FortiExtender LAN DHCP server, and has a default gateway as the FortiExtender LAN interface IP address, as illustrated above.

Wireless extension to LAN/internal interfaces of FortiGate

In some scenarios, you may want to connect FortiExtender to an internal/LAN interface of FortiGate (to use POE power or some other means). In this case, if the FortiGate internal /LAN is running a DHCP server, connect the FortiGate to port4 (FEX-201E/211E) of FortiExtender which acquires DHCP lease from the FortiGate DHCP server, as illustrated above.

Authorize FortiExtender on FortiOS

Once the FortiExtender is discovered, you must authorize it by associating it either with a virtual WAN interface or a VLAN interface.

To authorize the FortiExtender device in FortiOS:

1. Go to **Network>FortiExtender**, and wait for the FortiExtender device to be discovered by FortiGate.
2. Bind the device to an interface and authorize it.
In FortiGate 5.4 and later releases, you must manually create either a virtual WAN interface of type FEX-WAN or a VLAN sub-interface, and link it to FortiExtender as part of the authorization process, as illustrated

below.

| | |
|---|---|
| Serial Number | FX04DA5918009600 |
| Status | Deauthorized  |
| Interface Name |  fext-wan1  |
| <div> <div>Authorize</div> <div>Delete</div> </div> | |

Make sure that FortiExtender and FortiGate are connected on Layer 2 by default. If they are not connected via Layer 2 but can reach each other via Layer-3 networking, configure your FortiExtender with static discovery using the following FortiExtender CLI commands:

```
config system management fortigate
  set ac-discovery-type static
  config static-ac-addr
    edit 1
      set server 192.168.1.99
    next
    edit 2
      set server fortinent.com
    next
  end
  set discovery-intf lan port4
end
```

VLAN mode and performance

For FortiGate to FortiExtender connectivity, alternate 'VLAN' mode is supported. It is an alternative for the default CAPWAP mode. While using the default FEX-WAN type interface, all the traffic to and from FortiGate is encapsulated in the CAPWAP data channel. In VLAN mode, the traffic is sent and received on the VLAN interface. Because there is no encapsulation overhead and data traffic is processed in userspace currently, VLAN mode delivers better performance with the requirement that the VLAN interface be directly created on the port on which FortiExtender is connected to FortiGate. It is important to note that in VLAN mode, FortiExtender and FortiGate can be connected directly to each other or via a switch. In case of a switch in between, the switch should be configured to allow the configured VLANs.

Note that VLAN mode must be explicitly enabled, as it is disabled by default on FortiGate, and that all the FEX-WAN interfaces must be deleted before VLAN mode is enabled.

```
config system global
    set fortiextender-vlan-mode enable
end
```

Ensure that the VLAN interface is created based on the physical interface of your connected FortiExtender.

Enable FortiExtender Controller on FortiOS

After connecting your FortiExtender LAN port to FortiGate, do the following:

1. Enable the FortiExtender Controller on FortiGate.

```
config system global
    set fortiextender enable
end
```

2. Make sure that your FortiGate enables FortiExtender Controller.
The FortiExtender-related GUI is enabled by default.

3. Enable the CAPWAP access to use the FortiGate interface to which FortiExtender is connected.

```
config system interface
    edit lan
        append allowaccess fabric
    next
end
```

The "append allowaccess fabric" command is introduced in FOS 6.2.3, and applies to FortiGate devices running FOS 6.2.3 and later. If you are connecting your FortiExtender to a pre-FortiOS 6.2.3 FortiGate device, you MUST use "append allowaccess capwap" instead.

Be sure to keep the following in mind:

- If FortiLink is enabled, FortiExtender must be connected to FortiGate through FortiLink.
- If FortiLink is enabled and FortiExtender is not part of FortiLink, the discovery type on FortiExtender must be static.

Support for device password and allowed protocols for FortiExtender in FortiGate.

This feature enables you to configure the admin password of your FortiExtender from FortiGate. You can also configure allowaccess of the ingress interface from FortiGate so that FortiGate can manage the FortiExtender based on the protocol specified in allowaccess.

For FortiExtenders configured as WAN extension in FortiGate, the ingress interface is the one specified in "ingress-intf" under "config system management fortigate". In the following example, the allowaccess of the "lan" interface will be changed as the configuration from FortiGate. The value of "ingress-intf" will be automatically filled by the system when FortiExtender is managed by FortiGate. It cannot be edited or unset.

```
FX201E5919000027 # config system management fortigate
FX201E5919000027 (fortigate) # show
config system management fortigate
    set ac-discovery-type broadcast
    set ac-ctl-port 5246
    set ac-data-port 25246
    set discovery-intf lan
    set ingress-intf lan <=== The value cannot be edited and unset
end
```

For FortiExtenders configured as LAN extension in FortiGate, the ingress interface is "le-switch", whose allowaccess will be changed as the configuration from FortiGate. In the following example, the "le-switch" is a predefined switch interface which will be automatically generated by the system when FortiExtender is managed by FortiGate. The entry "le-switch" under "config system switch-interface" is read-only and cannot be edited or deleted.

```
config system switch-interface
    edit le-switch <=== The entry cannot be edited or deleted
        set members le-agg-link lan
        set stp disable
    next
end
```

FortiExtender as FortiGate LAN extension

This section discusses how to configure FortiExtender as the LAN extension of FortiGate.

Discover a FortiExtender unit

For a FortiGate acting as the access controller (AC) to discover a FortiExtender unit, the FortiExtender must be able to reach the FortiGate. There are two ways in which a FortiExtender with the factory default configuration can be discovered by a FortiGate:

- Broadcast
- Static IP

Broadcast

FortiExtender can be discovered when sending broadcast traffic in its local subnet. In this case, the FortiGate and the FortiExtender must be in the same subnet. The interfaces specified in "discovery-intf" configured on the FortiExtender should include the interface that can reach out to FortiGate, as shown in the example below:

```
config system management fortigate
    set ac-discovery-type broadcast
```

```
    set discovery-intf lan port4
end
```

Static

The FortiExtender sends discover requests to a preconfigured IP address on the FortiGate. You can specify multiple FortiGates in IPv4-address or FQDN format. The FortiExtender will choose one that it can reach and connect. You can specify up to 16 FortiGate entries in the configuration. See the following example:

```
config system management fortigate
    set ac-discovery-type static
        config static-ac-addr
            edit 1
                set server 192.168.1.99
            next
            edit 2
                set server fortinent.com
            next
        end
    set discovery-intf lan port4
end
```

For FortiGate, you must ensure that the interface used for discovery should have allowaccess with "fabric", as shown in the example below:

```
config system interface
    edit "lan"
        set vdom "root"
        set ip 192.168.1.99 255.255.255.0
        set allowaccess ping https ssh fgfm fabric << fabric should be one option
            in allowaccess
        set type hard-switch
        set stp enable
        set role lan
        set snmp-index 21
    next
end
```

FortiGate reacts to FortiExtender discovery attempt

An extender entry will be auto-generated, and a default profile will be also auto-generated for users' convenience. The following example shows that a FortiExtender 200F joins the FortiGate and an auto-generated profile is created.

For details of the default extender profile, you can refer to the section of "Default FortiExtender profile".

```
config extender-controller extender
    edit "FX0035919000027"
        set id "FX200F5919000001"
        set extension-type lan-extension
        set profile "FX200F-lanext-default"
    next
end
```

Pre-authorize a FortiExtender unit

You can set the information of the FortiExtender unit on the FortiGate in advance, and the unit is authorized and begins functioning when it is connected.

You can create an entry with an entry name no longer than 15 characters (saying extender1 as below), and the enter its serial number for "id". The extension-type will be auto-filled based on the attribute "id". For the FortiExtender 200F model without LTE/5G, the default is lan-extension; for models with LTE/5G, the default is wan-extension. You can change the extension-type as you want. Note that for FortiExtender 200F, it has only lan-extension. You can then select a profile that you have created before. If you have not created a profile before, type "end" and a default profile will be auto-generated.

For details of the default extender profile, you can refer to the section of "Default FortiExtender profile".

```
config extender-controller extender
  edit extender1
    set id "FX200E5919000027"
    set extension-type lan-extension
    set profile "FX200F-lanext-default"
  next
end
```

Authorize a discovered FortiExtender

You can authorize a discovered FortiExtender via the FortiGate console using the following command:

```
config extender-controller extender
  edit "FX0035919000027"
    set authorized enable
  next
end
```

De-authorize discovered FortiExtender

You can also de-authorize a discovered FortiExtender via the FortiGate console with the following command:

```
config extender-controller extender
  edit "FX0035919000027"
    set authorized disable
  next
end
```

The default FortiExtender profile

In some circumstances, a default profile (or 2 default profiles) will be automatically generated.

The profile or profiles are generated based on the FortiExtender model. For the FortiExtender models without LTE/5G modems, such as FortiExtender 200F, FortiGate will generate a LAN extension profile as follows:

```
config extender-controller extender-profile
  edit "FX200F-lanext-default"
    set id 0
    set model FX200F
```

```
set extension lan-extension
config lan-extension
    set link-loadbalance loadbalance
    set ipsec-tunnel "fext-ipsec-WrXw"
    set backhaul-interface "port2"
    config backhaul
        edit "1"
            set port port1
        next
        edit "2"
            set port port2
        next
    end
end
next
end
```

In this default FortiExtender 200F profile, there are two default backhaul ports, which are port1 and port2. It indicates that the FortiExtender 200F will use its port1 and port2 for the uplinks connected to the FortiGate. The underlying will be VLAN over IPsec, which is transparent to users.

These two ports will be linked as an aggregated interface in FortiExtender and you can specify load-balance mode on it. More detailed LAN extension configuration is covered in the section, "LAN extension configuration".

For FortiExtender models with LTE/5G modems, two default profiles will be generated: one is for WAN extension and the other is for LAN extension.

For WAN extension, the default profile with default values for FortiExtender 201E is as follows.

The following example is for illustration only.

```
config extender-controller extender-profile
    edit "FX201E-wanext-default"
        set id 2
        config cellular
            config sms-notification
                end
            config modem1
                end
        end
    next
end

# get FX201E-wanext-default (default value will be shown below)
name : FX201E-wanext-default
id : 2
model : FX201E
extension : wan-extension
allowaccess :
login-password-change: no
cellular:
    dataplan :
    controller-report:
        status : disable
    sms-notification:
```

```
        status : disable
    modem1:
        redundant-mode : disable
        conn-status : 0
        default-sim : sim1
        gps : enable
        sim1-pin : disable
        sim2-pin : disable
        auto-switch:
            disconnect : disable
            signal : disable
            dataplan : disable
            switch-back :
            switch-back-time : 00:01
            switch-back-timer : 86400
```

For LAN extension, the default profile for FortiExtender 201E generated on FortiGate would look as follows. For details of LAN extension configuration, please go to the section of "LAN extension configuration".

```
config extender-controller extender-profile
    edit "FX201E-lanext-default"
        set id 3
        set extension lan-extension
        config cellular
            config sms-notification
            end
            config modem1
            end
        end
        config lan-extension
            set ipsec-tunnel "fext-ipsec-ut4Z"
            set backhaul-interface "lan"
            config backhaul
                edit "1"
                    set port wan
                    set role primary
                next
                edit "2"
                    set port ltel
                    set role secondary
                next
            end
        end
    next
end

# get FX201E-wanext-default (default value will be shown below)
name : FX201E-lanext-default
id : 3
model : FX201E
extension : lan-extension
allowaccess :
login-password-change: no
enforce-bandwidth : disable
cellular:
    dataplan :
```

```
controller-report:
  status : disable
sms-notification:
  status : disable
modem1:
  redundant-mode : disable
  conn-status : 0
  default-sim : sim1
  gps : enable
  sim1-pin : disable
  sim2-pin : disable
  auto-switch:
    disconnect : disable
    signal : disable
    dataplan : disable
    switch-back :
      switch-back-time : 00:01
      switch-back-timer : 86400
lan-extension:
  link-loadbalance : activebackup
  ipsec-tunnel : fext-ipsec-ut4Z
  backhaul-interface : lan
  backhaul-ip :
  backhaul:
    == [ 1 ]
    name: 1
    == [ 2 ]
    name: 2
```

Allowaccess for FortiExtender management

Allowaccess configuration controls the allowed access capability of the FortExtender uplink interface sending traffic to FortiGate. The allowaccess has six options that can be configured as needed.

- Ping
- Telnet
- HTTP
- HTTPS
- SSH
- SNMP

```
config extender-controller extender-profile
  edit "FX201E-lanext-default"
    set allowaccess ping telnet http https ssh snmp
  next
end
```

Each FortiExtender associated with this profile has the same allowaccess setting specified in the profile. However, it can also be overridden per device. For example, the following FortiExtender will use the allowaccess specified in the extender entry, but will not use the one specified in the profile, "FX201E-lanext-default".

```
config extender-controller extender
  edit "FX0015919000027"
```

```

        set id "FX201E5919000027"
        set authorized enable
        set extension-type lan-extension
        set override-allowaccess enable
        set allowaccess ping telnet
        set profile "FX201E-lanext-default"
    next
end

```

Configure FortiExtender admin password

You can configure the admin login password of a FortiExtender via the FortiGate console. Similar to allowaccess, it can be configured in a profile and also can be overridden in an extender entry.

```

config extender-controller extender
edit "FX201E0123456789"
    set override-login-password-change [enable|disable]
    set login-password-change [yes|default|no]
    set login-password <string>
next
end
config extender-controller extender-profile
edit "FX201E-default"
    set login-password-change [yes|default|no]
    set login-password <string>
next
end

```

| Parameter | Description |
|---|--|
| <pre>set login-password-change [yes default no]</pre> | <p>Use one of the following options:</p> <ul style="list-style-type: none"> yes — Change the administrator login password of the FortiExtender. default — Keep the managed FortiExtender administrator password set to the factory default. no — Do not change the administrator login password. |
| <pre>set override-login- password-change [enable disable]</pre> | <p>Enter either of the following:</p> <ul style="list-style-type: none"> enable — Override the administrator login password setting in the profile. disable — Use the administrator login password setting in the profile. |
| <pre>set login-password <string></pre> | <p>Set the administrator login password of the managed FortiExtender.</p> |

In earlier releases of FortiOS, there is a "set login-password" command in extender entry, but there are no override and login-password-change attributes. If you have an configured your administrator login password in an earlier version of the FortiOS, the "login-password-change" attribute will be set to "yes" and your login-password will remain the same as before after upgrade.

Set bandwidth limit for LAN extension

You can configure the bandwidth limit in FortiGate for the LAN extension switch, i.e., le-switch, on the FortiExtender side. Just like allowaccess and login password, the bandwidth limit for LAN extension can be configured in a profile, but can also be overridden in a extender entry.

```
config extender-controller extender-profile
  edit "FX200F-lanext-default"
    set model FX200F
    set extension lan-extension
    set enforce-bandwidth [enable|disable]
    set bandwidth-limit 1000 // only shown when enforce-bandwidth is enable
    config lan-extension
      ...
    end
  end
end
config extender-controller extender
  edit "FX0015919000027"
    set id "FX201E5919000027"
    set authorized enable
    set extension-type lan-extension
    set override-enforce-bandwidth [enable|disable] // override the profile
setting
  set enforce-bandwidth [enable|disable]
  set bandwidth-limit 1003 // only shown when enforce-bandwidth is enable
  set profile "FX201E-lanext-default"
next
end
```

| Parameter | Description |
|---------------------------------------|---|
| enforce-bandwidth [enable disable] | Enable/disable the enforcement of bandwidth limit on the LAN extension interface. |
| bandwidth-limit <integer> | Set the FortiExtender LAN extension interface bandwidth limit in Mbps. The range is from 1 to 16776000. |

Once it is configured, the FortiExtender will have the "shaper" configuration as shown in the example below and it can have bandwidth limit with the configuration. The terms "le-traffic-shaper" and "le-shaping-policy" are predefined, and will be created in FortiExtender.

```
config firewall shaper traffic-shaper
  edit le-traffic-shaper
    set max-bandwidth 1024 // set bandwidth-unit mbps
  next
end
config firewall shaping-policy
  edit le-shaping-policy
    set status enable
    set dstintf le-agg-link
    set traffic-shaper le-traffic-shaper
  next
end
```

Discovery response lockdown

By default, FortiGate can automatically generate a FortiExtender entry if a newly added FortiExtender discovers it, that is to say when the FortiExtender is sending a discovery request.

In order to avoid rogue devices to detect or scan the FortiGate, you can enable "`fortiextender-discovery-lockdown`" to ensure that discovery response is only sent to a pre-authorized device.

Once enabled, FortiGate will not automatically generate an extender entry when a newly discovered FortiExtender joins the network. Instead, it will only accept discovery request from a pre-authorized extender entry. By default, `fortiextender-discovery-lockdown` is disabled. You can enable it using the following command:

```
config system global
    set fortiextender-discovery-lockdown enable
end
```

Wildcard

In some cases, you may not know the ID (i.e., serial number) of a FortiExtender, but still intend to pre-create an extender entry in FortiGate for easy deployment. You can use the wildcard * (asterisk) in the "id" attribute when manually creating an extender entry.

The rule for using wildcard is to have a 6-digit model name followed by 10 * (asterisks).

Below are the 6-digit model names of FortiExtender devices:

- FX201E
- FX211E
- FX200F
- FXA11F
- FXE11F
- FXA21F
- FXE21F
- FXA22F
- FXE22F
- FX212F
- FX311F
- FX312F
- FX511F
- FVG21F
- FVA21F
- FVG22F
- FVA22F
- FX04DA

Take FX200F for example. You can configure as follows:

```
config extender-controller extender
    edit <entry> << any entry name you like (less than 15 characters)
        set id FX200F*****
```

```
        set extension lan-extension
        set profile "FX200F-lanext-default"
    next
end
```

You can also pre-authorize the entry as well, as shown below:

```
config extender-controller extender
    edit <entry>
        set authorized enable
        set id FX200F*****
        set extension lan-extension
        set profile "FX200F-lanext-default"
    next
end
```

Whenever a new FX200F joins (assuming its serial number is FX200F5919000001), FortiGate will select the extender entry and replace the "id" with its serial number. If there are more than two wildcard entries with the same model, it will choose the one that has "set authorized" enabled because of its higher priority.

```
config extender-controller extender
    edit entry1
        set id FX201E*****
        set extension lan-extension
        set profile "FX201E-lanext-default"
    next
    edit entry2
        set authorized enable
        set id FX200F5919000001
        set extension lan-extension
        set profile "FX201E-lanext-default"
    next
end
```

Data transportation over the LAN extension interface

FortiGate automatically generates an interface of "lan-extension" type for each authorized FortiExtender. The name of the interface is the same as the FortiExtender entry name.

```
config extender-controller extender
    edit "FX00159190000027"
        set id "FX201E59190000027"
        set authorized enable
        set device-id 1
        set extension-type lan-extension
        set override-allowaccess enable
        set profile "FX201E-lanext-default"
    next
end
config system interface
    edit "FX00159190000027"
        set vdom "root"
        set type lan-extension
        set role lan
        set snmp-index 26
        set interface "fext-ipsec-ut4Z"
```

```
    next
end
```

This interface is the virtual interface that abstracts all the underlying transportation detailed tunneling protocol. You can view the interface as a LAN interface in FortiGate. Unlike a real LAN interface, this lan-extension interface will connect a FortiExtender across the Internet.

It is transparent to users to provide a reliable, secure interface. For example, you can configure "ip" to this interface and enable DHCP server on it.

```
config system interface
    edit "FX0015919000027"
        set vdom "root"
        set ip 192.168.3.99 255.255.255.0
        set allowaccess ping https ssh snmp http telnet
        set type lan-extension
        set role lan
        set snmp-index 26
        set interface "fext-ipsec-ut42"
    next
end
config system dhcp server
    edit 3
        set default-gateway 192.168.3.99
        set netmask 255.255.255.0
        set interface "FX0015919000027"
        config ip-range
            edit 1
                set start-ip 192.168.3.2
                set end-ip 192.168.3.98
            next
        end
    next
end
```

A appropriate firewall policy can be used to forward the traffic out from the FortiGate's WAN interface. Suppose that "wan1" is the WAN interface of the FortiGate, you can configure it as follows. You can apply a more strict firewall policy based on your need.

```
config firewall policy
    edit 1
        set name "LAN-EXT"
        set uuid 8b7c21e4-221e-51ec-0a0d-34e7b478557b
        set srcintf "FX0015919000027"
        set dstintf "wan1"
        set action accept
        set srcaddr "all"
        set dstaddr "all"
        set schedule "always"
        set service "ALL"
        set nat enable
    next
end
```

On the FortiExtender side, the "lan" interface will be mapped to the lan-extension interface in FortiGate. You can have computers directly connected in any LAN port in FortiExtender, or have a switch between the LAN and the

computers. The computers will get IPs from the DHCP server configured in lan-extension interface and can forward traffic out through FortiGate based on the firewall policy.

LAN extension configuration in a profile

The following example shows the lan extension configuration in an LAN extension profile.

```
FortiGate (extender-profile) # get FX200F-lanext-default
name : FX200F-lanext-default
id : 4
model : FX200F
extension : lan-extension
allowaccess :
login-password-change: no
enforce-bandwidth : enable
bandwidth-limit : 200
lan-extension:
link-loadbalance : loadbalance
ipsec-tunnel : fext-ipsec-rthk
backhaul-interface : lan
backhaul-ip :
backhaul:
== [ 1 ]
name: 1
== [ 2 ]
name: 2
```

| Parameter | Description |
|---|---|
| name | The profile entry name |
| id | The profile ID (for system internal record) |
| model | The FortiExtender model for this profile |
| extension [lan-extension wan-extension] | The extension type for this profile |
| alloweaccess [telnet http https snmp ping ssh] | The multi-option setting for the lan-extension switch interface of the FortiExtender. For more details, refer to "Allowaccess for LAN extension". |
| login-password-change [yes no default] | The setting of admin password of FortiExtenders. For more details, ones can refer to the section of "Admin login password" |
| enforce-bandwidth [enable disable] | Enable or disable enforcement of bandwidth limit. Note: "enforce-bandwidth", which is disabled by default, is used to limit the egress bandwidth used to send traffic from FortiExtender. For more details, refer to "Bandwidth limit for LAN extension". |
| bandwidth-limit | Specify the bandwidth limit. |

| Parameter | Description |
|---|--|
| link-loadbalance [activebackup loadbalance] | Two ports are configured for FortiExtender for load-balancing. For <code>activebackup</code> mode, you can configure "role" (primary or secondary) on the two backhaul ports. For <code>loadbalance</code> mode, you can configure "weight" on each backhaul port. |
| ipsec-tunnel | This is the IPsec tunnel interface that will be used in underlying data transportation. It provide secure connection between a FortiExtender and a FortiGate. This entry will be auto-generated and the setting here is for information. |
| backhaul-interface | This is the egress interface for data transportation between the FortiGate and the other FortiExtenders using this profile. The default will be automatically filled with the interface that is used to manage FortiExtender. You can configure it based on your network topology. |
| backhaul-ip | This is used for FortiGate behind a NAT device (or DNAT, LoadBalancer, etc.). The backhaul-ip is the external IP of the NAT device. For more details, refer to "The backhaul IP for LAN extension". |

The following is an example of backhaul configuration.

```
FortiGate (backhaul) # edit 1
FortiGate (1) # get
name : 1
port : port1
weight : 1
```

If link-loadbalance is configured as "activebackup", the following will be shown.

```
name : 1
port : port1
role : primary
```

| Parameter | Description |
|----------------------------|---|
| name | The name of the backhaul entry. |
| port | The port in FortiExtender that sends traffic to FortiGate in LAN extension. |
| weight | Enter the weight if the link-loadbalance is configured as "loadbalance" |
| role [primary secondary] | Specify whether the port is primary or secondary. |

Backhaul IP in LAN extension

There is one optional backhaul-ip configuration in FortiGate to be used in the case that FortiGate is behind a NAT. The backhaul-ip is the external IP used in this NAT device. Both FortiExtender and FortiGate need to be aware of this backhaul IP. In FortiExtender, it needs to specify in its discovery static IP.

On FortiExtender

```
config system management fortigate
  set ac-discovery-type static
  config static-ac-addr
    edit 1
      set server <backhaul-ip>
    next
  end
end
```

On FortiGate:

```
config extender-controller extender-profile
  edit "FX200F-lanext-default"
    config lan-extension
      set backhaul-ip <backhaul-ip>
    end
  next
end
```

The NAT device should have port mapping/forwarding configuration, which is beyond the scope of this document.

Configure cellular settings

Configuration of the cellular settings involves the following tasks:

- [Create a data plan on page 26](#)
- [Set the default SIM on page 27](#)
- [Enable SIM-switch on page 28](#)
- [Report to FortiGate on page 29](#)
- [Capwap mode on page 30](#)
- [VLAN mode on page 31](#)

Create a data plan

You can configure a data plan on the FortiGate with the below parameters:

```
config extender-controller dataplan
  edit Verizon
    set modem modem1
    set type by-carrier
    set carrier Verizon
    set apn WE01.VZWSTATIC
    set auth NONE
    set user
    set pwd
    set pdn ipv4-only
    set signal-threshold 0
    set signal-period 0
    set capacity 0
    set monthly-fee 0
    set billing-date 0
    set overage disable
    set preferred-subnet 32
    set private-network disable
  next
end
```

When "private network" is enabled, FortiExtender allows the flow of non-NAT'ed IP traffic on to an LTE interface. Otherwise, it does not.

| Parameter | Description |
|-----------|--|
| modem | Choose "modem1", "modem2", or "all". |
| type | Choose the way for the modem to select the SIM card: <ul style="list-style-type: none">• carrier— Assign by SIM carrier. |

| Parameter | Description |
|------------------|---|
| | <ul style="list-style-type: none"> slot— Assign to SIM slot 1 or 2. iccid— Assign to a specific SIM by its serial number (18 to 22 digits). generic— Compatible with any SIM. Assigned if no other data plan matches the chosen SIM. |
| iccid | The serial number of the SIM, mandatory for “set type by-iccid”. |
| carrier | The SIM card carrier, mandatory for “set type by-carrier”. |
| slot | The SIM card slot, mandatory for “set type by-slot” |
| apn | Set the APN of the SIM card. |
| auth-type | Choose the Authorization mode. |
| username | Set the username. |
| password | Set the password. |
| pdn | Choose the Packet Data Network (PDN) IP address family. |
| signal-threshold | Set the signal-strength threshold beyond which SIM switch will occur. Note: Enter an integer value from <50> to <100> (default = <100>). |
| signal-period | Set the length of time (from 600 to 18000 seconds) for SIM switch to occur when signal strength remains below the set signal threshold for more than half of the set period. |
| capacity | Set data capacity per month (from 0 to 102400000 MB). |
| monthly-fee | Set the monthly fee for the data plan (from 0 to 1000000). |
| billing-date | Set the billing date of the month. |
| preferred-subnet | DHCP subnet. |
| private-network | Enable/disable blocking all non-NAT'ed traffic. |

Set the default SIM

When installing two SIM cards in one modem, you can configure the default SIM to use.

You can set the default SIM by

- [Set the default SIM by preferred carrier on page 27](#)
- [Set the default SIM by low cost on page 28](#)
- [Set the default SIM by SIM slot on page 28](#)

Set the default SIM by preferred carrier

Use this option to set the default SIM if you have SIM cards from different carriers.

```
config extender-controller extender
  edit <FEX_SN>
    set authorized enable
    config modem1
      set ifname <fext-wan>
      set default-sim carrier
      set preferred-carrier <carrier name>
    end
  next
end
```

Set the default SIM by low cost

This option applies when you need to choose the low-cost SIM over a more expensive one.

You must configure two entries under “config lte plan” for the two SIM cards separately. The system will calculate the cost based on the “set capacity” and “monthly-fee”.

```
config extender-controller extender
  edit <FEX SN>
    set authorized enable
    config modem1
      set ifname <fext-wan>
      set default-sim cost
    end
  next
end
```

Set the default SIM by SIM slot

The default SIM is sim1. You can change it to sim2 using the following commands:

```
config extender-controller extender
  edit <FEX SN>
    set authorized enable
    config modem1
      set ifname <fext-wan>
      set default-sim sim1|2
    end
  next
end
```

Enable SIM-switch

```
config extender-controller extender
  edit <FEX SN>
    set authorized enable
    config modem1
      set ifname <fext-wan>
      config auto-switch
        set by-disconnect enable
      end
    end
  next
end
```

```

        set by-signal disable
        set by-data-plan disable
        set disconnect-threshold 1
        set disconnect-period 600
        set switch-back by time by-timer set switch-back-by-time 00:01
        set switch-back-by-timer 3600
    end
end
next
end

```

SIM-switching can be configured by data plan, disconnect settings, signal strength, coupled with switch back by time or by timer. All these options are under the “Auto switch” setting.

| Parameter | Description |
|----------------------|---|
| by-disconnect | The SIM card switches when the active card gets disconnected according to the 'disconnect-threshold' and 'disconnect-period'. |
| by-signal | The SIM card switches when the signal strength gets weaker than the signal-threshold. |
| by-data-plan | The SIM card switches when 'capacity' is overrun and 'overage' is enabled. |
| disconnect-threshold | The number (1 - 100) of disconnects for SIM switch to take place. |
| disconnect-period | The evaluation period (600 - 18000) in seconds for SIM switch. |
| switch-back | Enables switching back to the preferred SIM card. |
| switch-back-by-time | Switches over to the preferred SIM /carrier at a specified (UTC) time (HH:MM). |
| switch-back-by-timer | Switches over to the preferred SIM/carrier after a given time (3600-2147483647) in seconds. |

Report to FortiGate

```

config extender-controller extender
    edit <FEX SN>
        set authorized enable
        config controller-report
            set status [enable|disable]
            set interval 300
            set signal-threshold 10
        end
    next
end

```

| Parameter | Description |
|------------------|--|
| status | Enable or disable periodic controller report. |
| interval | The interval at which to notify the FortiGate (once every 30 to 86400 seconds; the default is 300). |
| signal-threshold | The signal strength threshold (10 - 50 dBm). FortiExtender notifies the FortiGate once the RSSI change has exceeded the set threshold. |

Capwap mode

In CAPWAP IP pass-through mode, FortiExtender is managed by FortiGate, and traffic is forwarded via the CAPWAP tunnel between FortiGate and FortiExtender. Refer to the FortiGate documentation on how to manage FortiExtender on FortiGate. Once FortiExtender is managed by FortiGate, the following configurations will be synced from FortiGate and generated automatically.

Configurations On FortiExtender

The ingress-intf in system management setting is set automatically, and cannot be edited.

```
config system management fortigate
    set ingress-intf lan
end
```

Capwap interface

The capwap interface is created automatically. You can not edit or remove it.

```
config system interface
    edit capwap1
        set type capwap
        set rid 1
    next
end
```

Virtual wire pair

Configurations of the virtual wire pair are created automatically. They cannot be edited it or removed. These configurations specify the mapping of the LTE interfaces and the capwap interfaces. For example, 'set ltel-mapping capwap1' means the traffic from capwap1 interface will be sent out by the lte1 interface.

```
config system virtual-wire-pair
    set ltel-mapping capwap1
end
```

VLAN mode

CAPWAP mode do not perform well as desired on low-end FortiGate devices. VLAN mode has been introduced to improve performance. FortiExtender in VLAN mode is also managed by FortiGate in the same way as CAPWAP mode, but it uses VLAN to forward traffic between FortiGate and FortiExtender.

Configurations on FortiExtender

The VLAN interface is created automatically on FortiExtender. You cannot edit it or remove it.

```
config system interface
    edit vlan1
        set type vlan
        set vid 100
        set ingress-intf lan
    next
end
```

Virtual Wire Pair

Just like CAPWAP mode, Virtual Wire Pair Configurations of the virtual wire pair are created automatically. You cannot edit it or remove it. These configurations specify the mapping of the LTE interfaces and the VLAN interfaces.

```
config system virtual-wire-pair
    set ltel-mapping vlan1
end
```

Manage dual FortiExtender devices

Active/Passive mode

By default, each FortiGate device can support up to two FortiExtender devices at a time. The first FortiExtender linked interface can be configured to have a lower distance than the second FortiExtender linked interface.

Active/Active mode

To have access to active Internet sessions on both FortiExtender devices simultaneously, authorize both FortiExtender devices and configure the distance, priority, and firewall policies accordingly.

Cellular as backup of Ethernet WAN

In this redundant mode of operation, the FortiExtender daemon running on FortiGate monitors a given WAN link on the FortiGate, and brings up FortiExtender's cellular Internet access when the WAN link is down and brings down the FortiExtender cellular Internet when the WAN link comes up. For example:

```
config extender-controller extender
  edit <FEX SN>
    set authorized enable
    config modem1
      set ifname <fext-wan interface>
      set redundant-mode enable
      set redundant-intf <wan interface, ie wan1>
    end
  next
end
```

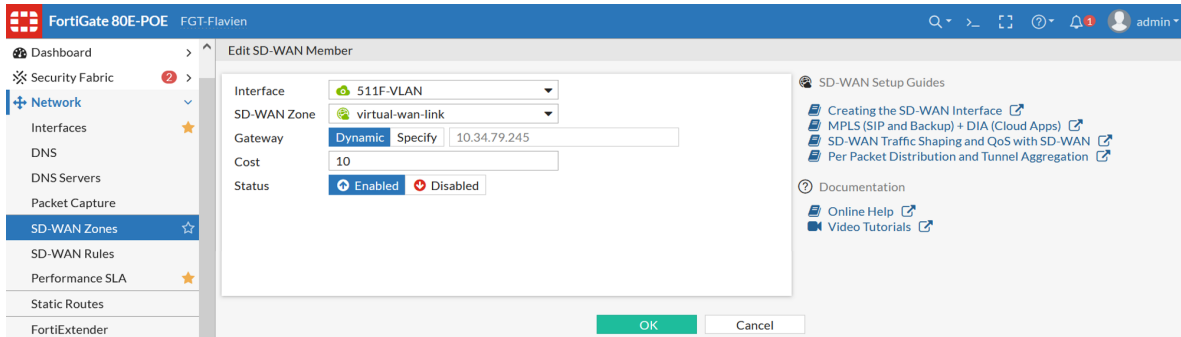

In this mode of operation, the FortiExtender interface comes up if the WAN interface goes down and goes down if the WAN interface comes up.

SD-WAN

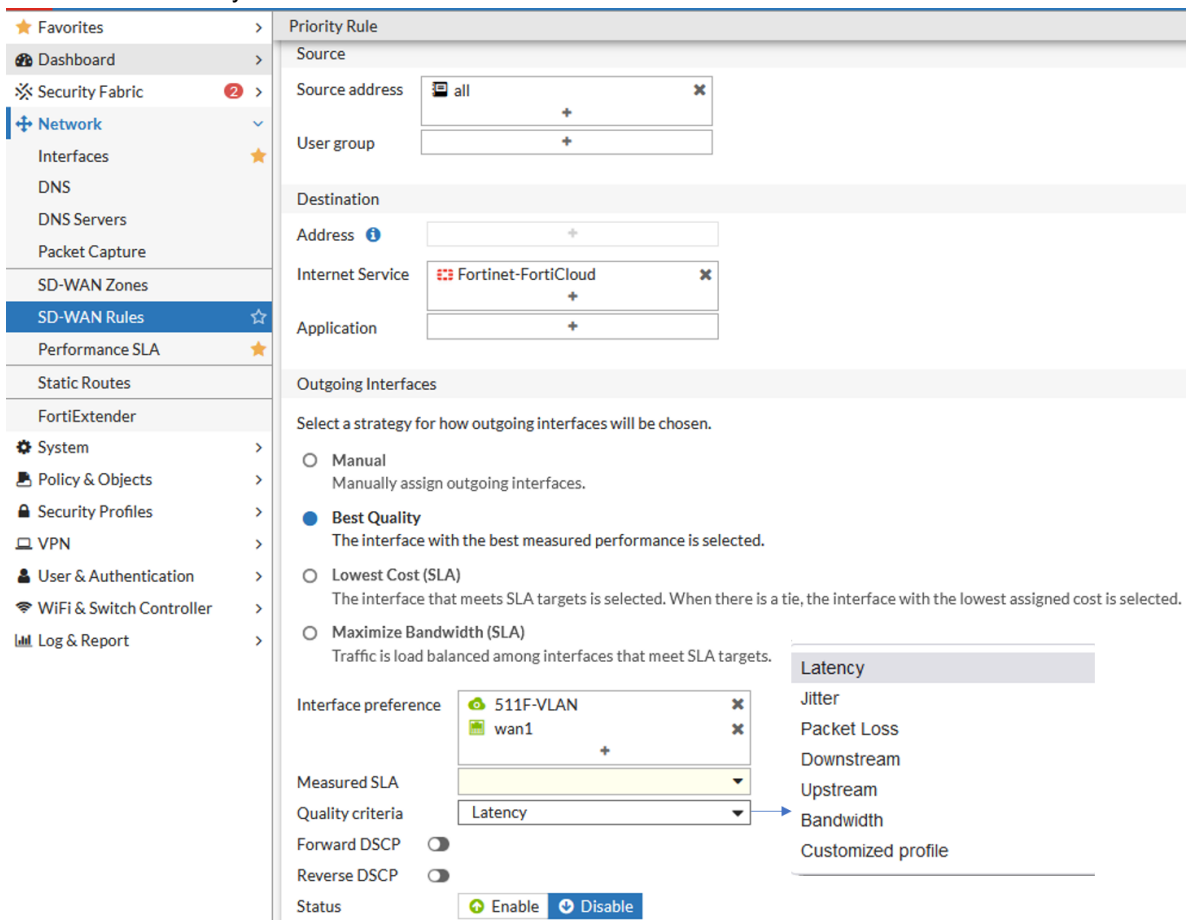

FortiOS recognizes and uses FEX as a valid interface within an SD-WAN interface zone. Using SD-WAN, FortiGate becomes a WAN path controller and supports diverse connectivity methods. With FEX, 3G/4G/5G can be used as a primary connection, a backup interface, or a load-balanced WAN access method with Application-Aware WAN path control selection. It provides high availability and QoS for business-critical applications by using the best effort access for low-priority applications through low-cost links, and backs up service through associations with an FortiExtender link. This enables aggregation of multiple interfaces into a single SD-WAN interface using a single policy.

To accomplish this:

1. Add the FortiExtender interface as a member of the SD-WAN interface, as illustrated below.

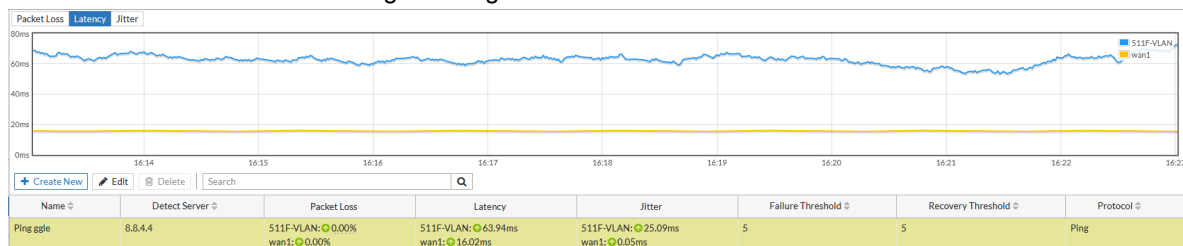

2. Define the priority rule, as shown in the following example, for instance, with the Best Quality strategy based on the Latency or Jitter criterion.

3. Order or combine your policies as illustrated below.

| ID | Name | Source | Destination | Criteria | Members | Hit Count | Last Used |
|----------|----------------------|--------|--|-----------|-------------------|-----------|---------------------|
| IPv4 | | | | | | | |
| 6 | nPerfFree5G | all | FreeParisNPerf | | 511F-VLAN | 387 | Wednesday |
| 7 | Citrix-Fiber | all | Citrix.CDN Citrix.Services Citrix.Services_Podio GoToMeeting GoToWebinar | | wan1 | 1,014 | 10 minutes ago |
| 5 | Test5G | | Deezer Salesforce Schwab | | 511F-VLAN wan1 | 2,039 | 26 minutes ago |
| 3 | FortiCloudVia5G | all | Fortinet-FortiCloud | | 511F-VLAN wan1 | | |
| 2 | AlarmVia5G | Alarme | all | | 511F-VLAN | | |
| 4 | fcld_eu_ping_5G_only | | FortiCloud_EU | | 511F-VLAN | | |
| 1 | LowestCost | | all | SLA | 511F-VLAN wan1 | 1,754,895 | 2021/08/04 16:18:40 |
| Implicit | | | | | | | |
| | sd-wan | all | all | Source IP | any | | |

4. Monitor the 4G/5G link health using the integrated Performance SLA tool in FortiGate.

CAPWAP on multiple ports for broadcast discovery

Starting from Version 4.2.1, FortiExtender is able to discover FortiGate on multiple interfaces. It sends discovery messages on multiple ports (port1, port2, and port3, and port4), one at a time, until it has successfully connected with a FortiGate on a link.

```
config system management fortigate
    set ac-discovery-type broadcast
    set ac-ctl-port 5246
    set ac-data-port 25246
    set discovery-intf lan port4
    set ingress-intf
end
```

By default, it starts the discovery process with the LAN ports (from port1 through port3) first. If it fails to establish a connection after several attempts, it will move on to port4. If it fails on port4, it will go back to the LAN ports and start the process all over again.

A LAN interface has a static IP of 192.168.200.99 and a DHCP Server IP of 192.168.200.110~192.168.200.210. We recommend connecting to the WAN port on FortiGate for ZTP.

The port4 interface is set for DHCP mode, and must be connected to the internal port on FortiGate to obtain an IP address for the CAPWAP tunnel, which is the same as in previous versions.

Check current manage mode

You can configure and manage FortiExtender from FortiGate or FortiExtender Cloud. If you are not sure "who" is your FortiExtender's controller, use the following command to find out:

```
FX511F5921000053 # get extender status
Extender Status
  name           : FX511F5921000053
  mode           : CLOUD
  fext-addr      : 192.168.237.1
  fext-wan-addr  : 25.75.193.57
  controller-addr : fortiextender-dispatch.forticloud.com:443
  deployed       : true
  account-id     : 343849
  uptime         : 5 days, 17 hours, 2 minutes, 45 seconds

Stopping data traffic on overaged LTE interface

When an LTE interface has breached its data usage limit, FortiExtender will stop forwarding outgoing traffic (except for management traffic) to that interface. The following types of traffic are affected:

- NATted traffic
- VPN data traffic on IPsec Tunnel based on the overaged LTE interface
- IP-passthrough traffic

Use cases

This section discusses some typical use cases to deploy FortiExtender.

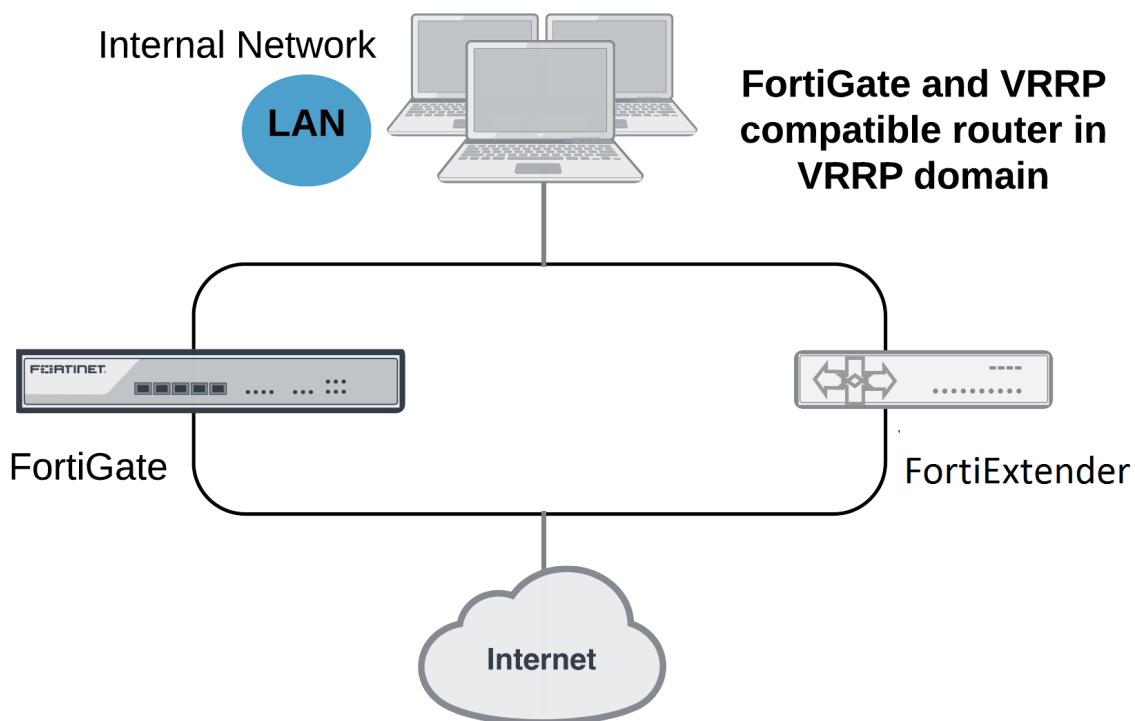

- [Redundant with FGT in IP Pass-through mode on page 39](#)
- [FEX-201E for FortiGate HA configuration on page 44](#)

Redundant with FGT in IP Pass-through mode

A Virtual Router Redundancy Protocol (VRRP) configuration can be used as a high-availability (HA) solution to ensure network connectivity in the event of a failing FortiGate router. With VRRP enabled on FortiExtender, all traffic will transparently fail over to FortiExtender when the FortiGate on your network fails. When the failed FortiGate is restored, it will take over the processing of traffic for the network.

For more information about VRRP, see [RFC 3768](#).

Use Case 1: FortiExtender in VRRP mode while being managed from FortiGate.

General configuration procedures

1. The FortiExtender LAN interface consists of multiple ports by default. Be sure to separate out an individual port from the LAN-switch for VRRP purposes. (Refer to "Step 3: Verify the port settings on FortiExtender" in [FEX-201E for FortiGate HA configuration on page 44](#).)

2. Continue managing FortiExtender from FortiGate over the LAN interface. (NOT the VRRP interface.)
3. Configure the VRRP gateway IP on the newly separated individual port on the FortiExtender and the corresponding VRRP port on the FortiGate.
4. Set the VRRP priority of the FortiExtender VRRP interface to a value lower than the FortiGate VRRP interface's priority.
5. Create a firewall policy on the FortiExtender to forward traffic from newly created VRRP interface to the LTE internet (Refer to [Configure firewall policies](#).)
6. Ensure the VRRP ports on the FortiExtender and the FortiGate are connected by verifying that the FortiExtender is in backup mode and the FortiGate is in master mode by running command "get router info vrrp".

In normal operations, all traffic to the internet passes through the primary VRRP interface of FortiGate. The primary VRRP router, which is the FortiGate, sends VRRP advertisement messages to the backup router, i.e., the FortiExtender. The backup FortiExtender will not attempt to become a primary router while receiving these messages. If the primary router fails, the backup FortiExtender becomes the new primary router after a brief delay, during which the new primary router, i.e., FortiExtender sends gratuitous ARP packets to the network to map the default route GW IP address of the network to the MAC address of the new primary router. All packets sent to the default router are now being sent to the new primary router, i.e., FortiExtender. Upon switchover, the network will not continue to benefit from FortiOS security features until the FortiGate is back online.

To enable VRRP on the interface attached to the LAN port on FortiGate:

```
config system interface
  edit <port num>
    set vdom "root"
    set ip <ip> <subnet mask>
    set allowaccess ping
    set vrrp-virtual-mac enable
    config vrrp
      edit <vrrp id>
        set vrip <vrrp IP>
        set priority <priority>
      next
    end
  next
end
```

To enable VRRP on FortiExtender:

```
config system management
  set discovery-type fortigate
  config fortigate-backup
    set vrrp-interface <vrrp interface i.e por1>
    set status enable
  end
end
config system interface wan vrrp
  set status enable
  set version 2 <only 2 is supported currently>
  set ip <IP of virtual router>
  set id <vrrp id>
  set priority <priority>
  set adv-interval <advertisement interval in seconds>
  set start-time <initialization timer for backup router, typically 1>
```

```
set preempt <enable | disable> (preempting master typically disable)
end
```

The VRRP interfaces on FortiGate and FortiExtender must be individual ports, and must not be part of a LAN switch with static IP address configuration. Devices reliant on the Internet from FortiGate or FortiExtender must also have a static IP configured.

To display the status of virtual router on FortiExtender:

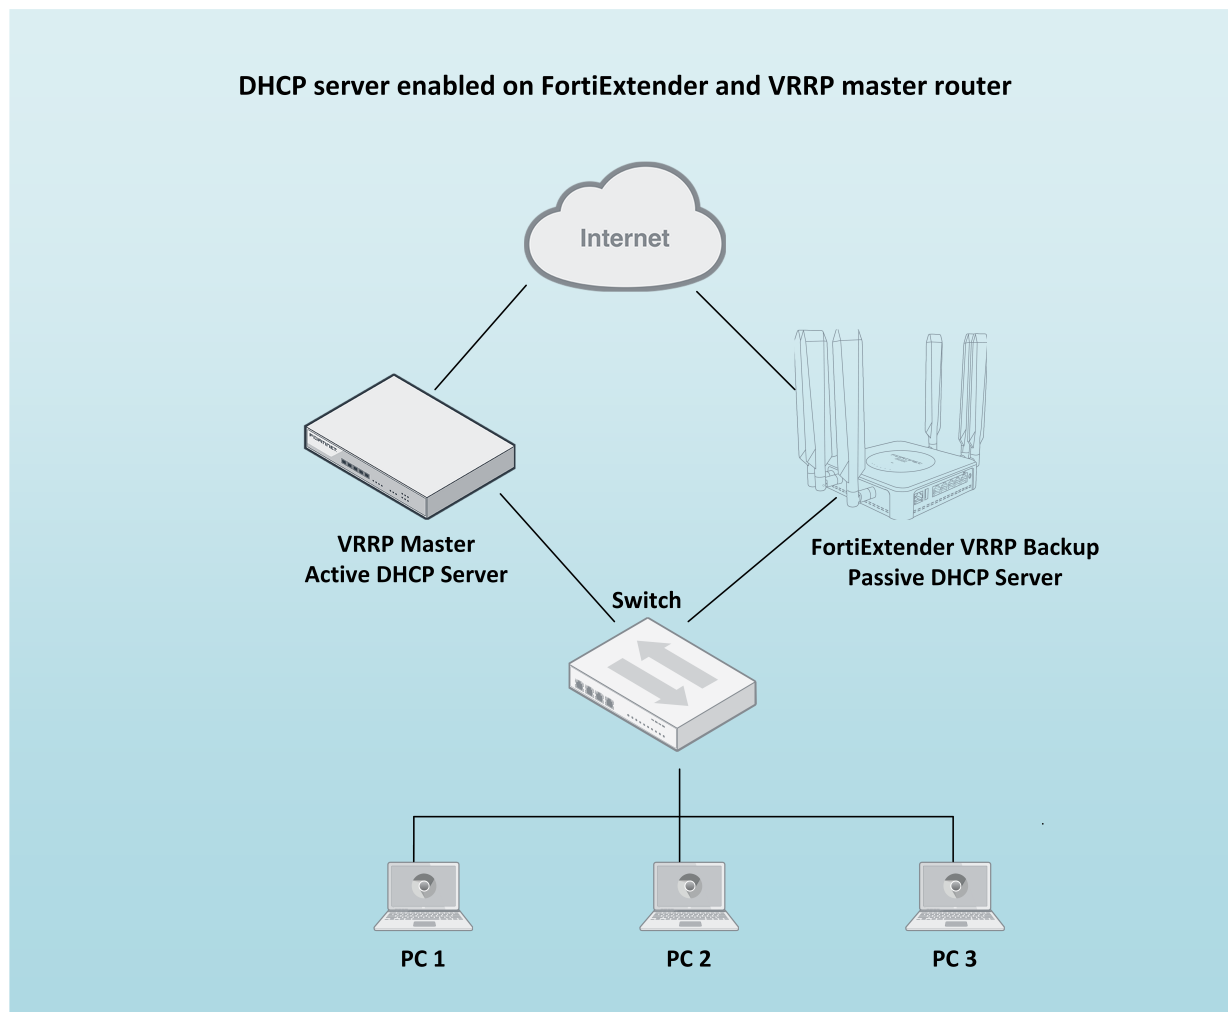

```
get router info vrrp
```

Enable DHCP server on FortiExtender and the VRRP master router

To ensure uninterrupted presence of a DHCP server when one of the VRRP-capable routers is down, you must ensure IP address availability all the time. Typically both the VRRP master and the backup routers are configured with DHCP servers with reserved IP addresses to their corresponding MAC addresses.

FortiExtender configured in VRRP backup mode will not launch the replicated copy of the DHCP server until and unless the VRRP master router goes down; FortiExtender will also terminate the DHCP server when the VRRP master router comes back up. This ability ensures that the hosts in the VRRP domain always gets the same IP address, irrespective of which VRRP router is in operation, without causing any IP address conflicts.

For information on DHCP server configuration, refer to [Configure DHCP server](#).

Enable DHCP relay on both FortiExtender and the VRRP master router

You must guarantee IP address availability to ensure access to the DHCP server at any time. The hosts must be able to access a DHCP server locally or remotely on an uninterrupted basis. In the event that the DHCP server is not present locally, a DHCP relay agent service is needed to receive DHCP requests from DHCP hosts and forwards the requests to the remote DHCP server, receive responses from the server, and cater to the needs of DHCP clients. In this configuration, the FortiExtender which acts in VRRP backup mode will be running a DHCP relay agent on a VRRP interface; the VRRP master router is also running a DHCP relay agent on the respective VRRP interface. This ability ensures that the hosts in the VRRP domain always gets the same IP address, irrespective of which VRRP router is in operation, without causing any IP address conflicts because the requests are catered to by the same remote DHCP server.

For information on DHCP relay configuration, refer to [Configure DHCP relay](#).

DHCP relay

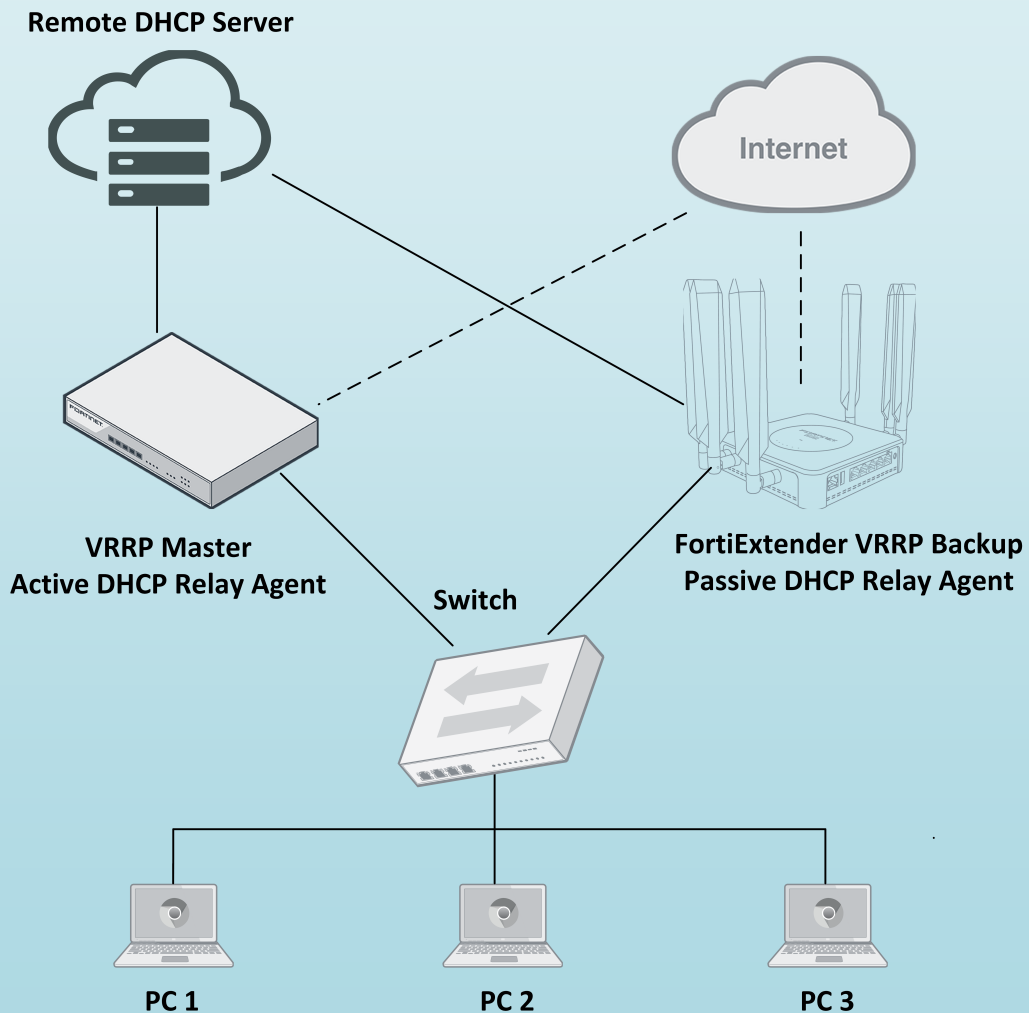

FortiExtender now supports DHCP relay agent which enables it to fetch DHCP leases from a remote server. It has to be configured per interface. Example below:

```
config system dhcprelay
edit 1
set status enable
set client-interfaces <vrrp interface name on which relay agent services are
offered>
set server-interface <interface name through which DHCP server can be reachable>
set server-ip <remote dhcp server IP>
end
```

The DHCP relay and DHCP server services can be run on any VRRP interface, which could be either a separate port or a VLAN interface.

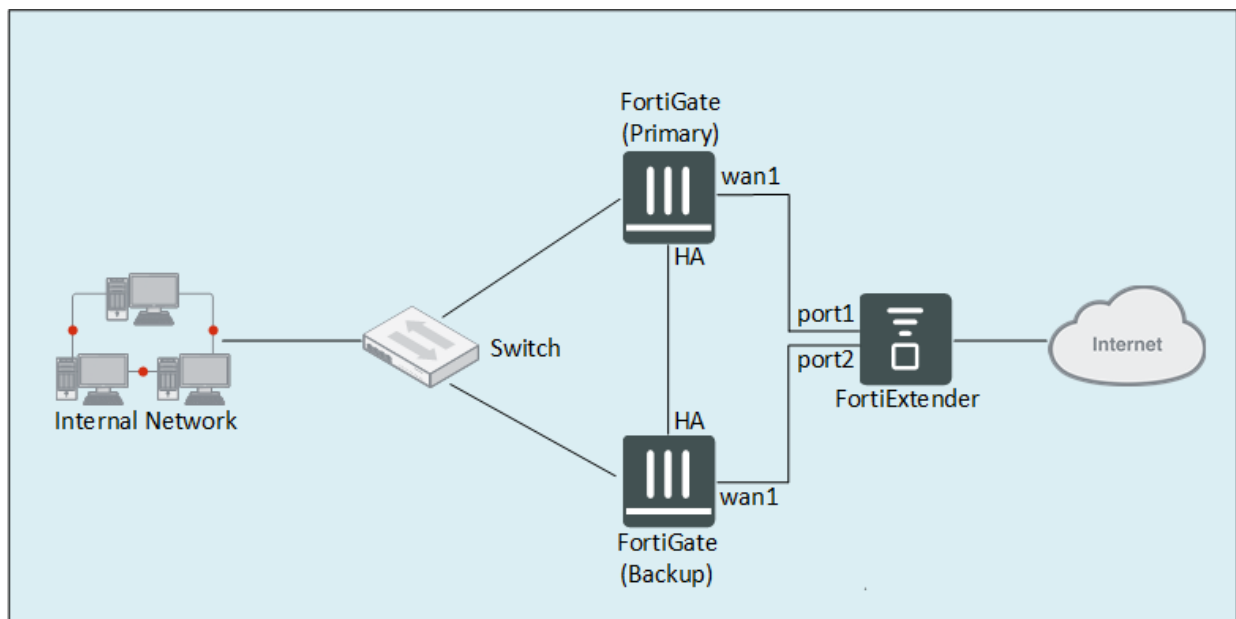

DHCP relay enabled on FortiExtender and VRRP master router

FEX-201E for FortiGate HA configuration

This use case discusses how to use a FortiExtender 201E to support two FortiGate devices in HA configuration to ensure uninterrupted network connectivity and business continuity. It provides step-by-step instructions on how to configure the FortiGate HA cluster from the FortiGate GUI. It also provides the FortiExtender CLI commands to verify the port configuration of FortiExtender 201E as a WAN switch to support the FortiGate HA configuration.

Network topology

Prerequisites

- The FortiExtender 201E device must be physically networked with the two FortiGate devices, with its Port 1 connected to wan1 on the primary FortiGate and Port 2 connected to wan1 on the backup FortiGate, as illustrated in the Network topology.
- The two FortiGate devices must be physically connected via the HA port on both of them, as illustrated in the Network topology.
- The two FortiGate devices must be running the same version of FOS.

The FortiGate devices used in this sample configuration are both running FOS 6.2.1.

Configuration procedures

This configuration involves the following major steps:

Step 1: Configure the primary FortiGate

1. Log in to the GUI of the primary FortiGate device.
2. From the menu, go to **Dashboard > Status**.
The **Status** page opens.
3. Locate the **System Information** widget, click the **Hostname**, and (from the drop-down menu) select the **Configure settings in System>Settings** link.
The **System Settings** page opens.
4. Change the **Host name** to something that identifies the FortiGate as the primary device, and click **Apply**.
5. Then, select **System>HA**, click the top part of the page to highlight it, and click **Edit**.
The **High Availability** page opens.

The **Edit** button will not be available until the top part of the Status page is highlighted.

6. Make the following required entries and/or selections:
 - a. Change **Mode** to **Active-Passive**.
 - b. Set **Device Priority** to a value greater than the one set on the backup FortiGate.
 - c. Specify a **Group name**.
 - d. Set the **Password**.
 - e. Select two **Heartbeat interfaces** (one at a time) by doing the following:
 - i. Click **+** (plus sign), and (from the pop-up list of interfaces) select **ha**.
 - ii. Set **Heartbeat Interface Priority** to 50.
 - iii. Click **OK**.
 - iv. Click **+** (plus sign) again, and (from the pop-up list of interfaces) select **wan1**.
 - v. Set **Heartbeat Interface Priority** to 50.
 - vi. Click **OK**.

Step 2: Configure the backup FortiGate

1. Log in to the GUI of the backup FortiGate device.
2. From the menu, go to **Dashboard > Status**.
The **Status** page opens.
3. Locate the **System Information** widget, click the **Hostname**, and (from the drop-down menu) select the **Configure settings in System > Settings** link.
The **System Settings** page opens.
4. Change the **Host name** to something that identifies the FortiGate as the backup device, and click **Apply**.
5. Then, select **System > HA**, click the top part of the page to highlight it, and click **Edit**.
The **High Availability** page opens.

The **Edit** button will not be available until the top part of the Status page is highlighted.

6. Make the following required entries and/or selections:
 - a. Change **Mode** to **Active-Passive**.
 - b. Set the **Device Priority** value smaller than the one set for the primary FortiGate.
 - c. Set the **Group name** to be the same as the one set on the primary FortiGate.
 - d. Set the **Password** to be the same as the one set on the primary FortiGate.
 - e. Select two **Heartbeat interfaces** (one at a time) by doing the following:
 - i. Click **+** (plus sign), and (from the pop-up list of interfaces) select **ha**.
 - ii. Set **Heartbeat Interface Priority** to 50.
 - iii. Click **OK**.
 - iv. Click **+** (plus sign) again, and (from the pop-up list of interfaces) select **wan1**.
 - v. Set **Heartbeat Interface Priority** to 50.
 - vi. Click **OK**.

- Ensure that the Device Priority value on the primary FortiGate is higher than the one for the backup FortiGate.
- Ensure that two heartbeat interfaces are selected and the Heartbeat Interface Priority are both set to 50 on both.

Step 3: Verify the port settings on FortiExtender

1. Ensure that Port 1 on the back of the FortiExtender is connected to the WAN1 port on the primary FortiGate. Refer to the Network topology.
2. Ensure that Port 2 on the back of the FortiExtender is connected to the WAN1 port on the backup FortiGate. Refer to the Network topology.
3. Run the following commands to verify and ensure that the physical Ports 1 and 2 are aggregated in the LAN switch port.

```

FX211E5919000011 # config system interface
FX211E5919000011 (interface) # edit lan
FX211E5919000011 (lan) # show
edit lan
    set type lan-switch
    set status up
    set mode dhcp
    set mtu 1500
    set vrrp-virtual-mac enable
    config vrrp
        set status disable
    end
    set allowaccess http https ssh ping telnet
next

FX211E5919000011 # config system lan-switch
FX211E5919000011 (lan-switch) # show
config system lan-switch
    config ports
        edit port1
        next
        edit port2
        next

```

```
edit port3
next
edit port4
next
end
end
```

-
- VLAN mode is best suited for high availability purposes because it delivers better throughput.
 - The "show" commands above yield the default settings of FortiExtender 201E as a LAN switch, which can be used out of the box to support FortiGate HA configurations. We recommend using these settings without change unless you are confident in your ability to configure custom settings of your own. If you prefer to configure your own LAN switch, be sure to use the aforementioned commands to double-check its configuration before putting FortiExtender to work.
-
